Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the open in the (K51) ASD Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (K51) ASD CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K51) ASD Control circuit at the C2 TIPM harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K51) ASD Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. ASD CONTROL OPERATION FROM THE PCM

Connect the C3 PCM harness connector.
 Ignition on, engine not running.
 Using the scan tool in the PCM, actuate the ASD.
 With a 12-volt test light connected to ground, probe the (K51) ASD Control circuit in the C2 TIPM harness connector.

Does the test light illuminate brightly and flash on and off?

Yes

- **NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

If OK, replace the TIPM in accordance with the Service Information.

No

- Go To [6](#)

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related TIPM and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the TIPM and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P0688-AUTO SHUTDOWN SENSE CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With ignition key on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

No voltage sensed at the PCM when the ASD is energized or voltage is sensed when the ASD is not energized. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(F342) ASD CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
(F342) ASD CONTROL OUTPUT CIRCUIT OPEN
(F342) ASD CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. VERIFY ASD DTC

NOTE: If any O2 SENSOR HEATER CIRCUIT HIGH DTCs set along with P0688-AUTO SHUTDOWN RELAY SENSE CIRCUIT LOW, all of the O2 Sensor Heater Control circuits need to be checked for a short to battery voltage.

NOTE: If any of the following component DTC(s) have set along with P0688, diagnose them first before continuing. Ignition Coil(s) Fuel Injector(s) ASD Control ASD Control Output (TIPM DTC)

Turn the ignition on.
With a scan tool, select View DTCs.

Is the DTC currently Active?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS

AND TESTING.)

2. EXCESSIVE RESISTANCE IN THE (F342) ASD CONTROL OUTPUT CIRCUIT

Turn the ignition off.
Disconnect the C1 PCM harness connector.
Disconnect the C5 TIPM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F342) ASD Control Output circuit from the C5 TIPM harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [3](#)

No

- Repair the excessive resistance in the (F342) ASD Control Output circuit. Inspect the related in-line connectors and splices.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. EXCESSIVE RESISTANCE IN THE (F342) ASD CONTROL OUTPUT CIRCUIT

Disconnect the C3 PCM harness connector.
Measure the resistance of the (F342) ASD Control Output circuit from the C5 TIPM harness connector to the appropriate terminals of special tool #8815.

Is the resistance below 5.0 ohms at each terminal?

Yes

- Go To [6](#)

No

- Repair the open in the (F342) ASD Control Output circuits.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (F342) ASD CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F342) ASD Control Output circuit at the C5 TIPM harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F342) ASD Control Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (F342) ASD CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE

Ignition on, engine not running.
Using a voltmeter measure the voltage on the (F342) ASD Control Output circuit in the C5 TIPM harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (F342) ASD Control Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. TOTALLY INTEGRATED POWER MODULE (TIPM)

Turn the ignition off.

Connect the C1 and C3 PCM harness connectors and the C5 TIPM harness connector.

Ignition on, engine not running.

Using the scan tool in the PCM, actuate the ASD.

With a 12-volt test light connected to ground, probe the (K51) ASD Control circuit at the C2 TIPM terminal connection.

Does the test light illuminate brightly and flash on an off during the actuation?

Yes

- **NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

If OK, replace the TIPM in accordance with the Service Information.

No

- Go To [Z](#)

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related TIPM and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the TIPM and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P0691-COOLING FAN 1 CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The PCM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects an open in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
LOW SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. LOW SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the Low Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit.

Remove the Low Speed Cooling Fan Relay and substitute it with a known good Relay.

Ignition on, engine not running.

With a scan tool, actuate the Low Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the Low Speed Cooling Fan Relay.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. TOTALLY INTEGRATED POWER MODULE (TIPM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cooling Fan Module, TIPM, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Cooling Fan Module, TIPM, and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

P0692-COOLING FAN 1 CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The PCM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects a shorted condition in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
LOW SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. LOW SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the Low Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit.

Remove the Low Speed Cooling Fan Relay and substitute it with a known good Relay.

Ignition on, engine not running.

With a scan tool, actuate the Low Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the Low Speed Cooling Fan Relay.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. TOTALLY INTEGRATED POWER MODULE (TIPM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cooling Fan Module, TIPM, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Cooling Fan Module, TIPM, and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

P0693-COOLING FAN 2 CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The PCM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects an open or short to ground in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND
(K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT OPEN
HIGH SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. HIGH SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the High Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit.

Remove the High Speed Cooling Fan Relay and substitute it with a known good Relay.

Ignition on, engine not running.

With a scan tool, actuate the High Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the High Speed Cooling Fan Relay.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C3 TIPM harness connector.

Remove the High Speed Cooling Fan Relay.

Measure the resistance between ground and the (K175) High Speed Cooling Fan Relay Control circuit at the relay connection.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K175) High Speed Cooling Fan Relay Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (K175) High Speed Cooling Fan Relay Control circuit from the C3 TIPM harness connector to the Relay connection.

Is the resistance above 5.0 ohms?

Yes

- Repair the open or excessive resistance in the (K175) High Speed Cooling Fan Relay Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. TOTALLY INTEGRATED POWER MODULE (TIPM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cooling Fan Module, TIPM, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Cooling Fan Module, TIPM, and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Totally Integrated Power Module per Service Information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

P0694-COOLING FAN 2 CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The PCM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects a short to voltage in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
HIGH SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. HIGH SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the High Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit. Remove the High Speed Cooling Fan Relay and substitute it with a known good Relay.

Ignition on, engine not running.

With a scan tool, actuate the High Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the High Speed Cooling Fan Relay.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the C3 TIPM harness connector.

Remove the High Speed Cooling Fan Relay.

Ignition on, engine not running.

Measure the voltage on the (K175) High Speed Cooling Fan Relay Control circuit at the relay connection.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K175) High Speed Cooling Fan Relay Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. TOTALLY INTEGRATED POWER MODULE (TIPM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cooling Fan Module, TIPM, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Cooling Fan Module, TIPM, and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

P0700-TRANSMISSION CONTROL SYSTEM (MIL REQUEST)

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and battery voltage greater than 10 volts.

◦ **Set Condition:**

An active DTC is stored in the TCM. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
DTC PRESENT IN THE TRANSMISSION CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC PRESENT IN EATX CONTROLLER

This is an informational DTC letting you know that a DTC(s) is stored in the Transmission Control Module. Erase this DTC from the PCM after all Transmission DTC(s) have been repaired.

Using a scan tool, read the Transmission Controller DTC and refer to the Transmission Category and perform the appropriate symptom.

PCM Diagnostic Information complete.

Continue

- Test Complete.

P0703-BRAKE SWITCH 2 PERFORMANCE

81917095

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

- **Set Condition:**

When the PCM recognizes Brake Switch No.2 voltage is not equal to the applied value at the PCM when Brake Switch No.1 is applied. This could be a normal condition. If this condition is seen repeatedly by the PCM the fault is set. Cruise will not work for the rest of the key cycle.

Possible Causes
(F941) FUSED IGNITION SWITCH OUTPUT CIRCUIT
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO GROUND
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Make sure the Stop Lamp Switch is adjusted properly before continuing.

NOTE: Make sure the Stop Lamp Switch is properly wired, such as (B15) Brake Signal 1 and (B16) Brake Signal 2 circuit are not switched at the harness connector.

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. (F941) FUSED IGNITION SWITCH CIRCUIT

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Using a 12-volt test light connected to ground, probe the (F941) Fused Ignition Switch Output circuit in the Stop Lamp Switch harness connector.

Does the test light illuminate brightly?**Yes**

- Go To [3](#)

No

- Repair the open or short to ground in the (F941) Fused Ignition Switch Output circuit. Inspect the related fuse and repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

**3. STOP LAMP SWITCH**

Turn the ignition off.

Measure the resistance between the (F941) Fused Ignition Switch Output circuit terminal and the (B16) Brake Signal 2 circuit terminal in the Stop Lamp Switch.

Measure the resistance between the (Z914) Ground circuit terminal and the (B15) Brake Signal 1 terminal in the Stop Lamp Switch.

Apply and release the Stop Lamp Switch while monitoring the ohmmeter.

Does the resistance change from below 5.0 ohms to open circuit for each circuit check?**Yes**

- Go To [4](#)

No

- Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors. If OK, replace the Stop Lamp Switch.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Disconnect the C3 PCM harness connector.
Measure the voltage on the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.
Ignition on, engine not running.

Is there any voltage present?

Yes

- Repair the short to voltage in the (B16) Brake Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (B16) Brake Signal 2 circuit from the Stop Lamp Switch harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (B16) Brake Signal 2 circuit.

Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the short to ground in the (B16) Brake Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [7](#)

7. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN

Measure the resistance of the (B15) Brake Signal 1 circuit from the Stop Lamp Switch harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [8](#)

No

- Repair the open in the (B15) Brake Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P0850-PARK/NEUTRAL SWITCH PERFORMANCE

8101020

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Park Neutral switch rationality test is enabled only for vehicles equipped with a 4/5 speed automatic transmission. This diagnostic checks if the park/neutral switch is incorrectly stuck in the neutral position during driving conditions by comparing Vehicle Speed, Engine Speed, Throttle Position, and Pressure Ratio to the fail thresholds and by looking at the state of the Park/Neutral Switch. The stuck in drive condition is not explicitly checked as the starter relay does not energize and therefore render the vehicle inoperable.

- **When Monitored:**

Continuously with the transmission in Park, Neutral, or Drive and NOT in Limp-in mode.

- **Set Condition:**

This code will set if the PCM detects an irrational Park/Neutral switch state for at least one minute. Two trip fault. Three good trips to turn off the MIL.

Possible Causes
TRS (T41) SENSE (P/N SENSE) CIRCUIT OPEN
TRS (T41) SENSE (P/N SENSE) CIRCUIT SHORTED TO GROUND
TRANSMISSION RANGE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Check the TCM for DTCs, if P0706 is set in the TCM diagnose the TCM code before continuing.

Ignition on, engine not running.

While moving the gear selector through all gear positions (Park to 1 and back to Park).

Using a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. TRS (T41) SENSE (P/N SENSE) CIRCUIT OPEN

Turn the ignition off.

Disconnect the C4 PCM harness connector.

Disconnect the Transmission Range Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the TRS (T41) Sense (P/N Sense) circuit from the TRS harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [3](#)

No

- Repair the open in the TRS (T41) Sense (P/N Sense) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. TRS (T41) SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the TRS (T41)

Sense (P/N Sense) circuit at the TRS harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [4](#)

No

- Repair the short to ground in the TRS (T41) Sense (P/N Sense) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. TRANSMISSION RANGE SENSOR

Measure the resistance between ground and the (T41) TRS Sense (P/N Sense) circuit while moving the gear selector through each gear in the TRS connector.

NOTE: The circuit is grounded in Park and Neutral and open in the other positions.

Did the resistance change from above 100 kohms (open) to below 10.0 ohms (grounded)?

Yes

- Go To [5](#)

No

- Replace the Transmission Range Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Transmission Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Solenoid and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1115-GENERAL TEMPERATURE RATIONALITY

The General Temperature Rationality looks at the outputs of the three temperature sensors and compare them under cold start conditions. Following a start to run delay time, the outputs of the ambient, engine coolant, and intake air temperature sensors will be compared. If two sensors agree but not the third, the third sensor is declared as irrational. If all three sensors are irrational the General Temperature Sensor Rationality is failed.

- **When Monitored:**

Engine off time is greater than 480 minutes and the vehicle has been driven for one minute over 35 mph. Ambient temperature is greater than -64° C (-83° F).

- **Set Condition:**

Once the vehicle is soaked for a calibrated engine off time and then driven over calibrated speed and load conditions for some calibrated time, the PCM compares the ambient air, engine coolant, and intake air temperature sensor values. If the values of all the three sensors disagree with one another, a general temperature sensor irrationality is declared. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
EXCESSIVE RESISTANCE IN THE SENSOR SIGNAL CIRCUIT
EXCESSIVE RESISTANCE IN THE SENSOR GROUND CIRCUIT
SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
SENSOR SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT
TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Turn the ignition off.

If possible, allow the vehicle to sit with the ignition off for more than 480 minutes in an environment where the

temperature is consistent and above -7° C (19.4° F).

Test drive the vehicle. The vehicle must exceed 48 km/h (30 mph) during the test drive. Do not cycle the ignition off when the test drive is completed.

With a scan tool, select View the DTCs.

NOTE: All ECT, Intake Air, and Ambient Air Temperature Sensor codes must be diagnosed and repaired before continuing.

NOTE: In cold weather, this DTC could be set by a high powered block heater and no repair would be required.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. TEMPERATURE SENSOR CIRCUIT

With a scan tool, read the ECT, Ambient Air Temp, and Intake Air Temp Sensor temp values.

Start the engine.

Allow the engine to reach normal operating temperature while monitoring the three Sensor temperature values.

Is the temperature for each of the Sensors increasing properly?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Go To [3](#)

3. TEMPERATURE SENSOR

Disconnect the suspected sensor.

Ignition on, engine not running.

With the scan tool, read the voltage of the suspected Sensor.

Connect a jumper wire between the Sensor Signal circuit and the Sensor ground circuit.

Did the voltage reading start at 4.8 to 5.0 volts and decrease to 0 volts when the jumper wire was installed?

Yes

- Verify that there is good pin to terminal contact in the related Sensor and Powertrain Control Module

connectors. Replace the Sensor if no problems were found in the connectors.

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)
- **NOTE: Remove the jumper wire before continuing.**

4. EXCESSIVE RESISTANCE IN THE TEMPERATURE SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the C2 PCM harness connector.
Disconnect the C4 TIPM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the Sensor Signal circuit from the Sensor harness connector to the appropriate terminal of special tool #8815 for the ECT Sensor and IAT Sensor. Measure the resistance of the (G31) AAT Sensor Signal circuit from the Sensor harness connector to the C4 TIPM harness connector.

Is the resistance above 5.0 ohms.

Yes

- Repair the excessive resistance in the Temperature Sensor Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. EXCESSIVE RESISTANCE IN THE SENSOR GROUND CIRCUIT

Measure the resistance of the (K900) Sensor ground circuit from the ECT Sensor and IAT Sensor to the appropriate terminal of special tool #8815.

Measure the resistance of the (G931) Sensor ground circuit from the AAT Sensor harness connector to the C4 TIPM

harness connector.

Is the resistance above 5.0 ohms.

Yes

- Repair the excessive resistance in the Sensor ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the Sensor Signal circuit at the Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the Sensor Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- Go To [7](#)

7. SENSOR SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT

Measure the resistance between ground and the Sensor Signal circuit at the Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short between the Sensor ground circuit and the Sensor Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- Go To [8](#)

8. SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage on the Sensor Signal circuit at the Sensor harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the Sensor Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- Go To [9](#)

9. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related Sensor and the Powertrain Control Module (PCM).
Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related Sensor and Powertrain Control Module connectors.
Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1128-CLOSED LOOP FUELING NOT ACHIEVED - BANK 1

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Engine running in closed loop mode.

- **Set Condition:**

Enable conditions are met and the O2 sensor has not been in closed loop control at least once on each of the two consecutive trips, the MIL illuminates and the DTC is set. Two Trip Fault. Three good trips to turn off the MIL

Possible Causes
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
O2 SIGNAL CIRCUIT
O2 RETURN CIRCUIT
1/1 O2 SENSOR
MAP SENSOR
ECT SENSOR
ENGINE MECHANICAL PROBLEM

FUEL FILTER/PRESSURE REGULATOR (HIGH)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Diagnose all other trouble codes before continuing.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. CHECKING FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge to the fuel rail.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Turn the ignition off.

Choose a conclusion that best matches your fuel pressure reading.

Within Specification

- Go To [3](#)

Above Specification

- Replace the fuel filter/pressure regulator.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

Below Specification

- Go To [12](#)
- **CAUTION: Stop All Actuations.**

3. O2 SENSOR OPERATION

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: If one of the O2 Sensor's Signal or Return circuit is shorted to ground the scan tool will display all O2 Sensor voltage readings low. The O2 Sensor that is shorted to ground will display a voltage reading near or at 0 volts.

NOTE: If one of the O2 Sensor Signal or Return circuits are shorted to voltage, the scan tool will display all O2 Sensor voltage readings high.

NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

With a scan tool, monitor all of the O2 Sensor voltage readings.

Is the voltage switching between 2.5 and 3.4 volts for all the O2 Sensors?

Yes

- Go To [4](#)

No

Go To [8](#)

4. 1/1 O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

Ignition on, engine not running.

With a scan tool, actuate the 1/1 O2 Heater Test.

With the scan tool, monitor 1/1 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

- Verify that there is good pin to terminal contact in the 1/1 O2 Sensor and Powertrain Control Module connectors. If OK, replace the 1/1 O2 Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. MAP SENSOR OPERATION

Turn the ignition off.

Connect a Vacuum Gauge to a Manifold Vacuum source.

Start the engine.

Allow the engine to idle.

NOTE: If engine will not idle, maintain a constant RPM above idle.

With the scan tool, read the MAP Sensor vacuum value.

Is the scan tool reading within 1 inch of Hg on the Vacuum Gauge reading?

Yes

- Go To [6](#)

No

- Verify that there is good pin to terminal contact in the MAP Sensor and Powertrain Control Module connectors. If OK, replace the MAP Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. ECT SENSOR OPERATION

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: This test works best if performed on a cold engine (cold soak)

Ignition on, engine not running.

With a scan tool, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82° C (180° F). The value should reach at least 82° C (180° F).

Did the ECT value increase smoothly and did it reach at least 82° C (180° F)?

Yes

- Go To [7](#)

No

- Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors. If OK, replace the Engine Coolant Temperature Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. ENGINE MECHANICAL PROBLEM

Turn the ignition off.

Check for any of the following conditions/mechanical problems.

AIR INDUCTION SYSTEM - must be free from leaks.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector

Are there any engine mechanical problems?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [11](#)

8. 1/1 O2 SENSOR

Disconnect the 1/1 O2 Sensor harness connector.

Ignition on, engine not running.

With a scan tool, monitor the 1/1 O2 Sensor voltage.

O2 Sensor voltage should read between 4.1 and 5.0 volts on the scan tool with the connector disconnected.

Connect a jumper wire between the (K41) Signal circuit and the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

NOTE: The voltage should drop from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire in place.

Did the O2 Sensor voltage change from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire installed?

Yes

- Verify that there is good pin to terminal contact in the 1/1 O2 Sensor and Powertrain Control Module connectors. If OK, replace the 1/1 O2 Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

NOTE: Remove the jumper wire before continuing.

**9. (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT**

With a scan tool, monitor the 1/1 O2 Sensor voltage reading with the jumper wire removed.

NOTE: The scan tool will display all O2 Sensor voltage readings approximately 5.0 volts when only one O2 Sensor's Signal circuit is shorted to voltage.

NOTE: The scan tool will display one O2 Sensor voltage close to zero and the others will read lower than normal when one O2 Sensor Signal circuit contains excessive resistance.

Is the voltage between 4.1 and 5.0 volts?

Yes

- Go To [10](#)

No

- Check the (K41) O2 Sensor 1/1 Signal circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

10. (K902) O2 RETURN UPSTREAM CIRCUIT

Disconnect the 1/1 O2 Sensor harness connector.
Measure the voltage on the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

Is the voltage at 2.5 volts?

Yes

- Go To [11](#)

No

- Check the O2 Return circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related Sensor and the Powertrain Control Module (PCM).
Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related Sensor and Powertrain Control Module connectors.
Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

12. RESTRICTED FUEL SUPPLY LINE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.
Install special 5/16 fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.
Attach a fuel pressure test gauge to the T fitting on tool #6539.
Ignition on, engine not running.
With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

- Repair or replace fuel supply line as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [13](#)
- **CAUTION: Stop All Actuations.**

13. FUEL PUMP INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or

servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.
Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

- Replace the Fuel Pump Inlet Strainer.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [14](#)

14. FUEL PUMP MODULE

If there are no possible causes remaining, view repair.

Repair

- Verify that there is good pin to terminal contact in the Fuel Pump Module, Relay, and Powertrain Control Module connectors. If OK, replace the Fuel Pump Module.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1129-CLOSED LOOP FUELING NOT ACHIEVED - BANK 2

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Engine running in closed loop mode.

- **Set Condition:**

Enable conditions are met and the O2 sensor has not been in closed loop control at least once on each of the two consecutive trips, the MIL illuminates and the DTC is set. Two Trip Fault. Three good trips to turn off the MIL

FUEL PUMP MODULE

O2 SIGNAL CIRCUIT
O2 RETURN CIRCUIT
2/1 O2 SENSOR
MAP SENSOR
ECT SENSOR
ENGINE MECHANICAL PROBLEM
FUEL FILTER/PRESSURE REGULATOR (HIGH)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Diagnose all other trouble codes before continuing.
 Start the engine.
 Allow the engine to reach normal operating temperature.
 With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. CHECKING FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge to the fuel rail.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Turn the ignition off.

Choose a conclusion that best matches your fuel pressure reading.

Within Specification

- Go To [3](#)

Above Specification

- Replace the fuel filter/pressure regulator.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

Below Specification

- Go To [12](#)
- **CAUTION: Stop All Actuations.**

3. O2 SENSOR OPERATION

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: If one of the O2 Sensor's Signal or Return circuit is shorted to ground the scan tool will display all O2 Sensor voltage readings low. The O2 Sensor that is shorted to ground will display a voltage reading near or at 0 volts.

NOTE: If one of the O2 Sensor Signal or Return circuits are shorted to voltage, the scan tool will display all O2 Sensor voltage readings high.

NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

With the scan tool, monitor the 2/1 O2 Sensor voltage reading.

Is the voltage switching between 2.5 and 3.4 volts?

Yes

- Go To [4](#)

No

- Go To [8](#)

4. 2/1 O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

NOTE: Perform the following test on all O2 Sensors.

Ignition on, engine not running.

With a scan tool, actuate the 2/1 O2 Heater Test.

With the scan tool, monitor 2/1 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

- Verify that there is good pin to terminal contact in the 2/1 O2 Sensor and Powertrain Control Module connectors. If OK, replace the 2/1 O2 Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. MAP SENSOR OPERATION

Turn the ignition off.

Connect a Vacuum Gauge to a Manifold Vacuum source.

Start the engine.

Allow the engine to idle.

NOTE: If engine will not idle, maintain a constant RPM above idle.

With the scan tool, read the MAP Sensor vacuum value.

Is the scan tool reading within 1 inch of Hg on the Vacuum Gauge reading?

Yes

- Go To [6](#)

No

- Verify that there is good pin to terminal contact in the MAP Sensor and Powertrain Control Module connectors. If OK, replace the MAP Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. ECT SENSOR OPERATION

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: This test works best if performed on a cold engine (cold soak).

Ignition on, engine not running.

With the scan tool, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82° C (180° F). The value should reach at least 82° C (180° F).

Did the ECT value increase smoothly and did it reach at least 82° C (180° F)?

Yes

- Go To [7](#)

No

- Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors. If OK, replace the Engine Coolant Temperature Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. ENGINE MECHANICAL PROBLEM

Turn the ignition off.

Check for any of the following conditions/mechanical problems.

AIR INDUCTION SYSTEM - must be free from leaks.

ENGINE VACUUM - must be at least 13 inches in neutral.

ENGINE VALVE TIMING - must be within specifications.

ENGINE COMPRESSION - must be within specifications.

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely.

TORQUE CONVERTER STALL SPEED - must be within specifications.

POWER BRAKE BOOSTER - no internal vacuum leaks.

FUEL - must be free of contamination.

FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector.

Are there any engine mechanical problems?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [11](#)

8. O2 SENSOR

Ignition on, engine not running.

Disconnect the 2/1 O2 Sensor harness connector.

With the scan tool, monitor the 2/1 O2 Sensor voltage.

O2 Sensor voltage should read between 4.1 and 5.0 volts on the scan tool with the connector disconnected.

Connect a jumper wire between the (K43) O2 Sensor 2/1 Signal circuit and the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

NOTE: The voltage should drop from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire in place.

Did the O2 Sensor voltage change from between 4.1 and 5.0 volts to 2.5 volts when the jumper wire was installed?

Yes

- Verify that there is good pin to terminal contact in the 2/1 O2 Sensor and Powertrain Control Module connectors. If OK, replace the 2/1 O2 Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

NOTE: Remove the jumper wire before continuing.

9. O2 SENSOR SIGNAL CIRCUIT

With the scan tool, monitor all the O2 Sensor voltage reading with the jumper wire removed.

NOTE: The scan tool will display all O2 Sensor voltage readings approximately 5.0 volts when only one O2 Sensor's Signal circuit is shorted to voltage.

NOTE: The scan tool will display one O2 Sensor voltage close to zero and the others will read lower than normal when one O2 Sensor Signal circuit contains excessive resistance.

Is the voltage between 4.1 and 5.0 volts?

Yes

- Go To [10](#)

No

- Check all the O2 Signal circuits for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

10. (K902) O2 RETURN UPSTREAM CIRCUIT

Disconnect the 2/1 O2 Sensor harness connector.
Measure the voltage on the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

Is the voltage at 2.5 volts?

Yes

- Go To [11](#)

No

- Check the (K902) O2 Return Upstream circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related Sensor and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

12. RESTRICTED FUEL SUPPLY LINE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special 5/16 fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.
Attach a fuel pressure test gauge to the T fitting on tool #6539.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

- Repair or replace fuel supply line as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [13](#)
- **CAUTION: Stop All Actuations.**

13. FUEL PUMP INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

- Replace the Fuel Pump Inlet Strainer.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [14](#)

14. FUEL PUMP MODULE

If there are no possible causes remaining, view repair.

Repair

- Verify that there is good pin to terminal contact in the Fuel Pump Module, Relay, and Powertrain Control

Module connectors. If OK, replace the Fuel Pump Module.

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1273-A/C CLUTCH CONTROL CIRCUIT 2 HIGH (TIPM)

818100cc

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts. A/C Switch on.

◦ **Set Condition:**

A shorted high condition has been detected in the A/C Clutch Control output circuit by the TIPM. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
EXCESSIVE RESISTANCE IN THE (Z906) A/C CLUTCH GROUND CIRCUIT
A/C COMPRESSOR CLUTCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. A/C CLUTCH OPERATION

Ignition on, engine not running.

With a scan tool under the PCM Actuators, actuate the A/C Clutch.

Is the A/C Clutch actuating?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Go To [2](#)

2. A/C CLUTCH CONTROL OPERATION FROM THE PCM

Turn the ignition off.
 Disconnect the C1 TIPM harness connector.
 Ignition on, engine not running.
 Using the scan tool under the PCM Actuators, actuate the A/C Clutch.
 With a 12-volt test light connected to ground, probe the (C13) A/C Clutch Control circuit in the C1 TIPM harness connector.

Does the test light illuminate brightly and flash on and off?

Yes

- Go To [3](#)

No

- Perform the Diagnostic Procedure for P0645-A/C CLUTCH CONTROL CIRCUIT. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

3. (C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the A/C Compressor Clutch harness connector.
 Ignition on, engine not running.
 Measure the voltage on the (C3) A/C Clutch Control Output circuit at the A/C Compressor Clutch harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (C3) A/C Clutch Control Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. A/C CLUTCH GROUND CIRCUIT OPEN

Turn the ignition off.
 Connect the C1 TIPM harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (Z906) A/C Clutch ground circuit at the A/C Compressor Clutch harness connector.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Repair the excessive resistance in the (Z906) A/C Clutch ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
 (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. A/C COMPRESSOR CLUTCH

Ignition on, engine not running.
 Using the scan tool under the TIPM Actuators, actuate the A/C Clutch.
 With a 12-volt test light connected to ground, probe the (C3) A/C Clutch Control Output circuit at the A/C Compressor Clutch harness connector.

Does the test light illuminate accordingly during the actuation?

Yes

- Verify that there is good pin to terminal contact in the A/C Clutch, TIPM, and Powertrain Control Module connectors. If OK, replace the A/C Compressor Clutch per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST.
 (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. TOTALLY INTEGRATED POWER MODULE (TIPM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Clutch,

TIPM, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the A/C Clutch, TIPM, and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

P1275-A/C CLUTCH CONTROL CIRCUIT 2 OVERCURRENT (TIPM)

818100cc

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10.4 volts. TIPM requesting A/C Clutch operation.

◦ **Set Condition:**

An overcurrent condition is detected in the A/C Clutch control output circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
TERMINAL DAMAGE OR CORROSION
A/C CLUTCH GROUND HIGH RESISTANCE
(C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
(C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
A/C COMPRESSOR CLUTCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. A/C CLUTCH OPERATION

Ignition on, engine not running.

With a scan tool in the TIPM Actuators, actuate the A/C Clutch.

Is the A/C Clutch actuating?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Go To [2](#)

2. VISUAL AND PHYSICAL CONNECTOR AND TERMINAL INSPECTION

Turn the ignition off.

Disconnect the C1 TIPM harness connector.

Disconnect the A/C Clutch harness connector.

Inspect the terminal and connector condition. Check for signs of corrosion build up or damage the would compromise the terminal to controller pin connector.

NOTE: Make sure that all in-line connectors are inspected for corrosion and/or damage.

Visually inspect the wiring harness. Look for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes

- Repair or replace as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT EXCESSIVE RESISTANCE

With a jumper wire, connect one end to the (C3) A/C Clutch Control Output circuit in the A/C Clutch harness connector and the other to a clean chassis ground.

Using a 12-volt test light connected to battery voltage, probe the (C3) A/C Clutch Control Output circuit in the C1 TIPM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the excessive resistance in the (C3) A/C Clutch Control Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST.

(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (C3) A/C CLUTCH CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (C3) A/C Clutch Control Output circuit at the A/C Clutch harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (C3) A/C Clutch Control Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. A/C CLUTCH GROUND CIRCUIT

Using a 12-volt test light connected to battery voltage, probe the (Z906) A/C Clutch Ground circuit in the A/C Clutch harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (Z906) A/C Clutch Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. A/C CLUTCH CONTROL OUTPUT FROM TIPM

Reconnect the C1 TIPM harness connector.

Ignition on, engine not running.

With a scan tool in the TIPM Actuators, actuate the A/C Clutch.

Using the 12-volt test light connected to ground, probe the (C3) A/C Clutch Control Output circuit in the A/C Clutch harness connector.

Does the test light illuminate brightly?

Yes

- Replace the A/C Clutch.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the TIPM in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

P01404-EGR POSITION SENSOR RATIONALITY CLOSED

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The EGR valve has a position sensor and the EGR position rationality is designed to make sure that the valve moves freely within its operating range. Closed valve position reference check verifies that the valve is within its allowable upper and lower limits. The EGR position rationality test looks for a sustained error relative to commanded valve position.

- **When Monitored:**

Engine running.

- **Set Condition:**

The EGR flow or valve movement is not what is expected. A rationality error has been detected for the EGR Open Position Performance. Two trip fault.

Possible Causes
EXCESSIVE RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN
(K34) EGR SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(Z906) GROUND CIRCUIT OPEN
EGR SOLENOID ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose and repair any EGR signal circuit high or low DTCs before continuing with this

procedure.

Turn the ignition on.

With the scan tool, select View DTCs. Record DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose fitting clothing. Failure to follow these instructions can result in personal or fatal injury.

WARNING: The normal operating temperature of the EGR system is very high. Never work around or attempt to service any part of the EGR system until it has cooled.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. EXCESSIVE RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the EGR Solenoid harness connector.

Disconnect the C1 and C2 PCM harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit from the EGR Solenoid harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [3](#)

No

- Repair the excessive resistance in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN

Measure the resistance of the (K35) EGR Solenoid Control circuit from the EGR Solenoid harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the open in the (K35) EGR Solenoid Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (K34) EGR SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K34) EGR Sensor Signal circuit in the EGR Solenoid harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the short to ground in the (K34) EGR Sensor Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the EGR Valve Assembly harness connector.

Using a 12 volt test light connected to the 12 volts, check the (Z906) Ground circuit in the EGR Valve Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [6](#)

No

- Repair the excessive resistance in the (Z906) Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (K35) EGR CONTROL CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Connect the EGR Valve Assembly connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 along with the #8815-1 to perform the diagnosis.

Using a voltmeter, perform a voltage drop test by backprobing the (K35) EGR Control circuit at the EGR Valve Assembly harness connector and probing the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, perform the EGR System Test.
Select OPEN to open the EGR valve.

Monitor the circuit voltage on the voltmeter.

Is the voltage below 0.5 volts when the valve was opened during the system test?

Yes

- Go to [7](#)

No

- Repair the excessive resistance in the (K35) EGR Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. EGR SOLENOID ASSEMBLY

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the EGR Valve Solenoid Duty Cycle.

Select the Duty Cycle reading of 79.9%

Using a 12 volt test light connected to ground, check the (K35) EGR Control circuit in the EGR Valve Assembly harness connector.

NOTE: If the DTC is active, the actuation test may not be allowed by the PCM. It may be necessary to clear the DTCs before starting the actuation.

NOTE: The voltage supplied to the solenoid circuit during the actuation may be less than battery voltage. The test light should be illuminated, but may not be as bright as a direct connection to the battery.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Does the test light illuminate accordingly during the actuation?

Yes

- Go To [8](#)

No

- Verify that there is good pin to terminal contact in the Solenoid and the Powertrain Control Module connectors. If OK, replace the EGR Solenoid Assembly per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Solenoid Assembly and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Solenoid and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1501-VEHICLE SPEED SENSOR 1/2 CORRELATION - DRIVE WHEELS

8181750a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and vehicle moving. Cruise is learned and customer is trying to use the Cruise.

- **Set Condition:**

The PCM recognizes rear wheel speed is greater than front wheel speed. One trip fault.

Possible Causes
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: Check for any Bus Communication DTCs. If no Bus Communication DTCs are set, check for active DTCs stored in the Anti-Lock Brake Module. Any Bus Communication DTCs or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

Start the engine.
Allow the engine to idle.

NOTE: It may be necessary to drive the vehicle for the fault to become Active.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. VISUAL INSPECTION

NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.

Check tire pressure of all the tires.

Check tire wear on all the tires.

Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes

- Repair as necessary. If the code sets during a front OR rear wheel spin condition, no repair is necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Wheel Speed Sensors, ABS Module, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Wheel Speed Sensor, ABS Module, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1502-VEHICLE SPEED SENSOR 1/2 CORRELATION - NON DRIVE WHEELS

8191759x

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on and vehicle moving. Brake pedal must not be applied.

- **Set Condition:**

The PCM recognizes front axle speed is greater than rear axle speed. One trip fault.

Possible Causes
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: Check for any Bus Communication DTCs. If no Bus Communication DTCs are set, check for active DTCs stored in the Anti-Lock Brake Module. Any Bus Communication DTCs or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

Start the engine.
Allow the engine to idle.

NOTE: It may be necessary to drive the vehicle for the fault to become Active.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. VISUAL INSPECTION

NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.
Check tire pressure of all the tires.

Check tire wear on all the tires.

Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes

- Repair as necessary. If the code sets during a front OR rear wheel spin condition, no repair is necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Wheel Speed Sensors, ABS Module, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Wheel Speed Sensor, ABS Module, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1572-BRAKE PEDAL STUCK ON

- **When Monitored:**

Ignition on. In plant mode only.

- **Set Condition:**

PCM recognizes the Brake Pedal could not electrically indicate the applied (On) position with both switch inputs. One trip fault.

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Make sure the Stop Lamp Switch is adjusted properly before continuing.

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. STOP LAMP SWITCH OPERATION

NOTE: Check the related fuse and relay for proper operation before continuing.

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Measure the resistance between the (Z914) Ground circuit terminal and the (B15) Brake Signal 1 circuit terminal in the Stop Lamp Switch.

Apply and release the Stop Lamp Switch while monitoring the ohmmeter.

Does the resistance change from below 5.0 ohms to open circuit when pressing and releasing the brake pedal switch?

Yes

- Go To [3](#)

No

- Replace the Stop Lamp Switch.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. STOP LAMP SWITCH OPERATION

Measure the resistance between the (F941) Fused Ignition Switch terminal and the (B16) Brake Signal 2 circuit terminal in the Stop Lamp Switch.

Apply and release the Stop Lamp Switch while monitoring the ohmmeter.

Does the resistance change from below 5.0 ohms to open circuit when pressing and releasing the Stop Lamp switch?

Yes

- Go To [4](#)

No

- Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors. If OK, replace the Stop Lamp Switch.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN

Disconnect the C3 PCM harness connector.

**CAUTION: Do not probe the PCM harness connectors.
Probing the PCM harness connectors will damage the**

PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (B15) Brake Signal 1 circuit from the Stop Lamp Switch harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [5](#)

No

- Repair the open in the (B15) Brake Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN

Measure the resistance of the (B16) Brake Signal 2 circuit from the Stop Lamp Switch harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (B16) Brake Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1573-BRAKE PEDAL STUCK OFF

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on, In plant mode passed the Applied test.

- **Set Condition:**

PCM recognizes the Brake Pedal could not electronically indicate the released (Off) position with both switches. If P1572 sets, P1573 will also set. One trip fault.

Possible Causes
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Make sure the Stop Lamp Switch is adjusted properly before continuing.

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. STOP LAMP SWITCH OPERATION

NOTE: Check the related fuse and relay for proper operation before continuing.

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connectors.

Measure the resistance between the (Z914) Ground circuit terminal and the (B15) Brake Signal 1 circuit terminal in the Stop Lamp Switch.

Apply and release the Stop Lamp Switch while monitoring the ohmmeter.

Does the resistance change from below 5.0 ohms to an open circuit when pressing and releasing the brake switch?

Yes

- Go To [3](#)

No

- Replace the Stop Lamp Switch.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. STOP LAMP SWITCH OPERATION

Measure the resistance between the (F941) Fused Ignition Switch circuit terminal and the (B16) Brake Signal 2 circuit terminal in the Stop Lamp Switch.

Apply and release the Stop Lamp Switch while monitoring the ohmmeter.

Does the resistance change from below 5.0 ohms to an open circuit when pressing and releasing the Stop Lamp switch?

Yes

- Go To [4](#)

No

- Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors. Replace the Stop Lamp Switch if no problems were found in the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Disconnect the C3 PCM harness connector.

Ignition on, engine not running.

Measure the voltage on the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (B16) Brake Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (B15) Brake Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?**Yes**

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1593-SPEED CONTROL SWITCH 1/2 STUCK

81c901a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

Cruise Switch inputs are not coherent with each other. Example: PCM is reading Switch No.1 as Accel and Switch No.2 as Coast at the same time. One trip fault.

Possible Causes
S/C SWITCH SIGNAL CIRCUITS SHORTED TO VOLTAGE
RESISTANCE IN THE S/C SWITCH SIGNAL CIRCUITS
RESISTANCE IN THE (V937) S/C SWITCH GROUND CIRCUIT
S/C SWITCH SIGNAL CIRCUITS SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V72) S/C SIGNAL 2 CIRCUIT
S/C SWITCH SIGNAL CIRCUITS SHORTED TO GROUND
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing the switch in two positions simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

Ask the customer if it is possible that button was held in two positions at the same time before this DTC set. If this is the case, no repair is necessary.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. SPEED CONTROL SWITCHES

Turn the ignition off.

Remove and disconnect the Speed Control Switch from the steering wheel per Service Information.

Measure the resistance across each Speed Control Switch.

Monitor the ohmmeter while pressing each function button on each switch.

The following resistance specs are taken between terminals (V72) S/C Signal 2 and (V937) S/C Switch Ground circuit of the Switch when holding the switch button in the following position.

Not pressing any switch - 20.5 kohms

On/Off - 8.87 kohms

Set - 0.825 kohms

Coast - 0.47 kohms

Cancel - 3.92 kohms

Resume/Accel - 1.87 kohms

The following resistance specs are taken between terminals (V71) S/C Signal 1 and (V937) S/C Switch Ground circuit of the Switch when holding the switch button in the following position

Not pressing any switch - 20.5 kohms

On/Off - 0.47 kohms

Set - 5.49 kohms

Coast - 2.94 kohms

Cancel - 1.24 kohms

Resume/Accel - 15.4 kohms

Does the function on the Speed Control Switch have the correct resistance value?

Yes

- Go To [3](#)

No

- Replace the Speed Control Switch that had the incorrect resistance value.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Disconnect the C3 PCM harness connector.
 Turn the ignition on.
 Measure the voltage on the (V71) S/C Signal 1 circuit at the Speed Control harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (V71) S/C Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
 (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage on the (V72) S/C Signal 2 circuit at the Speed Control harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (V72) S/C Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
 (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. S/C SIGNAL 1 CIRCUIT OPEN

CAUTION: Do not probe the PCM harness connectors.

Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Turn the ignition off.

Measure the resistance of the (V71) S/C Signal 1 circuit from the Speed Control harness connector to the appropriate terminals of special tool #8815.

Is the resistance below 5.0 ohms for each measurement?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (V71) Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (V72) S/C SIGNAL 2 CIRCUIT OPEN

Measure the resistance of the (V72) S/C Signal 2 circuit from the Speed Control harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the excessive resistance in the (V72) S/C Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (V937) S/C SWITCH GROUND CIRCUIT OPEN

NOTE: The measurement must be taken from both Speed Control Switch harness connectors.

Measure the resistance of the (V937) S/C Switch Ground circuit at the Speed Control harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms for both measurements?

Yes

- Go To [8](#)

No

- Repair the excessive resistance in the (V937) S/C Switch Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V937) S/C Switch Ground circuit and both of the (V71) S/C Signal 1 circuit in the S/C Switch harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the short between the (V937) S/C Switch Ground circuit and the (V71) S/C Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V937) S/C Switch Ground circuit and both of the (V72) S/C Signal 2 circuit in the S/C Switch harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the short between the (V937) S/C Switch Ground circuit and the (V72) S/C Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)

10. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V72) S/C SIGNAL 2 CIRCUIT

Measure the resistance between the (V71) S/C Signal 1 circuit and the (V72) S/C Signal 2 circuit at the Speed Control harness connector.

Is the resistance below 100 ohms for each circuit?

Yes

- Repair the short between the (V72) S/C Signal 2 circuit and the (V71) S/C Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [11](#)

11. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (V71) S/C

Switch Signal 1 circuit at the S/C Switch harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (V71) S/C Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [12](#)

12. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the ((V72) S/C Signal 2 at the S/C Switch harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (V72) S/C Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [13](#)

13. SPEED CONTROL SWITCH VOLTAGE VALUES

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 and #8815-1 to perform diagnosis.

Connect the C3 PCM harness connector and the S/C Switch harness connector.

Using a voltmeter check the voltage on the (V37) S/C Signal 1 circuit and the (V38) S/C Signal 2 circuit at the

appropriate terminals of the special tool #8815.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.

Monitor the voltmeter.

Allow the engine to idle.

With a scan tool, monitor the S/C Switch voltage readings.

SWITCH POSITION	SWITCH No.1 VOLTAGE VALUE	SWITCH No.2 VOLTAGE VALUE
NO SWITCHES PRESSED	4.31 to 4.78 volts	4.31 to 4.78 volts
ON/OFF PRESSED	0.59 to 1.13 volts	3.53 to 3.92 volts
RES/ACCEL PRESSED	3.88 to 4.17 volts	2.04 to 2.47 volts
SET PRESSED	3.16 to 3.56 volts	1.17 to 1.56 volts
COAST PRESSED	2.57 to 2.94 volts	0.77 to 1.09 volts
CANCEL PRESSED	1.59 to 1.99 volts	2.84 to 3.25 volts

Compare the voltage readings on the voltmeter to what the scan tool displayed.

Are the voltage readings out of the listed specification and is there less than a 0.2 of a volt difference between the voltmeter switch values and the scan tool switch values?

Yes

- Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors. Replace the Speed Control Switch if no problems are found in the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [14](#)

14. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1602-PCM NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on and battery voltage greater than 10 volts.

- **Set Condition:**

The PCM has not been programmed.

Possible Causes
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. PCM PROGRAMMED

Ignition on, engine not running.

With a scan tool, erase DTCs.

With a scan tool program the PCM.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, read DTCs.

Does the DTC reset?

Yes

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- The PCM has been successfully programmed. Test is complete.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

P1607-PCM INTERNAL SHUTDOWN TIMER RATIONALITY TOO SLOW

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The PCM compares actual shutdown time to a calculated shutdown time value. The calculated shut down time value is based on the amount the ECT should drop after a completely warmed up engine is shut down for a minimum of 8 hours. If the difference between actual shutdown time and the calculated shut down time is greater than a maximum value, a one trip failure will set. The shutdown time is measured again after 1 hour of ignition off time following the next engine warm up cycle. The PCM compares the shutdown time to a calculated value. If the difference is greater than a maximum value, the MIL is illuminated and a DTC will set.

◦ **When Monitored:**

With the engine running after a cycle when a complete engine warm up was achieved, the difference between engine coolant temperature and ambient air temperature less than or equal to 10° C (50° F), and battery voltage greater than 10 volts.

◦ **Set Condition:**

This DTC sets if the engine coolant temp does not drop enough or drops too much during engine off time. This DTC may also set if the controller timer is inaccurate. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
ENGINE COOLING CONDITIONS THAT MAY SET THIS DTC
ENGINE COOLANT LEVEL
PCM INTERNAL TIMER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ENGINE COOLANT INSPECTION

NOTE: This DTC will set if the engine cools quicker than is should compared to engine off times. If the customer washed a hot engine with the engine off, a One Trip Failure will set. If the vehicle is parked in a highly ventilated area or has a large fan blowing on it which might cause the engine to cool quicker than expected this DTC may set.

WARNING: Do not remove or loosen the radiator cap with the system hot and under pressure. Serious burns from coolant can occur.

Turn the ignition off.

Allow the engine to cool enough to allow the pressure in the coolant system to drop enough to safely remove the radiator cap.

Check the coolant level and condition.

Is the engine coolant level filled to the proper level?

Yes

- Go To [2](#)

No

- Add the appropriate type and amount of engine coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE.)
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

2. POWERTRAIN CONTROL MODULE (PCM)

Turn the ignition on.

With the scan tool under PCM/NGC Data Display, locate the Ignition Off Time value.

While monitoring a stop watch, turn the Ignition off for 10 minutes, watch the stop watch for those 10 minutes, and then turn the Ignition on.

With the scan tool under Data Functions, check the Ignition Off Time value again.

Does the Ignition Time Off value on the scan tool match the actual time you had the Ignition off on the stop watch?

Yes

- The conditions that set the DTC are not active at this time. For further assistance refer to the

INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1618-SENSOR REFERENCE VOLTAGE 1 CIRCUIT ERRATIC

81810042

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

When the PCM recognizes the Primary 5-volt Supply circuit voltage is varying too much too quickly. One Trip Fault. ETC light is flashing.

Possible Causes
(F855) PRIMARY 5-VOLT SUPPLY SHORTED TO GROUND
(F855) PRIMARY 5-VOLT SUPPLY SHORTED TO VOLTAGE
(F855) PRIMARY 5-VOLT SUPPLY CIRCUIT OPEN
5-VOLT SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Improperly installed aftermarket accessories can cause this DTC to set. Check for any improperly installed aftermarket accessories before continuing with this test.

Start the engine and allow it to idle for at least 60 seconds.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. (F855) PRIMARY 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Disconnect all the Sensors that share the (F855) Primary 5-volt Supply circuit.

NOTE: This code can be caused by the improper installation of after market accessories that may be causing excessive noise on the (F855) 5-volt Supply circuit.

Measure the resistance between ground and the (F855) Primary 5-volt Supply circuit in the CKP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F855) Primary 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. SENSOR SHORTED TO GROUND

Connect the C2 PCM harness connector and all the previously disconnected Sensors except for the CKP Sensor harness connector.

Ignition on, engine not running.

Measure the voltage on the (F855) Primary 5-volt Supply circuit at the Throttle Body harness connector.

NOTE: You must Turn the Ignition Off when disconnecting any of the Sensor harness connectors and Turn the Ignition On to check the voltage readings.

While monitoring the voltage, disconnect each Sensor harness connector that shares the (F855) Primary 5-volt Supply circuit, one at a time.

Does the voltage increase above 4.5 volts when disconnecting any of the Sensor harness connectors?

Yes

- Verify that there is good pin to terminal contact in the Related Sensor and the Powertrain Control Module connectors. If OK, replace the Sensor that causes the (F855) Primary 5-volt Supply circuit voltage to increase when disconnected.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. 5-VOLT SENSOR

Turn the ignition off.

Connect all the previously disconnected Sensors except for the CKP Sensor harness connector.

Ignition on, engine not running.

Measure the voltage on the (F855) Primary 5-volt Supply circuit at the CKP Sensor harness connector.

Is the voltage between 4.8 and 5.2 volts?

Yes

- Verify that there is good pin to terminal contact in the Related Sensor and the Powertrain Control Module connectors. If OK, replace the Crank Position Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (F855) PRIMARY 5-VOLT SUPPLY SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Disconnect all the Sensors that share the (F855) Primary 5-volt Supply circuit.
 Ignition on, engine not running.
 Measure the voltage on the (F855) Primary 5-volt Supply circuit in the CKP Sensor harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (F855) Primary 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (F855) PRIMARY 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Reconnect all the sensors that were disconnected in the previous step except for the CKP Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance in the (F855) Primary 5-volt Supply circuit from the Sensor harness connector to the appropriate terminal of special tool #8815.

It may be necessary to perform this test from every sensor that uses the (F855) Primary 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (F855) Primary 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Related Sensors and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Related Sensor and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1628-SENSOR REFERENCE VOLTAGE 2 CIRCUIT ERRATIC

81010311

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on.

- **Set Condition:**

When the PCM recognizes the Auxiliary 5-volt Supply circuit voltage is varying too much too quickly. One Trip Fault. ETC light is flashing.

Possible Causes
(F856) AUXILIARY 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) AUXILIARY 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(F856) AUXILIARY 5-VOLT SUPPLY CIRCUIT OPEN
5-VOLT SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Improperly installed aftermarket accessories can cause this DTC to set. Check for any improperly installed aftermarket accessories before continuing with this test.

Start the engine and allow it to idle for at least 60 seconds.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. (F856) AUXILIARY 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C1 PCM harness connector.

Disconnect all the Sensors that share the (F856) Auxiliary 5-volt Supply circuit.

NOTE: This code can be caused by the improper installation of after market accessories that may be causing excessive noise on the (F856) 5-volt Supply circuit.

Measure the resistance between ground and the (F856) Auxiliary 5-volt Supply circuit at the CMP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F856) Auxiliary 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. SENSOR SHORTED TO GROUND

Connect the C1 PCM harness connector and all the previously disconnected Sensors except for the CMP Sensor harness connector.

Ignition on, engine not running.

Measure the voltage on the (F856) Auxiliary 5-volt Supply

circuit in the CMP Sensor harness connector.

NOTE: You must Turn the Ignition OFF when disconnecting any of the Sensor harness connectors and Turn the Ignition On to check the voltage readings.

While monitoring the voltage, disconnect each Sensor harness connector that shares the (F856) Auxiliary 5-volt Supply circuit, one at a time.

Does the voltage increase above 4.5 volts when disconnecting any of the Sensor harness connectors?

Yes

- Verify that there is good pin to terminal contact in the Related Sensor and the Powertrain Control Module connectors. If OK, replace the Sensor that causes the (F856) Auxiliary 5-volt Supply circuit voltage to increase when disconnected.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. 5-VOLT SENSOR

Turn the ignition off.

Connect all the previously disconnected Sensors except for the CMP Sensor harness connector.

Ignition on, engine not running.

Measure the voltage on the (F856) Auxiliary 5-volt Supply circuit in the CMP Sensor harness connector.

Is the voltage below 4.5 volts?

Yes

- Go To [5](#)

No

- Verify that there is good pin to terminal contact in the Camshaft Position Sensor and the Powertrain Control

Module connectors. If OK, replace the Cam Position Sensor.

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. (F856) AUXILIARY 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the C1 PCM harness connector.
 Disconnect all the Sensors that share the (F856) Auxiliary 5-volt Supply circuit.
 Ignition on, engine not running.
 Measure the voltage on the (F856) Auxiliary 5-volt Supply circuit at the CMP Sensor harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (F856) Auxiliary 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (F856) AUXILIARY 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Reconnect all the sensors that were disconnected in the previous step except the CMP Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance in the (F856) Auxiliary 5-volt Supply circuit from the Sensor harness connector to the appropriate terminal of special tool #8815.

It may be necessary to perform this test from every sensor that uses the (F856) Auxiliary 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (F856) Auxiliary 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Related Sensors and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Related Sensor and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P1696-EEPROM MEMORY WRITE DENIED/INVALID

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition on.

- **Set Condition:**

An attempt to program/write to the internal EEPROM failed, Also checks at power down. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) SOFTWARE UPDATE
EXCESSIVE RESISTANCE IN THE PCM POWER OR GROUND CIRCUITS
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose and repair any other DTCs set in the PCM before proceeding with this test.

Turn the ignition on.

With the scan tool, Clear DTCs.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle in order for this DTC to set.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go to [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. PCM ODOMETER MILEAGE NOT PROGRAMMED

Turn the ignition on.

With the scan tool, attempt to perform the Program PCM Odometer function.

With the scan tool, Clear DTCs.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [3](#)

No

- The SRI mileage has been successfully programmed into the PCM. Test is complete.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

3. CHECKING THE PCM POWER AND GROUND CIRCUITS

Perform the diagnostic procedure for *CHECKING THE PCM POWER AND GROUND CIRCUITS.

Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module (PCM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- Go to [4](#)

4. POWERTRAIN CONTROL MODULE (PCM)

Turn the ignition on.

With the scan tool, attempt to perform the Program PCM Odometer function.

With the scan tool, Clear DTCs.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- The SRI mileage has been successfully programmed into the PCM. Test is complete.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

P1697-EMR (SRI) MILEAGE NOT STORED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition on.

- **Set Condition:**

The PCM Odometer mileage has not been programmed into the PCM.

Possible Causes
PCM ODOMETER MILEAGE NOT PROGRAMMED
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. PCM ODOMETER MILEAGE NOT PROGRAMMED

Turn the ignition on.

With the scan tool, attempt to perform the Program PCM Odometer function.

With the scan tool, clear DTCs.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Replace and program the Powertrain Control Module in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- The SRI mileage has been successfully programmed into the PCM. Test is complete.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

P1897-LEVEL 1 RPM BUS UNLOCK

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Engine running.

◦ **Set Condition:**

When the PCM recognizes an internal failure to communicate with the FCM or the CMP and CKP Sensor count periods are too short. One trip fault. ETC light is flashing.

Possible Causes
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. POWERTRAIN CONTROL MODULE (PCM)

NOTE: Diagnose any CMP or CKP Sensor faults before continuing. Check for intermittent loose CMP or CKP connections.

The Powertrain Control Module is reporting internal errors, view repair to continue.

Repair

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2072-ELECTRONIC THROTTLE CONTROL SYSTEM - ICE BLOCKAGE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on.

- **Set Condition:**

The PCM recognizes the Throttle plate is stuck during extremely cold Ambient Temperature operation. The throttle plate goes through a de-icing procedure. If the throttle blade still doesn't move this fault sets. The MIL will not illuminate. The vehicle will be in Limp home condition, limiting rpm and vehicle speed.

Possible Causes
THROTTLE PLATE FROZEN

Diagnostic Test

1. THROTTLE BODY INSPECTION

Ignition on, engine not running.

With a scan tool, select View DTCs and record the related Freeze Frame data.

NOTE: This DTC sets in extreme cold Ambient Temperatures with the throttle plate stuck by the time the vehicle gets to the dealership the condition may be corrected.

NOTE: P2110 will set with P2072. P2118 may also set and the customer will experience a Limp-in condition. If either of these two faults are set, it indicates that the ice blockage software has run and no repair is necessary.

NOTE: Diagnose any other DTCs that may also be set before continuing.

Turn the ignition off.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material (ice or dirt) on the Throttle Plate or in the bore causing the Throttle Plate to stick.

Is the throttle blade still stuck because it is frozen?

Yes

- Allow the Throttle Body to thaw naturally in a room temperature climate.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Test Complete.

P2096-DOWNSTREAM FUEL TRIM SYSTEM 1 LEAN

81811440

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the engine running in closed loop mode, the ambient/battery temperature above -6.7° C (20° F) and altitude below 2590.8 m (8500 ft).

◦ **Set Condition:**

The conditions that cause this diagnostic to fail is when the upstream O2 sensor becomes biased from an exhaust leak, O2 sensor contamination, or some other extreme operating condition. The downstream O2 sensor is considered to be protected from extreme environments by the catalyst. The PCM monitors the downstream O2 sensor feedback control, called downstream fuel trim, to detect any shift in the upstream O2 sensor target voltage from nominal target voltage. The value of the downstream fuel trim is compared with the lean thresholds. Every time the value exceeds the calibrated threshold, a fail timer is incremented and mass flow through the exhaust is accumulated. If the fail timer and accumulated mass flow exceed the fail thresholds, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

Possible Causes
EXHAUST LEAK
FUEL DELIVERY SYSTEM
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Check the vehicle repair history. If the 1/2 O2 has been replaced make sure that the O2 sensor was properly installed and meets OEM specification.

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false O2 Sensor failure

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear. Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear. Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary. Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

- Repair or replace the leaking exhaust parts as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. CHECKING THE FUEL DELIVERY SYSTEM

Perform the diagnostic procedure for *CHECKING THE FUEL DELIVERY SYSTEM.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. CHECKING THE OXYGEN SENSOR OPERATION

Perform the diagnostic procedure for *CHECKING THE OXYGEN SENSOR OPERATION.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. ENGINE MECHANICAL

Check for any of the following conditions/mechanical problems.

AIR INDUCTION SYSTEM - must be free from leaks

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector

Are there any engine mechanical problems?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to the components tested in this procedure.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to the components tested in this procedure and wiggle test the wiring and connectors.

Look for the data to change or for a DTC to set during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the PCM in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2097-DOWNSTREAM FUEL TRIM SYSTEM 1 RICH

81811440

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the engine running in closed loop mode, the ambient/battery temperature above -6.7° C (20° F) and altitude below 2590.8 m (8500 ft).

◦ **Set Condition:**

The conditions that cause this diagnostic to fail is when the upstream O2 sensor becomes biased from an exhaust leak, O2 sensor contamination, or some other extreme operating condition. The downstream O2 sensor is considered to be protected from extreme environments by the catalyst. The PCM monitors the downstream O2 sensor feedback control, called downstream fuel trim, to detect any shift in the upstream O2 sensor target voltage from nominal target voltage. The value of the downstream fuel trim is compared with the rich thresholds. Every time the value exceeds the calibrated threshold, a fail timer is incremented and mass flow through the exhaust is accumulated. If the fail timer and accumulated mass flow exceed the fail thresholds, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

Possible Causes
EXHAUST LEAK
FUEL DELIVERY SYSTEM
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Check the vehicle repair history. If the 1/2 O2 has been replaced make sure that the O2 sensor was properly installed and meets OEM specification.

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false O2 Sensor failure

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the PCM in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2098-DOWNSTREAM FUEL TRIM SYSTEM 2 LEAN

With the engine running in closed loop mode, the ambient/battery temperature above -6.7° C (20° F) and altitude below 2590.8 m (8500 ft). Fuel level greater than 15%.

◦ **Set Condition:**

The conditions that cause this diagnostic to fail is when the upstream O2 sensor becomes biased from an exhaust leak, O2 sensor contamination, or some other extreme operating condition. The downstream O2 sensor is considered to be protected from extreme environments by the catalyst. The PCM monitors the downstream O2 sensor feedback control, called downstream fuel trim, to detect any shift in the upstream O2 sensor target voltage from nominal target voltage. The value of the downstream fuel trim is compared with the lean thresholds. Every time the value exceeds the calibrated threshold, a fail timer is incremented and mass flow through the exhaust is accumulated. If the fail timer and accumulated mass flow exceed the fail thresholds, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

Possible Causes
EXHAUST LEAK
FUEL DELIVERY SYSTEM
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Check the vehicle repair history. If the 2/2 O2 has been replaced make sure that the O2 sensor was properly installed and meets OEM specification.

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false O2 Sensor failure

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor

P2100-ELECTRONIC THROTTLE CONTROL MOTOR CIRCUIT

8100000

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on and the ETC Motor is not in Limp Home mode.

- **Set Condition:**

When the PCM detects an internal error or a short between the ETC Motor - and ETC Motor + circuits in the ETC Motor Driver. One trip fault. ETC light is flashing.

Possible Causes
THROTTLE PLATE / BORE INSPECTION
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT OPEN
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
LOW BATTERY VOLTAGE
ETC MOTOR/THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

NOTE: If the P2100 is intermittent, it is possible that the controller is overheating in extreme hot temperatures, and this is considered a normal protection operation. No repair is necessary.

NOTE: Low battery voltage can also cause excessive current draw, in very hot and very cold ambient temperatures. Make sure the battery can pass a load test before continuing.

With a scan tool, select View DTCs.

View the Freeze Frame data and look closely at the temperatures at which this DTC set.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material (ice or dirt) on the Throttle Plate or in the bore causing the Throttle Plate to stick.

Were any signs of foreign material or scoring of the throttle plate or bore found?

Yes

- Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the C2 PCM harness connector.

**CAUTION: Do not probe the PCM harness connectors.
Probing the PCM harness connectors will damage the**

PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform the diagnostics.

Ignition on, engine not running.

Measure the voltage on the (K124) ETC Motor (+) circuit at the appropriate terminal of special tool #8815.

Is there any voltage present?

Yes

- Repair the short to voltage on the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage on the (K126) ETC Motor (-) circuit at the appropriate terminal of special tool #8815.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT

Turn the ignition off.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit at the appropriate terminals of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (K124) ETC MOTOR (+) CIRCUIT OPEN

Measure the resistance of the (K124) ETC Motor (+) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K124) ETC Motor (+) circuit between the appropriate terminals of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. (K126) ETC MOTOR (-) CIRCUIT OPEN

Measure the resistance of the (K126) ETC Motor (-) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the open in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K126) ETC Motor (-) circuit using the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)

10. ETC MOTOR

NOTE: Take the following measurement using special tool #8815 to avoid possible damage to the Throttle Body harness connector.

Connect the Throttle Body harness connector.
Measure the resistance of the ETC Motor between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit at the appropriate terminals of special tool #8815.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes

- Go To [11](#)

No

- Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2101-ELECTRONIC THROTTLE CONTROL MOTOR PERFORMANCE

81000000

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the vehicle running, ETC Motor not in Limp Home mode, and the TPS adaptation is complete.

- **Set Condition:**

The PCM recognizes too large of an error between the actual position of the Throttle Plate and the Set Point position. One trip fault and the code will set within 5 seconds. Three good trips to turn off the MIL ETC light is flashing.

Possible Causes
THROTTLE BODY ASSEMBLY
LOW BATTERY VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

NOTE: Before continuing visually inspect the throttle blade and bore for any obstructions. Icing of the throttle body may have caused this code to set.

NOTE: Low battery voltage can also cause excessive current draw, in very hot and very cold ambient temperature. Make sure the battery can pass a load test before continuing.

NOTE: Diagnose any 5-Volt Supply, Battery, and TP Sensor DTCs before continuing.

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. THROTTLE POSITION WITHIN 2° DEGREES OF DESIRED THROTTLE POSITION

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, monitor the Actual Throttle Position and Desired Throttle Position.

Compare the Actual Throttle Position and the Set Point Throttle Position.

Is the Actual Throttle Position within 2° degrees of the Desired Throttle Position?

Yes

- Go To [3](#)

No

- Replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. ETC OPERATION

Ignition on, engine not running.

With a scan tool, perform the ETC Throttle Follower Test.

NOTE: It may be necessary to use a mirror to see the throttle blade.

Observe the throttle blade.

NOTE: Make sure the motion of the throttle blade is smooth and that it opens and closes.

Did the ETC motor operate properly?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2107-ELECTRONIC THROTTLE CONTROL MODULE PROCESSOR

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on.

- **Set Condition:**

Internal PCM failure. Module will attempt to reset, so you will be able to hear the throttle relearning. If the condition is continuous, the vehicle may not be driveable. One trip fault. ETC light is flashing.

Possible Causes
POWERTRAIN CONTROL MODULE NEEDS TO BE REPROGRAMMED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Diagnostic Test

1. REPROGRAM THE POWERTRAIN CONTROL MODULE

Check for any related TSBs.

Verify the PCM is at the latest calibration (flash level).

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

Flash the Powertrain Control Module per Service Information if any updates are available.

Start the engine.

Allow the engine to reach normal operating temperature.

Operate the accelerator pedal. (do not exceed 3500 rpm)

Test drive the vehicle for 10 miles on a flat road surface.

Does this DTC reset?

Yes

- Replace and reprogram the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

Test Complete.

P2110-ELECTRONIC THROTTLE CONTROL - FORCED LIMITED RPM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on and ETC motor is working.

- **Set Condition:**

When the PCM requests to limit engine speed if PWM is too high for 20.5 seconds and before P2118 sets. One trip fault and the code will set within 5 seconds. ETC light is illuminated.

Possible Causes
THROTTLE PLATE STUCK
(K124) ETC MOTOR (+) CIRCUIT OPEN
(K126) ETC MOTOR (-) CIRCUIT OPEN
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
ETC MOTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

NOTE: If P2072 is also set, this indicates that the cold weather ice blockage routine has run. No repair action is required.

Ignition on, engine not running.
With a scan tool, select View DTCs.

In the Freeze Frame data, look at the temperature at which the fault occurred. If it occurred in extreme cold temperatures, Icing of the throttle body may have caused this code to set.

NOTE: Diagnose any TP Sensor faults, 5-Volt Supply faults, and Battery Voltage High or Low DTCs before continuing.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. (K124) ETC MOTOR (+) CIRCUIT OPEN

Turn the ignition off.
Disconnect the Throttle Body harness connector.
Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K124) ETC Motor (+) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [3](#)

No

- Repair the open in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. (K126) ETC MOTOR (-) CIRCUIT OPEN

Measure the resistance of the (K126) ETC Motor (-) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the open in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between a known good ground and the (K124) ETC Motor (+) circuit at the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between a known good ground and the (K126) ETC Motor (-) circuit at the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. ETC MOTOR

NOTE: Take the following measurement using special tool #8815 to avoid possible damage to the Throttle Body harness connector.

Measure the resistance of the ETC Motor between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit at the appropriate terminals of special tool #8815.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes

- Go To [7](#)

No

- Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. THROTTLE PLATE STUCK

Turn the ignition off.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material (ice or dirt) causing the Throttle to stick.

Using a scan tool, perform the ETC Throttle Follower Test.

You may need an assistant to watch the Throttle Plate move.

Does the Throttle Plate move during the test?

Yes

- Go To [8](#)

No

- Remove the debris if possible or replace the Throttle Body Assembly if signs of physical damage are present. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body

and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2111-ELECTRONIC THROTTLE CONTROL - UNABLE TO CLOSE

81000000

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and battery voltage greater than 10 volts.

◦ **Set Condition:**

Just after key on, the throttle is opened and closed to test the system. If the TP Sensor does not return to Limp Home Position at the end of this test, this DTC will set. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
THROTTLE PLATE STUCK ABOVE LIMP HOME POSITION
TP SENSOR NO.1 AND TP SENSOR NO.2 BOTH READ 2.5 VOLTS
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT OPEN
(K126) ETC MOTOR (-) CIRCUIT OPEN
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Maximum engine speed could be reduced while this fault is active, it just depends where the throttle gets stuck.

Ignition on, engine not running.

NOTE: The PCM tests the ETC Motor by opening and closing the Throttle Plate before starting the engine. If during this test the Throttle plate does not return to the closed position this DTC sets.

With a scan tool select View DTCs.

NOTE: Diagnose any TP Sensor or 5-Volt Supply DTCs before continuing.

Is the DTC Active at this time?**Yes**

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. THROTTLE PLATE STUCK OPEN

Turn the ignition off.

NOTE: The PCM tests the ETC Motor by opening and closing the Throttle Plate before starting the engine. If during this test the Throttle plate does not return to the closed position this DTC sets.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material causing the Throttle to remain open.

Using a scan tool, under System Tests, perform the ETC Throttle Follower Test.

Have an assistant watch the throttle plate to verify it moves during the test.

Does the Throttle Plate move?**Yes**

- Go To [3](#)

No

- Remove the debris if possible or replace the Throttle Body Assembly if signs of physical damage are present. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. TP SENSOR NO.1 AND TP SENSOR NO.2 BOTH EQUAL 2.5 VOLTS

With a scan tool, perform the ETC Throttle Follower test while reading both TP Sensor voltage readings.

Are both TP Sensor readings stuck at 2.5 volts?**Yes**

- Check the TP Sensor Signal circuits for excessive resistance, being shorted to each other, or shorted to the Sensor Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Throttle Body harness connector.
Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform the diagnostics.

Ignition on, engine not running.
Measure the voltage on the (K124) ETC Motor (+) circuit at the appropriate terminal of special tool #8815.

Is there any voltage present?

Yes

- Repair the short to voltage on the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K124) ETC MOTOR (+) CIRCUIT OPEN

Turn the ignition off.
Measure the resistance of the (K124) ETC Motor (+) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (K126) ETC MOTOR (-) CIRCUIT OPEN

Measure the resistance of the (K126) ETC Motor (-) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between a known good ground and the (K124) ETC Motor (+) circuit at the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between a known good ground and the (K126) ETC Motor (-) circuit at the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2112-ELECTRONIC THROTTLE CONTROL - UNABLE TO OPEN

81000000

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and battery voltage greater than 10 volts.

◦ **Set Condition:**

Just after key on, the throttle is opened and closed to test the system. If the TP Sensor does not return to Limp Home Position at the end of this test, this DTC will set. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
THROTTLE PLATE STUCK AT OR BELOW LIMP HOME POSITION
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT OPEN
(K126) ETC MOTOR (-) CIRCUIT OPEN
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: The PCM tests the ETC Motor by opening and closing the Throttle Plate before starting the engine. If during this test the Throttle plate does not return to the closed position this DTC sets.

With a scan tool, select View DTCs.

NOTE: Diagnose any TP Sensor, Battery Voltage, and 5-Volt Supply DTCs before continuing.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. THROTTLE PLATE STUCK OPEN

Turn the ignition off.

NOTE: The PCM tests the ETC Motor by opening and closing the Throttle Plate before starting the engine. If during this test the Throttle plate does not open this DTC sets.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material causing the Throttle to remain open.

Using a scan tool, under System Tests, perform the ETC Throttle Follower Test.

Have an assistant watch the throttle plate to verify it moves during the test.

Does the Throttle Plate move?

Yes

- Go To [3](#)

No

- Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Ignition on, engine not running.

Measure the voltage on the (K126) ETC Motor (-) circuit at the appropriate terminal of special tool #8815.

Is there any voltage present?

Yes

- Repair the short to voltage on the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (K124) ETC MOTOR (+) CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (K124) ETC Motor (+) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [5](#)

No

- Repair the open in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. (K126) ETC MOTOR (-) CIRCUIT OPEN

Measure the resistance of the (K126) ETC Motor (-) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between a known good ground and the (K124) ETC Motor (+) circuit at the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [Z](#)

7. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between a known good ground and the (K126) ETC Motor (-) circuit at the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2115-ACCELERATOR PEDAL POSITION SENSOR 1 MINIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on. During in plant mode the APP Sensors need to be checked to make sure that idle and full pedal travel can be reached on both sensors. The test for P2115 is only enabled once test for P2166 has passed.

- **Set Condition:**

APPS No.1 has failed to achieve the required minimum value during In Plant testing. One trip fault and the code will set within 5 seconds. Engine will only idle. ETC light is illuminated.

Possible Causes
IN PLANT TEST FAILURE
APPS RELEARN

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. IN PLANT TEST FAILURE

Ignition on, engine not running.

NOTE: This DTC is set when the APP Sensors are learned in plant but do not reach the Minimum or Maximum voltage range.

With a scan tool, select View DTCs.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, view DTCs.

NOTE: Diagnose any APPS out of Range and 5-Volt Supply DTCs before continuing.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS

AND TESTING.)

2. APPS RELEARN

With a scan tool select the ETC RELEARN function.

Next, erase DTCs.

Start the engine.

Does the DTC return?

Yes

- Replace the APPS Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Test Complete.

P2116-ACCELERATOR PEDAL POSITION SENSOR 2 MINIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on. During in plant mode the APP Sensors need to be checked to make sure that idle and full pedal travel can be reached on both sensors. The test for P2116 is only enabled once test for P2167 has passed.

◦ **Set Condition:**

APPS No.2 has failed to achieve the required minimum value during In Plant testing. One trip fault and the code will be stored within 5 seconds. Engine will only idle. ETC light is illuminated.

Possible Causes
IN PLANT TEST FAILURE
APPS RELEARN

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. IN PLANT TEST FAILURE

Ignition on, engine not running.

NOTE: This DTC is set when the APP Sensors are learned in plant but do not reach the Minimum or Maximum voltage range.

With a scan tool, select View DTCs and record the related Freeze Frame data.

With a scan tool, erase DTCs.

Start the engine.

With a scan tool, view DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. APPS RELEARN

With a scan tool select the ETC RELEARN function.

Next, erase DTCs.

Start the engine.

Does the DTC return?

Yes

- Replace the APPS Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Test Complete.

P2118-ELECTRONIC THROTTLE CONTROL MOTOR CIRCUIT

810028a5

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on and the ETC Motor is not in Limp Home mode.

Set Condition:

When the PCM detects an internal error or a short between the ETC Motor - and ETC Motor + circuits in the ETC Motor Driver. One trip fault. ETC light is flashing.

Possible Causes
THROTTLE PLATE / BORE INSPECTION
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT OPEN
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
ETC MOTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test**1. ACTIVE DTC**

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

NOTE: If P2072 is also set, this indicates that the cold weather ice blockage routine has run. No repair action is necessary.

Ignition on, engine not running.

NOTE: If the P2118 is intermittent, it is possible that the controller is overheating in extreme hot temperatures, and this is considered a normal protection operation. No repair is necessary.

With a scan tool, select View DTCs.
Look closely at the temperatures at which this DTC set.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. THROTTLE PLATE INSPECTION

Turn the ignition off.
Remove the Air Cleaner Assembly from the Throttle Body.
Check for any signs of a foreign material (ice or dirt) on the Throttle Plate or in the bore causing the Throttle Plate to stick.

Were any signs of foreign material or scoring of the throttle plate or bore found?

Yes

- Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Throttle Body harness connector.
Disconnect the C2 PCM harness connector.
Ignition on, engine not running.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the voltage on the (K124) ETC Motor (+) circuit at the appropriate terminal of special tool #8815.

Is there any voltage present?

Yes

- Repair the short to voltage on the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage on the (K126) ETC Motor (-) circuit at the appropriate terminal of special tool #8815.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT

Turn the ignition off.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit at the appropriate terminals of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (K124) ETC MOTOR (+) CIRCUIT OPEN

Measure the resistance of the (K124) ETC Motor (+) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K124) ETC Motor (+) circuit between the appropriate terminals of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. (K126) ETC MOTOR (-) CIRCUIT OPEN

Measure the resistance of the (K126) ETC Motor (-) circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the open in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K126) ETC Motor (-) circuit between the appropriate terminals of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)

10. ETC MOTOR

NOTE: Take the following measurement using special tool #8815 to avoid possible damage to the Throttle Body harness connector.

Connect the Throttle Body harness connector.
Measure the resistance of the ETC Motor between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit at the appropriate terminals of special tool #8815.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes

- Go To [11](#)

No

- Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2122-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT LOW

01514288

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on and no other APPS No.1 DTCs present.

◦ **Set Condition:**

When the APP Sensor No.1 voltage is too low. Engine will additionally idle if the brake pedal is pressed or has failed. Acceleration rate and Engine output are limited. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
(F855) 5-VOLT SUPPLY CIRCUIT OPEN
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K23) APP SIGNAL 1 CIRCUIT OPEN
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO GROUND
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K167) APP RETURN 1 CIRCUIT
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K400) APP RETURN 2 CIRCUIT
APP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

NOTE: If you are viewing data recorder information or Freeze Frame data the APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens every 320 milliseconds and may not show up on the scan tool but may show up on a data recorder or lab scope. It is acceptable to see the voltage close to zero with a normal sensor when using a data recorder/lab scope.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Go To [11](#)

2. (F855) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Ignition on, engine not running.

Measure the voltage on the (F855) 5-volt Supply circuit in the APP Sensor harness connector.

Is the voltage between 4.5 and 5.2 volts?

Yes

- Go To [3](#)

No

- Go To [8](#)

3. (K23) APP SIGNAL 1 CIRCUIT OPEN

Turn the ignition off.
Disconnect the PCM harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K23) APP Signal 1 circuit from the APP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the open in the (K23) APP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K23) APP Signal 1 circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K23) APP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K167) APP RETURN 1 CIRCUIT

Measure the resistance between the (K23) APP Signal 1 circuit and the (K167) Return 1 circuit at the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short between the (K167) APP Return 1 circuit and the (K23) APP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K400) APP RETURN 2 CIRCUIT

Measure the resistance between the (K23) APP Signal 1 circuit and the (K400) Return 2 circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short between the (K400) APP Return 2 circuit and the (K23) APP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [7](#)

7. ACCELERATOR PEDAL POSITION SENSOR

Connect the PCM harness connectors.

Ignition on, engine not running.

With a scan tool, monitor the APP Sensor No.1 voltage. Connect a jumper wire between the (F855) 5-volt Supply circuit and the (K23) APP Signal 1 circuit in the Sensor harness connector.

NOTE: The sensor voltage should be approximately 5.0 volts (plus or minus .1 volt) with the jumper wire installed.

Does the scan tool display the voltage as described above?

Yes

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)
- **NOTE: Remove the jumper wire before continuing.**

8. (F855) 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.
Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F855) 5-volt Supply circuit from the Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the open in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F855) 5-volt Supply circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F855) 5-volt Supply

circuit.

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)

10. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. APP SENSOR SWEEP

Ignition on, engine not running.

With a scan tool, monitor the APP Sensor No.1 voltage.

Slowly press the Accelerator pedal down.

Does voltage start at approximately 0.45 of a volt and go above 4.6 volts with a smooth transition?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2123-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT HIGH

With the ignition on and no other APPS No.1 DTCs present.

◦ **Set Condition:**

When APP Sensor No.1 voltage is too high. Engine will additionally idle if the brake pedal is pressed or has failed. Acceleration rate and Engine output are limited. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(K23) APP SIGNAL 1 SHORTED TO THE (F855) 5-VOLT SUPPLY CIRCUIT
(K23) APP SIGNAL 1 SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT
(K167) APP RETURN 1 CIRCUIT OPEN
APP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

NOTE: If you are viewing data recorder information or Freeze Frame data the APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens every 320 milliseconds and may not show up on the scan tool but may show up on a data recorder or lab scope. It is acceptable to see the

voltage close to zero with a normal sensor when using a data recorder/lab scope.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Go To [8](#)

2. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the PCM harness connectors.
 Disconnect the APP Sensor harness connector.
 Ignition on, engine not running.
 Measure the voltage on the (K23) APP Signal 1 circuit in the APP Sensor harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K23) APP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (F855) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
 Measure the resistance between the (K23) APP Signal 1 circuit and the (F855) 5-volt Supply circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short between the (K23) APP Signal 1 circuit and the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT

Measure the resistance between the (K23) APP Signal 1 circuit and the (F856) 5-volt Supply circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short between the (K23) APP Signal 1 circuit and the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K167) APP RETURN 1 CIRCUIT OPEN

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K167) APP Return 1 circuit from the APP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (K167) APP Return 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. ACCELERATOR PEDAL POSITION SENSOR

Connect the PCM harness connectors.
Ignition on, engine not running.
With a scan tool, monitor the APP Sensor 1 voltage.

Is the voltage above 0 volts?

Yes

- Go To [7](#)

No

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. APP SENSOR NO.1 SWEEP

Ignition on, engine not running.

With a scan tool, monitor the Accelerator Pedal Position Sensor voltage.

Slowly press the Accelerator Pedal down.

Does voltage start at approximately 0.45 of a volt and go above 4.6 volts with a smooth transition?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2127-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT LOW

01514288

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on and no other APPS No.2 DTCs present.

◦ **Set Condition:**

When the APP Sensor No.2 voltage is too low. Engine will only idle if the Brake pedal is Pressed or has failed. Acceleration rate and Engine output are limited. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K29) APP SIGNAL 2 CIRCUIT OPEN
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO GROUND
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K167) APP RETURN 1 CIRCUIT
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K400) APP RETURN 2 CIRCUIT
APP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

NOTE: If you are viewing data recorder information or Freeze Frame data the APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens every 320 milliseconds and may not show up on the scan tool but may show up on a data recorder or lab scope. It is acceptable to see the voltage close to zero with a normal sensor when using a data recorder/lab scope.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Go To [11](#)

2. (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
Disconnect the APP Sensor harness connector.
Ignition on, engine not running.
Measure the voltage on the (F856) 5-volt Supply circuit in the APP Sensor harness connector.

Is the voltage between 4.5 and 5.2 volts?

Yes

- Go To [3](#)

No

- Go To [8](#)

3. (K29) APP SENSOR NO.2 SIGNAL CIRCUIT OPEN

Turn the ignition off.
Disconnect the PCM harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K29) APP Sensor No.2 Signal circuit from the APP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the open in the (K29) APP Sensor No.2 Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (K29) APP SENSOR NO.2 SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K29) APP Sensor No.2 Signal circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K29) APP Sensor No.2 Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K29) APP SENSOR NO.2 SIGNAL CIRCUIT SHORTED TO THE (K400) APP SENSOR NO.2 RETURN CIRCUIT

Measure the resistance between the (K29) APP Sensor No.2 Signal circuit and the (K400) Sensor No.2 Return circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short between the (K400) APP Sensor No.2 Return circuit and the (K29) APP Sensor No.2 Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (K29) APP SENSOR NO.2 SIGNAL CIRCUIT SHORTED TO THE (K167) APP SENSOR NO.1

RETURN CIRCUIT

Measure the resistance between the (K29) APP Sensor No.2 Signal circuit and the (K167) Sensor No.1 Return circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short between the (K167) APP Sensor No.1 Return circuit and the (K29) APP Sensor No.2 Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [7](#)

7. ACCELERATOR PEDAL POSITION SENSOR

Connect the PCM harness connectors.

Ignition on, engine not running.

With a scan tool, monitor the APP Sensor No.2 voltage.

Connect a jumper wire between the (F856) 5-volt Supply circuit and the (K29) APP Sensor No.2 Signal circuit in the Sensor harness connector.

NOTE: The sensor voltage should be approximately 5.0 volts (plus or minus .1 volt) with the jumper wire installed.

Does the scan tool display the voltage as described above?

Yes

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service

Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)
- **NOTE: Remove the jumper wire before continuing.**

8. (F856) 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.
Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit from the Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the open in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit in the APP Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)

10. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. APP SENSOR SWEEP

Ignition on, engine not running.

With a scan tool, monitor the APP Sensor No.2 voltage.

Slowly press the Accelerator pedal down.

Does voltage start at approximately 0.22 of a volt and go above 2.31 volts with a smooth transition?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2128-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT HIGH

With the ignition on and no other APPS No.2 DTCs present.

◦ **Set Condition:**

When APP Sensor No.2 voltage is too high. Idle is additionally forced any time the brake is applied or failed. Acceleration rate and Engine output are limited. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(K29) APP SIGNAL 2 SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT
(K29) APP SIGNAL 2 SHORTED TO THE (F855) 5-VOLT SUPPLY CIRCUIT
(K400) APP RETURN 2 CIRCUIT OPEN
APP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

NOTE: If you are viewing data recorder information or Freeze Frame data the APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens every 320 milliseconds and may not show up on the scan tool but may show up on a data recorder or lab scope. It is acceptable to see the voltage close to zero with a normal sensor when using a data recorder/lab scope.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Go To [8](#)

2. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the PCM harness connectors.
 Disconnect the APP Sensor harness connector.
 Ignition on, engine not running.
 Measure the voltage on the (K29) APP Signal 2 circuit in the APP Sensor harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K29) APP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Measure the resistance between the (K29) APP Signal 2 circuit and the (F856) 5-volt Supply circuit in the APP Sensor harness connector.

Is the resistance below 10 ohms?

Yes

- Repair the short between the (K29) APP Signal 2 circuit and the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (F855) 5-VOLT SUPPLY CIRCUIT

Measure the resistance between the (K29) APP Signal 2 circuit and the (F855) 5-volt Supply circuit in the APP Sensor harness connector.

Is the resistance below 10 ohms?

Yes

- Repair the short between the (K29) APP S Signal 2 circuit and the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K400) APP RETURN 2 CIRCUIT OPEN

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K400) APP Return 2 circuit from the APP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (K400) APP Return 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. ACCELERATOR PEDAL POSITION SENSOR

Connect the PCM harness connectors.
Ignition on, engine not running.
With a scan tool, monitor the APP Sensor 2 voltage.

Is the voltage above 0 volts?

Yes

- Go To [7](#)

No

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. APP SENSOR NO.2 SWEEP

Ignition on, engine not running.

With a scan tool, monitor the APP Sensor 2 voltage.

Slowly press the Accelerator Pedal down.

Does voltage start at approximately 0.22 of a volt and go above 2.31 volts with a smooth transition?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2135-THROTTLE POSITION SENSOR 1/2 CORRELATION

81000000

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on and no other DTCs present for TP Sensor No.1 or No.2.

◦ **Set Condition:**

PCM recognizes TP Sensors No.1 and No.2 are not coherent. One trip fault and the code will set within 5 seconds. ETC light is illuminated.

Possible Causes
(K22) TP SIGNAL 1 SHORTED TO VOLTAGE
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
RESISTANCE IN THE (K22) TP SIGNAL 1 CIRCUIT
RESISTANCE IN THE (K122) TP SIGNAL 2 CIRCUIT
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K922) TP SENSOR GROUND CIRCUIT
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO THE (K122) TP SIGNAL 2 CIRCUIT
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

Ignition on, engine not running.

NOTE: Inspect the engine for vacuum leaks.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Go To [14](#)

2. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Disconnect the Throttle Body harness connector.
 Ignition on, engine not running.
 Measure the voltage on the (K22) TP Signal 1 circuit in the Throttle Body harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage on the (K122) TP Signal 2 circuit in the Throttle Body harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K122) TP Signal 2 circuit.

- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. THROTTLE POSITION SENSOR

Turn the ignition off.

Connect the C2 PCM harness connector.

Ignition on, engine not running.

With a scan tool, monitor the TP Signal 1 and Signal 2 voltage.

Connect a jumper wire between the (K922) Sensor Return circuit and the (K22) TP Signal 1 circuit.

TP Sensor No.1 voltage should change from approximately

4.5 volts to 0.5 of a volt?

For TP Sensor No.2, connect a jumper wire between (F855) 5-volt supply circuit and the (K122) TP Signal 2 circuit.

TP Sensor No.2 voltage should change from approximately 0 volts to 5.0 volts?

Is the voltage reading within the listed specification with the jumper wire installed?

Yes

- Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors. If OK, replace the Throttle Body in accordance with Service Information. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)
- **NOTE: Remove the jumper wire before continuing.**

5. EXCESSIVE RESISTANCE IN THE (K22) TP SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K22) TP Signal 1 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. EXCESSIVE RESISTANCE IN THE (K122) TP SIGNAL 2 CIRCUIT

Measure the resistance of the (K122) TP Signal 2 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [7](#)

No

- Repair the excessive resistance in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K22) TP Signal 1 circuit at the Throttle Body harness connector.

Is the resistance below 100 ohms for each circuit?

Yes

- Repair the short to ground in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K122) TP Signal 2 circuit at the Throttle Body harness connector.

Is the resistance below 100 ohms for each circuit?

Yes

- Repair the short to ground in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. EXCESSIVE RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F855) 5-volt Supply circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [10](#)

No

- Repair the excessive resistance in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

10. (F855) 5-VOLT SUPPLY SHORTED TO GROUND

Measure the resistance between ground and the (F855) 5-volt Supply circuit at the Throttle Body harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [11](#)

11. EXCESSIVE RESISTANCE IN THE (K922) SENSOR RETURN CIRCUIT

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K922) Sensor Return circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [12](#)

No

- Repair the excessive resistance in the (K922) Sensor Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

12. (K22) TP SIGNAL 1 SHORTED TO (K122) TP SIGNAL 2

Measure the resistance between the (K22) TP Signal 1 circuit and the (K122) TP Signal 2 circuit at the Throttle Body harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the short between the (K122) TP Signal 2 circuit and the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [13](#)

13. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

14. THROTTLE FOLLOWER TEST

Ignition on, engine not running.

With a scan tool, perform the ETC Throttle Follower Test and monitor the TP Sensor No.1 or No.2 voltage.

Slowly press the throttle pedal down.

The voltage for TP Sensor No.1 should start at approximately 0.7 of a volt and increase to approximately 4.3 volts.

The voltage for TP Sensor No.2 should start at approximately 4.3 volts and decrease to approximately 0.7 of a volt.

Is the voltage within the range of the listed specification for the appropriate Sensor?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors. If OK, replace the Throttle Body in accordance with Service Information. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2138-ACCELERATOR PEDAL POSITION SENSOR 1/2 CORRELATION

8151a08

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on and no APPS No.1 and APPS No.2 DTC present.

- **Set Condition:**

APPS values No.1 and No.2 are not coherent. Idle is additionally forced when the brake pedal is pressed or failed. Acceleration rate and Engine output are limited. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
EXCESSIVE RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT
EXCESSIVE RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT
EXCESSIVE RESISTANCE IN THE (K167) APP RETURN 1 CIRCUIT
EXCESSIVE RESISTANCE IN THE (K400) APP RETURN 2 CIRCUIT
EXCESSIVE RESISTANCE IN THE (K23) APP SIGNAL 1 CIRCUIT
EXCESSIVE RESISTANCE IN THE (K29) APP SIGNAL 2 CIRCUIT
APP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

NOTE: If you are viewing data recorder information or Freeze Frame data the APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens every 320 milliseconds and may not show up on the scan tool but may show up on a data recorder or lab scope. It is acceptable to see the voltage close to zero with a normal sensor when using a data recorder/lab scope.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. EXCESSIVE RESISTANCE IN THE (K23) APP SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the C3 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 along with the #8815-1 to perform the diagnosis.

Using a voltmeter perform a voltage drop test. Backprobe the (K23) APP Signal 1 circuit at the APPS harness connector and probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.
Monitor the voltmeter.

Is the voltage below 0.5 of a volt?

Yes

- Go To [3](#)

No

- Repair the excessive resistance in the (K23) APP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. EXCESSIVE RESISTANCE IN THE (K167) APP RETURN 1 CIRCUIT

Turn the ignition off.

Move the voltmeter leads to backprobe the (K167) APP Return 1 circuit at the APPS harness connector and probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.
Monitor the voltmeter.

Is the voltage below 0.5 of a volt?

Yes

- Go To [4](#)

No

- Repair the excessive resistance in the (K167) APP Return 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. EXCESSIVE RESISTANCE IN THE (K29) APP SIGNAL 2 CIRCUIT

Turn the ignition off.

Move the voltmeter leads to backprobe the (K29) APP Signal 2 circuit at the APPS harness connector and probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.
Monitor the voltmeter.

Is the voltage below 0.5 of a volt?

Yes

- Go To [5](#)

No

- Repair the excessive resistance in the (K29) APP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. EXCESSIVE RESISTANCE IN THE (K400) APP RETURN 2 CIRCUIT

Turn the ignition off.

Move the voltmeter leads to backprobe the (K400) APP Return 2 circuit at the APPS harness connector and probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.
Monitor the voltmeter.

Is the voltage below 0.5 of a volt?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (K400) APP Return 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. EXCESSIVE RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT

Turn the Ignition off.

Remove special tool #8815 from the C3 PCM harness connector and Re-Connect the C3 PCM harness connector to the PCM.

Disconnect the C2 PCM harness connector to install special tool #8815 and #8815-1.

Using a voltmeter perform a voltage drop test. Backprobe the (F855) 5-volt Supply circuit at the APPS harness connector and probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.

Monitor the voltmeter.

Is the voltage below 0.5 of a volt?

Yes

- Go To [7](#)

No

- Repair the excessive resistance in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. EXCESSIVE RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT

Turn the Ignition off.

Remove special tool #8815 from the C2 PCM harness connector and Re-Connect the C2 PCM harness connector to the PCM.

Disconnect the C1 PCM harness connector to install special tool #8815 and #8815-1.

Using a voltmeter perform a voltage drop test. Backprobe the (F856) 5-volt Supply circuit at the APPS harness connector and probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.
Monitor the voltmeter.

Is the voltage below 0.5 of a volt?

Yes

- Go To [8](#)

No

- Repair the excessive resistance in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. CHECKING APPS NO.1 AND NO.2 WITH A LAB SCOPE

Ignition on, engine not running.

Set up a lab scope in a way that you can view two graphs simultaneously.

Backprobe (K23) APP Signal 1 circuit using Channel 1 at the APP Sensor harness connector.

Backprobe (K29) APP Signal 2 circuit using Channel 2 at the APP Sensor harness connector.

NOTE: The APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens

every 320 milliseconds and may not show up on the scan tool but may show up on a data recorder or lab scope. It is acceptable to see the voltage close to zero with a normal sensor when using a data recorder/lab scope.

Slowly press and release the Accelerator Pedal while monitoring the lab scope screen.

Does the scope pattern show any missing or erratic signals?

Yes

- Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

Go To [9](#)

9. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2161-VEHICLE SPEED SENSOR 2 ERRATIC

8181750a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

PCM recognizes Vehicle speed input No.2 erratic or high. VSS No.2 is based on the average of the Front Wheel Speeds. One trip fault and the code will set within 5 seconds. No MIL and No ETC light. Cruise is disabled.

Possible Causes
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active DTCs stored in the Anti-Lock Brake Module. Any bus or communication DTCs or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. VISUAL INSPECTION

NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.

Check tire pressure of all the tires.

Check tire wear on all the tires.

Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes

- Repair as necessary. If the code sets during a front OR rear wheel spin condition, no repair is necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the ABS Module and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the ABS Module and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2166-ACCELERATOR PEDAL POSITION SENSOR 1 MAXIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on. During in plant mode the APP Sensors need to be checked to make sure that idle and full pedal travel can be reached on both sensors.

◦ **Set Condition:**

APPS No.1 has failed to achieve the required maximum value during In Plant testing. One trip fault and the code will set within 5 seconds. Engine will only idle. ETC light will illuminate.

Possible Causes
IN PLANT TEST FAILURE
APPS RELEARN

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. IN PLANT TEST FAILURE

Ignition on, engine not running.

NOTE: This DTC is set when the APP Sensors are learned in plant but do not reach the Minimum or Maximum voltage range.

With a scan tool, select View DTCs.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, view DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. APPS RELEARN

With a scan tool select the ETC RELEARN function.
Next, erase DTCs.
Start the engine.

Does the DTC return?

Yes

- Replace the APPS Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Test Complete.

P2167-ACCELERATOR PEDAL POSITION SENSOR 2 MAXIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on. During in plant mode the APP Sensors need to be checked to make sure that idle and full pedal travel can be reached on both sensors.

◦ **Set Condition:**

APPS No.2 has failed to achieve the required maximum value during In Plant testing. One trip fault and the code will set within 5 seconds. Engine will only idle. ETC light will illuminate.

Possible Causes
IN PLANT TEST FAILURE
APPS RELEARN

Diagnostic Test

1. IN PLANT TEST FAILURE

Ignition on, engine not running.

NOTE: This DTC is set when the APP Sensors are learned in plant but do not reach the Minimum or Maximum voltage range.

With a scan tool, select View DTCs.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, view DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. APPS RELEARN

With a scan tool select the ETC RELEARN function.

Next, erase DTCs.

Start the engine.

Does the DTC return?

Yes

- Replace the APPS Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Test Complete.

P2172-HIGH AIRFLOW/VACUUM LEAK DETECTED (INSTANTANEOUS ACCUMULATION)

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and engine running with no MAP Sensor DTCs.

◦ **Set Condition:**

A large vacuum leak has been detected or both of the TP Sensors have failed based on their position being 2.5 volts and the calculated MAP value is less than the actual MAP minus an Offset value. One trip fault and the code will set within 5 seconds. ETC light will flash.

Possible Causes
VACUUM LEAK
RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT
(K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT
RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE TP SENSOR SIGNAL CIRCUIT
TP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K922) TP RETURN CIRCUIT
MAP SENSOR
TP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: The most likely cause of this DTC is a vacuum leak.

NOTE: This fault code could be present if any Cam/Crank DTCs are set. No repair is necessary for P2172 if any Cam or Crank Sensor faults are set.

NOTE: Diagnose any 5-Volt Supply, TP Sensor, Fuel System Lean or Rich, or MAP Sensor DTCs before continuing.

NOTE: The throttle plate should be free from binding and carbon build up.

Start the engine and allow it to reach normal operating temperature.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. VACUUM LEAK

NOTE: This code is enabled on engines with a plastic intake manifold and is intended to limit the maximum engine speed if a large crack occurs.

NOTE: A large vacuum leak is most likely the cause of this DTC.

Inspect the Intake Manifold and Throttle body for leaks and cracks.
Inspect the Power Brake Booster for any vacuum leaks.
Inspect the PCV system for proper operation or any vacuum leaks.
Inspect the MAP Sensor for proper installation.

Were any vacuum leaks found?

Yes

- Repair the vacuum leak as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. MAP SENSOR OPERATION

Start the engine.
With a scan tool, monitor the MAP Sensor voltage.
Snap the Accelerator pedal.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at Wide Open Throttle?

Yes

- Go To [4](#)

No

- Go To [13](#)

4. TP SENSOR OPERATION

Ignition on, engine not running.
With a scan tool, perform the ETC Throttle Follower Test.
TP Sensor No.1 should start at approximately 0.8 of a volt and increase to 4.2 volts.
TP Sensor No.2 should start at approximately 4.2 volts and decrease to 0.8 of a volt.

Is the voltage transition smooth between the appropriate values?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Go To [5](#)

5. RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
Disconnect the Throttle Body harness connector.
Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F855) 5-volt Supply circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance above 100 ohms?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and (F855) 5-volt Supply circuit at the Throttle Body harness connector.

Is the resistance above 100 ohms?

Yes

- Go To [7](#)

No

- Repair the short to ground in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7.

Connect the C2 PCM harness connector.
 Ignition on, engine not running.
 With a scan tool, monitor the TP Sensor voltage.
 Connect a jumper wire between the (K22) TP Signal 1 circuit and the (K922) TP Return circuit in the Throttle Body harness connector.
 TP Sensor No.1 voltage should start at approximately 4.8 volts and decrease to 0.2 of a volt.
 Connect a jumper wire between the (K122) TP Signal 2 circuit and the (F855) 5-volt Supply circuit in the Throttle Body harness connector.
 TP Sensor No.2 voltage should start at approximately 0 volts and increase to 4.8 to 5.2 volts.

Does the TP Sensor voltage change to the appropriate voltage with the jumper wire installed?

Yes

- Disconnect the Battery before replacing the Throttle Body Assembly. Replace the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. RESISTANCE IN THE (K22) TP SIGNAL 1 CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K22) TP Signal 1 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the excessive resistance in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. RESISTANCE IN THE (K122) TP SIGNAL 2 CIRCUIT

Measure the resistance of the (K122) TP Signal 2 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [10](#)

No

- Repair the excessive resistance in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.

(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

10. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K22) TP Signal 1 circuit at the Throttle Body harness connector.

Is the resistance above 100 ohms?

Yes

- Go To [11](#)

No

- Repair the short to ground in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K122) TP Signal 2 circuit at the Throttle Body harness connector.

Is the resistance above 100 ohms?

Yes

- Go To [12](#)

No

- Repair the short to ground in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

12. RESISTANCE IN THE (K922) TP RETURN CIRCUIT

Measure the resistance of the (K922) TP Return circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K922) TP Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

13. RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
Disconnect the MAP Sensor harness connector.
Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [14](#)

No

- Repair the excessive resistance in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

14. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [15](#)

No

- Repair the short to ground in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

15. MAP SENSOR

Connect the C1 PCM harness connector.
 Ignition on, engine not running.
 With a scan tool, monitor the MAP Sensor voltage.
 Connect a jumper wire between the (K1) MAP Signal circuit and the (K900) Sensor ground circuit in the MAP Sensor harness connector.
 Cycle the ignition switch from off to on.
 With a scan tool, monitor the MAP Sensor voltage.

Does the scan tool display MAP voltage from approximately 4.9 volts to below 0.5 volt with the jumper wire installed?

Yes

- Replace the MAP Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [16](#)
- **NOTE: Remove the jumper wire before continuing.**

16. RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K1) MAP Signal circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [17](#)

No

- Repair the excessive resistance in the (K1) MAP Signal circuit
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

17. (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K1) MAP Signal circuit in the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [18](#)

No

- Repair the short to ground in the (K1) MAP Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

18. RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT

Measure the resistance of the (K900) Sensor ground circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K900) Sensor ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

19. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor, Throttle Body, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the MAP Sensor, Throttle Body, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2173-HIGH AIRFLOW/VACUUM LEAK DETECTED (SLOW ACCUMULATION)

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and engine running with no MAP Sensor DTCs.

◦ **Set Condition:**

A large vacuum leak has been detected or both of the TP Sensors have failed based on their position being 2.5 volts and the calculated MAP value is less than the Gas Flow Adaptation value is too high. One trip fault the code will set within 5 seconds. ETC light will flash.

Possible Causes
VACUUM LEAK
RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT
(K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT
RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE TP SENSOR SIGNAL CIRCUIT
TP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K922) TP RETURN CIRCUIT
MAP SENSOR
TP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: The most likely cause of this DTC is a vacuum leak.

NOTE: Diagnose any 5-Volt Supply, TP Sensor, Oxygen Sensor, Fuel related, or MAP Sensor DTCs before continuing.

NOTE: The throttle plate should be free from binding and carbon build up.

Start the engine and allow it to reach normal operating temperature.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. VACUUM LEAK

NOTE: This code is enabled on engines with a plastic intake manifold and is intended to limit the maximum engine speed if a large crack occurs.

NOTE: A large vacuum leak is most likely the cause of this DTC.

Inspect the Intake Manifold and Throttle body for leaks and cracks.
Inspect the Power Brake Booster for any vacuum leaks.
Inspect the PCV system for proper operation or any vacuum leaks.
Inspect the MAP Sensor for proper installation.

Were any vacuum leaks found?

Yes

- Repair the vacuum leak as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. MAP SENSOR OPERATION

Start the engine.
With a scan tool, monitor the MAP Sensor voltage.
Snap the Accelerator pedal.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at Wide Open Throttle?

Yes

- Go To [4](#)

No

- Go To [13](#)

4. TP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, perform the ETC Throttle Follower Test.

TP Sensor No.1 should start at approximately 0.8 of a volt and increase to 4.2 volts.

TP Sensor No.2 should start at approximately 4.2 volts and decrease to 0.8 of a volt.

Is the voltage transition smooth between the appropriate values?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Go To [5](#)

5. RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F855) 5-volt Supply circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and (F855) 5-volt Supply circuit at the Throttle Body harness connector.

Is the resistance above 100 ohms?

Yes

- Go To [7](#)

No

- Repair the short to ground in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

TP SENSOR

7.

Connect the C2 PCM harness connector.
 Ignition on, engine not running.
 With a scan tool, monitor the TP Sensor voltage.
 Connect a jumper wire between the (K22) TP Signal 1 circuit and the (K922) TP Return circuit in the Throttle Body harness connector.
 TP Sensor No.1 voltage should start at approximately 4.8 volts and decrease to 0.2 of a volt.
 Connect a jumper wire between the (K122) TP Signal 2 circuit and the (F855) 5-volt Supply circuit in the Throttle Body harness connector.
 TP Sensor No.2 voltage should start at approximately 0 volts and increase to 4.8 to 5.2 volts.

Does the TP Sensor voltage change to the appropriate voltage with the jumper wire installed?

Yes

- Disconnect the Battery before replacing the Throttle Body Assembly. Replace the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. RESISTANCE IN THE (K22) TP SIGNAL 1 CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K22) TP Signal 1 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the excessive resistance in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. RESISTANCE IN THE (K122) TP SIGNAL 2 CIRCUIT

Measure the resistance of the (K122) TP Signal 2 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [10](#)

No

- Repair the excessive resistance in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.

(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

10. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K22) TP Signal 1 circuit at the Throttle Body harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [11](#)

No

- Repair the short to ground in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K122) TP Signal 2 circuit at the Throttle Body harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [12](#)

No

- Repair the short to ground in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

12. RESISTANCE IN THE (K922) TP RETURN CIRCUIT

Measure the resistance of the (K922) TP Return circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K922) TP Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

13. RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
Disconnect the MAP Sensor harness connector.
Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [14](#)

No

- Repair the excessive resistance in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

14. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [15](#)

No

- Repair the short to ground in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

15. MAP SENSOR

Connect the C1 PCM harness connector.
 Ignition on, engine not running.
 With a scan tool, monitor the MAP Sensor voltage.
 Connect a jumper wire between the (K1) MAP Signal circuit and the (K900) Sensor ground circuit in the MAP Sensor harness connector.
 Cycle the ignition switch from off to on.
 With a scan tool, monitor the MAP Sensor voltage.

Does the scan tool display MAP voltage from approximately 4.9 volts to below 0.5 volt with the jumper wire installed?

Yes

- Replace the MAP Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [16](#)
- **NOTE: Remove the jumper wire before continuing.**

16. RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K1) MAP Signal circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [17](#)

No

- Repair the excessive resistance in the (K1) MAP Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

17. (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K1) MAP Signal circuit at the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [18](#)

No

- Repair the short to ground in the (K1) MAP Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

18. RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT

Measure the resistance of the (K900) Sensor ground circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K900) Sensor ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

19. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor, Throttle Body, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the MAP Sensor, Throttle Body, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

**P2174-LOW AIRFLOW/RESTRICTION DETECTED
(INSTANTANEOUS ACCUMULATION)**

8151ccc

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and engine running with no MAP Sensor DTCs.

◦ **Set Condition:**

PCM calculated MAP value is greater than actual MAP value plus an offset value. One trip fault. Three good trips to turn of the mil. MIL is on and the ETC light will flash.

Possible Causes
RESTRICTED AIR INLET SYSTEM
RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT
(K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT
RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE TP SENSOR SIGNAL CIRCUIT
TP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K922) TP RETURN CIRCUIT
MAP SENSOR
TP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: The most likely cause of this DTC is a plugged intake air system or dirty Throttle Body. Check for any TSBs before continuing.

NOTE: Diagnose any 5-Volt Supply, TP Sensor, Fuel System Lean or Rich, or MAP Sensor DTCs before continuing.

NOTE: The throttle plate should be free from binding and carbon build up.

NOTE: Question the customer about weather conditions, as ICE build up on the blade can cause this fault when ambient is around -10 to +4°C (14 to 39.2°F) range.

Start the engine and allow it to reach normal operating temperature.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. RESTRICTED AIR INLET SYSTEM

Turn the ignition off.
Remove the Air Cleaner Assembly.
Remove the Air Filter.
Inspect the Throttle Body opening for signs of any foreign materials.
Check the intake tube / air cleaner for obstructions - include snow packing questions to customer.

Were any restrictions found?

Yes

- Repair the restriction as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. MAP SENSOR OPERATION

Start the engine.
With a scan tool, monitor the MAP Sensor voltage.
Snap the Accelerator pedal.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at Wide Open Throttle?

Yes

- Go To [4](#)

No

- Go To [13](#)

4. TP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, perform the ETC Throttle Follower Test.

TP Sensor No.1 should start at approximately 0.8 of a volt and increase to 4.2 volts.

TP Sensor No.2 should start at approximately 4.2 volts and decrease to 0.8 of a volt.

Is the voltage transition smooth between the appropriate values?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Go To [5](#)

5. RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F855) 5-volt Supply circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and (F855) 5-volt Supply circuit at the Throttle Body harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [7](#)

No

- Repair the short to ground in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7.

Connect the PCM harness connectors.
 Ignition on, engine not running.
 With a scan tool, monitor the TP Sensor voltage.
 Connect a jumper wire between the (K22) TP Signal 1 circuit and the (K922) TP Return circuit in the Throttle Body harness connector.
 TP Sensor No.1 voltage should start at approximately 4.8 volts and decrease to 0.2 of a volt.
 Connect a jumper wire between the (K122) TP Signal 2 circuit and the (F855) 5-volt Supply circuit in the Throttle Body harness connector.
 TP Sensor No.2 voltage should start at approximately 0 volts and increase to 4.8 to 5.2 volts.

Does the TP Sensor voltage change to the appropriate voltage with the jumper wire installed?

Yes

- Disconnect the Battery before replacing the Throttle Body Assembly. Replace the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. RESISTANCE IN THE (K22) TP SIGNAL 1 CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K22) TP Signal 1 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the excessive resistance in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. RESISTANCE IN THE (K122) TP SIGNAL 2 CIRCUIT

Measure the resistance of the (K122) TP Signal 2 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [10](#)

No

- Repair the excessive resistance in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.

(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

10. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K22) TP Signal 1 circuit at the Throttle Body harness connector.

Is the resistance above 100k?

Yes

- Go To [11](#)

No

- Repair the short to ground in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K122) TP Signal circuit at the Throttle Body harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [12](#)

No

- Repair the short to ground in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

12. RESISTANCE IN THE (K922) TP RETURN CIRCUIT

Measure the resistance of the (K922) TP Return circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K922) TP Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

13. RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
Disconnect the MAP Sensor harness connector.
Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [14](#)

No

- Repair the excessive resistance in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

14. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [15](#)

No

- Repair the short to ground in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

15. MAP SENSOR

Connect the PCM harness connectors.

Ignition on, engine not running.

With a scan tool, monitor the MAP Sensor voltage.

Connect a jumper wire between the (K1) MAP Signal circuit and the (K900) Sensor ground circuit.

Cycle the ignition switch from off to on.

With a scan tool, monitor the MAP Sensor voltage.

Does the scan tool display MAP voltage from approximately 4.9 volts to below 0.5 volt with the jumper wire installed?

Yes

- Replace the MAP Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [16](#)
- **NOTE: Remove the jumper wire before continuing.**

16. RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K1) MAP Signal circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [17](#)

No

- Repair the excessive resistance in the (K1) MAP Signal circuit
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

17. (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K1) MAP Signal circuit in the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [18](#)

No

- Repair the short to ground in the (K1) MAP Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

18. RESISTANCE IN (K900) SENSOR GROUND CIRCUIT

Measure the resistance of the (K900) Sensor ground circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K900) Sensor ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

19. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor, Throttle Body, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the MAP Sensor, Throttle Body, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2175-LOW AIRFLOW/RESTRICTION DETECTED (SLOW ACCUMULATION)

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on and engine running with no MAP Sensor DTCs.

◦ **Set Condition:**

PCM calculated MAP value is greater than actual MAP value plus an offset value. One trip fault and the code will set within 5 seconds. Three good trips to turn off the mil. MIL is on and the ETC light will flash.

Possible Causes
RESTRICTED AIR INLET SYSTEM
RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT
(K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT
RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE TP SENSOR SIGNAL CIRCUIT
TP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
RESISTANCE IN THE (K922) TP RETURN CIRCUIT
MAP SENSOR
TP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: The most likely cause of this DTC is a plugged intake air system or dirty Throttle Body. Check for any TSBs before continuing.

NOTE: Diagnose any 5-Volt Supply, TP Sensor, Oxygen Sensor, Fuel related or MAP Sensor DTCs before continuing.

NOTE: The throttle plate should be free from binding and carbon build up.

NOTE: Question the customer about weather conditions, as ICE build up on the blade can cause this fault when ambient is around -10 to +4°C (14 to 39.2°F) range.

Start the engine and allow it to reach normal operating temperature.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. RESTRICTED AIR INLET SYSTEM

Turn the ignition off.
Remove the Air Cleaner Assembly.
Remove the Air Filter.
Inspect the Throttle Body opening for signs of any foreign materials.
Check the intake tube / air cleaner for obstructions - include snow packing questions to customer.

Were any restrictions found?

Yes

- Repair the restriction as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. MAP SENSOR OPERATION

Start the engine.
With a scan tool, monitor the MAP Sensor voltage.
Snap the Accelerator pedal.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at Wide Open Throttle?

Yes

- Go To [4](#)

No

- Go To [13](#)

4. TP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, perform the ETC Throttle Follower Test.

TP Sensor No.1 should start at approximately 0.8 of a volt and increase to 4.2 volts.

TP Sensor No.2 should start at approximately 4.2 volts and decrease to 0.8 of a volt.

Is the voltage transition smooth between the appropriate values?

Yes

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Go To [5](#)

5. RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F855) 5-volt Supply circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 100 ohms?

Yes

- Go To [6](#)

No

- Repair the excessive resistance in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and (F855) 5-volt Supply circuit at the Throttle Body harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [7](#)

No

- Repair the short to ground in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7.

Connect the PCM harness connector.
 Ignition on, engine not running.
 With a scan tool, monitor the TP Sensor voltage.
 Connect a jumper wire between the (K22) TP Signal 1 circuit and the (K922) TP Return circuit in the Throttle Body harness connector.
 TP Sensor No.1 voltage should start at approximately 4.8 volts and decrease to 0.2 of a volt.
 Connect a jumper wire between the (K122) TP Signal 2 circuit and the (F855) 5-volt Supply circuit in the Throttle Body harness connector.
 TP Sensor No.2 voltage should start at approximately 0 volts and increase to 4.8 to 5.2 volts.

Does the TP Sensor voltage change to the appropriate voltage with the jumper wire installed?

Yes

- Disconnect the Battery before replacing the Throttle Body Assembly. Replace the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. RESISTANCE IN THE (K22) TP SIGNAL 1 CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K22) TP Signal 2 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the excessive resistance in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

9. RESISTANCE IN THE (K122) TP SIGNAL 2 CIRCUIT

Measure the resistance of the (K122) TP Signal 2 circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [10](#)

No

- Repair the excessive resistance in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.

(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

10. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K22) TP Signal 1 circuit at the Throttle Body harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [11](#)

No

- Repair the short to ground in the (K22) TP Signal 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K122) TP Signal 2 circuit at the Throttle Body harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [12](#)

No

- Repair the short to ground in the (K122) TP Signal 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

12. RESISTANCE IN THE (K922) TP RETURN CIRCUIT

Measure the resistance of the (K922) TP Return circuit from the Throttle Body harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K922) TP Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

13. RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
Disconnect the MAP Sensor harness connector.
Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [14](#)

No

- Repair the excessive resistance in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

14. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [15](#)

No

- Repair the short to ground in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

15. MAP SENSOR

Connect the C1 PCM harness connector.
 Ignition on, engine not running.
 With a scan tool, monitor the MAP Sensor voltage.
 Connect a jumper wire between the (K1) MAP Signal circuit
 and the (K900) Sensor ground circuit.
 Cycle the ignition switch from off to on.
 With a scan tool, monitor the MAP Sensor voltage.

**Does the scan tool display MAP voltage from
 approximately 4.9 volts to below 0.5 volt with the jumper
 wire installed?**

Yes

- Replace the MAP Sensor.
- Perform the POWERTRAIN VERIFICATION TEST.
 (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [16](#)
- **NOTE: Remove the jumper wire before continuing.**

16. RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT

Turn the ignition off.
 Disconnect the C2 PCM harness connector.
 Measure the resistance of the (K1) MAP Signal circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [17](#)

No

- Repair the excessive resistance in the (K1) MAP Signal circuit
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

17. (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K1) MAP Signal circuit in the MAP Sensor harness connector.

Is the resistance above 100k ohms?

Yes

- Go To [18](#)

No

- Repair the short to ground in the (K1) MAP Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

18. RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT

Measure the resistance of the (K900) Sensor ground circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [19](#)

No

- Repair the excessive resistance in the (K900) Sensor ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

19. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor, Throttle Body, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the MAP Sensor, Throttle Body, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2181-COOLING SYSTEM PERFORMANCE

010127aa

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on, Engine running, and no ECT DTCs present.

◦ **Set Condition:**

PCM recognizes that the ECT has failed its self coherence test. The coolant temp should only change at a certain rate, if this rate is too slow or too fast this fault will set. Two trip fault. Three good trips to clear MIL. The MIL and ETC light will illuminate.

Possible Causes
LOW COOLANT LEVEL
(K2) ECT SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K2) ECT SIGNAL CIRCUIT OPEN
(K900) SENSOR GROUND CIRCUIT OPEN
(K2) ECT SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ECT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT
THERMOSTAT
ECT SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: If this code sets during extreme ambient temperatures, improper installation of a block heater could be the cause of this DTC.

With a scan tool, select View DTCs.

Diagnose all other ECT and Cooling System codes before continuing.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. LOW COOLANT LEVEL

NOTE: If an Engine Coolant Temperature (ECT) DTC is set along with this code, diagnose the ECT DTC first.

NOTE: Inspect the ECT terminals and related PCM terminals. Ensure the terminals are free from corrosion and damage.

NOTE: The best way to diagnose this DTC is to allow the vehicle to sit overnight outside in order to have a totally cold soaked engine.

NOTE: Extremely cold outside ambient temperatures may have caused this DTC to set.

NOTE: Need to make sure that no Cooling System DTCs are set or changes that would make the warm up much slower or much faster: broken water pump can set this, addition of aftermarket auxiliary cooler can set this DTC.

WARNING: Never open the cooling system when the engine is hot. The system is under pressure. Failure to follow these instructions can result in personal injury or death. Allow the engine to cool before opening the cooling system.

Inspect the coolant system for proper level and condition.

Is the coolant level and condition OK?

Yes

- Go To [3](#)

No

- Inspect the vehicle for a coolant leak and add the necessary amount of coolant.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. THERMOSTAT

NOTE: This test works best if performed on a cold engine (cold soak).

Ignition on, engine not running.

With a scan tool, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82° C (180° F) . Also monitor the actual coolant temperature with a thermometer.

NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the Eng Coolant Tmp Deg on the scan tool should stay relatively close to each other.

Using the appropriate service information, determine the proper opening temperature of the thermostat.

Did the thermostat open at the proper temperature?

Yes

- Go To [4](#)

No

- Replace the thermostat.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. ECT SENSOR

Turn the ignition off.

Disconnect the ECT Sensor harness connector.

With a scan tool, read the ECT voltage.

Connect a jumper between the (K2) ECT Signal circuit and the (K900) Sensor ground circuit in the ECT Sensor harness connector.

NOTE: The sensor voltage should be approximately 0.0 volts (plus or minus .1 volt) with the jumper wire in place.

Does the scan tool display the voltage as described above?

Yes

- Verify that there is good pin to terminal contact in the

ECT Sensor and Powertrain Control Module connectors. If OK, replace the ECT Sensor.

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (K2) ECT SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Ignition on, engine not running.

Measure the voltage on the (K2) ECT Signal circuit in the ECT Sensor harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K2) ECT Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (K2) ECT SIGNAL CIRCUIT OPEN

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K2) ECT Signal circuit from the ECT Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (K2) ECT Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (K900) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K900) Sensor ground circuit from the ECT Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [8](#)

No

- Repair the open in the (K900) Sensor ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. (K2) ECT SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K2) ECT Signal circuit in the ECT Sensor harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K2) ECT Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. (K2) ECT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K2) ECT Signal circuit and the (K900) Sensor ground circuit in the ECT Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the short between the (K900) Sensor ground and the (K2) ECT Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)

10. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the ECT Sensor and

the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2271-O2 SENSOR 1/2 SIGNAL STUCK RICH

81811440

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the engine running, vehicle speed above 96 kph (60 mph), throttle open for a minimum of 120 seconds, ECT greater than 70° C (158° F), catalytic converter temperature greater than 600° C (1112° F), and downstream oxygen sensor in a rich state. During a decel fuel shutoff event, the downstream oxygen sensor should switch from rich to lean within a specific time.

- **Set Condition:**

The PCM monitors the downstream O2 sensor. If the PCM does not detect a rich to lean switch within a specific time during a decel fuel shutoff event, the monitor will fail. Two trip fault. Three good trips to turn off the MIL.

Possible Causes
OXYGEN SENSOR WIRING OR CONNECTORS
O2 SENSOR SIGNAL CIRCUIT
O2 SENSOR RETURN CIRCUIT
1/2 O2 SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

2. CHECKING THE OXYGEN SENSOR OPERATION

NOTE: Check for signs of contaminants that may have damaged the O2 Sensor, such as contaminated fuel, unapproved silicone, oil and coolant.

Perform the diagnostic procedure for *CHECKING THE OXYGEN SENSOR OPERATION.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the 1/2 O2 Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2273-O2 SENSOR 2/2 SIGNAL STUCK RICH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the engine running, vehicle speed above 96 kph (60 mph), throttle open for a minimum of 120 seconds, ECT greater than 70 C (158 F), catalytic converter temperature greater than 600 C (1112 F), and downstream oxygen sensor in a rich state. During a decel fuel shutoff event, the downstream oxygen sensor should switch from rich to lean within a specific time.

- **Set Condition:**

The PCM monitors the downstream O2 sensor. If the PCM does not detect a rich to lean switch within a specific time during a decel fuel shutoff event, the monitor will fail. Two trip fault. Three good trips to turn off the MIL.

Possible Causes
OXYGEN SENSOR WIRING OR CONNECTORS
O2 SENSOR SIGNAL CIRCUIT
O2 SENSOR RETURN CIRCUIT
2/2 O2 SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

2. CHECKING THE OXYGEN SENSOR OPERATION

NOTE: Check for signs of contaminants that may have damaged the O2 Sensor, such as contaminated fuel, unapproved silicone, oil and coolant.

Perform the diagnostic procedure for *CHECKING THE OXYGEN SENSOR OPERATION.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the 2/2 O2 Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2299-BRAKE PEDAL POSITION/ACCELERATOR PEDAL POSITION INCOMPATIBLE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on. No Break or APPS faults present.

- **Set Condition:**

The PCM recognizes a brake application following the APPS showing a fixed pedal opening. Temporary or permanent. Internally the PCM will reduce throttle opening below driver demand. One trip fault and the code will be set within 5 seconds. ETC light will illuminate, the light will only stay illuminated while DTC is active.

Possible Causes
CUSTOMER PRESSING ACCELERATOR PEDAL, THEN PRESSING BRAKE PEDAL, AND CONTINUES HOLDING THEM DOWN SIMULTANEOUSLY
STOP LAMP SWITCH
APP SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC INFORMATION

NOTE: If a pedal assembly becomes mechanically stuck the voltage output will stay fixed, if this is also Followed by a long application of the brakes this code will set.

NOTE: When this code sets the pedal position in the PCM software will ramp to idle. If the Pedal voltage changes OR the brake pedal is released, the pedal position in the PCM software will ramp up to the pedal position and the ETC light will go out.

With a scan tool, read DTCs and record the related Freeze Frame data.

Diagnose all other Stop Lamp Switch and APP Sensor codes before continuing.

This code can be set by a driver who uses both feet while driving, one for the Accelerator Pedal and the other for the Brake Pedal.

NOTE: The most likely cause of this DTC is caused by the customer Brake Torquing the engine by pressing the Accelerator pedal and the pressing the Brake Pedal.

Ask the driver of the vehicle if these conditions apply to their driving habits.

Are the listed conditions part of the customers driving habits?

Yes

- Advise the customer of what caused the DTC. This is normal operation of a ETC equipped vehicle because of safety issues.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [2](#)

2. STOP LAMP SWITCH OPERATION

With a scan tool, read both Stop Lamp Switch statuses while pressing and releasing the Brake Pedal.

Does the scan tool display the Pressed and Released while pressing and releasing the Pedal?

Yes

- Go To [3](#)

No

- Check the Stop Lamp Switch for proper installation and check the related circuits for opens and shorts using the appropriate wiring diagram. If OK, replace the Stop Lamp Switch assembly.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. APP SENSOR SWEEP

Ignition on, engine not running.

With a scan tool, monitor both APP Sensor voltage readings.

Slowly press the accelerator pedal from idle until it reaches the end stop near the floor.

APPS No.1 voltage should start at approximately 0.45 of a volt and increase to approximately 4.6 volts with a smooth transition.

APPS No.2 voltage should start at approximately 0.22 of a volt and increase to approximately 2.31 volts with a smooth transition.

Does the voltage for the appropriate sensor follow the list specification?**Yes**

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

No

- Check the Signal and Return circuits for opens and shorts. If OK, Replace the APP Sensor Assembly per Service Information. After installation is complete, with a scan tool select the ETC RELEARN function to relearn the APPS values.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2302-IGNITION COIL 1 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

81a2589c

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Engine running and battery voltage greater than 10 volts.

◦ **Set Condition:**

If PCM detects that the secondary ignition burn time is incorrect, too short, or not present, an error is detected. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(F342) ASD OUTPUT CIRCUIT
(K19) COIL CONTROL 1 CIRCUIT OPEN
(K19) COIL CONTROL 1 CIRCUIT SHORTED TO GROUND
COIL
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose any ASD related DTCs before continuing.

Start the engine.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS

AND TESTING.)

2. (F342) ASD OUTPUT CIRCUIT

Turn the ignition off.

Disconnect the Ignition Coil harness connector.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, probe the (F342) ASD Output circuit in the Ignition Coil harness connector.

With a scan tool, actuate the ASD.

NOTE: Make sure the test light is probing the circuit before actuating the Coil or a DTC may set and not allow the actuation.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the open or short to ground in the (F342) ASD Output circuit between the TIPM and Coil harness connector. Refer to the ASD diagnostic procedures for further assistance.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)
- **NOTE: Stop All Actuations.**

3. IGNITION COIL

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Using a 12-volt test light connected to a 12-volt source, probe the (K19) Coil Control 1 circuit in the Coil harness connector.

Crank the engine for 5 seconds while observing the test light.

What is the condition of the test light while cranking the engine?

Brightly blinking.

- Replace the Ignition Coil.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

ON constantly.

- Go To [4](#)

OFF constantly.

- Go To [5](#)

4. (K19) COIL CONTROL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the C2 PCM harness connector.
Measure the resistance between ground and the (K19) Coil Control 1 circuit in the Coil harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K19) Coil Control 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

5. (K19) COIL CONTROL 1 CIRCUIT OPEN

Turn the ignition off.
Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K19) Coil Control 1 circuit from the Coil harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (K19) Coil Control 1 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Ignition Coil and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

PROCEDURE.)

P2305-IGNITION COIL 2 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

81a2589c

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Engine running and battery voltage greater than 10 volts.

◦ **Set Condition:**

If PCM detects that the secondary ignition burn time is incorrect, too short, or not present, an error is detected. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(F342) ASD OUTPUT CIRCUIT
(K17) COIL CONTROL 2 CIRCUIT OPEN
(K17) COIL CONTROL 2 CIRCUIT SHORTED TO GROUND
COIL
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose any ASD related DTCs before continuing.

Start the engine.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS

AND TESTING.)

2. (F342) ASD OUTPUT CIRCUIT

Turn the ignition off.
 Disconnect the Ignition Coil harness connector.
 Ignition on, engine not running.
 Using a 12-volt test light connected to ground, probe the (F342) ASD Output circuit in the Ignition Coil harness connector.

NOTE: Make sure the test light is probing the circuit before actuating the Coil or a DTC may set and not allow the actuation.

With a scan tool, actuate the ASD.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the open or short to ground in the (F342) ASD Relay Output circuit between the TIPM and Coil harness connector. Refer to the ASD diagnostic procedures for further assistance.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)
- **NOTE: Stop All Actuations.**

3. IGNITION COIL

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Using a 12-volt test light connected to a 12-volt source, probe the (K17) Coil Control 2 circuit.
 Crank the engine for 5 seconds while observing the test light.

What is the state of the test light during the actuation?

Brightly blinking.

- Replace the Ignition Coil.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

ON constantly.

- Go To [4](#)

OFF constantly.

- Go To [5](#)

4. (K17) COIL CONTROL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Measure the resistance between ground and the (K17) Coil Control 2 circuit in the Coil harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K17) Coil Control 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

5. (K17) COIL CONTROL 2 CIRCUIT OPEN

Turn the ignition off.
Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K17) Coil Control 2 circuit from the Coil harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (K17) Coil Control 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Ignition Coil and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2308-IGNITION COIL 3 SECONDARY CIRCUIT- INSUFFICIENT IONIZATION

01-03-0000

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Engine running and battery voltage greater than 10 volts.

- **Set Condition:**

If PCM detects that the secondary ignition burn time is incorrect, too short, or not present, an error is detected. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(F342) ASD OUTPUT CIRCUIT
(K18) COIL CONTROL 3 CIRCUIT OPEN
(K18) COIL CONTROL 3 CIRCUIT SHORTED TO GROUND
COIL
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose any ASD related DTCs before continuing.

Start the engine.
With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. (F342) ASD OUTPUT CIRCUIT

Turn the ignition off.

Disconnect the Ignition Coil harness connector.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, probe the (F342) ASD Output circuit in the Ignition Coil harness connector.

With a scan tool, actuate the ASD.

NOTE: Make sure the test light is probing the circuit before actuating the Coil or a DTC may set and not allow the actuation.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the open or short to ground in the (F342) ASD Output circuit between the TIPM and Coil harness connector. Refer to the ASD diagnostic procedures for further assistance.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)
- **NOTE: Stop All Actuations.**

3. IGNITION COIL

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal

injury or death.

Using a 12-volt test light connected to a 12-volt source, probe the (K18) Coil Control 3 circuit in the Ignition Coil harness connector.
Crank the engine for 5 seconds while observing the test light.

What is the state of the test light during the actuation?

Brightly blinking.

- Replace the Ignition Coil.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

ON constantly.

- Go To [4](#)

OFF constantly.

- Go To [5](#)

4. (K18) COIL CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the C2 PCM harness connector.
Measure the resistance between ground and the (K18) Coil Control 3 circuit in the Coil harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K18) Coil Control 3 circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

5. (K18) COIL CONTROL 3 CIRCUIT OPEN

Turn the ignition off.
Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K18) Coil Control 3 circuit from the Coil harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (K18) Coil Control 3 circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Ignition Coil and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

PROCEDURE.)

P2503-CHARGING SYSTEM OUTPUT LOW

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

The engine running. The engine RPM is high enough to assure sufficient generator current output to satisfy the electrical loads.

◦ **Set Condition:**

The battery sensed voltage is less than the target charging voltage, during engine operation, for a calibrated amount of time. One Trip Fault. Generator light will illuminate.

Possible Causes
LOOSE ACCESSORY DRIVE BELT
EXCESSIVE RESISTANCE IN THE (A801) BATTERY POSITIVE CIRCUIT
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.

NOTE: The battery must be fully charged.

NOTE: The Generator belt tension and condition must be checked before continuing.

Ignition on, engine not running.

With a scan tool, select View DTCs and record the related Freeze Frame data.

With a scan tool, erase DTCs.

Start the engine.

Allow the idle to stabilize.

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. FUSED B+ CIRCUIT HIGH RESISTANCE

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

Measure the voltage between the Generator B+ Output Terminal and the Battery+ Post.

Start the engine.

Is the voltage above 0.4 of a volt?

Yes

- Repair the excessive resistance in the battery positive circuit between the Generator and Battery.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. GENERATOR OPERATION

Turn the ignition off.

Disconnect the Generator Field harness connector.

Using a 12-volt test light connected to ground, probe (K125) Generator Field Control circuit in the Generator Field harness connector.

Ignition on, engine not running.

With a scan tool, actuate the Generator Field Driver.

NOTE: The DTC needs to be cleared before actuating the Solenoid, if the DTC is not cleared, the Solenoid may not be allowed to actuate.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct

connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Does the test light illuminate accordingly during the actuation?

Yes

- Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors. Replace the Generator if no problems were found with the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- Go To [4](#)

4. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2504-CHARGING SYSTEM OUTPUT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The engine running. The engine speed greater than 1157 RPM.

◦ **Set Condition:**

The alternator B+ voltage sense circuit voltage reading exceeds the direct Battery B+ sense circuit. The Generator output terminal is not connected to the Battery B+ post. One trip fault.

Possible Causes
EXCESSIVE RESISTANCE IN THE (A209) BATTERY FEED CIRCUIT
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.

NOTE: The battery must be fully charged.

NOTE: The Generator belt tension and condition must be checked before continuing.

Ignition on, engine not running.

With a scan tool, select View DTCs and record the related Freeze Frame data.

With the scan tool erase DTCs.

Start the engine.

Allow the idle to stabilize.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. (A801) BATTERY POSITIVE CIRCUIT VISUAL INSPECTION

Turn the ignition off.

Inspect the (A801) Battery Positive circuit at Generator Output post for corrosion and looseness.

Inspect the Battery + and – cables for corrosion and looseness.

Inspect the (A0) Battery Positive circuit at the C8 TIPM harness connector for corrosion and looseness.

Were any problems found?

Yes

- Repair and replace as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. EXCESSIVE RESISTANCE IN THE (A209) BATTERY FEED CIRCUIT

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 and #8815-1 to perform diagnosis.

Disconnect the C1 PCM harness connector.

Perform a voltage drop test on the (A209) Battery Feed circuit from the appropriate terminals of special tool #8815-1 to the C2 TIPM harness.

Using a voltmeter probe the appropriate terminal of special tool #8815-1 with the Negative lead of the voltmeter and back probe the (A209) Battery Feed circuit at the C2 TIPM with the Positive lead of the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine

Monitor the voltmeter.

Is the voltage above 0.4 of a volt?

Yes

- Repair the excessive resistance in the (A209) Battery Positive circuit between the Generator and TIPM.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

P2610-PCM INTERNAL SHUTDOWN TIMER RATIONALITY TOO FAST

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The PCM compares actual shutdown time to a calculated shutdown time value. The calculated shut down time value is based on the amount of shutdown time necessary for the ECT to drop a specific amount after a completely warmed up engine is shut down. If the difference between actual shutdown time and the calculated shut down time is greater than a maximum value, a one trip failure will set. The shutdown time is measured again after 1 hour of ignition off time following the next engine warm up cycle. The PCM compares the shutdown time to a calculated value. If the difference is greater than a maximum value, the MIL is illuminated and a DTC will set.

◦ When Monitored:

With the engine running after a cycle when a complete engine warm up was achieved, the difference between engine coolant temperature and ambient air temperature greater than 10° C (50° F), after a minimum temperature drop of 10° C (50° F) during ignition off, and battery voltage greater than 10 volts.

◦ Set Condition:

The PCM detects that the engine coolant temperature drops a specified amount during the measured engine off time. Two trip fault. Three good trips to turn off the MIL.

Possible Causes

POWERTRAIN CONTROL MODULE (PCM) SOFTWARE UPDATE
EXCESSIVE RESISTANCE IN THE PCM POWER OR GROUND CIRCUITS
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose and repair any other DTCs set in the PCM before proceeding with this test.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. PCM IGNITION CIRCUITS

Turn the ignition off.

Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

With a 12-volt test light connected to ground probe the (F1) Fused Ignition Switch circuit.

Perform the above check with the Ignition key in the off lock position, Ignition on, engine not running position, and during cranking.

Wiggle the related wire harness while probing the special tool with the test light to try to interrupt the circuit.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the open or excessive resistance in the (F1) Fused Ignition Switch circuit. Inspect the related fuse, if the fuse is open check the circuits for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. POWERTRAIN CONTROL MODULE (PCM)

Verify that the PCM is operating at the latest software version available.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U0001-CAN C BUS

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.

- **Set Condition:**

The PCM loses communication over the CAN C Bus circuit. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, read TIPM DTCs.

Is the DTC Active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0101-LOST COMMUNICATION WITH TCM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.

- **Set Condition:**

The PCM doesn't receive a Bus Message from the Transmission Control Module for 7 consecutive seconds. The circuit is continuously monitored. Two Trip fault.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, View PCM DTCs.

Is the DTC Active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition run time is greater than 1 second. Battery voltage between 10 and 16 volts. Engine run time greater than 3 seconds.

- **Set Condition:**

The PCM doesn't receive an ABS message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
ABS MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View PCM DTCs.

Is the DTC Active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts.

- **Set Condition:**

The PCM doesn't receive a TIPM message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View PCM DTCs.

Is the DTC Active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM-WCM)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.

- **Set Condition:**

The PCM doesn't receive a SKREEM message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
NO POWER TO VEHICLE SECURITY CONTROL MODULE (SKREEM) — MODULE UNPLUGGED OR OPEN FUSE
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

NOTE: Check the IOD fuse before continuing. If the fuse is open, check the circuit for a short to ground.

Turn the ignition on.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for

diagnostic procedures and for further possible causes.

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U110A-LOST COMMUNICATION WITH SCM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.

- **Set Condition:**

The PCM doesn't receive a SKREEM message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
SCM
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, View PCM DTCs.

Is the DTC Active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

U110C-NO FUEL LEVEL BUS MESSAGE RECEIVED

01017141

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

When the PCM does not receive a fuel level signal from the TIPM over the CAN C circuit. The circuit is constantly monitored. One Trip fault.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM) ALSO ACTIVE

With the scan tool, select View DTCs.

Is the U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM) also set?

Yes

- Follow the diagnostics for U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U110E-LOST AMBIENT TEMPERATURE MESSAGE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on.

- **Set Condition:**

The PCM doesn't receive the ambient temperature signal over the CAN C bus from the TIPM. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ambient temperature sensor signal is a direct input to the TIPM. The TIPM sends the PCM the ambient temperature signal over the CAN C bus.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM) ALSO ACTIVE

2.

With the scan tool, select View DTCs.

Is the U0141-NO BUS MESSAGE RECEIVED FROM THE FCM (TIPM) also set?

Yes

- Follow the diagnostics for U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U110F-LOST FUEL VOLUME MESSAGE

00017141

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

When the PCM does not receive a fuel volume signal from the TIPM over the CAN C circuit. The circuit is constantly monitored. One Trip fault.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM) ALSO ACTIVE

With the scan tool, select View DTCs.

Is the U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM) also set?

Yes

Follow the diagnostics for U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)

- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1110-LOST VEHICLE SPEED MESSAGE

8181750a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

The PCM doesn't receive a vehicle speed signal from the Anti-lock brake Module over the CAN C bus.
One Trip fault.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Theory of Operation

The PCM receives the vehicle speed signal over the CAN C bus from the Anti-lock Brake Module.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. U0121-LOST COMMUNICATION WITH ABS MODULE ALSO SET

With the scan tool continue reading DTCs.

Is the U0121-LOST COMMUNICATION WITH ABS MODULE also set?

Yes

- Follow the diagnostics for U0121-LOST COMMUNICATION WITH ABS MODULE. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1113-LOST A/C PRESSURE MESSAGE

**MODULE-
POWERTRAIN
CONTROL C1
(GAS)**

**MODULE-
TOTALLY
INTEGRATED
POWER C1**

**TRANSDUCER-A/C
PRESSURE**

01017401

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

- **Set Condition:**

The PCM doesn't receive the A/C Pressure signal over the CAN C bus from the TIPM. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The A/C Pressure Transducer signal is a direct input to the TIPM. The TIPM sends the PCM the A/C pressure signal over the CAN C bus.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM) ALSO ACTIVE

With the scan tool continue reading DTCs.

Is the U0141-NO BUS MESSAGE RECEIVED FROM THE TIPM also set?

Yes

- Follow the diagnostics for U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1120-LOST WHEEL DISTANCE MESSAGE

8181750a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

The PCM doesn't receive a vehicle speed signal from the Anti-lock brake Module over the CAN C bus.
One Trip fault.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Theory of Operation

The PCM receives the vehicle speed signal over the CAN C bus from the Anti-lock Brake Module.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. U0121-LOST COMMUNICATION WITH ABS MODULE ALSO SET

With the scan tool continue reading DTCs.

Is the U0121-LOST COMMUNICATION WITH ABS MODULE also set?

Yes

- Follow the diagnostics for U0121-LOST COMMUNICATION WITH ABS MODULE. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1403-IMPLAUSIBLE FUEL LEVEL SIGNAL RECEIVED

Ignition on.

◦ **Set Condition:**

The fuel level message the PCM is receiving is implausible. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN CIRCUIT OPEN OR SHORTED
FUEL LEVEL SENSOR
(N4) FUEL LEVEL SIGNAL CIRCUIT OPEN
(N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT
(K900) SENSOR GROUND CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The Totally Integrated Power Module isn't receiving a fuel volume signal from the Fuel Level Sensor. The PCM received the Fuel Level signal from the TIPM over the CAN C Bus circuit. The signal the TIPM is sending over CAN C is implausible.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. CAN C HARDWARE DTCS ALSO ACTIVE

With a scan tool check for DTCs in the TIPM.

Are any CAN C Hardware related DTCs active at this time?

Yes

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the appropriate diagnostic procedures.
- Perform BODY VERIFICATION TEST - VER 1.

No

- Go To [3](#)

3. FUEL LEVEL SENSOR

Turn the ignition off.

Disconnect the Fuel Pump Module harness connector.

Ignition on, engine not running.

Using a fused jumper wire, jump the (K900) Sensor Ground circuit to the (N4) Fuel Level Sensor No.1 Signal circuit in the Fuel Pump Motor harness connector.

Did the Fuel gauge level change from empty to full?

Yes

- Replace the Fuel Level Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. (N4) FUEL LEVEL SIGNAL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the C7 TIPM harness connector.
 Measure the resistance of the (N4) Fuel Level Signal circuit from the Fuel Pump Module harness connector to the C7 TIPM harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [5](#)

No

- Repair the open in the (N4) Fuel Level Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
 (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (N4) Fuel Level Signal circuit and the (K900) Sensor Ground circuit from the Fuel Pump Module harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the short between the (K900) Sensor Ground circuit and the (N4) Fuel Level Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST.
 (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (K900) SENSOR GROUND CIRCUIT OPEN

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K900) Sensor Ground circuit from the Fuel Pump Module harness connector to the TIPM harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (K900) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connector at the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1411-IMPLAUSIBLE FUEL VOLUME SIGNAL RECEIVED

01017141

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The TIPM has to send the PCM a fuel volume signal over CAN C. The signal the TIPM sends over CAN C is implausible.

- **When Monitored:**

Ignition on.

- **Set Condition:**

The fuel volume message the PCM is receiving is implausible. The circuit is continuously monitored.

Possible Causes
CAN C OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. CAN C BUS DTCS ALSO ACTIVE

With a scan tool check for DTCs in the TIPM.

Are any CAN C related DTCs Active at this time?

Yes

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the appropriate diagnostic procedures.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1412-IMPLAUSIBLE VEHICLE SPEED SIGNAL RECEIVED

8181750a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

The PCM gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ABS MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ABS Module sends vehicle speed information over the CAN C Bus circuit to the PCM.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the U1412-IMPLAUSIBLE VEHICLE SPEED SIGNAL RECEIVED active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. U0001-NO COMMUNICATION ON THE CAN C BUS CIRCUIT IS ACTIVE

Continue reading DTCs.

Is the U0001-NO COMMUNICATION ON THE CAN C BUS CIRCUIT Active at this time?

Yes

- Refer to the Diagnostic Procedure for the U0001-NO COMMUNICATION ON THE CAN C BUS CIRCUIT. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING.)

No

- Go To [3](#)

3. ABS MODULE IS ACTIVE ON THE CAN C BUS

With the scan tool, select ECU View.
Verify that the ABS Module active on the bus.

Is the ABS Module active on the bus?

Yes

- Go To [4](#)

No

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

4. ACTIVE DTCS IN THE TIPM

With the scan tool, select ECU View and select TIPM.
With the scan tool, read active DTCs.

Is the U0001-NO COMMUNICATION ON THE CAN C BUS CIRCUIT ACTIVE in the TIPM at this time?

Yes

- Replace the ABS Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1417-IMPLAUSIBLE LEFT WHEEL DISTANCE SIGNAL RECEIVED

8181750a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

The PCM gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored. One Trip fault.

Possible Causes
VEHICLE SPEED SENSOR FAULT ACTIVE IN ANTI-LOCK BRAKE MODULE
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ABS MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ABS Module sends an implausible distance signal over the CAN C Bus circuit to the PCM.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the U1417-IMPLAUSIBLE LEFT WHEEL DISTANCE SIGNAL RECEIVED Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. ABS MODULE IS ACTIVE ON THE CAN C BUS

With the scan tool, select ECU View.
Verify that the ABS Module active on the bus.

Is the ABS Module active on the bus?

Yes

- Go To [3](#)

No

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

3. DTCS STORED OR ACTIVE IN THE ABS MODULE

Check for DTCs in the ABS Module.

Are any DTCs active or stored in the ABS Module?

Yes

- Refer to section 5 - BRAKES - ABS ELECTRICAL DIAGNOSTICS and perform the diagnostics for the DTCs in the ABS Module.
- Perform ABS VERIFICATION TEST - VER 1

No

- Go to [4](#)

4. ACTIVE DTCS IN THE TIPM

With the scan tool, select ECU View and select TIPM.
With the scan tool, read active DTCs.

Are any Communication DTCs active in the TIPM relating to the ABS System?

Yes

- Replace the ABS Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

U1418-IMPLAUSIBLE RIGHT WHEEL DISTANCE SIGNAL RECEIVED

8181750a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on.

◦ **Set Condition:**

The PCM gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored. One Trip fault.

Possible Causes
VEHICLE SPEED SENSOR FAULT ACTIVE IN ANTI-LOCK BRAKE MODULE
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ABS MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ABS Module sends an implausible distance signal over the CAN C Bus circuit to the PCM.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View DTCs.

Is the U1418-IMPLAUSIBLE RIGHT WHEEL DISTANCE SIGNAL RECEIVED Active at this time?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.)

2. ABS MODULE IS ACTIVE ON THE CAN C BUS

With the scan tool, select ECU View.
Verify that the ABS Module active on the bus.

Is the ABS Module active on the bus?

Yes

- Go To [3](#)

No

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

3. DTCS STORED OR ACTIVE IN THE ABS MODULE

Check for DTCs in the ABS Module.

Are any DTCs active or stored in the ABS Module?

Yes

- Refer to section 5 - BRAKES - ABS ELECTRICAL DIAGNOSTICS and perform the diagnostics for the DTCs in the ABS Module.
- Perform ABS VERIFICATION TEST - VER 1

No

- Go to [4](#)

4. ACTIVE DTCS IN THE TIPM

With the scan tool, select ECU View and select TIPM.
With the scan tool, read Active DTCs.

Are any Communication DTCs active in the TIPM relating to the ABS System?

Yes

- Replace the ABS Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

*CHECKING THE EXHAUST SYSTEM FOR LEAKS

1. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the Mopar® Air Leak Detector PN# 05191804AA (or the equivalent leak finder liquid) to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater

O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary. Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

- Repair or replace the leaking exhaust parts as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Test complete.

***CHECKING THE FUEL DELIVERY SYSTEM**

00017141

For a complete wiring diagram **Refer to Section 8W.**

RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN
(N1) FUSED FUEL PUMP OUTPUT OPEN
(N1) FUSED FUEL PUMP OUTPUT SHORTED TO GROUND
FUEL PUMP MODULE
TIPM
PCM

Diagnostic Test

1. FUEL PUMP OPERATION

Ignition on, engine not running.
With a scan tool, actuate the Fuel System test.

NOTE: It may be necessary to use a mechanics stethoscope in the next step.

Listen for fuel pump operation at the fuel tank.

Does the Fuel Pump operate?

Yes

- Go To [2](#)

No

- Go To [5](#)

CAUTION: Stop All Actuations.

2. FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge at the engine.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Choose a conclusion that best matches your fuel pressure reading.

Below Specification

- Go To [3](#)

Within Specification

- Test Complete.

Above Specification

- Replace the fuel filter/fuel pressure regulator.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

CAUTION: Stop All Actuations.

3. RESTRICTED FUEL SUPPLY LINE

WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special tool #6539 (5/16") or #6631(3/8") fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Is the fuel pressure within specification now?**Yes**

- Repair/replace fuel supply line as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

CAUTION: Stop All Actuations.

4. CHECKING FUEL INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?**Yes**

- Replace the Fuel Pump Inlet Strainer.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Fuel Pump Module.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. FUEL PUMP CONTROL OPERATION FROM THE PCM

Stop the Fuel Pump actuation.

Turn the ignition off.

Disconnect the C1 TIPM harness connector.

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Ignition on, engine not running.

Using a 12-volt test light connected to B+ probe the (K31) Fuel Pump Control circuit in the C1 TIPM harness connector.

Using a scan tool actuate the Fuel Pump under the PCM actuations.

Does the test light illuminate brightly during the actuation?

Yes

- Go To [8](#)

No

- Go To [6](#)

6. (K31) FUEL PUMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the C3 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K31) Fuel Pump Control circuit from the C1 TIPM harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the open in the (K31) Fuel Pump Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the TIPM C1 harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K31) Fuel Pump Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [11](#)

8. (N1) FUEL PUMP OUTPUT CIRCUIT OPEN

Turn the ignition off.
 Disconnect the C5 TIPM harness connector.
 Disconnect the Fuel Pump Module harness connector.
 Measure the resistance of the (N1) Fused Fuel Pump Output circuit from the C5 TIPM harness connector and the Fuel Pump Module harness connector.

Is the resistance above 5.0 ohms?

Yes

- Repair the open in the (N1) Fused Fuel Pump Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. (N1) FUEL PUMP OUTPUT CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (N1) Fused Fuel Pump Output circuit at the Fuel Pump Module harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (N1) Fused Fuel Pump Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST.

(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [10](#)

10. FUEL PUMP MODULE/TIPM

Connect the C3 PCM harness connector.
 Connect the C1 and C5 TIPM harness connectors.
 Turn the ignition on.
 Using a scan tool actuate the Fuel Pump Module.
 Using a 12-volt test light connected to ground, probe the (N1) Fused Fuel Pump Output circuit at the Fuel Pump Module harness connector.

Does the test light illuminate?

Yes

- Replace the Fuel Pump Module in accordance with the Service Information. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL PUMP MODULE - REMOVAL).
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Totally Integrated Power Module in accordance with the Service Information. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - REMOVAL).
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

11. PCM

NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

*CHECKING THE OXYGEN SENSOR OPERATION

For a complete wiring diagram **Refer to Section 8W.**

Diagnostic Test

1. OXYGEN SENSOR, WIRING, OR CONNECTORS

NOTE: Diagnose and repair any O2 sensor or rationality DTCs before proceeding with this test.

NOTE: When performing this procedure as part of another diagnostic process, it may be necessary to repeat this test for all of the oxygen sensors on the vehicle.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen sensor and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Turn the ignition on.

Monitor the scan tool data relative to the sensor and wiggle test the wiring and connectors.

Look for the data to change or for a DTC to set during the wiggle test. If necessary, check each sensor circuit for high resistance or a shorted condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go to [2](#)

2. OXYGEN SENSOR VOLTAGE

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, monitor all O2 Sensor voltage readings.

Is the voltage switching between 2.5 and 3.4 volts for all O2 sensors?

Yes

- Go to [3](#)
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go to [4](#)

3. O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

Turn the ignition on.

With a scan tool, actuate the O2 Sensor heater.

With the scan tool, monitor O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

- Go to [4](#)
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD

PROCEDURE.)

No

- Test complete.

4. O2 SENSOR

Turn the ignition off.

NOTE: Check for contaminants that may cause improper O2 Sensor operation, such as contaminated fuel, unapproved silicone, or evidence of oil or coolant.

Disconnect the O2 Sensor harness connector.

Turn the ignition on.

With a scan tool, monitor the O2 Sensor voltage.

NOTE: The voltage should be approximately 5.0 volts with the connector disconnected.

Connect a jumper wire between the signal circuit and the return circuit in the O2 Sensor harness connector.

NOTE: The voltage should drop from 5.0 volts to 2.5 volts with the jumper wire in place.

Is the O2 Sensor voltage displayed on the scan tool as described?

Yes

- Replace the O2 Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go to [5](#)

5. O2 SENSOR SIGNAL CIRCUIT

Using the wiring diagram/schematic as a guide, inspect the O2 Sensor Signal circuit and connectors between the O2 sensor and the PCM.

Check the O2 Sensor signal circuit for a short to ground, open circuit, short to voltage, or high resistance.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go to [6](#)

6. O2 SENSOR RETURN CIRCUIT

Using the wiring diagram/schematic as a guide, inspect the O2 Sensor Return circuit and connectors between the O2 sensor and the PCM.

Check the O2 Sensor return circuit for a short to ground, open circuit, short to voltage or high resistance.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go to [7](#)

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the O2 sensor and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to the components tested in this procedure and wiggle test the wiring and connectors.

Look for the data to change or for a DTC to set during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

*CHECKING THE PCM POWER AND GROUND CIRCUITS

For a complete wiring diagram **Refer to Section 8W.**

Diagnostic Test

1. PCM WIRING OR CONNECTORS

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and each connector at the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- Go To [2](#)

2. CHECKING THE PCM GROUND CIRCUITS

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12 volt test light connected to 12 volts, check the PCM ground circuits.

Wiggle test each circuit during the test to check for an intermittent open in the circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To [3](#).

No

- Repair the PCM ground circuit(s) for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

3. CHECKING THE PCM FUSED IGNITION CIRCUITS

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the PCM Fused Ignition circuits.

Check each circuit with the ignition on, engine running position, and during cranking.

Wiggle test each circuit during the test to check for an intermittent open in the circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To [4](#).

No

- Repair the open or short to ground in the PCM Fused Ignition circuits.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

4. CHECKING THE PCM FUSED B+ CIRCUITS

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12 volt test light connected to Ground, check the PCM Fused B+ circuits.

Wiggle test each circuit during the test to check for an intermittent open in the circuit.

NOTE: The test light should be illuminated and bright with the ignition on and not illuminated with the ignition off. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated as described above?

Yes

- Test complete.

No

- Repair the open or short to ground in the PCM Fused B+ circuit(s) for as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

***ENGINE CRANKS BUT DOES NOT START**

For a complete wiring diagram **Refer to Section 8W.**

POWERTRAIN FUSES OPEN
CRANKSHAFT POSITION SENSOR
CAMSHAFT POSITION SENSOR
ASD RELAY
(A209) FUSED B+ CIRCUIT OPEN OR SHORTED TO GROUND
(F342) FUSED ASD RELAY OUTPUT CIRCUIT OPEN
FUEL CONTAMINATION
ENGINE MECHANICAL
PCM

Diagnostic Test

1. NO START PRE-TEST

NOTE: Verify no codes are set in the Occupant Restraint Controller. If codes are present, they may be the cause of a No Start condition.

NOTE: The following list of items must be checked before continuing with any no start tests.

The battery must be fully charged and in good condition. A low charged battery may produce invalid test results. If the battery is low, charge the battery and then attempt to start the vehicle by cranking the engine for 15 seconds, 3 consecutive times. This will allow any DTCs to set that may have been erased due to a dead battery. Try to communicate with PCM using a scan tool. If communication between the scan tool and PCM is not allowed inspect fuses. If the PCM reports a No Response condition, refer to section 8 Electrical Electronic Control Module Electrical Diagnostics for the proper tests.

Make sure the PCM Power and Ground circuits are OK.

Read the PCM DTCs with the scan tool . If any DTCs are present, they must be repaired before continuing with any other No Start diagnostic tests. Refer to the Table of Contents for the related P-code that is reported by the PCM.

Make sure that the Bus is functional. Attempt to communicate with the Instrument Cluster and VTSS, If you are unable to establish communications refer to 8 Electrical Electronic Control Module Electrical Diagnostics for the proper Diagnostic procedures.

The Sentry Key Immobilizer System must be operating properly. Check for proper communication with the scan tool and check for DTCs that may be stored in the Sentry Key Immobilizer Module (SKREEM). Repair the DTC(s) before continuing.

If no DTCs are found, using the scan tool, select Clear PCM (BATT Disconnect).

Crank the engine several times. Using the scan tool, View DTCs. If a DTC is present perform the DTC diagnostics before continuing.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [2](#)

2. OPEN FUSE

Check for any open fuses in the TIPM or Junction Block that may be related to the No Start condition.

Are any of the fuses open?

Yes

- Replace the open fuse and check the related circuit(s) for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. CRANKSHAFT POSITION SENSOR

Turn the ignition off.

Disconnect the CKP Sensor.

Attempt to start the engine.

Does the engine start?

Yes

- Replace the Crankshaft Position Sensor in accordance with the Service Information. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL.)
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [4](#)

4. CAMSHAFT POSITION SENSOR

Turn the ignition off.
 Connect the CKP Sensor.
 Disconnect the CMP Sensor.
 Attempt to start the engine.

Does the engine start?

Yes

- Replace the Camshaft Position Sensor in accordance with the Service Information. (Refer to 8 - ELECTRICAL/IGNITION CONTROL/CAMSHAFT POSITION SENSOR - REMOVAL.)
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. (A209) FUSED B+ CIRCUIT CHECK

Turn the ignition off.
 Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground probe the (A209) Fused B+ circuits.

Does the test light illuminate brightly?

Yes

- Go To [6](#)

No

- Repair the open or short to ground in the (A209) Fused B+ circuit between the TIPM and PCM.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (F342) FUSED ASD RELAY OUTPUT CIRCUIT OPEN

Disconnect the C5 TIPM harness connector
Disconnect the C3 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F342) ASD Relay Output circuit from the C5 TIPM harness connector to the appropriate terminals of special tool #8815, Ignition coils, and the Fuel injectors.

Is the resistance below 5.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the open in the (F342) Fused ASD Relay Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. FUEL PUMP DELIVERY

Verify that the Fuel tank is not empty before continuing.

Follow the diagnostics for Checking the Fuel Delivery System in the Driveability section of this manual.

Was the No Start condition solved after following the Checking the Fuel Delivery System diagnostic procedure?

Yes

- Test Complete.

No

- Go To [8](#)

8. ENGINE MECHANICAL

Check for any of the following conditions/mechanical problems.

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE VALVE TIMING - must be within specifications, check for broken timing components

Are there any engine mechanical problems?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. PCM

NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

***ETC INTERMITTENT NO CRANK CONDITION**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
ETC STARTER INHIBIT

Diagnostic Test

1. ETC STARTER INHIBIT

NOTE: This ETC equipped engine will try to relearn ETC position when the key is left in the on position for an extended period of time and will not allow the starter to crank during this procedure. This procedure can take up to 2.5 seconds.

To verify the cause of the no crank condition or delayed crank use the scan tool, and read the ETC Starter Inhibit mileage.

The controller will store the mileage at which the no start condition occurred because of the ETC testing procedure.

This is considered normal operation for a vehicle equipped with an Electronic Throttle Control System and no repairs are necessary.

Is a mileage stored under the ETC Starter Inhibit?

Yes

- Test Complete.

No

- Refer to the appropriate diagnostic procedure for further assistance if any other DTC's are set.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

*FUEL PRESSURE LEAK DOWN

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
FUEL PUMP MODULE
FUEL INJECTOR(S)

Diagnostic Test

1. FUEL PUMP MODULE

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair/replace as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install special tool #6539 (5/16") or #6631 (3/8") fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi)

Does the fuel pressure drop?

Yes

- Replace Fuel Pump Module.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [2](#)

2. FUEL INJECTOR(S)

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Remove special tool #C4390.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Move special tool #C4390, Hose Clamp Pliers, from between the fuel pressure gauge and the engine to between the fuel pressure gauge and fuel pump module.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi)

Does the fuel pressure drop?

Yes

- Replace the leaking fuel injectors.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Test Complete.

*HARD START FUEL SYSTEM

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
FUEL CONTAMINATION
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
FUEL INJECTOR(S)

Diagnostic Test

1. CHECKING FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge at the engine.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Choose a conclusion that best matches your fuel pressure reading.

Below Specification

- Go To [2](#)

Within Specification

- Go To [4](#)

2. RESTRICTED FUEL SUPPLY LINE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Raise vehicle on hoist, and disconnect the fuel supply line at the fuel pump module.

Install special tool #6539 (5/16") #6631(3/8") fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

- Visually and physically inspect the fuel supply lines between the fuel tank and the fuel rail. Repair/replace as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. CHECKING THE FUEL INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

- Replace the Fuel Pump Inlet Strainer.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Fuel Pump Module.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. FUEL PUMP MODULE

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair/replace as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install special tool #6539 (5/16") or #6631 (3/8") fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi)

Does the fuel pressure drop?

Yes

- Replace Fuel Pump Module.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. FUEL INJECTOR(S)

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Remove special tool #C4390.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Move special tool #C4390, Hose Clamp Pliers, from between the fuel pressure gauge and the engine to between the fuel pressure gauge and fuel pump module.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi)

Does the fuel pressure drop?

Yes

- Replace the leaking fuel injectors.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Check the fuel for contaminants.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

***NO CRANK CONDITION**

01020039

For a complete wiring diagram **Refer to Section 8W.**

MECHANICAL CONDITION
FUSED B+ CIRCUITS OPEN
BATTERY CIRCUIT RESISTANCE TOO HIGH
(T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER RELAY CONTROL CIRCUIT OPEN
(T750) STARTER RELAY OUTPUT CIRCUIT SHORTED TO GROUND
(T750) STARTER RELAY OUTPUT CIRCUIT OPEN
TRANSMISSION RANGE SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)
STARTER

Diagnostic Test

1. MECHANICAL CONDITION

NOTE: Verify the battery is fully charged and capable of passing a load test before continuing.

WARNING: Make sure the battery is disconnected, then wait two minutes before proceeding. Failure to do so may result in personal injury or possible death.

Turn the engine over by hand to make sure the engine is not seized.

Is the engine able to turn over?

Yes

- Go To [2](#)

No

- Repair the mechanical condition preventing the starter motor from cranking.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

2. PCM FUSED B+ CIRCUITS

Turn the ignition off.
Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, probe the Fused B+ circuits at the appropriate terminals of special too #8815.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the open or short to ground in the PCM Fused B+ circuits.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. TRANSMISSION RANGE SENSOR

Turn the ignition off.
Disconnect the TRS harness connectors.
Move the Gear selector through all gear positions, from Park to 1st and back.
While moving the gear selector through each gear, measure the resistance between ground and the TRS (T41) Sense (P/N Sense) circuit at the TRS connector.

NOTE: The circuit is grounded in Park and Neutral and open in the other positions.

Did the resistance change from above 100 kohms (open) to below 10.0 ohms (grounded) ?

Yes

- Go To [4](#)

No

- Replace the Transmission Range Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. EXCESSIVE RESISTANCE IN THE BATTERY CIRCUIT

Turn the ignition off.

Check the Battery Cables for excessive resistance using the service information procedure.

Did either Battery Cable have a voltage drop greater than 0.2 of a volt?

Yes

- Repair the excessive resistance in the Battery circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [5](#)

5. STARTER

CAUTION: The Parking Brake must be on and the Transmission must be in park for a vehicle equipped with an automatic transmission.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn ignition off.
Disconnect the Starter Solenoid harness connector.

NOTE: The Starter Solenoid harness connector must remain disconnected at this time.

Have an assistant turn the ignition key to the CRANK position.

Using a 12-volt test light connected ground, probe the (T750) Starter Relay Output circuit in the Starter Solenoid harness connector while the ignition key is in the CRANK position.

Does the test light illuminate brightly?

Yes

- Replace the Starter per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [6](#)

6. (T752) STARTER RELAY CONTROL CIRCUIT CHECK

Turn the ignition off.
Disconnect the C2 TIPM harness connector.
Use a 12-volt test light connected to ground and probe the (T752) Starter Relay Control circuit in the C2 TIPM harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Have an assistant turn the key to the CRANK position.

Does the test light illuminate brightly when the key is turned to the crank condition?

Yes

- Go To [7](#)

No

- Repair the excessive resistance or short to ground in the (T752) Starter Relay Control circuit between the PCM and TIPM.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

7. (T750) STARTER CONTROL OUTPUT CIRCUIT OPEN

Disconnect the Starter Solenoid connector.
Measure the resistance of the (T750) Starter Control Output circuit between the Starter Solenoid harness connector and the C2 TIPM harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [8](#)

No

- Repair the open in the (T750) Starter Control Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

8. (T750) STARTER RELAY OUTPUT CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (T750) Starter Relay Output circuit in the Starter Solenoid harness connector.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (T750) Starter Relay Output circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. TOTALLY INTEGRATED POWER MODULE (TIPM)

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.
Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Totally Integrated Power Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE.)

*NO RESPONSE WITH A NO START CONDITION

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes

(A209) PCM FUSED B+ CIRCUIT
PCM NO RESPONSE
(F1) PCM FUSED IGNITION SWITCH OUTPUT CIRCUIT
(Z903) PCM GROUND CIRCUITS
CRANKSHAFT POSITION SENSOR
(F855) 5-VOLT SENSOR OPEN/SHORTED
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
PCM

Diagnostic Test

1. (A209) PCM FUSED B+ CIRCUIT

NOTE: The scan tool and cable must be operating properly for the results of this test to be valid.

NOTE: Make sure the ignition switch was on while trying to communicate with the PCM.

Turn the ignition off.
Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground probe the appropriate terminal of special tool #8815.

Does the test light illuminate brightly?

Yes

- Go To [2](#)

No

- Repair the open or short to ground in the (A209) Fused B+ circuit. Inspect and replace fuses as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

2. (F1) PCM FUSED IGNITION SWITCH CIRCUIT

Using a 12-volt test light connected to ground, probe the (F1) PCM Fused Ignition Switch Output circuit in the appropriate terminals of special tool #8815.

Does the test light illuminate brightly?**Yes**

- Go To [3](#)

No

- Repair the (F1) Ignition Switch Output circuit. Inspect and replace fuses as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

3. (Z903) PCM GROUND CIRCUITS

Using a 12-volt test light connected to battery voltage, probe the (Z903) PCM ground circuits in the appropriate terminals of special tool #8815.

Does the test light illuminate brightly?**Yes**

- Go To [4](#)

No

- Repair the (Z903) PCM ground circuits.

- Perform the POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. (F855) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.
Connect the C2 PCM harness connector.
Disconnect the Crankshaft Position Sensor harness connector.
Ignition on, engine not running.
Measure the voltage on the (F855) 5-volt Supply circuit.

Is the voltage between 4.5 and 5.2 volts?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. CKP SENSOR

Turn the ignition off.
Disconnect the Throttle Body harness connector.
Ignition on, engine not running.
Measure the voltage on the (F855) 5-volt Supply circuit in

the Throttle Body harness connector.

Is the voltage between 4.5 and 5.2 volts?

Yes

- If communication is available with a PCM on a like vehicle, replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace the Crankshaft Position Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. (F855) 5-VOLT SENSOR OPEN/SHORTED

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Ignition on, engine not running.

Measure the voltage on the (F855) 5-volt Supply circuit.

Disconnect all the sensors that use the (F855) 5-volt Supply circuit.

Did the voltage return to 4.5 to 5.2 volts when disconnecting any of the sensors.

Yes

- Replace the sensor that is pulling down the (F855) 5-volt supply.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [7](#)

7. (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect PCM harness connectors.

Disconnect all the sensors that share the (F855) 5-volt Supply circuit.

Measure the resistance between ground and the (F855) 5-volt Supply circuit at one of the sensor harness connectors.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F855) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [8](#)

8. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Disconnect all the sensors that share the (F856) 5-volt Supply circuit.

Measure the resistance between ground and the (F856) 5-volt Supply circuit at one of the sensor harness connectors.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (F856) 5-volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [9](#)

9. PCM

NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Replace and program the Powertrain Control Module per Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

***START AND STALL CONDITION**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
CURRENT PCM DTCS
CURRENT SKIM DTCS
THROTTLE POSITION SENSOR SWEEP
TP SENSOR 1 VOLTAGE GREATER THAN 0.92 VOLTS WITH THROTTLE CLOSED
ECT SENSOR
OTHER POSSIBLE CAUSES FOR START AND STALL CONDITION
FUEL CONTAMINATION

Diagnostic Test**1. CHECKING DTCS**

Ignition on, engine not running.
With a scan tool, select View DTCS.

Are any DTCS present?**Yes**

- Refer to the appropriate Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [2](#)

2. CHECKING SKREEM DTCS

NOTE: If you are unable to communicate with the SKIM/SKREEM, refer to the VEHICLE THEFT AND SECURITY ELECTRICAL DIAGNOSTICS in Section 8 and perform the appropriate diagnostics.

With the scan tool, read the SKIM codes.

Are there any SKREEM DTCS?

Yes

- Refer to the Sentry Key Vehicle Theft Security Electrical Diagnostics in Section 8.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [3](#)

3. TP SENSOR SWEEP

Ignition on, engine not running.

With the scan tool read TP Sensor voltage.

On vehicles equipped with an electronic throttle body, use a scan tool to perform the ETC Throttle Follower test and monitor both TP Sensor voltage readings.

Was the voltage change smooth?

Yes

- Go To [4](#)

No

- Replace the Throttle Body Assembly on an ETC throttle body.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

4. TP SENSOR NO.1 VOLTAGE GREATER THAN 0.92 VOLTS WITH THROTTLE CLOSED

With the scan tool, read Throttle Position Sensor No.1 voltage.

Throttle must be against its stop.

Is the voltage 0.92 or less with the Throttle closed?

Yes

- Go To [5](#)

No

- Check for a binding throttle condition. If OK, replace the Throttle Position Sensor or the Throttle Body Assembly for ETC vehicles.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

5. ECT SENSOR OPERATION

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: This test works best if performed on a cold engine (cold soaked).

NOTE: If the vehicle was allowed to sit over night with no engine start, coolant temperature should be near ambient temperatures.

Ignition on, engine not running.
With the scan tool, read the ECT value.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the engine.

During engine warm-up, monitor the Engine Coolant Temperature value. The temperature value change should be a smooth transition from start up to normal operating temp 82° C (180° F). The value should reach at least 82° C (180° F).

Did the Engine Temperature value increase smoothly and did it reach at least 82° C (180° F)?

Yes

- Go To [6](#)

No

- Replace the Engine Coolant Temperature Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

6. OTHER POSSIBLE CAUSES OF START AND STALL CONDITION

The following additional items should be checked as a possible cause for a start and stall condition. Refer to any Technical Service Bulletins (TSBs) that may apply to the symptom.

The exhaust system must be free of any restrictions.

The engine compression must be within specifications.

The engine valve timing must be within specifications.

The engine must be free from vacuum leaks.

The throttle body must be free of carbon buildup and dirt.

Do any of the above conditions exist?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

No

- Go To [7](#)

7. FUEL PUMP DELIVERY

Verify that the Fuel tank is not empty before continuing.
Follow the diagnostics for Checking Fuel Delivery in this manual.

Was the No Start condition solved after following the above diagnostic test?

Yes

- Test Complete.

No

- Check for contamination/water in the fuel. Ensure the fuel being used in this vehicle meets manufactures Fuel Requirement, refer to the service manual.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE.)

STANDARD PROCEDURE

PCM/ECM REPROGRAMMING - GAS

MODULE REPROGRAMING

Replacement PCM's will require programming utilizing the StarSCAN® or equivalent. The PCM will not operate the engine until it is programmed. A Diagnostic Trouble Code (DTC) will be set - "not programmed".

CAUTION: Extreme care must be taken when programming a calibration into a generic PCM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The module can only be reprogrammed to a more recent version of that calibration.

SPECIAL TOOLS/EQUIPMENT OR EQUIVALENT REQUIRED:

NPN	Battery Charger
-----	-----------------

CH9401	StarSCAN® Tool
CH9404	StarSCAN® Vehicle Cable
CH9409	StarSCAN® Documentation Kit
CH9410	StarSCAN® Ethernet Cable, 12 ft.
CH9412	StarSCAN® Software Update Device Kit
	TechCONNECT PC or equivalent
	StarSCAN® Software Update CD

****REPAIR PROCEDURE - USING THE INTERNET TO RETRIEVE THE FLASH FILE:**

NOTE: The StarSCAN® or equivalent diagnostic scan tool fully supports Internet connectivity. However, in order to take advantage of this feature you must first configure the StarSCAN® or equivalent for your dealership's network. For instruction on setting up your StarSCAN® or equivalent for the dealer's network; refer to the StarSCAN® or equivalent Quick Start Networking Guide available on DealerCONNECT > Service > StarSCAN® or equivalent and StarMOBILE Tools >Online Documentation or at www.dcctools.com website under the download center.

NOTE: If this flash process is interrupted/aborted, the flash should be restarted.

1. Open the hood, install a battery charger and verify that the charging rate provides approximately 13.5 volts. Set the battery charger timer to maintain the charging voltage for the duration of the flash process.
2. Connect the CH9410 StarSCAN® or equivalent ethernet cable to the StarSCAN® or equivalent and the dealer's network drop.
3. Connect the CH9404 StarSCAN® or equivalent vehicle cable to the StarSCAN® or equivalent and the vehicle.
4. Power ON the StarSCAN® or equivalent.
5. Retrieve the old ECU part number. Using the StarSCAN® or equivalent at the "Home" screen:
 - a. Select "ECU View"
 - b. Touch the screen to highlight the PCM in the list of modules.
 - c. Select "More Options"
 - d. Select "ECU Flash"
 - e. Record the part number at the top of the "Flash PCM" screen for later reference.
6. Replace the PCM with the appropriate Generic PCM. Refer to the detailed service information available in TechCONNECT, under: Service Info, 8-Electrical, Electronic Control Module, Powertrain Control Module, Removal.
7. Program the PCM as follows:
 - a. Using the StarSCAN® or equivalent at the "Home" screen, Select "ECU View"
 - b. Touch the screen to highlight the PCM in the list of modules.
 - c. Select "More Options"
 - d. Select "ECU Flash"

- e. Select “Browse for New File”. Follow the on screen instructions.
- f. Highlight the appropriate calibration based on the part number recorded in Step 5.
- g. Select “Download to Scantool”.
- h. Select “Close” after the download is complete, then select “Back”.
- i. Highlight the listed calibration.
- j. Select “Update Controller”. Follow on screen instructions.
- k. When the update is complete, select “OK”.
- l. Verify the part number at the top of the “Flash PCM” screen has updated to the new part number.
- 8. Is this a GPEC Module?
 - a. Yes >> go to [STEP 9](#).
 - b. No >> go to [STEP 12](#).
- 9. Do not start the engine prior to completing the following steps (a. and b.)
 - a. Turn the ignition switch to the OFF position for no less than 15 seconds.
 - b. Turn the ignition to the RUN position (DO NOT CRANK THE ENGINE) for no less than 20 seconds.
- 10. Is this vehicle equipped with a CVT?
 - a. Yes >> go to [STEP 11](#).
 - b. No >> go to [STEP 17](#).
- 11. The TCM must be reprogrammed as follows:
 - a. Using the StarSCAN® or equivalent at the “Home” screen, Select “ECU View”
 - b. Touch the screen to highlight the TCM in the list of modules.
 - c. Select “More Options”
 - d. Select “ECU Flash”
 - e. Record the part number at the top of the “Flash TCM” screen for later reference.
 - f. Select “Browse for New File”. Follow the on screen instructions.

NOTE: If the part number recorded in step “11e” is the same as the new p/n shown on the “Flash File List” screen no further action is required. Cancel the TCM reprogram procedure. Continue to step [STEP 17](#).

- g. Highlight the appropriate calibration.
- h. Select “Download to Scantool”.
- i. Select “Close” after the download is complete, then select “Back”.
- j. Highlight the listed calibration.
- k. Select “Update Controller”. Follow on screen instructions.
- l. When the update is complete, select “OK”.
- m. Verify the part number at the top of the “Flash TCM” screen has updated to the new part number.
- n. Continue to step [STEP 15](#)
- 12. Is “WCM - Wireless Control Module” displayed in the “ECU Overview” screen list of modules?
 - a. Yes >> go to [STEP 13](#).
 - b. No >> go to [STEP 14](#).
- 13. Program the PCM to the Wireless Control Module (WCM).
 - a. Highlight the WCM.
 - b. Select “Misc. Function”.
 - c. Highlight “PCM Replaced”.
 - d. Select “Start”
 - e. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.
 - f. When complete proceed to [STEP 15](#).
- 14. Program the VIN into the PCM.
 - a. Scroll through the list of controllers and highlight the PCM.
 - b. Select “Misc. Function”.
 - c. Highlight “Check PCM VIN”.
 - d. Select “Start”

- e. Follow the on screen instructions. Select “Next” after each step . When the window appears with 17 boxes, select “Show Keyboard”. Place the cursor to the right of the last box and then backspace to delete the boxes from the window. Enter the VIN. Select “Finish” after completing the last step.
 - f. Unplug the scan tool from the Data Link Connector.
 - g. At the “Vehicle Disconnected” screen, press “OK”.
 - h. Connect the scan tool to the Data Link Connector and verify that the VIN is visible at the top of the “Home” screen.
15. Is the vehicle equipped ETC?
- a. Yes >> go to [STEP 17](#).
 - b. No >> go to [STEP 16](#).
16. Using the StarSCAN® or equivalent at the “Home” screen:
- a. Select ECU View
 - b. Scroll through the list of controllers and highlight the PCM.
 - c. Select Misc. Function.
 - d. Highlight “Learn ETC”.
 - e. Select “Start”
 - f. Follow the on screen instructions. Select Next after each step . Select Finish after completing the last step.

NOTE: Due to the PCM programming procedure, a DTC may be set in other modules (TCM, BCM, MIC, SKREEM, etc.) within the vehicle, if so equipped. Some DTC's may cause the MIL to illuminate. From the Home screen select System View. Then select All DTCs. Press Clear All Stored DTCs if there are any DTCs shown on the list.

NOTE: The following step is required by law when reprogramming a PCM and/or TCM.

17. Type the necessary information on the Authorized Modification Label p/n 04275086AB and attach near the VECI label .

DaimlerChrysler AUTHORIZED MODIFICATIONS THESE MODIFICATIONS HAVE BEEN APPROVED AS APPROPRIATE, BY SRV AND CSRV.

THE FOLLOWING MODIFICATIONS HAVE BEEN MADE:

1

CHANGE AUTHORITY 2 DEALER CODE 3 DATE 4

80F34528

REPAIR PROCEDURE USING SOFTWARE UPDATE CD TO RETRIEVE THE FLASH FILE:

NOTE: If this flash process is interrupted/aborted, the flash should be restarted.

NOTE: For detailed information on the operation of the StarSCAN® or equivalent, refer to the Quick Reference documentation provided in the StarSCAN® or equivalent documentation kit. In addition, more recent information may also be available at the www.dcctools.com website. Look under Training Aids and also under Download Center > Frequently Asked Questions for more help.

1. Open the hood, install a battery charger and verify that the charging rate provides approximately 13.5 volts. Set the battery charger timer to maintain the charging voltage for the duration of the flash process.
2. Connect the CH9404 StarSCAN® or equivalent vehicle cable to the StarSCAN® or equivalent and the vehicle.

3. Power ON the StarSCAN® or equivalent.
4. Retrieve the old ECU part number. Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select “ECU View”
 - b. Touch the screen to highlight the PCM in the list of modules.
 - c. Select “More Options”
 - d. Select “ECU Flash”
 - e. Record the part number at the top of the “Flash PCM” screen for later reference.
5. Replace the PCM with the appropriate Generic PCM. Refer to the detailed service information available in TechCONNECT, under: Service Info, 8-Electrical, Electronic Control Module, Powertrain Control Module, Removal.
6. Insert the StarSCAN® or equivalent Software Update CD into the TechCONNECT or equivalent PC. The StarSCAN® or equivalent Software Update CD will start automatically. Select “Download Flash Updates”.
7. At the “**Select a method for looking up controller flash updates.**” screen:
 - a. Select “Enter part number”. Enter the “Part Number” recorded in [STEP 4](#) when prompted to do so.
 - b. Using the mouse highlight the appropriate “Calibration”. Select “Next”.
 - c. Follow the on screen instructions.
 - d. When completed, proceed to [STEP 8](#).
8. With the StarSCAN® or equivalent powered OFF, connect the USB Key and Gender Changer to the StarSCAN® or equivalent USB port .

9. Connect the StarSCAN® or equivalent to the vehicle (if not already connected).
10. Power ON the StarSCAN® or equivalent.
11. Download the flash file from the USB key to the StarSCAN® or equivalent. Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select “Flash Download”, then select “Retrieve files from the USB storage device”
 - b. Highlight the appropriate calibration. Select “Download to Scan Tool”
 - c. When the download is complete, select “Close” and “Back”.
12. Reprogram the ECU. Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select “ECU View”.
 - b. Select More Options”.
 - c. Select “ECU Flash”.
 - d. Highlight the appropriate calibration.
 - e. Select “Update Controller”. Follow the on screen instructions.
 - f. When the update is complete, select “OK”.
 - g. Verify the part number at the top of the “Flash PCM” screen has updated to the new part number.
13. Is “WCM - Wireless Control Module” displayed in the “ECU Overview” screen list of modules?
 - a. Yes >> go to [STEP 14](#).
 - b. No >> go to [STEP 15](#).
14. Program the PCM to the Wireless Control Module (WCM). Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select “ECU View”
 - b. Scroll through the list of controllers and highlight the WCM.
 - c. Select “Misc. Function”.
 - d. Highlight “PCM Replaced”.
 - e. Select “Start”
 - f. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.

g. When complete proceed to [STEP 16](#).

15. Program the VIN into the PCM.

a. Scroll through the list of controllers and highlight the PCM.

b. Select “Misc. Function”.

c. Highlight “Check PCM VIN”.

d. Select “Start”

e. Follow the on screen instructions. Select “Next” after each step . When the window appears with 17 boxes, select “Show Keyboard”. Place the cursor to the right of the last box and then backspace to delete the boxes from the window. Enter the VIN. Select “Finish” after completing the last step.

f. Unplug the scan tool from the Data Link Connector.

g. At the “Vehicle Disconnected” screen, press “OK”.

h. Connect the scan tool to the Data Link Connector and verify that the VIN is visible at the top of the “Home” screen.

16. Is the vehicle equipped with a 3.7L or 4.7L engine?

a. Yes >> go to [STEP 18](#).

b. No >> go to [STEP 17](#).

17. Using the StarSCAN® or equivalent at the “Home” screen:

a. Select “ECU View”

b. Scroll through the list of controllers and highlight the PCM.

c. Select “Misc. Function”.

d. Highlight “Learn ETC”.

e. Select “Start”

f. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.

NOTE: Due to the PCM programming procedure, a DTC may be set in other modules (TCM, BCM, MIC, SKIM, etc.) within the vehicle, if so equipped. Some DTC's may cause the MIL to illuminate. Check all modules using “ECU View” from the Home screen, record the DTC's, and erase these DTC's prior to returning the vehicle to the customer. Erase any DTC's in the PCM only after all other modules have had their DTC's erased.

NOTE: The following step is required by law.

18. Type the necessary information on the “Authorized Modification Label” p/n 04275086AB and attach near the VECI label . **

POWERTRAIN VERIFICATION TEST

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. SELECTING THE PROPER VERIFICATION TEST

The following verification test are for different repairs . Select the appropriate Verification test for the repair that has been completed.

Speed Control repair

- Go To [2](#)

Charging System repair

- Go To [3](#)

NVLD System repair

- Go To [4](#)

All other repairs

- Go To [5](#)

2. POWERTRAIN VERIFICATION TEST 1

NOTE: 1. If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.

NOTE: 2. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.

NOTE: 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM/SKREEM.

NOTE: 4. If the vehicle is equipped with a Sentry Key Remote Entry, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM/SKREEM and the Transponder (ignition key) for programming information. Using the scan tool, program the Secret Key information into the PCM using the PCM replaced function under the WCM menu.

5. Inspect the vehicle to make sure that all engine components are properly installed and connected.
6. Connect the scan tool to the data link connector and erase all codes.
7. Turn the speed control ON (if equipped, cruise light will be on).
8. Depress and release the SET Switch when the vehicle speed is greater than 56 km/h (35 mph). The speed control should engage and hold the selected speed.
9. Press and hold the RESUME/ACCEL Switch. The vehicle speed should increase by at least 3 km/h (2 mph).
10. Press and hold the COAST switch. The vehicle speed should decrease.
11. Using caution, press and release the brake pedal. The speed control should disengage.
12. Bring the vehicle speed back up to 56 km/h (35 mph).
13. Press the RESUME/ACCEL switch. The speed control should resume the previously set speed.
14. Hold down the SET switch. The vehicle should decelerate.

15. Make sure vehicle speed is greater than 56 km/h (35 mph) and release the SET Switch. The vehicle should adjust and set a new vehicle speed.
16. Press and release the CANCEL switch. The speed control should disengage.
17. Bring the vehicle speed back up above 56 km/h (35 mph) and engage speed control.
18. Turn the Speed Control Off. (Cruise light will be off). The speed control should disengage.

NOTE: OVERSHOOT/UNDERSHOOT FOLLOWING SPEED CONTROL SET.

19. If the vehicle operator repeatedly presses and releases the SET button with their foot off of the accelerator (referred to as "lift foot set"), the vehicle may accelerate and exceed the desired set speed by up to 8 km/h (5 mph).
20. It may also decelerate to less than the desired set speed, before finally achieving the desired set speed.
21. The Speed Control System has an adaptive strategy that compensates for vehicle-to-vehicle variations in speed control cable lengths.
22. When the speed control is set with the vehicles operators foot off of the accelerator pedal, the speed control thinks there is excessive speed control cable slack and adapts accordingly.
23. If the "lift foot sets" are continually used, a speed control overshoot/undershoot condition will develop.
24. To "unlearn" the overshoot/undershoot condition, the vehicle operator has to press and release the set button while maintaining the desired set speed using the accelerator pedal (not decelerating or accelerating).
25. Then turn the cruise control switch to the OFF position (or press the CANCEL button if equipped) after waiting 10 seconds.
26. This procedure must be performed approximately 10-15 times to completely unlearn the overshoot/undershoot condition.

Did the Speed Control pass the above test?

Yes

- Repair is complete.

No

- Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

3. POWERTRAIN VERIFICATION TEST 2

1. If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly has been replaced use a scan tool to perform the ETC RELEARN function.

NOTE: 2. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.

NOTE: 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM/SKREEM.

NOTE: 4. If the vehicle is equipped with a Sentry Key Remote Entry, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM/SKREEM and the Transponder (ignition key) for programming information. Using the scan tool, program the Secret Key information into the PCM using

the PCM replaced function under the WCM menu.

5. Inspect the vehicle to make sure that all components related to the repair are properly installed and connected.
6. With the scan tool, clear DTCs.
7. Perform generator output test. Refer to the appropriate service information as necessary.
8. Start the engine and set engine speed to 2000 RPM for at least thirty seconds.
9. Cycle the ignition key off and on.
10. With the scan tool, read the DTCs.

Are any DTCs or symptoms remaining?

Yes

- Check for any Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

No

- Repair is complete.

4. POWERTRAIN VERIFICATION TEST 3

1. Install the Miller Tool #8404 Evaporative Emission Leak Detector (EELD) according to the instructions in the previous DTC table.
2. Set the smoke/air control switch to AIR.
3. Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).
4. Press the remote smoke/air start button.
5. Position the red flag on the air flow meter so it is aligned with the indicator ball.
6. When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute to the size of leak indicated by the DTC set in the PCM.
7. Install the service port adapter #8404-14 on the vehicle's service port.
8. Connect the Air supply hose from the EELD to the vehicle.
9. Press the remote button to activate AIR flow.

NOTE: 10. Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill.

11. Compare the flow meter indicator ball reading to the red flag.
12. ABOVE the red flag indicates a leak present.
13. BELOW the red flag indicates a sealed system.

NOTE: If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.

14. If the indicator ball shows a leak present, perform the smoke test indicated in the previous test and identify the leak and repair. Perform this verification test when the repair is complete.

Did the indicator ball indicate the a leak is present?

Yes

- Repeat the DTC test to identify the leak and repair.

No

- Repair is complete.

5. POWERTRAIN VERIFICATION TEST 4

NOTE: 1. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.

NOTE: 2. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM/SKREEM.

NOTE: 3. If the vehicle is equipped with a Sentry Key Remote Entry, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM/SKREEM and the Transponder (ignition key) for programming information. Using the scan tool, program the Secret Key information into the PCM using the PCM replaced function under the WCM menu.

NOTE: 4. If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.

NOTE: 5. When replacing an O2 Sensor, the PCM RAM memory must be cleared, either by disconnecting the PCM C1 connector or momentarily disconnecting the Battery negative terminal.

6. The NGC learns the characteristics of each O2 heater element and these old values should be cleared when installing a new O2 sensor. The customer may experience driveability issues if this is not performed.
7. Inspect the vehicle to make sure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
8. Connect the scan tool to the data link connector.
9. Make sure the fuel tank has at least a quarter tank of fuel. Turn off all accessories.
10. If the Catalyst was replaced, with the scan tool go to the Miscellaneous Menu Option "Catalyst Replaced" and press enter.
11. If a Comprehensive Component DTC was repaired, perform steps 12 - 14. If a Major OBDII Monitor DTC was repaired skip those steps and continue verification.
12. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes.
13. With the scan tool, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running).
14. If the repaired OBDII trouble code has reset or was seen in the monitor while on the road test, the repair is not complete. Check for any related technical service bulletins or flash updates and return to Engine Electrical

Diagnostic List.

15. If the conditions cannot be duplicated, erase all DTCs with the Scan tool.

16. If another DTC has set, return to the Engine Electrical Diagnostic List and follow the path specified for that DTC.

Did the OBDII Monitor run successfully and has the Good Trip Counter changed to one or more?

Yes

- Repair is complete.

No

- Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

ENGINE ELECTRICAL DIAGNOSTICS - DIESEL

ENGINE ELECTRICAL DIAGNOSTICS - DIESEL

DIAGNOSIS AND TESTING

P0001 - FUEL QUANTITY CONTROL CIRCUIT/OPEN

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Fuel Quantity Solenoid (FQS) is a solenoid operated valve designed to regulate fuel volume to the fuel injection pump. The FQS valve is positioned in the inlet side of the fuel injection pump assembly. The solenoid receives 12-volt power and a duty-cycle ground signal from the ECM. When the solenoid is not actuated (no ground signal from the ECM), the fuel injection pump inlet passage is open allowing full fuel flow to the pump chamber. When the ECM grounds the FQS control signal the solenoid valve closes the fuel inlet passage, preventing fuel from entering the pump chamber.

- **When Monitored:**

With the ignition on and the ECM command of the Fuel Quantity Solenoid off.

- **Set Condition:**

The ECM does not detect voltage on the (K365) Fuel Quantity Solenoid Control circuit for 0.2 seconds.

Possible Causes
INTERMITTENT DTC
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO (K366) FUEL QUANTITY SOLENOID 12 VOLT SUPPLY CIRCUIT
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K366) FUEL QUANTITY SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
FUEL QUANTITY SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.
 With the scan tool, Clear DTCs in the Engine Control Module (ECM).
 With the scan tool, actuate the Fuel Quantity Solenoid at 100%.
 Monitor the scan tool for at least two minutes.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Fuel Quantity Solenoid harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage of the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

Is there any voltage present?

Yes

- Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO (K366) FUEL QUANTITY SOLENOID 12 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K365) Fuel Quantity Solenoid Control circuit and the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit in the Fuel Quantity Solenoid harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K365) Fuel Quantity Solenoid Control circuit between the Fuel Quantity Solenoid harness

connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K365) Fuel Quantity Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K366) FUEL QUANTITY SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit between the Fuel Quantity Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL QUANTITY SOLENOID

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Fuel Quantity Solenoid (CP3 Metering Pump) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when

checking the circuit.

Is the test light illuminated and bright with the actuation at 100%?

Yes

- Replace the Fuel Quantity Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Quantity Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0003 - FUEL QUANTITY CONTROL CIRCUIT LOW

The Fuel Quantity Solenoid (FQS) is a solenoid operated valve designed to regulate fuel volume to the fuel injection pump. The FQS valve is positioned in the inlet side of the fuel injection pump assembly. The solenoid receives 12-volt power and a duty-cycle ground signal from the ECM. When the solenoid is not actuated (no ground signal from the ECM), the fuel injection pump inlet passage is open allowing full fuel flow to the pump chamber. When the ECM grounds the FQS control signal the solenoid valve closes the fuel inlet passage, preventing fuel from entering the pump chamber.

- **When Monitored:**

With the ignition on and the ECM command of the Fuel Quantity Solenoid off.

- **Set Condition:**

The ECM detects that the (K365) Fuel Quantity Solenoid Control circuit voltage is shorted to ground for 0.2 seconds.

Possible Causes
INTERMITTENT DTC
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K366) FUEL QUANTITY SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
FUEL QUANTITY SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Quantity Solenoid at 100%.
 Monitor the scan tool for at least two minutes.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Fuel Quantity Solenoid harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K365) Fuel Quantity Solenoid Control circuit between the Fuel Quantity Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [4](#)

No

- Repair the (K365) Fuel Quantity Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K366) FUEL QUANTITY SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit between the Fuel Quantity Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Remove the ASD Relay.

Connect a jumper wire between cavity 30 and cavity 87 in the ASD Relay harness connector.

Using a 12-volt test light connected to ground, check the ASD Relay Output circuit in ECM harness connector C2 cavities 1, 3 and 5.

Did the test light illuminate for each circuit?

Yes

- Go To [6](#)

No

- Repair the ASD Relay Output circuit(s) for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL QUANTITY SOLENOID

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Fuel Quantity Solenoid (CP3 Metering Pump) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when

checking the circuit.

With the scan tool, actuate the Fuel Quantity Solenoid (CP3 Metering Pump) to 0%.

Using a 12 volt test light connected to 12 volts, check the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

NOTE: The test light should not be illuminated.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes

- Replace the Fuel Quantity Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [Z](#)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Quantity Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0004 - FUEL QUANTITY CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Fuel Quantity Solenoid (FQS) is a solenoid operated valve designed to regulate fuel volume to the fuel injection pump. The FQS valve is positioned in the inlet side of the fuel injection pump assembly. The solenoid receives 12-volt power and a duty-cycle ground signal from the ECM. When the solenoid is not actuated (no ground signal from the ECM), the fuel injection pump inlet passage is open allowing full fuel flow to the pump chamber. When the ECM grounds the FQS control signal the solenoid valve closes the fuel inlet passage, preventing fuel from entering the pump chamber.

- **When Monitored:**

With the ignition on and the ECM command of the Fuel Quantity Solenoid on.

- **Set Condition:**

The ECM detects excessive current on the (K365) Fuel Quantity Solenoid Control circuit for 0.2 second.

Possible Causes
INTERMITTENT DTC
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL QUANTITY SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Quantity Solenoid at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Quantity Solenoid harness connector.
Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

Is there any voltage present?

Yes

- Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO (K366) FUEL QUANTITY SOLENOID 12 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Remove the jumper wire and install the ASD Relay
Measure the resistance between the (K365) Fuel Quantity Solenoid Control circuit and the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit in the Fuel Quantity Solenoid harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to the (K366) Fuel Quantity Solenoid 12 Volt Supply circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K365) FUEL QUANTITY SOLENOID CONTROL OPEN OR HIGH RESISTANCE

Measure the resistance of the (K365) Fuel Quantity Solenoid Control circuit between the Fuel Quantity Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K365) Fuel Quantity Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL QUANTITY SOLENOID

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Fuel Quantity Solenoid (CP3 Metering Pump) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K365) Fuel Quantity Solenoid Control circuit in the Fuel Quantity Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when

checking the circuit.

Is the test light illuminated and bright with the actuation at 100%?

Yes

- Replace the Fuel Quantity Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Quantity Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0016—CRANKSHAFT / CAMSHAFT TIMING MISALIGNMENT

01a94782

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Engine cranking and Engine running

◦ **Set Condition:**

Engine Control Module detects an error when the camshaft position is out of phase with the crankshaft position.

Possible Causes
(K44) ERRATIC CAM POSITION SENSOR 1 SIGNAL
CAMSHAFT POSITION SENSOR TONE WHEEL/PULSE RING
(K24) ERRATIC CRANKSHAFT POSITION SENSOR SIGNAL
CRANKSHAFT POSITION SENSOR MAGNETIC RING
CAMSHAFT POSITION SENSOR
CRANKSHAFT POSITION SENSOR
TIMING GEAR MISALIGNMENT/INCORRECT VALVE TIMING

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool clear the DTC(s).

Start the engine and run until operating temp is reached.

If the DTC does not reset it may be necessary to test drive the vehicle.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. CHECKING THE (K44) CMP SIGNAL WITH A LAB SCOPE

With a lab scope, backprobe the (K44) CMP Signal circuit at the CMP Sensor harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.
Observe the lab scope screen.

NOTE: The CMP Sensor is a hall-effect type sensor that produces a 5-volt digital (square wave) signal.

Are there any irregular or missing signals?

Yes

- Go To [3](#)

No

- Go To [6](#)

3. CMP WIRE HARNESS INSPECTION

Turn the ignition off.

Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Make sure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) are torqued to their proper specification. Refer to any TSBs that may apply.

Were any of the above conditions present?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. TONE WHEEL/PULSE RING INSPECTION

Remove the Camshaft Position Sensor.

Inspect the Tone Wheel/Pulse Ring for damage, foreign material, or excessive movement.

Were any problems found?

Yes

- Repair or replace the Tone Wheel/Pulse Ring as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CAMSHAFT POSITION SENSOR

If there are no possible causes remaining, view repair.

Repair

- Replace the Camshaft Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ERRATIC CMP SIGNAL

Turn the ignition off.

Remove the lab scope probe.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

With scan tool, erase DTCs.

Start the engine.

Gently tap on and wiggle the Cam Position Sensor.

Ignition on, engine not running.

Inspect the Sensor connector and harness connector, and inspect the ECM connector and harness connector for

loose, bent, corroded, or pushed out pins/terminals.
Inspect the related wire harness and the splices in the CMP circuit.

Did this DTC set again?

Yes

- Repair the wiring/connector concerns as needed or replace the Camshaft Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECKING THE (K24) CKP SIGNAL WITH A LAB SCOPE

Turn the ignition off.

With a lab scope, backprobe the (K24) CKP Signal circuit at the CKP harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.

Observe the lab scope screen.

NOTE: The CKP Sensor is a hall-effect type sensor that produces a 5-volt digital (square wave) signal.

Are there any irregular or missing signals?

Yes

- Go To [8](#)

No

- Go To [10](#)

8. CKP WIRE HARNESS INSPECTION

Turn the ignition off.

Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Make sure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) are torqued to their proper specification. Refer to any TSBs that may apply.

Were any of the above conditions present?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. MAGNETIC RING INSPECTION

Remove the Crankshaft Position Sensor.
Inspect the Magnetic Ring for damage, foreign material, or excessive movement.

Were any problems found?

Yes

- Repair or replace the CKP Magnetic Ring as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Crankshaft Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ERRATIC CKP SIGNAL

NOTE: The conditions that set this DTC are not present at this time. The following test may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.

Gently tap on and wiggle the Crank Position Sensor.

Turn the ignition off.

Inspect the Sensor connector and harness connector, and inspect the ECM connector and harness connector for loose, bent, corroded, or pushed out pins/terminals.

Inspect the related wire harness and the splices in the CKP circuits.

Were any problems found?**Yes**

- Repair the wiring/connector concerns as needed or replace the Crankshaft Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

P0030 - O2 SENSOR 1/1 HEATER CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the Oxygen Sensor Heater command on.

- **Set Condition:**

The ECM detects an implausible voltage on the (K79) O2 1/1 Heater Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND
(K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K79) O2 1/1 Heater Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay
 Measure the resistance between ground and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K79) O2 1/1 Heater Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Measure the resistance of the (F344) Fused ASD Relay Output circuit between the Oxygen Sensor harness connector and the ASD Relay connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [7](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0031 - O2 SENSOR 1/1 HEATER CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the Oxygen Sensor Heater command on.

- **Set Condition:**

The ECM detects that the (K79) O2 1/1 Heater Control circuit is shorted to ground for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND
(K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.
 With the scan tool, Clear DTCs in the Engine Control Module (ECM).
 Start the engine and allow it to reach normal operating temperature.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Oxygen Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (K79) O2 1/1 Heater Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K79) O2 1/1 Heater Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [4](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. OXYGEN SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Oxygen Sensor in accordance with the Service Information.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 Start the engine and allow it to reach normal operating temperature.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [5](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0032 - O2 SENSOR 1/1 HEATER CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the Oxygen Sensor Heater command on.

◦ **Set Condition:**

The ECM detects that the (K79) O2 1/1 Heater Control circuit is shorted to voltage for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT
(K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K79) O2 1/1 Heater Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay
 Measure the resistance between the (K79) O2 1/1 Heater Control circuit and the (F344) Fused ASD Relay Output circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for a short to the (F344) Fused ASD Relay Output circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K79) O2 1/1 Heater Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Oxygen Sensor in accordance with the Service Information.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 Start the engine and allow it to reach normal operating temperature.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0045 - TURBOCHARGER BOOST CONTROL CIRCUIT/OPEN

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Boost Pressure Servo Motor is a electrically operated DC motor designed to regulate the boost pressure output of the turbocharger. The BPSM is mounted to the side of the turbocharger assembly. The BPSM receives 12-volt power, ground and a duty-cycle ground signal from the ECM.

- **When Monitored:**

With the ignition on and the Boost Pressure Servo Motor command off.

- **Set Condition:**

The ECM detects that the (K137) Boost Pressure Servo Motor Control circuit is open for 0.5 second.

Possible Causes
INTERMITTENT DTC
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT SHORTED TO GROUND
(K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SERVO MOTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Boost Pressure Servo Motor at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Boost Pressure Servo Motor harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [3](#)

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K137) Boost Pressure Servo Motor Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K137) Boost Pressure Servo Motor Control circuit between the Boost Pressure Servo Motor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K137) Boost Pressure Servo Motor Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. BOOST PRESSURE SERVO MOTOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Boost Pressure Servo Motor (Boost Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller

for 30 seconds. Be certain the actuation is active when checking the circuit.

With the scan tool, actuate the Boost Pressure Servo Motor (Boost Pressure Actuator) to 0%. Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should not be illuminated.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes

- Replace the Boost Pressure Servo Motor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Servo Motor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0046 - TURBOCHARGER BOOST CONTROL CIRCUIT/EXCESSIVE CURRENT

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Boost Pressure Servo Motor is a electrically operated DC motor designed to regulate the boost pressure output of the turbocharger. The BPSM is mounted to the side of the turbocharger assembly. The BPSM receives 12-volt power, ground and a duty-cycle ground signal from the ECM.

- **When Monitored:**

With the ignition on and the Boost Pressure Servo Motor command off.

- **Set Condition:**

The Boost Pressure Servo Motor reports an internal error to the ECM.

Possible Causes
INTERMITTENT DTC
TURBOCHARGER MECHANICAL PROBLEM
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SERVO MOTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

1. (F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Boost Pressure Servo Motor harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go to [2](#)

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. (Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Using a 12 volt test light connected to 12 volts, check the (Z906) Ground circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [3](#)

No

- Repair the (Z906) Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. TURBOCHARGER MECHANICAL PROBLEM

Ensure the ignition is off.

Inspect the Turbocharger and Boost Pressure Servo Motor linkage for damage, debris and other problems that could effect Turbocharger vane movement.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Boost Pressure Servo Motor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0047 - TURBOCHARGER BOOST CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Boost Pressure Servo Motor command off.

◦ **Set Condition:**

The ECM detects that the (K137) Boost Pressure Servo Motor Control circuit is shorted to ground for 0.5 second.

Possible Causes
INTERMITTENT DTC
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT SHORTED TO GROUND
(K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SERVO MOTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Boost Pressure Servo Motor at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Boost Pressure Servo Motor harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [3](#)

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K137) Boost Pressure Servo Motor Control circuit for a short to ground.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K137) Boost Pressure Servo Motor Control circuit between the Boost Pressure Servo Motor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K137) Boost Pressure Servo Motor Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. BOOST PRESSURE SERVO MOTOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Boost Pressure Servo Motor (Boost Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller

for 30 seconds. Be certain the actuation is active when checking the circuit.

With the scan tool, actuate the Boost Pressure Servo Motor (Boost Pressure Actuator) to 0%. Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should not be illuminated.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes

- Replace the Boost Pressure Servo Motor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Servo Motor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0048 - TURBOCHARGER BOOST CONTROL CIRCUIT HIGH

81a78009

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Boost Pressure Servo Motor command on.

◦ **Set Condition:**

The ECM detects that the (K137) Boost Pressure Servo Motor Control circuit is shorted to voltage for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
(K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SERVO MOTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Boost Pressure Servo Motor at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K137) BOOST PRESSURE SERVO MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Boost Pressure Servo Motor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

Is there any voltage present?

Yes

- Repair the (K137) Boost Pressure Servo Motor Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K137) BOOST PRESSURE SERVO MOTOR CONTROL OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay
 Measure the resistance of the (K137) Boost Pressure Servo Motor Control circuit between the Boost Pressure Servo Motor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [4](#)

No

- Repair the (K137) Boost Pressure Servo Motor Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

4. BOOST PRESSURE SERVO MOTOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Boost Pressure Servo Motor (Boost Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Servo Motor Control circuit in the Boost Pressure Servo Motor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller

for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100%?

Yes

- Replace the Boost Pressure Servo Motor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Servo Motor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0053-O2 SENSOR 1/1 HEATER RESISTANCE

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the Oxygen Sensor Heater command on.

- **Set Condition:**

The ECM detects an implausible voltage on the (K79) O2 1/1 Heater Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND
(K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Oxygen Sensor Heater.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage of the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K79) O2 1/1 Heater Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Measure the resistance between ground and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K79) O2 1/1 Heater Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (F344) Fused ASD Relay Output 2 circuit between the Oxygen Sensor harness connector and the ASD Relay connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (F344) Fused ASD Relay Output 2 circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [7](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0069–MANIFOLD PRESSURE/BAROMETRIC PRESSURE CORRELATION

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Barometric/Atmospheric Pressure Sensor is calculated from the Inlet Pressure Sensor Signal. The ECM compares the signal of the Inlet Pressure Sensor to the signal of the Boost Pressure Sensor during key on, engine off and during after-run mode to determine the plausibility of these sensors.

- **When Monitored:**

With the ignition on and at engine idle. There are no Sensor Reference Voltage DTC's. There are no other Boost Pressure related DTC's. There are no Inlet Pressure Sensor DTC's.

- **Set Condition:**

The difference between the Boost Pressure Sensor Signal and the Inlet Pressure Sensor Signal is greater than 100 hpa (1.45 psi) for 4.0 seconds.

Possible Causes

BOOST PRESSURE SENSOR RELATED WIRING & CONNECTORS
BOOST PRESSURE SENSOR
INLET PRESSURE SENSOR RELATED WIRING & CONNECTORS
INLET PRESSURE SENSOR
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. CHECK FOR ACTIVE DTCS IN THE ECM

NOTE: Verify and note actual Atmospheric/Barometric pressure.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure.

2. ECM

With the scan tool, view the ECM Data and read the Atmospheric Pressure.

Compare ECM Atmospheric Pressure reading to the actual atmospheric pressure.

Does the scan tool display Atmospheric Pressure that is within 100 hpa (1.45 psi.) of actual atmospheric pressure?

Yes

- Go To [3](#)

No

- Check the wiring connectors between the Inlet Pressure Sensor and the ECM for high resistance, poor terminal contact, corrosion or other problems. If Inlet Pressure Sensor wiring and connectors check out good, replace the Inlet Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. BOOST PRESSURE SENSOR WIRING INSPECTION

Turn the ignition off.

Using the wiring schematics as a guide, inspect the wiring and connectors associated with the Boost Pressure Sensor circuits between the Boost Pressure Sensor and the ECM.

Were any problems found?**Yes**

- Repair or replace wiring/connectors as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Boost Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0070 - AMBIENT AIR TEMPERATURE SENSOR STUCK

01a783aa

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Ambient Air Temperature Sensor is a two wire sensor that is hard wired to the TIPM. The TIPM supplies a 5 volt sensor signal and sensor ground to the sensor. The sensor internal resistance changes in response to changes in ambient temperature. The TIPM provides the ECM with ambient temperature over the CAN Bus network.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Ambient Air Temperature Sensor signal over CAN Bus from the TIPM is implausible.

Possible Causes
INTERMITTENT DTC
TOTALLY INTEGRATED POWER MODULE
AMBIENT TEMPERATURE SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. DTC IS ACTIVE

NOTE: The Ambient Air Temperature Sensor is hardwired to the TIPM.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to the Service Information to diagnose problem with Ambient Air Temperature Sensor or associated wiring and connectors.

No

- Test Complete.

**P0072-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW
(TIPM)**

01a783a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10.4 volts.

◦ **Set Condition:**

The Ambient Air Temperature (AAT) sensor circuit voltage at the TIPM is less than 0.078 of a volt for more than 2.8 seconds. One Trip Fault. Three good trips to clear the MIL.

Possible Causes
(G31) AAT SIGNAL CIRCUIT SHORTED TO GROUND
(G31) AAT SIGNAL CIRCUIT SHORTED TO THE (G931) AAT RETURN
AAT SENSOR
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. AAT SENSOR VOLTAGE BELOW 0.078 OF A VOLT

Ignition on, engine not running.
With a scan tool, read the AAT voltage.

Is the voltage below 0.078 of a volt?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. AAT SENSOR

Turn the ignition off.
Disconnect the AAT harness connector.

Ignition on, engine not running.
With a scan tool, read AAT voltage.

Is the voltage above 1.0 volt?

Yes

- Replace the AAT Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (G31) AAT SIGNAL CIRCUIT SHORTED TO THE (G931) AAT RETURN CIRCUIT

Turn the ignition off.
Disconnect the C4 TIPM harness connector.
Measure the resistance between the (G931) AAT Return circuit and the (G31) AAT Signal circuit in the AAT Sensor harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the short to between the (G931) AAT Return circuit and the (G31) AAT Signal circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (G31) AAT SIGNAL CIRCUIT SHORTED GROUND

Measure the resistance between ground and the (G31) AAT Signal circuit in the AAT Sensor harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the short to ground in the (G31) AAT Signal circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. TIPM

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Totally Integrated Power Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0073-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT HIGH (TIPM)

01a783a

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10.4 volts.

◦ **Set Condition:**

The Ambient Air Temperature (AAT) sensor circuit voltage at the TIPM is greater than 4.98 volts for more than 2.8 seconds. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(G31) AAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
(G31) AAT SIGNAL CIRCUIT OPEN
(G931) AAT RETURN CIRCUIT OPEN
AAT SENSOR
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. AAT SENSOR VOLTAGE ABOVE 4.98 VOLTS

Ignition on, engine not running.
With a scan tool, read the AAT voltage.

Is the voltage above 4.98 volts?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. AAT SENSOR

Turn the ignition off.
 Disconnect the AAT harness connector.
 Connect a jumper wire between the (G31) AAT Signal circuit and the (G931) AAT Return circuit in the AAT harness connector.
 Ignition on, engine not running.
 With a scan tool, read AAT voltage.

Is the voltage below 1.0 volt with the jumper wire installed?

Yes

- Replace the AAT Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

NOTE: Remove the jumper wire before continuing.

3. (G31) AAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.
 Disconnect the C4 TIPM harness connector.
 Ignition on, engine not running.
 Measure the voltage on the (G31) AAT Signal circuit in the AAT Sensor harness connector.

Is voltage present?

Yes

- Repair the short to battery voltage in the (G31) AAT Signal circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (G31) AAT SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (G31) AAT Signal circuit between the AAT Sensor harness connector and C4 TIPM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the open in the (G31) AAT Signal circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (G931) AAT RETURN CIRCUIT OPEN

Measure the resistance of the (G931) AAT Return circuit between the AAT Sensor harness connector and the C4 TIPM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the open in the (G931) AAT Return circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. TIPM

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Totally Integrated Power Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0087-FUEL RAIL PRESSURE TOO LOW

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM determines that the fuel rail pressure is too low for a given engine speed and load.

Possible Causes
AIR IN FUEL SYSTEM
FUEL DELIVERY SYSTEM
FUEL PRESSURE SENSOR
FUEL INJECTOR(S)
FUEL PRESSURE SOLENOID
FUEL PUMP
FUEL SYSTEM CONTAMINATION
FUEL SYSTEM LEAK
INTERMITTENT DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECKING FOR OTHER ECM DTCS

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Turn the ignition on.

With the scan tool, read the ECM DTCs.

Are there any other DTCs present?

Yes

- Refer to symptom list for problems related to the DTC other than this DTC.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CURRENT DTC

NOTE: Refer to the Service Information and perform the Air Bleed Procedure before continuing diagnosis.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

NOTE: Driving the vehicle up and down steep hills or rapid cornering with a low fuel level can cause this DTC to set. Verify with customer if Low Fuel Light was illuminated when fault occurred.

Test drive the vehicle under various load and speed conditions to attempt to duplicate the fault.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. FUEL SYSTEM LEAK

Turn the ignition off.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the entire fuel system for leakage.

Is there any evidence of leakage?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL SYSTEM CONTAMINATION

NOTE: Mixing any other fuels such as gasoline or kerosine can cause this DTC to set.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the fuel system for contamination.

Is the fuel contaminated?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL PRESSURE SENSOR CALIBRATION

Turn the ignition on.

With the scan tool, read the Fuel Pressure Sensor volts.

Does the scan tool display between 0.45 and 0.60 volts for the Fuel Pressure Sensor?

Yes

- Go To [6](#)

No

- Check the Fuel Pressure Sensor wiring and connectors for corrosion or poor terminal contact that could cause high resistance. Repair as necessary. If wiring and connectors are o.k., replace the Fuel Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ATTEMPT TO START ENGINE

With the scan tool, erase the ECM DTCs.

Attempt to start the engine.

Does the engine start and idle?

Yes

- Go To [7](#)

No

- Go To [12](#)

7. CHECKING FOR AIR IN FUEL SYSTEM

With the scan tool in Sensors, compare the Fuel Pressure Setpoint with the Actual Fuel Pressure readings.

NOTE: If there is air in the fuel system, the Actual Fuel Pressure will oscillate more than 100 psi above and/or below the Fuel Pressure Setpoint.

Does Actual Fuel Pressure oscillate more than 100 psi above and/or below the Fuel Pressure Setpoint?

Yes

- Refer to the Service Information to purge air from the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. FUEL PRESSURE SOLENOID

With the scan tool, compare the Fuel Pressure Setpoint with the Actual Fuel Pressure.

NOTE: A sticking Fuel Pressure Solenoid is indicated by the Actual Fuel Pressure gradually dropping below the Fuel Pressure Setpoint then suddenly increasing (spiking) above the Fuel Pressure Setpoint.

Does the Actual Fuel Pressure gradually decrease then suddenly increase (spike) above the Fuel Pressure Setpoint?

Yes

- Replace the Fuel Pressure Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECKING FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and refer to Diagnosis and Testing Fuel Delivery System table.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, failed fuel pressure solenoid, air in fuel system, failed fuel sending unit, contaminated fuel, faulty injector.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [10](#)

10. FUEL INJECTOR(S)

NOTE: An injector that sticks open can cause this DTC. A sticking injector will cause the engine to misfire and emit excessive black smoke from the exhaust system.

Does the engine exhibit the symptoms described in the above note?

Yes

- Using the Service Information, remove and inspect the Fuel Injectors for signs of damage or debris that may cause the injector to stick. Sticking injectors may cause the combustion chamber to become black and oil soaked. Replace Injector(s) as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [11](#)

11. FUEL PRESSURE SOLENOID

Turn the ignition off.

Replace the Fuel Pressure Solenoid in accordance with the Service Information.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the ECM display this DTC?

Yes

- Replace the Fuel Pump in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

12. CHECKING FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and refer to Diagnosis and Testing Fuel Delivery System table.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, failed fuel pressure solenoid, air in fuel system, failed fuel sending unit, contaminated fuel, faulty injector.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. FUEL PRESSURE SOLENOID

Turn the ignition off.

Replace the Fuel Pressure Solenoid in accordance with the Service Information.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the ECM display this DTC?**Yes**

- Replace the Fuel Pump in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0088-FUEL RAIL PRESSURE TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM determines that the fuel rail pressure is too high for a given engine speed and load.

Possible Causes
AIR IN FUEL SYSTEM
FUEL DELIVERY SYSTEM
FUEL PRESSURE SENSOR
FUEL INJECTOR(S)
FUEL PRESSURE SOLENOID
FUEL PUMP
FUEL SYSTEM CONTAMINATION
FUEL SYSTEM LEAK
INTERMITTENT DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECKING FOR OTHER ECM DTCS

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING

WHEN SERVICING FUEL SYSTEM.

Turn the ignition on.

With the scan tool, read the ECM DTCs.

Are there any other DTCs present?

Yes

- Refer to symptom list for problems related to the DTC other than this DTC.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CURRENT DTC

NOTE: Refer to the Service Information and perform the Air Bleed Procedure before continuing diagnosis.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

NOTE: Driving the vehicle up and down steep hills or rapid cornering with a low fuel level can cause this DTC to set. Verify with customer if Low Fuel Light was illuminated when fault occurred.

Test drive the vehicle under various load and speed conditions to attempt to duplicate the fault.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. FUEL SYSTEM LEAK

Turn the ignition off.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE

FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the entire fuel system for leakage.

Is there any evidence of leakage?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL SYSTEM CONTAMINATION

NOTE: Mixing any other fuels such as gasoline or kerosine can cause this DTC to set.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the fuel system for contamination.

Is the fuel contaminated?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

Go To [5](#)

5. FUEL PRESSURE SENSOR CALIBRATION

Turn the ignition on.

With the scan tool, read the Fuel Pressure Sensor volts.

Does the scan tool display between 0.45 and 0.60 volts for the Fuel Pressure Sensor?

Yes

- Go To [6](#)

No

- Check the Fuel Pressure Sensor wiring and connectors for corrosion or poor terminal contact that could cause high resistance. Repair as necessary. If wiring and connectors are o.k., replace the Fuel Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ATTEMPT TO START ENGINE

With the scan tool, erase the ECM DTCs.

Attempt to start the engine.

Does the engine start and idle?

Yes

- Go To [7](#)

No

- Go To [12](#)

7. CHECKING FOR AIR IN FUEL SYSTEM

With the scan tool in Sensors, compare the Fuel Pressure Setpoint with the Actual Fuel Pressure readings.

NOTE: If there is air in the fuel system, the Actual Fuel Pressure will oscillate more than 100 psi above and/or below the Fuel Pressure Setpoint.

Does Actual Fuel Pressure oscillate more than 100 psi above and/or below the Fuel Pressure Setpoint?

Yes

- Refer to the Service Information to purge air from the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. FUEL PRESSURE SOLENOID

With the scan tool, compare the Fuel Pressure Setpoint with the Actual Fuel Pressure.

NOTE: A sticking Fuel Pressure Solenoid is indicated by the Actual Fuel Pressure gradually dropping below the Fuel Pressure Setpoint then suddenly increasing (spiking) above the Fuel Pressure Setpoint.

Does the Actual Fuel Pressure gradually decrease then suddenly increase (spike) above the Fuel Pressure Setpoint?

Yes

- Replace the Fuel Pressure Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECKING FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and refer to Diagnosis and Testing Fuel Delivery System table.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, failed fuel pressure solenoid, air in fuel system, failed fuel sending unit, contaminated fuel, faulty injector.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [10](#)

10. FUEL INJECTOR(S)

NOTE: An injector that sticks open can cause this DTC. A sticking injector will cause the engine to misfire and emit excessive black smoke from the exhaust system.

Does the engine exhibit the symptoms described in the above note?

Yes

- Using the Service Information, remove and inspect the Fuel Injectors for signs of damage or debris that may cause the injector to stick. Sticking injectors may cause the combustion chamber to become black and oil soaked. Replace Injector(s) as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [11](#)

11. FUEL PRESSURE SOLENOID

Turn the ignition off.

Replace the Fuel Pressure Solenoid in accordance with the Service Information.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the ECM display this DTC?

Yes

- Replace the Fuel Pump in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

12. CHECKING FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and refer to Diagnosis and Testing Fuel Delivery System table.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, failed fuel pressure solenoid, air in fuel system, failed fuel sending unit, contaminated fuel, faulty injector.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. FUEL PRESSURE SOLENOID

Turn the ignition off.

Replace the Fuel Pressure Solenoid in accordance with the Service Information.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the ECM display this DTC?

Yes

- Go To [14](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

14. FUEL QUANTITY SOLENOID

Turn the ignition off.

Replace the Fuel Quantity Solenoid in accordance with the Service Information.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Replace the Fuel Pump in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0090 - FUEL PRESSURE 1 CONTROL CIRCUIT/OPEN

81a78003

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Fuel Pressure Solenoid (FPS) is a solenoid operated valve designed to regulate fuel pressure in the fuel rail. The FPS valve is positioned in-line with the outlet passage of the high pressure fuel rail. The solenoid receives 12 volt power and a duty-cycle ground signal from the ECM. When the solenoid is not actuated (no ground signal from the ECM), the fuel rail outlet passage opens allowing fuel pressure in the rail to escape into the return circuit to the fuel tank. When the ECM grounds the FPS control signal, the solenoid valve closes allowing fuel pressure to build in the rail.

- **When Monitored:**

With the ignition on and the Fuel Pressure Solenoid command off.

- **Set Condition:**

The ECM detects that the (K370) Fuel Pressure Solenoid Control circuit is open for 0.28 second.

Possible Causes
INTERMITTENT DTC
(K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K369) FUEL PRESSURE SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
FUEL PRESSURE SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Pressure Solenoid at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Fuel Pressure Solenoid harness connector.
Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K370) Fuel Pressure Solenoid Control circuit in the Fuel Pressure Solenoid harness connector.

Is the resistance above 1000 ohms?**Yes**

- Go to [3](#)

No

- Repair the (K370) Fuel Pressure Solenoid Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**3. (K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE**

Measure the resistance of the (K370) Fuel Pressure Solenoid Control circuit between the Fuel Pressure Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?**Yes**

- Go to [4](#)

No

- Repair the (K370) Fuel Pressure Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K369) FUEL PRESSURE SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K369) Fuel Pressure Solenoid 12 Volt Supply circuit between the Fuel Pressure Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K369) Fuel Pressure Solenoid 12 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL PRESSURE SOLENOID

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Fuel Pressure Solenoid (Rail Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K370) Fuel Pressure Solenoid Control circuit in the Fuel Pressure Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when

checking the circuit.

Is the test light illuminated and bright with the actuation at 100%?

Yes

- Replace the Fuel Pressure Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pressure Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0091 - FUEL PRESSURE 1 CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Fuel Pressure Solenoid (FPS) is a solenoid operated valve designed to regulate fuel pressure in the fuel rail. The FPS valve is positioned in the in-line with the outlet passage of the high pressure fuel rail. The solenoid receives 12 volt power and a duty-cycle ground signal from the ECM. When the solenoid is not actuated (no ground signal from the ECM), the fuel rail outlet passage opens allowing fuel pressure in the rail to escape into the return circuit to the fuel tank. When the ECM grounds the FPS control signal, the solenoid valve closes allowing fuel pressure to build in the rail.

- **When Monitored:**

With the ignition on and the Fuel Pressure Solenoid command off.

- **Set Condition:**

The ECM detects that the (K370) Fuel Pressure Solenoid Control circuit is shorted to ground for 0.22 second.

Possible Causes
INTERMITTENT DTC
(K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K369) FUEL PRESSURE SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
FUEL PRESSURE SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Pressure Solenoid at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Fuel Pressure Solenoid harness connector.
Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K370) Fuel Pressure Solenoid Control circuit in the Fuel Pressure Solenoid harness connector.

Is the resistance above 1000 ohms?**Yes**

- Go to [3](#)

No

- Repair the (K370) Fuel Pressure Solenoid Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**3. (K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE**

Measure the resistance of the (K370) Fuel Pressure Solenoid Control circuit between the Fuel Pressure Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?**Yes**

- Go to [4](#)

No

- Repair the (K370) Fuel Pressure Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K369) FUEL PRESSURE SOLENOID 12 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K369) Fuel Pressure Solenoid 12 Volt Supply circuit between the Fuel Pressure Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K369) Fuel Pressure Solenoid 12 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Remove the ASD Relay.

Connect a jumper wire between cavity 30 and cavity 87 in the ASD Relay connector.

Using a 12-volt test light connected to ground, check the ASD Relay Output circuit in ECM harness connector C2 cavities 1, 3 and 5.

Did the test light illuminate for each circuit?

Yes

- Go To [6](#)

No

- Repair the ASD Relay Output circuit(s) for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL PRESSURE SOLENOID

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Fuel Pressure Solenoid to 100%.

Using a 12 volt test light connected to 12 volts, check the (K370) Fuel Pressure Solenoid Control circuit in the Fuel Pressure Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when

checking the circuit.

With the scan tool, actuate the Fuel Pressure Solenoid to 0%.

Using a 12 volt test light connected to 12 volts, check the (K370) Fuel Pressure Solenoid Control circuit in the Fuel Pressure Solenoid harness connector.

NOTE: The test light should not be illuminated.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes

- Replace the Fuel Pressure Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [Z](#)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pressure Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0092 - FUEL PRESSURE 1 CONTROL CIRCUIT HIGH

The Fuel Pressure Solenoid (FPS) is a solenoid operated valve designed to regulate fuel pressure in the fuel rail. The FPS valve is positioned in-line with the outlet passage of the high pressure fuel rail. The solenoid receives 12 volt power and a duty-cycle ground signal from the ECM. When the solenoid is not actuated (no ground signal from the ECM), the fuel rail outlet passage opens allowing fuel pressure in the rail to escape into the return circuit to the fuel tank. When the ECM grounds the FPS control signal, the solenoid valve closes allowing fuel pressure to build in the rail.

- **When Monitored:**

With the ignition on and the Fuel Pressure Solenoid command on.

- **Set Condition:**

The ECM detects excessive current on the (K370) Fuel Pressure Solenoid Control circuit for 0.28 second.

Possible Causes
INTERMITTENT DTC
(K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
(K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO THE (K369) FUEL PRESSURE SOLENOID 12 VOLT SUPPLY CIRCUIT
(K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL PRESSURE SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Pressure Solenoid at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Pressure Solenoid harness connector.

Disconnect the Engine Control Module (ECM) connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K370) Fuel Pressure Solenoid Control circuit in the Fuel Pressure Solenoid harness connector.

Is there any voltage present?**Yes**

- Repair the (K370) Fuel Pressure Solenoid Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

**3. (K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT SHORTED TO THE (K369) FUEL PRESSURE SOLENOID 12 VOLT SUPPLY CIRCUIT**

Turn the ignition off.

Remove the jumper wire and install the ASD Relay

Measure the resistance between the (K370) Fuel Pressure

Solenoid Control circuit and the (K369) Fuel Pressure Solenoid 12 Volt Supply in the Fuel Pressure Solenoid harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K370) Fuel Pressure Solenoid Control circuit for a short to the (K369) Fuel Pressure Solenoid 12 Volt Supply circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K370) FUEL PRESSURE SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K370) Fuel Pressure Solenoid Control circuit between the Fuel Pressure Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K370) Fuel Pressure Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL PRESSURE SOLENOID

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Fuel Pressure Solenoid (Rail Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K370) Fuel Pressure Solenoid Control circuit in the Fuel Pressure Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when

checking the circuit.

Is the test light illuminated and bright with the actuation at 100%?

Yes

- Replace the Fuel Pressure Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pressure Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

AAT SENSOR - COLD
AAT SENSOR - HOT
CHECKING CONNECTORS
IAT SENSOR - COLD
IAT SENSOR - HOT
INTERMITTENT CONDITION

Diagnostic Test

1. CHECKING CONNECTORS

Turn the ignition off.

Disconnect the IAT and AAT Sensor harness connectors.

Inspect both connectors for poor terminal contact, corrosion, damage or other problems.

Is there any evidence of connector problems?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Go To [2](#)

2. IAT SENSOR - COLD

NOTE: Allow the engine to completely cool to ambient temperature.

Reconnect all connectors.

Turn the ignition on.

With the scan tool, read and note the engine coolant temperature.

With the scan tool, read the Intake Air Temperature and compare it to the engine coolant temperature reading.

Are the readings within 7°C (13°F) of each other?

Yes

- Go To [3](#)

No

- Check the wiring and connectors associated with the IAT Sensor for corrosion, damage or other problems. Repair as necessary. If wiring and connectors are o.k., replace the Intake Air Temperature Sensor.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. AAT SENSOR - COLD

NOTE: Allow the engine to completely cool to ambient temperature.

With the scan tool, read and note the engine coolant temperature.

With the scan tool, read the Ambient Air Temperature and compare it to the engine coolant temperature reading.

Are the readings within 7°C (13°F) of each other?

Yes

- Go To [4](#)

No

- Check the wiring and connectors associated with the AAT Sensor for corrosion, damage or other problems. Repair as necessary. If wiring and connectors are o.k., replace the Ambient Air Temperature Sensor.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. IAT SENSOR - HOT

Start the engine and bring the engine to operating temperature (thermostat open).

Turn the engine off and wait 10 minutes to allow the engine temperature to stabilize.

With the scan tool, read and note the engine coolant temperature.

With the scan tool, read the Intake Air Temperature.

Are the readings within 7°C (13°F) of each other?

Yes

- Go To [5](#)

No

- Check the wiring and connectors associated with the IAT Sensor for corrosion, damage or other problems. Repair as necessary. If wiring and connectors are o.k., replace the Intake Air Temperature Sensor.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. AAT SENSOR - HOT

Start the engine and bring the engine to operating temperature (thermostat open).
With the scan tool, read the Ambient Air Temperature.

Is the Ambient Temperature Sensor reading correct outside temperature?

Yes

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Check the wiring and connectors associated with the AAT Sensor for corrosion, damage or other problems. Repair as necessary. If wiring and connectors are o.k., replace the Ambient Air Temperature Sensor.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0100-MASS AIR FLOW SENSOR

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects that the (K157) Mass Air Flow Sensor Signal circuit is not within a valid range.

Possible Causes
INTERMITTENT DTC
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT
MASS AIR FLOW SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Mass Air Flow Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K957) Mass Air Flow Sensor Ground circuit for a short to voltage.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Mass Air Flow Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [5](#)

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Disconnect the ECM harness connector.
 Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K957) Mass Air Flow Sensor Ground circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K957) Mass Air Flow Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [8](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT

Measure the resistance between the (K157) Mass Air Flow Sensor Signal circuit and the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor connector.

Is the resistance above 1000 ohms?

Yes

- Go to [9](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to the (K957) Mass Air Flow Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MASS AIR FLOW SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Mass Air Flow Sensor in accordance with the Service Information.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 Start the engine and allow it to reach normal operating temperature.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [10](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0101-MASS AIR FLOW SENSOR PERFORMANCE

With the ignition on.

◦ **Set Condition:**

The ECM detects that the (K157) Mass Air Flow Sensor Signal circuit is not within a valid range.

Possible Causes
INTERMITTENT DTC
INTAKE/EXHAUST SYSTEM PROBLEMS
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT
MASS AIR FLOW SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).
Start the engine and allow it to reach normal operating temperature.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK THE INTAKE SYSTEM HOSES/TUBES

NOTE: Damaged, restricted or poorly connected intake and turbocharger related tubes can cause this DTC to set.

Turn the ignition off.
Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections.
Inspect the Charge Air Cooler hoses/tubes and connections.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Mass Air Flow Sensor harness connector.
Turn the ignition on.
Measure the voltage of the (K157) Mass Air Flow Sensor
Signal circuit in the Mass Air Flow Sensor harness
connector.

Is there any voltage present?

Yes

- Repair the (K157) Mass Air Flow Sensor Signal circuit

for a short to voltage.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K957) Mass Air Flow Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Mass Air

Flow Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [6](#)

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Mass Air Flow Sensor harness connector. Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K957) Mass Air Flow Sensor Ground circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K957) Mass Air Flow Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [9](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT

Measure the resistance between the (K157) Mass Air Flow Sensor Signal circuit and the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor connector.

Is the resistance above 1000 ohms?

Yes

- Go to [10](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to the (K957) Mass Air Flow Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. MASS AIR FLOW SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Mass Air Flow Sensor in accordance with the Service Information.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 Start the engine and allow it to reach normal operating temperature.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [11](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

11. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0102-MASS AIR FLOW SENSOR CIRCUIT LOW

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

No reference Voltage DTC's present. With the engine running and engine speed below 5100 rpm..

◦ **Set Condition:**

The (K157) Mass Air Flow Sensor Signal is below the valid operating range for 0.5 second.

Possible Causes
INTERMITTENT DTC
INTAKE/EXHAUST SYSTEM PROBLEMS
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(F888) MASS AIR FLOW SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT
MASS AIR FLOW SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure.

2. CHECK FOR INTAKE AND EXHAUST SYSTEM RESTRICTIONS

Turn the ignition off.

Inspect the exhaust system for damaged components that could cause exhaust flow blockage.

Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections for damage, air leaks or blockage.

Inspect the Charge Air Cooler hoses/tubes and connections.

Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.

Were any problems found?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go to [3](#)

3. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Mass Air Flow Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?**Yes**

- Go to [4](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit

- for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K957) Mass Air Flow Sensor Ground circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K957) Mass Air Flow Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (F888) MASS AIR FLOW SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (F888) Mass Air Flow Sensor 5 Volt Supply circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (F888) Mass Air Flow Sensor 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [Z](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT

Measure the resistance between the (K157) Mass Air Flow Sensor Signal circuit and the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor connector.

Is the resistance above 1000 ohms?

Yes

- Go to [8](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to the (K957) Mass Air Flow Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. MASS AIR FLOW SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Mass Air Flow Sensor in accordance with the Service Information.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 Start the engine and allow it to reach normal operating temperature.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [9](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0103-MASS AIR FLOW SENSOR CIRCUIT HIGH

No reference Voltage DTC's present. With the engine running and engine speed below 5100 rpm..

◦ **Set Condition:**

The (K157) Mass Air Flow Sensor Signal is above the valid operating range for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MASS AIR FLOW SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure.

2. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Mass Air Flow Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K957) Mass Air Flow Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K157) Mass Air Flow Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K957) Mass Air Flow Sensor Ground circuit between the Mass Air Flow Sensor connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K957) Mass Air Flow Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. MASS AIR FLOW SENSOR

Connect the Engine Control Module (ECM) harness connector.

Replace the Mass Air Flow Sensor in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [7](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0112-INTAKE AIR TEMPERATURE SENSOR CIRCUIT LOW

01a783aa

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The (K48) Intake Air Temperature Sensor Signal circuit voltage is below 0.25 volt for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) INTAKE AIR TEMPERATURE SENSOR GROUND
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

2. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Boost Pressure/Intake Air Temperature Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K48) Intake Air Temperature Sensor Signal circuit in the Boost Pressure/Intake Air Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K48) Intake Air Temperature Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K48) Intake Air Temperature Sensor Signal circuit and the (K656) Intake Air Temperature Sensor Ground circuit in the Boost Pressure/Intake Air Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K48) Intake Air Temperature Sensor Signal circuit for a short to the (K656) Intake Air Temperature Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (K48) Intake Air Temperature Sensor Signal circuit between the Boost Pressure/Intake Air Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K48) Intake Air Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR

Turn the ignition off.
 Connect the Engine Control Module (ECM) connector.
 Turn the ignition on.
 With the scan tool, clear DTCs.
 With the scan tool, select View DTCs.

NOTE: The scan tool should display an Intake Air Temperature Sensor high voltage or open circuit DTC with the Boost Pressure/Intake Air Temperature Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Boost Pressure/Intake Air Temperature Sensor in accordance with the service information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Air Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0113-INTAKE AIR TEMPERATURE SENSOR CIRCUIT HIGH

01a783a

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K48) Intake Air Temperature Sensor Signal circuit voltage is above 4.96 volts for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Boost Pressure/Intake Air Temperature Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K48) Intake Air Temperature Sensor Signal circuit in the Boost Pressure/Intake Air Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K48) Intake Air Temperature Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K656) Intake Air Temperature Sensor Ground circuit in the Boost Pressure/Intake Air Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K656) Intake Air Temperature Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

- ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the ASD Relay..

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K656) Intake Air Temperature Sensor Ground circuit and the (K48) Intake Air Temperature Sensor Signal circuit in the Boost Pressure/Intake Air Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Intake Air Temperature Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Boost Pressure/Intake Air Temperature Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K48) Intake Air Temperature Sensor Signal circuit between the Boost Pressure/Intake Air Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K48) Intake Air Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K656) Intake Air Temperature Sensor Ground circuit between the Boost Pressure/Intake Air Temperature Sensor harness connector and the Engine

Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K656) Intake Air Temperature Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Air Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0115-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K2) Engine Coolant Temperature Sensor Signal is defective.

Possible Causes
INTERMITTENT DTC
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Coolant Temperature Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K2) Engine Coolant Temperature Sensor Signal circuit and the (K914) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to the (K914) Engine Coolant Temperature Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the Engine Coolant Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ENGINE COOLANT TEMPERATURE SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 With the scan tool, select View DTCs.

NOTE: The scan tool should display an Engine Coolant Temperature Sensor high voltage or open circuit DTC with the connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Engine Coolant Temperature Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0116-ENGINE COOLANT TEMPERATURE SENSOR PERFORMANCE

01a77365

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The Engine Control Module (ECM) detects an implausible voltage on the (K2) Engine Coolant Temperature Sensor Signal circuit.

Possible Causes
INTERMITTENT DTC
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Coolant Temperature Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K914) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant

Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K914) Engine Coolant Temperature Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.. Measure the resistance between ground and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K914)

ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K2) Engine Coolant Temperature Sensor Signal circuit and the (K914) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to the (K914) Engine Coolant Temperature Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the Engine Coolant Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K914) Engine Coolant Temperature Sensor Ground circuit between the Engine Coolant Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K914) Engine Coolant Temperature Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE COOLANT TEMPERATURE SENSOR

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K914) Engine Coolant Temperature Sensor Ground circuit and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Engine Coolant Temperature Sensor low voltage or short to ground DTC with the jumper wire in place.

Turn the ignition off.

Remove the jumper wire.

Turn the ignition on.
With the scan tool, Clear DTCs.
With the scan tool, select View DTCs.

NOTE: The scan tool should display an Engine Coolant Temperature Sensor high voltage or open circuit DTC with the Engine Coolant Temperature Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Engine Coolant Temperature Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [9](#)

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0117-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT LOW

01a77365

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K2) Engine Coolant Temperature Sensor Signal circuit voltage is below 0.13 volt for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Engine Coolant Temperature Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K2) Engine Coolant Temperature Sensor Signal circuit and the (K914) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to the (K914) Engine Coolant Temperature Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the Engine Coolant Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ENGINE COOLANT TEMPERATURE SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 With the scan tool, select View DTCs.

NOTE: The scan tool should display an Engine Coolant Temperature Sensor high voltage or open circuit DTC with the connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Engine Coolant Temperature Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0118-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT HIGH

01a77365

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The (K2) Engine Coolant Temperature Sensor Signal circuit voltage is above 4.93 volts for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Engine Coolant Temperature Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K914) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K914) Engine Coolant Temperature Sensor

Ground circuit for a short to voltage.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. ENGINE COOLANT TEMPERATURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the ASD Relay..

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K914) Engine Coolant Temperature Sensor Ground circuit and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Engine Coolant Temperature Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Engine Coolant Temperature Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the Engine Coolant Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K914) Engine Coolant Temperature Sensor Ground circuit between the Engine Coolant Temperature Sensor harness connector and the

Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K914) Engine Coolant Temperature Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0128-ENGINE COOLANT TEMP SENSOR ENGINE IS COLD TOO LONG

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine running and engine temperature is below 34°C.

- **Set Condition:**

Engine temperature does not increase enough during a calibrated amount of time.

Possible Causes
ENGINE COLD TOO LONG

Diagnostic Test

1. CHECK COOLING SYSTEM PERFORMANCE

NOTE: The best way to diagnose this DTC is to allow the vehicle to remain outside overnight in order to have a completely cold soaked engine.

NOTE: Extremely cold outside ambient temperatures may cause this DTC to set.

Verify that the coolant level is correct.

Start the engine.

With the scan tool, set the engine RPM to 1500 and allow the engine to warm up for 10-15 minutes.

With the scan tool, monitor the Engine Coolant Temperature value during the warm up cycle. Make sure the transition of temperature change is smooth.

Did the engine temperature reach a minimum of 80° C (176° F)?

Yes

- Test Complete.

No

- Refer to the Service Information for cooling system performance diagnosis. The most probable cause is a Thermostat problem. Also, refer to any related TSBs. If there are no cooling system problems replace the Engine Coolant Temperature Sensor.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P012C-TURBO INLET AIR PRESSURE SENSOR CIRCUIT LOW

With the ignition on.

- **Set Condition:**

The (K68) Inlet Air Pressure Sensor Signal circuit voltage is below 0.35 volt for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K901) INLET AIR PRESSURE SENSOR GROUND
(K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K901) INLET AIR PRESSURE SENSOR GROUND
(K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
INLET AIR PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.
Disconnect the Inlet Air Pressure Sensor harness connector.
Turn the ignition on.
Measure the voltage of the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit in the Inlet Air Pressure Sensor harness connector.

Is the voltage above 4.5 volts?

Yes

- Go to [6](#)

No

- Go to [3](#)

3. (K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition on.
Disconnect the Engine Control Module (ECM) harness connector.
Measure the resistance between ground and the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit in the Inlet Air Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K901) INLET AIR PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit and the (K901) Inlet Air Pressure Sensor Ground circuit in the Inlet Air Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit for a short to the (K901) Inlet Air Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit between the Inlet Air Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. INLET AIR PRESSURE SENSOR

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Inlet Air Pressure Sensor high voltage or open DTC with the Inlet Air Pressure Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Inlet Air Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. (K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K68) Inlet Air Pressure Sensor Signal circuit in the Inlet Air Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [8](#)

No

- Repair the (K68) Inlet Air Pressure Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K901) INLET AIR PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K68) Inlet Air Pressure Sensor Signal circuit and the (K901) Inlet Air Pressure Sensor Ground circuit in the Inlet Air Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [9](#)

No

- Repair the (K68) Inlet Air Pressure Sensor Signal circuit for a short to the (K901) Inlet Air Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K68) Inlet Air Pressure Sensor Signal circuit between the Inlet Air Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K68) Inlet Air Pressure Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Inlet Air Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P012D-TURBO INLET AIR PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K68) Inlet Air Pressure Sensor Signal circuit voltage is above 4.76 volts for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K901) INLET AIR PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K901) INLET AIR PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
INLET AIR PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Inlet Air Pressure Sensor harness connector.
Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit in the Inlet Air Pressure Sensor harness connector.

Is there any voltage present?**Yes**

- Repair the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

**3. (K68) INLET AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K68) Inlet Air Pressure Sensor Signal circuit in the Inlet Air Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K68) Inlet Air Pressure Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K901) INLET AIR PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K901) Inlet Air Pressure Sensor Ground circuit in the Inlet Air Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K901) Inlet Air Pressure Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. INLET AIR PRESSURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the ASD Relay. Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K901) Inlet Air Pressure Sensor Ground circuit and the (K68) Inlet Air Pressure Sensor Signal circuit in the Inlet Air Pressure Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Inlet Air Pressure Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Inlet Air Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (K68) INLET AIR PRESSURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K68) Inlet Air Pressure Sensor Signal between the Inlet Air Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K68) Inlet Air Pressure Sensor Signal for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K901) INLET AIR PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K901) Inlet Air Pressure Sensor Ground circuit between the Inlet Air Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K901) Inlet Air Pressure Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Inlet Air Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0130-O2 SENSOR 1/1 CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

- **Set Condition:**

The ECM detects an open on the (K902) O2 1/1 Negative Current Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K902) O2 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay..
 Measure the resistance between the (K902) O2 1/1 Negative Current Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 10.0 ohms?

Yes

- Go to [4](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K902) O2 1/1 Negative Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Oxygen Sensor in accordance with the Service Information.
 Start the engine.
 Allow the engine to reach normal operating temperature.
 Monitor the scan tool for at least two minutes.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0131-O2 SENSOR 1/1 CIRCUIT LOW

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects a short to ground on the (K902) O2 1/1 Negative Current Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Oxygen Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K902) O2 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K902) O2 1/1 Negative Current Control circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K902) O2 1/1 Negative Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Oxygen Sensor in accordance with the Service Information.
 Start the engine.
 Allow the engine to reach normal operating temperature.
 Monitor the scan tool for at least two minutes.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0132-O2 SENSOR 1/1 CIRCUIT HIGH

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects a short to voltage on the (K902) O2 1/1 Negative Current Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K902) O2 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay..
 Measure the resistance between the (K902) O2 1/1 Negative Current Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K902) O2 1/1 Negative Current Control

circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K902) O2 1/1 Negative Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Oxygen Sensor in accordance with the Service Information.
 Start the engine.
 Allow the engine to reach normal operating temperature.
 Monitor the scan tool for at least two minutes.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0135-O2 SENSOR 1/1 HEATER PERFORMANCE

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on and the Oxygen Sensor Heater command on.

- **Set Condition:**

The ECM detects an implausible voltage on the (K79) O2 1/1 Heater Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE
(K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND
(K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Oxygen Sensor Heater.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K79) O2 1/1 Heater Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K79) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay..
 Measure the resistance between ground and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

4. (K79) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K79) O2 1/1 Heater Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K79) O2 1/1 Heater Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (F344) Fused ASD Relay Output 2 circuit between the Oxygen Sensor harness connector and the ASD Relay connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (F344) Fused ASD Relay Output 2 circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. OXYGEN SENSOR

Connect the Engine Control Module (ECM) harness connector.
 Replace the Oxygen Sensor in accordance with the Service Information.
 Start the engine.
 Allow the engine to reach normal operating temperature.
 Monitor the scan tool for at least two minutes.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [Z](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0182-FUEL TEMPERATURE SENSOR CIRCUIT LOW

01a77365

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K156) Fuel Temperature Sensor Signal circuit voltage is below 0.13 volt for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K914) FUEL TEMPERATURE SENSOR GROUND
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL TEMPERATURE SENSOR

Turn the ignition off.

Disconnect the Fuel Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Fuel Temperature Sensor high voltage or open circuit DTC with the Fuel Temperature Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Fuel Temperature Sensor in accordance with the service information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K156) Fuel Temperature Sensor Signal circuit in the Fuel Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K914) FUEL

TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K156) Fuel Temperature Sensor Signal circuit and the (K914) Fuel Temperature Sensor Ground circuit in the Fuel Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to the (K914) Fuel Temperature Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (K156) Fuel Temperature Sensor Signal circuit between the Fuel Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K156) Fuel Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0183-FUEL TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K156) Fuel Temperature Sensor Signal circuit voltage is above 4.93 volts for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K914) FUEL TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) FUEL TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Fuel Temperature Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K156) Fuel Temperature Sensor Signal circuit in the Fuel Temperature Sensor harness connector.

Is there any voltage present?**Yes**

- Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K914) FUEL TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K914) Fuel Temperature Sensor Ground circuit in the Fuel Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K914) Fuel Temperature Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. FUEL TEMPERATURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the ASD Relay..
Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K914) Fuel Temperature Sensor Ground circuit and the (K156) Fuel Temperature Sensor Signal circuit in the Fuel Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Fuel Temperature Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Fuel Temperature Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (K156) FUEL TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K156) Fuel Temperature Sensor Signal circuit between the Fuel Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K156) Fuel Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K914) FUEL TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K914) Fuel Temperature Sensor Ground circuit between the Fuel Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [Z](#)

No

- Repair the (K914) Fuel Temperature Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0191 FUEL RAIL PRESSURE SENSOR CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

At ignition shut off during Afterrun.

- **Set Condition:**

The Fuel Pressure Sensor signal is below 0.298 volt for 1.0 second.

Possible Causes
FUEL PRESSURE SENSOR
INTERMITTENT CONDITION

Diagnostic Test

1. FUEL PRESSURE SENSOR

NOTE: This code can be caused by an intermittent problem in the wiring and connectors to the Fuel Pressure Sensor. Inspect the Fuel Pressure Sensor harness connector and associated wiring for signs of poor terminal contact.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Replace the Fuel Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0192-FUEL RAIL PRESSURE SENSOR LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K181) Fuel Pressure Sensor Signal circuit voltage is below 0.25 volt for 0.14 second.

Possible Causes
INTERMITTENT DTC
(K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K359) FUEL PRESSURE SENSOR GROUND
(K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K359) FUEL PRESSURE SENSOR GROUND
(K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Fuel Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K350) Fuel Pressure Sensor 5 Volt Supply circuit in the Fuel Pressure Sensor harness connector.

Is the voltage above 4.5 volts?

Yes

- Go to [6](#)

No

- Go to [3](#)

3. (K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K350) Fuel Pressure Sensor 5 Volt Supply circuit in the Fuel Pressure

Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K350) Fuel Pressure Sensor 5 Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K359) FUEL PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K350) Fuel Pressure Sensor 5 Volt Supply circuit and the (K359) Fuel Pressure Sensor Ground circuit in the Fuel Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K350) Fuel Pressure Sensor 5 Volt Supply circuit for a short to the (K359) Fuel Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K350) Fuel Pressure Sensor 5 Volt Supply circuit between the Fuel Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K350) Fuel Pressure Sensor 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL PRESSURE SENSOR

With the scan tool, Clear DTCs.
With the scan tool, select View DTCs.

NOTE: The scan tool should display a Fuel Pressure Sensor high voltage or open DTC with the Fuel Pressure Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Fuel Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. (K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (K181) Fuel Pressure Sensor Signal circuit in the Fuel Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [8](#)

No

- Repair the (K181) Fuel Pressure Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K359) FUEL PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K181) Fuel Pressure Sensor Signal circuit and the (K359) Fuel Pressure Sensor Ground circuit in the Fuel Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [9](#)

No

- Repair the (K181) Fuel Pressure Sensor Signal circuit for a short to the (K359) Fuel Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K181) Fuel Pressure Sensor Signal circuit between the Fuel Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K181) Fuel Pressure Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0193-FUEL RAIL PRESSURE SENSOR HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K181) Fuel Pressure Sensor Signal circuit voltage is above 4.75 volts for 0.14 second.

Possible Causes
INTERMITTENT DTC
(K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K359) FUEL PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K359) FUEL PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time. Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K350) FUEL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Pressure Sensor harness connector.
Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K350) Fuel Pressure Sensor 5 Volt Supply circuit in the Fuel Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K350) Fuel Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K181) FUEL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K181) Fuel Pressure Sensor Signal circuit in the Fuel Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K181) Fuel Pressure Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K359) FUEL PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K359) Fuel Pressure Sensor Ground circuit in the Fuel Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K359) Fuel Pressure Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. FUEL PRESSURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the ASD Relay. Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K359) Fuel Pressure Sensor Ground circuit and the (K181) Fuel Pressure Sensor Signal circuit in the Fuel Pressure Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Fuel Pressure Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Fuel Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (K181) FUEL PRESSURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) connector. Measure the resistance of the (K181) Fuel Pressure Sensor Signal between the Fuel Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K181) Fuel Pressure Sensor Signal for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K359) FUEL PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K359) Fuel Pressure Sensor Ground circuit between the Fuel Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K359) Fuel Pressure Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0201-FUEL INJECTOR 1 CIRCUIT / OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects an open or shorted Fuel Injector 1 control circuit.

Possible Causes
INTERMITTENT DTC
(K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT
(K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR NO. 1
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.
 With the scan tool, Clear DTCs in the Engine Control Module (ECM).
 Attempt to start the engine and test drive the vehicle.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Fuel Injector No. 1 harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K11) Fuel Injector No. 1 High-Side Control circuit in the Fuel Injector No. 1 harness connector.

Is there any voltage present?

Yes

- Repair the (K11) Fuel Injector No. 1 High-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K611) Fuel Injector No. 1 Low-Side Control circuit.

Is there any voltage present?

Yes

- Repair the (K611) Fuel Injector No. 1 Low-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay..

Measure the resistance between ground and the (K11) Fuel Injector No. 1 High-Side Control circuit in the Fuel Injector No. 1 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K11) Fuel Injector No. 1 High-Side

- Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K611) Fuel Injector No. 1 Low-Side Control circuit in the Fuel Injector No. 1 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K611) Fuel Injector No. 1 Low-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K11) Fuel Injector No. 1 High-Side Control circuit and the (K611) Fuel Injector No.

1 Low-Side Control circuit in the Fuel Injector No. 1 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [7](#)

No

- Repair the (K11) Fuel Injector No. 1 High-Side Control circuit for a short to the (K611) Fuel Injector No. 1 Low-Side Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K11) FUEL INJECTOR NO. 1 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K11) Fuel Injector No. 1 High-Side Control circuit between the Fuel Injector No. 1 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K11) Fuel Injector No. 1 High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K611) FUEL INJECTOR NO. 1 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K611) Fuel Injector No. 1 Low-Side Control circuit between the Fuel Injector No. 1 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [9](#)

No

- Repair the (K611) Fuel Injector No. 1 Low-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. FUEL INJECTOR NO. 1

Measure the resistance between the terminals of Fuel Injector No. 1.

Is the resistance between 150k and 210k ohms?

Yes

- Go to [10](#)

No

- Replace the Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector No. 1 and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors. Look for the data to change or for the DTC to reset during the wiggle test. Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0202-FUEL INJECTOR 2 CIRCUIT / OPEN

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects an open or shorted Fuel Injector 2 control circuit.

Possible Causes
INTERMITTENT DTC
(K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT
(K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR NO. 2
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Injector No. 2 harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K12) Fuel Injector No. 2 High-Side Control circuit in the Fuel Injector No. 2 harness connector.

Is there any voltage present?**Yes**

- Repair the (K12) Fuel Injector No. 2 High-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

**3. (K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE**

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K612) Fuel Injector No. 2 Low-Side Control circuit.

Is there any voltage present?

Yes

- Repair the (K612) Fuel Injector No. 2 Low-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Remove the jumper wire and install the ASD Relay..
Measure the resistance between ground and the (K12) Fuel Injector No. 2 High-Side Control circuit in the Fuel Injector No. 2 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K12) Fuel Injector No. 2 High-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K612) Fuel Injector No. 2 Low-Side Control circuit in the Fuel Injector No. 2 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K612) Fuel Injector No. 2 Low-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K12) Fuel Injector No. 2 High-Side Control circuit and the (K612) Fuel Injector No. 2 Low-Side Control circuit in the Fuel Injector No. 2 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [7](#)

No

- Repair the (K12) Fuel Injector No. 2 High-Side Control circuit for a short to the (K612) Fuel Injector No. 2 Low-Side Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K12) FUEL INJECTOR NO. 2 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K12) Fuel Injector No. 2 High-Side Control circuit between the Fuel Injector No. 2 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K12) Fuel Injector No. 2 High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K612) FUEL INJECTOR NO. 2 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K612) Fuel Injector No. 2 Low-Side Control circuit between the Fuel Injector No. 2 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [9](#)

No

- Repair the (K612) Fuel Injector No. 2 Low-Side

Control circuit for an open circuit or high resistance.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. FUEL INJECTOR NO. 2

Measure the resistance between the terminals of Fuel Injector No. 2.

Is the resistance between 150k and 210k ohms?

Yes

- Go to [10](#)

No

- Replace the Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector No. 2 and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors. Look for the data to change or for the DTC to reset during the wiggle test. Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0203-FUEL INJECTOR 3 CIRCUIT / OPEN

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects an open or shorted Fuel Injector 3 control circuit.

POSSIBLE CAUSES
INTERMITTENT DTC
(K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT
(K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR NO. 3
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

DIAGNOSTIC TEST

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select view DTCs.

Is the status active for this DTC?**YES**

- GO TO [2](#)

NO

- Refer to the *checking for an intermittent DTC diagnostic procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Injector No. 3 harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD relay connector.

Turn the ignition on.

Measure the voltage of the (K13) Fuel Injector No. 3 High-Side Control circuit in the Fuel Injector No. 3 harness connector.

Is there any voltage present?**Yes**

- Repair the (K13) Fuel Injector No. 3 High-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K613) Fuel Injector No. 3 Low-Side Control circuit in the Fuel Injector No. 3 harness connector.

Is there any voltage present?

Yes

- Repair the (K613) Fuel Injector No. 3 Low-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Remove the jumper wire and install the ASD Relay..
Measure the resistance between ground and the (K13) Fuel Injector No. 3 High-Side Control circuit in the Fuel Injector No. 3 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K13) Fuel Injector No. 3 High-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K613) Fuel Injector No. 3 Low-Side Control circuit in the Fuel Injector No. 3 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K613) Fuel Injector No. 3 Low-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K13) Fuel Injector No. 3 High-Side Control circuit and the (K613) Fuel Injector No. 3 Low-Side Control circuit in the Fuel Injector No. 3 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [7](#)

No

- Repair the (K13) Fuel Injector No. 3 High-Side Control circuit for a short to the (K613) Fuel Injector No. 3 Low-Side Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K13) FUEL INJECTOR NO. 3 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K13) Fuel Injector No. 3 High-Side Control circuit between the Fuel Injector No. 3 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K13) Fuel Injector No. 3 High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K613) FUEL INJECTOR NO. 3 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K613) Fuel Injector No. 3 Low-Side Control circuit between the Fuel Injector No. 3 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [9](#)

No

- Repair the (K613) Fuel Injector No. 3 Low-Side

Control circuit for an open circuit or high resistance.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. FUEL INJECTOR NO. 3

Measure the resistance between the terminals of Fuel Injector No. 3.

Is the resistance between 150k and 210k ohms?

Yes

- Go to [10](#)

No

- Replace the fuel injector in accordance with the service information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector No. 3 and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors. Look for the data to change or for the DTC to reset during the wiggle test. Refer to any technical service bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the service information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0204-FUEL INJECTOR 4 CIRCUIT / OPEN

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects an open or shorted Fuel Injector 4 control circuit.

Possible Causes
INTERMITTENT DTC
(K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT
(K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR NO. 4
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Injector No. 4 harness connector.
Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K14) Fuel Injector No. 4 High-Side Control circuit in the Fuel Injector No. 4 harness connector.

Is there any voltage present?**Yes**

- Repair the (K14) Fuel Injector No. 4 High-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

**3. (K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE**

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K614) Fuel Injector No. 4 Low-Side Control circuit in the Fuel Injector No. 4 harness connector.

Is there any voltage present?

Yes

- Repair the (K614) Fuel Injector No. 4 Low-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Remove the jumper wire and install the ASD Relay..
Measure the resistance between ground and the (K14) Fuel Injector No. 4 High-Side Control circuit in the Fuel Injector No. 4 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K14) Fuel Injector No. 4 High-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K614) Fuel Injector No. 4 Low-Side Control circuit in the Fuel Injector No. 4 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K614) Fuel Injector No. 4 Low-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K14) Fuel Injector No. 4 High-Side Control circuit and the (K614) Fuel Injector No. 4 Low-Side Control circuit in the Fuel Injector No. 4 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [7](#)

No

- Repair the (K14) Fuel Injector No. 4 High-Side Control circuit for a short to the (K614) Fuel Injector No. 4 Low-Side Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K14) FUEL INJECTOR NO. 4 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K14) Fuel Injector No. 4 High-Side Control circuit between the Fuel Injector No. 4 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K14) Fuel Injector No. 4 High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K614) FUEL INJECTOR NO. 4 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K614) Fuel Injector No. 4 Low-Side Control circuit between the Fuel Injector No. 4 harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [9](#)

No

- Repair the (K614) Fuel Injector No. 4 Low-Side

Control circuit for an open circuit or high resistance.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. FUEL INJECTOR NO. 4

Measure the resistance between the terminals of Fuel Injector No. 4.

Is the resistance between 150k and 210k ohms?

Yes

- Go to [10](#)

No

- Replace the Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector No. 4 and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors. Look for the data to change or for the DTC to reset during the wiggle test. Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0219-ENGINE OVERSPEED CONDITION

For a complete wiring diagram **Refer to Section 8W**

◦ When Monitored:

With the engine running.

◦ Set Condition:

The CKP Sensor indicates engine speed is at or above 4800 rpm. NOTE: Engine damage is possible when the engine speed exceeds 4800 rpm.

Possible Causes
INTERMITTENT DTC
CRANKSHAFT POSITION SENSOR WIRING AND CONNECTORS
CRANKSHAFT POSITION SENSOR
DRIVER ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition off.

Check the CKP Sensor wiring between the ECM and CKP harness connectors for poor terminal contact, corrosion or other problems that may cause erratic CKP Sensor signals.

Check the CKP Sensor for damage and proper mounting.

View repair.

No

- Repair or replace as necessary. Refer to the Service Information to check for engine mechanical problems that may have occurred due to excessive engine speed. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0234-TURBOCHARGER OVERBOOST CONDITION

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running and the ECM attempting to govern turbocharger boost pressure.

◦ **Set Condition:**

The Boost Pressure Sensor indicates actual turbocharger boost is greater than the ECM setpoint for engine boost for 0.71 second.

Possible Causes
INTERMITTENT DTC
CLOGGED AIR FILTER
INTAKE/EXHAUST RESTRICTION
INTAKE AIR LEAK
BOOST PRESSURE SERVO MOTOR
TURBOCHARGER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK THE AIR FILTER

Turn the ignition off.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause air flow restriction.

Were any of these problems found?

Yes

- Replace the Air Filter element
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. AIR RESTRICTION

NOTE: Inspect all air intake, crankcase vent, charge air cooler and turbocharger related tubes for damage, restriction or poor connection. Any of these conditions can cause this DTC to set.

NOTE: Inspect the exhaust system and related tubes for damage, restriction or poor connection. Any of these conditions can cause this DTC to set.

Inspect the intake system, exhaust system and related tubes and connections.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK FOR INTAKE SYSTEM AIR LEAKS

Remove the Crankcase Vent Heater.

Remove the Mass Air Flow Sensor from the turbocharger inlet tube.

Seal off and/or plug the turbocharger inlet tube where the MAF sensor was removed.

Connect smoke machine 84-04 to the Crankcase Vent Heater port in the intake duct and begin injecting smoke into the intake system.

Observe all intake system components for evidence of smoke leakage.

Is there evidence of smoke leakage?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. REPLACE THE BOOST PRESSURE SERVO MOTOR

Replace the Boost Pressure Servo Motor in accordance with the Service Information.

NOTE: Ensure the Boost Pressure Servo Motor and ECM harness connectors are connected.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Replace the Turbocharger assembly in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0235-TURBO BOOST PRESSURE SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K37) Boost Pressure Sensor Signal is defective.

Possible Causes
INTERMITTENT DTC
(K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND
(K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.
 Disconnect the Boost Pressure Sensor harness connector.
 Turn the ignition on.
 Measure the voltage of the (K356) Boost Pressure Sensor 5 Volt Supply circuit in the Boost Pressure Sensor harness connector.

Is the voltage above 4.5 volts?

Yes

- Go to [6](#)

No

- Go to [3](#)

3. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Engine Control Module (ECM) harness connectors.
 Measure the resistance between ground and the (K356) Boost Pressure Sensor 5 Volt Supply circuit in the Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K356) Boost Pressure Sensor 5 Volt Supply circuit and the (K656) Boost Pressure Sensor Ground circuit in the Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for a short to the (K656) Boost Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K356) Boost Pressure Sensor 5 Volt Supply circuit between the Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. BOOST PRESSURE SENSOR

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Boost Pressure Sensor high voltage or open DTC with the Boost Pressure Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Boost Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (K37) Boost Pressure Sensor Signal circuit in the Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [8](#)

No

- Repair the (K37) Boost Pressure Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K37) Boost Pressure Sensor Signal circuit and the (K656) Boost Pressure Sensor Ground circuit in the Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [9](#)

No

- Repair the (K37) Boost Pressure Sensor Signal circuit for a short to the (K656) Boost Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K37) Boost Pressure Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0237-TURBO BOOST PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K37) Boost Pressure Sensor Signal circuit voltage is below 0.29 volt for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND
(K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Boost Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K356) Boost Pressure Sensor 5 Volt Supply circuit in the Boost Pressure Sensor harness connector.

Is the voltage above 4.5 volts?

Yes

- Go to [6](#)

No

- Go to [3](#)

3. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connectors.

Measure the resistance between ground and the (K356) Boost Pressure Sensor 5 Volt Supply circuit in the Boost

Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K356) Boost Pressure Sensor 5 Volt Supply circuit and the (K656) Boost Pressure Sensor Ground circuit in the Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for a short to the (K656) Boost Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K356) Boost Pressure Sensor 5 Volt Supply circuit between the Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. BOOST PRESSURE SENSOR

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Boost Pressure Sensor high voltage or open DTC with the Boost Pressure Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Boost Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (K37) Boost Pressure Sensor Signal circuit in the Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [8](#)

No

- Repair the (K37) Boost Pressure Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K37) Boost Pressure Sensor Signal circuit and the (K656) Boost Pressure Sensor Ground circuit in the Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [9](#)

No

- Repair the (K37) Boost Pressure Sensor Signal circuit for a short to the (K656) Boost Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K37) Boost Pressure Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0238-TURBO BOOST PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K37) Boost Pressure Sensor Signal circuit voltage is above 4.70 volts for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K656) BOOST PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K656) BOOST PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time. Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K356) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Boost Pressure Sensor harness connector.
Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K356) Boost Pressure Sensor 5 Volt Supply circuit in the Boost Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K37) Boost Pressure Sensor Signal circuit in the Boost Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K37) Boost Pressure Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K656) Boost Pressure Sensor Ground circuit in the Boost Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K656) Boost Pressure Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. BOOST PRESSURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.
Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K656) Boost Pressure Sensor Ground circuit and the (K37) Boost Pressure Sensor Signal circuit in the Boost Pressure Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Boost Pressure Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Boost Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K37) Boost Pressure Sensor Signal for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K656) Boost Pressure Sensor Ground circuit between the Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K656) Boost Pressure Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors the Boost Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0261-FUEL INJECTOR 1 CIRCUIT LOW

81a781a6

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.
 With the scan tool, erase the ECM DTCs.
 Attempt to start the engine and test drive the vehicle.
 With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect all of the Cylinder Fuel Injector harness connectors.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage of each Fuel Injector High-Side Control circuit.
 Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure 185k ohms (+/- 10%)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 1.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.

Turn the ignition on.

With the scan tool, clear all ECM DTC's.

Disconnect the Cylinder 1 Fuel Injector harness connector.

With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0262-FUEL INJECTOR 1 CIRCUIT HIGH

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect all of the Cylinder Fuel Injector harness connectors.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure 185k ohms (+/- 10%).
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 1.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.
Turn the ignition on.

With the scan tool, clear all ECM DTC's.
Disconnect the Cylinder 1 Fuel Injector harness connector.
With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0263-CYLINDER 1 CONTRIBUTION/BALANCE

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The Engine Control Module (ECM) is unable to stabilize fuel quantity in cylinder 1.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.
 Test drive the vehicle and attempt to duplicate the problem.
 With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes

- Refer to the Service Information to remove and replace fuel throughout the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the symptom Checking the Fuel Supply System and test for proper Fuel pressure from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes

Go To [5](#)

No

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.

Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Check the intake system for air leaks that could affect this cylinder. If found, repair intake system leak as necessary. If o.k. replace the Fuel Injector.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0264-FUEL INJECTOR 2 CIRCUIT LOW

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect all of the Cylinder Fuel Injector harness connectors.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 2.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.
Turn the ignition on.

With the scan tool, clear all ECM DTC's.
Disconnect the Cylinder 1 Fuel Injector harness connector.
With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0265-FUEL INJECTOR 2 CIRCUIT HIGH

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect all of the Cylinder Fuel Injector harness connectors.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 2.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.
Turn the ignition on.

With the scan tool, clear all ECM DTC's.
Disconnect the Cylinder 1 Fuel Injector harness connector.
With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0266-CYLINDER 2 CONTRIBUTION/BALANCE

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The Engine Control Module (ECM) is unable to stabilize fuel quantity in cylinder 2.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.
 Test drive the vehicle and attempt to duplicate the problem.
 With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes

- Refer to the Service Information to remove and replace fuel throughout the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the symptom Checking the Fuel Supply System and test for proper Fuel pressure from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes

Go To [5](#)

No

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.

Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Check the intake system for air leaks that could affect this cylinder. If found, repair intake system leak as necessary. If o.k. replace the Fuel Injector.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0267-FUEL INJECTOR 3 CIRCUIT LOW

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect all of the Cylinder Fuel Injector harness connectors.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure 185k ohms (+/- 10%).
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 3.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.
Turn the ignition on.

With the scan tool, clear all ECM DTC's.
Disconnect the Cylinder 1 Fuel Injector harness connector.
With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0268-FUEL INJECTOR 3 CIRCUIT HIGH

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect all of the Cylinder Fuel Injector harness connectors.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure 185K ohms (+/- 10%).
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 3.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.
Turn the ignition on.

With the scan tool, clear all ECM DTC's.
Disconnect the Cylinder 1 Fuel Injector harness connector.
With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0269-CYLINDER 3 CONTRIBUTION/BALANCE

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The Engine Control Module (ECM) is unable to stabilize fuel quantity in cylinder 3.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.
 Test drive the vehicle and attempt to duplicate the problem.
 With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes

- Refer to the Service Information to remove and replace fuel throughout the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the symptom Checking the Fuel Supply System and test for proper Fuel pressure from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes

Go To [5](#)

No

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.

Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Check the intake system for air leaks that could affect this cylinder. If found, repair intake system leak as necessary. If o.k. replace the Fuel Injector.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0270-FUEL INJECTOR 4 CIRCUIT LOW

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect all of the Cylinder Fuel Injector harness connectors.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure 185K ohms (+/- 10%).
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 4.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.
Turn the ignition on.

With the scan tool, clear all ECM DTC's.
Disconnect the Cylinder 1 Fuel Injector harness connector.
With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0271-FUEL INJECTOR 4 CIRCUIT HIGH

81a781a6

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the engine cranking or running.

- **Set Condition:**

The ECM detects a fault on a Fuel Injector Control circuit.

Possible Causes
ENGINE CONTROL MODULE
INTERMITTENT CONDITION
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR CIRCUITS SHORTED TOGETHER
FUEL INJECTOR CONTROL CIRCUIT OPEN
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (REFER TO 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine and test drive the vehicle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ASD power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect all of the Cylinder Fuel Injector harness connectors.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is the voltage above 1.0 volt for any of the measurements?

Yes

- Repair the appropriate Fuel Injector Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL INJECTOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and each Fuel Injector High-Side Control circuits.

Measure the resistance between ground and each Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. FUEL INJECTOR CIRCUITS SHORTED TOGETHER

Measure the resistance between each of the Fuel Injector High-Side Control circuits and the Fuel Injector Low-Side Control circuits.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the Fuel Injector circuits that measured below 1000 ohms for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. FUEL INJECTOR CONTROL CIRCUIT OPEN

Measure the resistance of each Fuel Injector High-Side and Low-Side Control circuits between its respective injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [7](#)

No

- Repair the appropriate Fuel Injector Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR INTERNAL SHORT TO GROUND

Measure the resistance between either terminal of each Fuel Injector and ground.

Is the resistance above 500k ohms for each measurement?

Yes

- Go to [8](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure above 500k ohms to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. CHECK CYLINDER FUEL INJECTOR RESISTANCE

Measure the resistance of each Fuel Injector (measure across both terminals of the injector).

Is the resistance between 150k and 210k ohms?

Yes

- Go To [9](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Fuel Injector that did not measure 185k ohms (+/- 10%).
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. MULTIPLE CYLINDER FUEL INJECTOR DTC'S

Were there multiple Cylinder Fuel Injector DTC's set in the ECM?

Yes

- Go to [10](#)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Cylinder Fuel Injector 4.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. CYLINDER FUEL INJECTOR

Reconnect all harness connectors.
Turn the ignition on.

With the scan tool, clear all ECM DTC's.
Disconnect the Cylinder 1 Fuel Injector harness connector.
With the scan tool, read the ECM DTC's.

NOTE: The continuing setting of multiple DTC's indicates that the disconnected injector is not the cause of these faults.

NOTE: If multiple DTC's did not reset after disconnecting a single injector, replace the injector that was disconnected. In this case the lack of multiple DTC's setting indicates that the disconnected injector is the cause of these faults.

Choose the correct result below.

The ECM set multiple Cylinder Injector DTC's.

- Reconnect the disconnected Injector harness connector and repeat test by disconnecting another injector until multiple DTC's are not set.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

The ECM set only a DTC for the disconnected Cylinder Injector

- Replace the Cylinder Fuel Injector that was disconnected.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0272-CYLINDER 4 CONTRIBUTION/BALANCE

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The Engine Control Module (ECM) is unable to stabilize fuel quantity in cylinder 4.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.
 Test drive the vehicle and attempt to duplicate the problem.
 With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes

- Refer to the Service Information to remove and replace fuel throughout the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the symptom Checking the Fuel Supply System and test for proper Fuel pressure from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes

Go To [5](#)

No

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.

Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Check the intake system for air leaks that could affect this cylinder. If found, repair intake system leak as necessary. If o.k. replace the Fuel Injector.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0299-TURBOCHARGER UNDERBOOST CONDITION

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running and the ECM attempting to govern turbocharger boost pressure.

◦ **Set Condition:**

The Boost Pressure Sensor indicates actual turbocharger boost is less than the ECM setpoint for engine boost for 0.83 second.

Possible Causes
INTERMITTENT DTC
CLOGGED AIR FILTER
INTAKE AIR RESTRICTION
INTAKE AIR LEAK

BOOST PRESSURE SERVO MOTOR
TURBOCHARGER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle.

With the scan tool, select View DTCs.

NOTE: If there are any EGR related DTC's, repair the EGR DTC's before continuing with this test.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK THE AIR FILTER

Turn the ignition off.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause air flow restriction.

Were any of these problems found?

Yes

- Replace the Air Filter element
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK FOR INTAKE SYSTEM RESTRICTIONS

NOTE: Damaged, restricted or poorly connected intake and turbocharger related tubes can cause this DTC to set.

Turn the ignition off.

Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections.

Inspect the Charge Air Cooler hoses/tubes and connections.

Inspect the EGR Air Flow Control Valve to ensure the valve is not stuck in the closed position.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. CHECK FOR INTAKE SYSTEM AIR LEAKS

Remove the Crankcase Vent Heater.

Remove the Mass Air Flow Sensor from the turbocharger inlet tube.

Seal off and/or plug the turbocharger inlet tube where the MAF sensor was removed.

Connect smoke machine 84-04 to the Crankcase Vent Heater port in the intake duct and begin injecting smoke into the intake system.

Observe all intake system components for evidence of smoke leakage.

Is there evidence of smoke leakage?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. REPLACE THE BOOST PRESSURE SERVO MOTOR

Replace the Boost Pressure Servo Motor in accordance with the Service Information.

NOTE: Ensure the Boost Pressure Servo Motor and ECM harness connectors are connected.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Replace the Turbocharger assembly in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0335-CRANKSHAFT POSITION SENSOR CIRCUIT

01a94782

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Crankshaft Position (CKP) Sensor is a hall effect type sensor. The sensor produces a 5-volt digital signal (square wave). The ECM provides a 5-volt supply, 5-volt sensor signal and ground to the CKP Sensor. The sensor is positioned opposite a magnetic ring at the rear of the crankshaft. The magnetic ring contains internal magnetic strips (electric teeth) that act on the hall-effect switch causing the digital switching of the sensor signal from high (5-volts) to low (0 volts).

- **When Monitored:**

With the engine cranking or running

- **Set Condition:**

The Engine Control Module (ECM) does not receive a signal from the Crankshaft Position Sensor when the Camshaft Position Sensor indicates engine rpm.

Possible Causes
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT OPEN
(K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
CHECKING (K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT
DAMAGED CKP SENSOR OR CRANKSHAFT

(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K24) CKP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
CRANKSHAFT POSITION SENSOR
(K925) CKP SENSOR GROUND CIRCUIT OPEN
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT
(K24) CKP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE -

DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. TEST DRIVE

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. CHECKING (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Go To [4](#)

Voltage is between 4.7 and 5.4 volts.

- Go To [5](#)

Voltage is below 4.7 volts.

- Go To [12](#)

4. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K24) Crankshaft Position Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. CHECKING (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

Measure the voltage of the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Repair the (K853) CKP 5-Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

Voltage is between 4.7 and 5.4 volts.

- Go To [6](#)

Voltage is below 4.7 volts.

- Go To [9](#)

6. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECT Sensor harness connector.
 Connect one end of a jumper wire to the ECT Sensor signal circuit in the ECT Sensor harness connector.
 Connect the other end of the jumper wire to the (K925) CKP Sensor Ground circuit in the Crankshaft Position Sensor harness connector.
 Turn the ignition on.
 With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.

Is the voltage below 0.5 volt?

Yes

- Go To [8](#)

No

- Go To [7](#)

7. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K925) CKP Sensor Ground circuit between the CKP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the ECM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K925) CKP Sensor Ground circuit for an

open.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. DAMAGED CRANKSHAFT POSITION SENSOR OR CRANKSHAFT

Turn the ignition off.

Remove the CKP Sensor.

Inspect the CKP Sensor for conditions such as loose mounting screws, damage, or cracks.

Inspect the Crankshaft magnetic ring for conditions such as damage, or debris.

Is there any evidence of these conditions?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Crankshaft Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K853) CKP Sensor 5-Volt Supply circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [10](#)

No

- Repair the (K853) CKP Sensor 5-Volt Supply circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [11](#)

No

- Repair the (K853) CKP Sensor 5-Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

11. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Measure the resistance between the (K853) CKP Sensor 5-Volt Supply circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K853) CKP Sensor 5-Volt Supply circuit and (K925) CKP Sensor Ground circuits for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

12. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

Disconnect the ECM harness connectors.
Measure the resistance of the (K24) CKP Sensor Signal circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [13](#)

No

- Repair the (K24) CKP Sensor Signal circuit for an open
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

13. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [14](#)

No

- Repair the (K24) CKP Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

14. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Measure the resistance between the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0336-CRANKSHAFT POSITION SENSOR PERFORMANCE

DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. TEST DRIVE

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. CHECKING (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Go To [4](#)

Voltage is between 4.7 and 5.4 volts.

- Go To [5](#)

Voltage is below 4.7 volts.

- Go To [12](#)

4. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (K24) CKP Position Sensor Signal circuit at the CKP Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K24) Crankshaft Position Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. CHECKING (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

Measure the voltage of the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Repair the (K853) CKP 5-Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

Voltage is between 4.7 and 5.4 volts.

- Go To [6](#)

Voltage is below 4.7 volts.

- Go To [9](#)

6. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Disconnect the ECT Sensor harness connector.
 Connect one end of a jumper wire to the ECT Sensor signal circuit in the ECT Sensor harness connector.
 Connect the other end of the jumper wire to the (K925) CKP Sensor Ground circuit in the Crankshaft Position Sensor harness connector.
 With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.

Is the voltage below 0.5 volt?

Yes

- Go To [8](#)

No

- Go To [7](#)

7. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K925) CKP Sensor Ground circuit between the CKP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the ECM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K925) CKP Sensor Ground circuit for an

open.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. DAMAGED CRANKSHAFT POSITION SENSOR OR CRANKSHAFT

Turn the ignition off.

Remove the CKP Sensor.

Inspect the CKP Sensor for conditions such as loose mounting screws, damage, or cracks.

Inspect the Crankshaft magnetic ring for conditions such as damage, or debris.

Is there any evidence of these conditions?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Crankshaft Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K853) CKP Sensor 5-Volt Supply circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [10](#)

No

- Repair the (K853) CKP Sensor 5-Volt Supply circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [11](#)

No

- Repair the (K853) CKP Sensor 5-Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

11. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Measure the resistance between the (K853) CKP Sensor 5-Volt Supply circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K853) CKP Sensor 5-Volt Supply circuit and (K925) CKP Sensor Ground circuits for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

12. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K24) CKP Sensor Signal circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [13](#)

No

- Repair the (K24) CKP Sensor Signal circuit for an open
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

13. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [14](#)

No

- Repair the (K24) CKP Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

14. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Measure the resistance between the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0340-CAMSHAFT POSITION SENSOR CIRCUIT

01a94782

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Camshaft Position (CMP) Sensor is a hall effect type sensor. The sensor produces a 5-volt digital signal (square wave). The ECM provides a 5-volt supply, 5-volt sensor signal and ground to the CMP Sensor. The sensor is positioned opposite a toothed eccentric on the camshaft. As the camshaft rotates, the teeth on the eccentric pass closely to the CMP sensor triggering the hall-effect switch causing the digital switching of the sensor signal from high (5-volts) to low (0 volts).

- **When Monitored:**

With the engine speed above 50 rpm.

- **Set Condition:**

The Engine Control Module (ECM) does not receive a signal from the Camshaft Position Sensor when the Crankshaft Position Sensor indicates engine rpm.

Possible Causes
(K844) CMP 5-VOLT SUPPLY CIRCUIT OPEN

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. TEST DRIVE

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. CHECKING (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.
Disconnect the Camshaft Position Sensor harness connector.
Turn the ignition on.
Measure the voltage of the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Go To [4](#)

Voltage is between 4.7 and 5.4 volts.

- Go To [5](#)

Voltage is below 4.7 volts.

- Go To [12](#)

4. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.
Disconnect the ECM harness connectors.
Remove the ASD Relay.
Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
Turn the ignition on.
Measure the voltage of the (K44) CMP Position Sensor Signal circuit at the CMP Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K44) Camshaft Position Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. CHECKING (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

Measure the voltage of the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Repair the (K844) CMP 5-Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

Voltage is between 4.7 and 5.4 volts.

- Go To [6](#)

Voltage is below 4.7 volts.

- Go To [9](#)

6. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition on.

Disconnect the ECT Sensor harness connector.

Connect one end of a jumper wire to the ECT Sensor signal circuit in the ECT Sensor harness connector.

Connect the other end of the jumper wire to the (K944) CMP Sensor Ground circuit in the Camshaft Position Sensor harness connector.

With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.

Is the voltage below 0.5 volt?

Yes

- Go To [8](#)

No

- Go To [7](#)

7. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance of the (K944) CMP Sensor Ground circuit between the CMP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the ECM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K944) CMP Sensor Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. DAMAGED CAMSHAFT POSITION SENSOR OR CAMSHAFT

Turn the ignition off.

Remove the CMP Sensor.

Inspect the CMP Sensor for conditions such as loose mounting screws, damage, or cracks.

Inspect the camshaft for conditions such as damage, debris or cracked teeth.

Is there any evidence of these conditions?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Camshaft Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K844) CMP 5-Volt Supply circuit between the ECM harness connector and the CMP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [10](#)

No

- Repair the (K844) CMP 5-Volt Supply circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [11](#)

No

- Repair the (K844) CMP Sensor 5-Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

11. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT

Measure the resistance between the (K844) CMP Sensor 5-Volt Supply circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K844) CMP Sensor 5-Volt Supply circuit and (K944) CMP Sensor Ground circuits for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

12. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K44) CMP Sensor Signal circuit between the ECM harness connector and the CMP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [13](#)

No

- Repair the (K44) CMP Sensor Signal circuit for an open
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

13. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [14](#)

No

- Repair the (K44) CMP Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

14. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT

Measure the resistance between the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0341-CAMSHAFT POSITION SENSOR PERFORMANCE

01a94782

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Camshaft Position (CMP) Sensor is a hall effect type sensor. The sensor produces a 5-volt digital signal (square wave). The ECM provides a 5-volt supply, 5-volt sensor signal and ground to the CMP Sensor. The sensor is positioned opposite a toothed eccentric on the camshaft. As the camshaft rotates, the teeth on the eccentric pass closely to the CMP sensor triggering the hall-effect switch causing the digital switching of the sensor signal from high (5-volts) to low (0 volts).

- **When Monitored:**

With the engine speed above 50 rpm.

- **Set Condition:**

The Engine Control Module (ECM) does not receive a signal from the Camshaft Position Sensor when the Crankshaft Position Sensor indicates engine rpm.

Possible Causes
(K844) CMP 5-VOLT SUPPLY CIRCUIT OPEN
(K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
CHECKING (K844) CMP 5-VOLT SUPPLY CIRCUIT
DAMAGED CMP SENSOR OR CAMSHAFT
ECM
(K944) CMP SENSOR GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
(K44) CMP SENSOR SIGNAL CIRCUIT OPEN
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
CAMSHAFT POSITION SENSOR
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. TEST DRIVE

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. CHECKING (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.
 Disconnect the Camshaft Position Sensor harness connector.
 Turn the ignition on.
 Measure the voltage of the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Go To [4](#)

Voltage is between 4.7 and 5.4 volts.

- Go To [5](#)

Voltage is below 4.7 volts.

- Go To [12](#)

4. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage of the (K44) CMP Position Sensor Signal circuit at the CMP Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K44) Camshaft Position Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. CHECKING (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

Measure the voltage of the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

- Repair the (K844) CMP 5-Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

Voltage is between 4.7 and 5.4 volts.

- Go To [6](#)

Voltage is below 4.7 volts.

- Go To [9](#)

6. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECT Sensor harness connector.
 Connect one end of a jumper wire to the ECT Sensor signal circuit in the ECT Sensor harness connector.
 Connect the other end of the jumper wire to the (K944) CMP Sensor Ground circuit in the Camshaft Position Sensor harness connector.
 Turn the ignition on.
 With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.

Is the voltage below 0.5 volt?

Yes

- Go To [8](#)

No

- Go To [7](#)

7. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K944) CMP Sensor Ground circuit between the CMP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the ECM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K944) CMP Sensor Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. DAMAGED CAMSHAFT POSITION SENSOR OR CAMSHAFT

Turn the ignition off.

Remove the CMP Sensor.

Inspect the CMP Sensor for conditions such as loose mounting screws, damage, or cracks.

Inspect the camshaft for conditions such as damage, debris or cracked teeth.

Is there any evidence of these conditions?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Replace the Camshaft Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K844) CMP 5-Volt Supply circuit between the ECM harness connector and the CMP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [10](#)

No

- Repair the (K844) CMP 5-Volt Supply circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [11](#)

No

- Repair the (K844) CMP Sensor 5-Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

11. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT

Measure the resistance between the (K844) CMP Sensor 5-Volt Supply circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K844) CMP Sensor 5-Volt Supply Circuit and (K944) CMP Sensor Ground circuits for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

12. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (K44) CMP Sensor Signal circuit between the ECM harness connector and the CMP Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [13](#)

No

- Repair the (K44) CMP Sensor Signal circuit for an open
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

13. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [14](#)

No

- Repair the (K44) CMP Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

14. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT

Measure the resistance between the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit for a short together.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0383-GLOW PLUG CONTROL MODULE CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The ECM detects an open or short to ground on the (K202) Glow Plug Module Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND
(K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GLOW PLUG MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Glow Plugs.

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

2. (K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Glow Plug Module harness connector.
 Disconnect the Engine Control Module (ECM) harness connectors.
 Measure the resistance between ground and the (K202) Glow Plug Module Control circuit in the Glow Plug Module harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (K202) Glow Plug Module Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K202) Glow Plug Module Control circuit between the Glow Plug Module harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Glow Plug Control Module.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K202) Glow Plug Module Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0384-GLOW PLUG CONTROL MODULE CONTROL CIRCUIT HIGH

81a70293

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a short to voltage on the (K202) Glow Plug Module Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Glow Plugs.

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

(K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO VOLTAGE

2.

Turn the ignition off.
 Disconnect the Glow Plug Module harness connector.
 Disconnect the Engine Control Module (ECM) harness connectors.
 Turn the ignition on.
 Measure the voltage of the (K202) Glow Plug Module Control circuit.

Is the voltage below 0.5 volt?

Yes

- Replace the Glow Plug Control Module.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K202) Glow Plug Module Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0401-EGR SOLENOID CIRCUIT NEGATIVE DEVIATION

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects EGR flow is less than the requested flow.

Possible Causes
AIR FILTER
AIR RESTRICTION
CHECKING FOR AIR LEAKS
CHECKING THE EGR AIR FLOW CONTROL VALVE
CHECKING THE EGR COOLER AND TUBES
EGR VALVE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and monitor the scan tool for ECM DTCs.

NOTE: If there are any Mass Air Flow DTC's, diagnose the MAF DTC's before continuing EGR diagnostics.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. AIR FILTER

Turn the ignition off.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause air flow restriction.

Were any of these problems found?**Yes**

- Replace the Air Filter element.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. AIR RESTRICTION

NOTE: Inspect all air intake, crankcase vent and turbocharger related tubes for damage, restriction or poor connection. Any of these conditions can cause this DTC to set.

NOTE: Inspect the exhaust system and related tubes for damage, restriction or poor connection. Any of these conditions can cause this DTC to set.

Inspect the intake system, exhaust system and related tubes and connections.

Were any problems found?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECKING FOR AIR LEAKS

Remove the Inlet Pressure Sensor.

Connect smoke machine 84-04 to the Inlet Pressure Sensor port in the intake duct and begin injecting smoke into the intake system.

Observe all intake system components for evidence of smoke leakage.

Is there evidence of smoke leakage?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECKING EGR AIR FLOW CONTROL VALVE (EGR AFCV)

Disconnect the air tube at the inlet port of the EGR Air Flow Control Valve.

Turn the ignition on.

Use a mirror to observe the motion of the EGR Air Flow Control Valve in the following step.

NOTE: The EGR AFCV should be normally open (allowing full air flow) then close during actuation.

With the scan tool, actuate the “Throttle Valve” while observing the EGR Air Flow Control Valve.

Does the EGR AFCV close completely when actuated?

Yes

- Go To [6](#)

No

- Replace the EGR Air Flow Control Valve.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. CHECKING EGR COOLER AND TUBES

Turn the ignition off.

Gain access to and inspect the EGR Cooler and both tubes that connect to the EGR Cooler. Check tubes and cooler for damage, leaks, excessive carbon build up and other problems that could restrict or prevent proper exhaust gas flow.

NOTE: Compressed air (at low pressure) can be applied to the lower port of the EGR Cooler. When applying compressed air check for air to flow through cooler and out the upper port. Always wear safety glasses when working with compressed air.

Were any problems found?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECKING THE EGR VACUUM SUPPLY

Refer to the symptom Checking The EGR Vacuum Supply to check for proper EGR vacuum supply and EGR Solenoid operation.

Were any problems found?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the EGR Valve.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0402-EGR SOLENOID CIRCUIT POSITIVE DEVIATION

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects EGR flow is more than the requested flow.

Possible Causes
AIR FILTER
AIR RESTRICTION
CHECKING FOR AIR LEAKS
CHECKING THE EGR AIR FLOW CONTROL VALVE
CHECKING THE EGR COOLER AND TUBES
EGR VALVE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and monitor the scan tool for ECM DTCs.

NOTE: If there are any Mass Air Flow DTC's, diagnose the MAF DTC's before continuing EGR diagnostics.

Did this DTC set again?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. AIR FILTER

Turn the ignition off.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause air flow restriction.

Were any of these problems found?**Yes**

- Replace the Air Filter element.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. AIR RESTRICTION

NOTE: Inspect all air intake, crankcase vent and turbocharger related tubes for damage, restriction or poor connection. Any of these conditions can cause this DTC to set.

NOTE: Inspect the exhaust system and related tubes for damage, restriction or poor connection. Any of these conditions can cause this DTC to set.

Inspect the intake system, exhaust system and related tubes and connections.

Were any problems found?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECKING FOR AIR LEAKS

Remove the Inlet Pressure Sensor.

Connect smoke machine 84-04 to the Inlet Pressure Sensor port in the intake duct and begin injecting smoke into the intake system.

Observe all intake system components for evidence of smoke leakage.

Is there evidence of smoke leakage?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECKING EGR AIR FLOW CONTROL VALVE (EGR AFCV)

Disconnect the air tube at the inlet port of the EGR Air Flow Control Valve.

Turn the ignition on.

Use a mirror to observe the motion of the EGR Air Flow Control Valve in the following step.

NOTE: The EGR AFCV should be normally open (allowing full air flow) then close during actuation.

With the scan tool, actuate the “Throttle Valve” while observing the EGR Air Flow Control Valve.

Does the EGR AFCV close completely when actuated?

Yes

- Go To [6](#)

No

- Replace the EGR Air Flow Control Valve.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. CHECKING EGR COOLER AND TUBES

Turn the ignition off.

Gain access to and inspect the EGR Cooler and both tubes that connect to the EGR Cooler. Check tubes and cooler for damage, leaks, excessive carbon build up and other problems that could restrict or prevent proper exhaust gas flow.

NOTE: Compressed air (at low pressure) can be applied to the lower port of the EGR Cooler. When applying compressed air check for air to flow through cooler and out the upper port. Always wear safety glasses when working with compressed air.

Were any problems found?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECKING THE EGR VACUUM SUPPLY

Refer to the symptom Checking The EGR Vacuum Supply to check for proper EGR vacuum supply and EGR Solenoid operation.

Were any problems found?**Yes**

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the EGR Valve.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0403-EGR SOLENOID CIRCUIT OPEN

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The EGR Solenoid is a two-wire electrically operated vacuum solenoid used to control the vacuum supply to the EGR Solenoid. The Solenoid receives 12 volts from the ECM/ASD relay and a pulse-width modulated ground signal from the ECM. The solenoid contains 2 vacuum ports. Vacuum from the vacuum pump system is supplied to one of the ports. The other port is connected to the EGR Solenoid. With the solenoid de-energized (off) the vacuum supply is blocked within the solenoid, prohibiting vacuum from reaching the EGR Solenoid. When the ECM energizes (grounds) the solenoid, the vacuum supply is applied to the EGR Solenoid causing the EGR Solenoid to open.

- **When Monitored:**

With the ignition on and the EGR Solenoid command off.

- **Set Condition:**

The ECM detects an open on the (K35) EGR Solenoid Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
EGR SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Exhaust Gas Recirc Positioner.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the EGR Solenoid harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K35) EGR Solenoid Control circuit in the EGR Solenoid harness connector.

Is the resistance above 1000 ohms?**Yes**

- Go to [3](#)

No

- Repair the (K35) EGR Solenoid Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**3. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE**

Measure the resistance of the (K35) EGR Solenoid Control circuit between the EGR Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?**Yes**

- Go to [4](#)

No

- Repair the (K35) EGR Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Connect the Engine Control Module (ECM) connector.
Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit at the EGR Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [5](#)

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. EGR SOLENOID

With the scan tool, actuate the Exhaust Gas Recirc Positioner to 100%.

Using a 12 volt test light connected to 12 volts, check the (K35) EGR Solenoid Control circuit in the EGR Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright?

Yes

- Replace the EGR Solenoid in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0480-COOLING FAN 1 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The ECM is requesting the TIPM to turn on the Cooling Fan On and it is not operating.

Possible Causes
CAN C BUS FAILURE
ENGINE COOLANT TEMP SENSOR DTCS SET
COOLING FAN CONTROL CIRCUIT DTCS SET IN THE TIPM
ECM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. COOLING FAN RELAY OPERATION

Ignition on, engine not running.

With a scan tool, actuate the Cooling Fan.

Is the Cooling Fan operating?

Yes

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. CAN C or ECT DTCS CURRENTLY ACTIVE

Are any CAN C or ECT DTCs Active at this time?

Yes

- Refer to the appropriate diagnostics for the ECT Sensor or CAN C Bus DTC.

No

- Go To [3](#)

3. COOLING FAN CONTROL CIRCUIT DTCS SET IN THE TIPM

Are any Cooling Fan Control Circuit DTCs set in the TIPM?**Yes**

- Diagnose the appropriate Cooling Fan Control Circuit DTC in the TIPM

No

- Go To [4](#)

4. ECM

NOTE: Before continuing, check the ECM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0481-COOLING FAN 2 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The ECM is requesting the TIPM to turn on the Cooling Fan On and it is not operating.

Possible Causes
CAN C BUS FAILURE
ENGINE COOLANT TEMP SENSOR DTCS SET
COOLING FAN CONTROL CIRCUIT DTCS SET IN THE TIPM
ECM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. COOLING FAN RELAY OPERATION

Ignition on, engine not running.

With a scan tool, actuate the Cooling Fan High Speed Relay.

Is the Cooling Fan operating?

Yes

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CAN C or ECT DTCS CURRENTLY ACTIVE

Are any CAN C or ECT DTCs Active at this time?

Yes

- Refer to the appropriate diagnostics for the ECT Sensor or CAN C Bus DTC.

No

- Go To [3](#)

3. COOLING FAN CONTROL CIRCUIT DTCS SET IN THE TIPM

Are any Cooling Fan Control Circuit DTCs set in the TIPM?**Yes**

- Diagnose the appropriate Cooling Fan Control Circuit DTC in the TIPM

No

- Go To [4](#)

4. ECM

NOTE: Before continuing, check the ECM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0489-EGR CONTROL CIRCUIT LOW

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The EGR Solenoid is a two-wire electrically operated vacuum solenoid used to control the vacuum supply to the EGR Valve. The Solenoid receives 12 volts from the ECM/ASD relay and a pulse-width modulated ground signal from the ECM. The solenoid contains 2 vacuum ports. Vacuum from the vacuum pump system is supplied to one of the ports. The other port is connected to the EGR Valve. With the solenoid de-energized (off) the vacuum supply is blocked within the solenoid, prohibiting vacuum from reaching the EGR Valve. When the ECM energizes (grounds) the solenoid, the vacuum supply is applied to the EGR Valve causing the EGR Valve to open.

- **When Monitored:**

With the ignition on and the EGR Solenoid command off.

- **Set Condition:**

The ECM detects a short to ground on the (K35) EGR Solenoid Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EGR SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Solenoid at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the EGR Solenoid harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K35) EGR Solenoid Control circuit in the EGR Solenoid harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (K35) EGR Solenoid Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K35) EGR Solenoid Control circuit between the EGR Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the EGR Solenoid.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K35) EGR Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0490-EGR CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The EGR Solenoid is a two-wire electrically operated vacuum solenoid used to control the vacuum supply to the EGR Valve. The Solenoid receives 12 volts from the ECM/ASD relay and a pulse-width modulated ground signal from the ECM. The solenoid contains 2 vacuum ports. Vacuum from the vacuum pump system is supplied to one of the ports. The other port is connected to the EGR Valve. With the solenoid de-energized (off) the vacuum supply is blocked within the solenoid, prohibiting vacuum from reaching the EGR Valve. When the ECM energizes (grounds) the solenoid, the vacuum supply is applied to the EGR Valve causing the EGR Valve to open.

- **When Monitored:**

With the ignition on and the EGR Solenoid command on.

- **Set Condition:**

The ECM detects excessive current on the (K35) EGR Solenoid Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EGR SOLENOID
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Solenoid at 100%.

Monitor the scan tool for at least two minutes.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the EGR Solenoid harness connector.

Disconnect the Engine Control Module harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K35) EGR Solenoid Control circuit in the EGR Solenoid harness connector.

Is there any voltage present?

Yes

- Repair the (K35) EGR Solenoid Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Turn the ignition off.

Measure the resistance between the (K35) EGR Solenoid Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the EGR Solenoid harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K35) EGR Solenoid Control circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K35) EGR Solenoid Control circuit between the EGR Solenoid harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the EGR Solenoid.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K35) EGR Solenoid Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0504-BRAKE SWITCH A/B CORRELATION

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on. VSS indicates increasing and decreasing vehicle speed. APP Sensor indicates increasing and decreasing acceleration demand.

- **Set Condition:**

The ECM determines that the brakes have been applied without the receiving an input from the Primary Brake Switch Signal and Secondary Brake Switches.

Possible Causes
INTERMITTENT CONDITION
(Z914) GROUND CIRCUIT OPEN
STOP LAMP SWITCH
(F941) IGNITION SWITCH START/RUN CIRCUIT
(B15) BRAKE SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
(B15) BRAKE SWITCH 1 SIGNAL CIRCUIT OPEN
(B16) BRAKE SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B16) BRAKE SWITCH 2 SIGNAL CIRCUIT OPEN
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK THE BRAKE SWITCH 2 STATUS

Turn the ignition on.

While observing the BRAKE SWITCH 2 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH 2: PRESSED and NOT PRESSED for the appropriate pedal position?

Yes

- Go To [2](#)

No

- Go To [11](#)

2. CHECK THE BRAKE SWITCH 1 STATUS

While observing the BRAKE SWITCH 1 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH 1: PRESSED and NOT PRESSED for the appropriate pedal position

Yes

- Go To [3](#)

No

- Go To [4](#)

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

4. (B15) BRAKE SWITCH 1 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.
 Disconnect the Stop Lamp Switch harness connector.
 Turn the ignition on.
 Measure the voltage between the (B15) Brake Switch 1 Signal circuit and ground.

Is the voltage above 9.0 volts?

Yes

- Go To [5](#)

No

- Go To [8](#)

5. STOP LAMP SWITCH - SIGNAL 1 CKT OPEN

While monitoring the BRAKE SWITCH 1 status with the scan tool, connect a jumper wire between (Z914) Ground and the Brake Switch 1 Signal circuit.

Does the scan tool display change from PRESSED to NOT PRESSED?

Yes

- Adjust or replace the Brake Lamp Switch in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (Z914) GROUND CIRCUIT OPEN

Turn the ignition off.
Measure the resistance between ground and the (Z914) Ground circuit.

Is the resistance below 10.0 ohms?

Yes

- Go To [7](#)

No

- Repair the (Z914) Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE - INTERNAL

If there are no possible causes remaining, view repair.

Repair

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (B15) BRAKE SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between ground and the (B15) Brake Switch 1 Signal circuit.

Is the resistance above 1000 ohms?

Yes

- Go To [9](#)

No

- Repair the (B15) Brake Switch 1 Signal circuit for a short to ground.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (B15) BRAKE SWITCH 1 SIGNAL CIRCUIT OPEN

Measure the resistance of the (B15) Brake Switch 1 Signal circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [10](#)

No

- Repair the (B15) Brake Switch 1 Signal circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE - BRAKE SWITCH 1 SIGNAL

If there are no possible causes remaining, view repair.

Repair

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

11. (F941) IGNITION SWITCH START/RUN CIRCUIT OPEN

Turn the ignition off.
Disconnect the Stop Lamp Switch harness connector.
Turn the ignition on.
Using a 12-volt test light connected to ground, check the (F941) Ignition Switch Start/Run circuit.

Does the test light illuminate brightly?

Yes

- Go To [12](#)

No

- Repair the (F941) Ignition Switch Start/Run circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

12. STOP LAMP SWITCH - BRAKE SWITCH 2 SIGNAL OPEN

While monitoring the BRAKE SWITCH 2 status with the scan tool, connect a jumper wire between the Brake Switch 2 Signal circuit and the (F941) Ignition Switch Start/Run circuit.

Does the scan tool display change from PRESSED to NOT PRESSED?

Yes

- Adjust or replace the Brake Lamp Switch in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

81ac2546

No

- Go To [13](#)

13. (B16) BRAKE SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage between the (B16) Brake Switch 2 Signal circuit and ground.

Is the voltage above 1.0 volt?

Yes

- Repair the (B16) Brake Switch 2 Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [14](#)

81ac261e

14. (B16) BRAKE SWITCH 2 SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B16) Brake Switch 2 Signal circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (B16) Brake Switch 2 Signal circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0513-INVALID SKIM KEY

For a complete wiring diagram **Refer to Section 8W**

◦ When Monitored:

With the ignition on.

◦ Set Condition:

The ECM receives and invalid SKIM Key message from the SKREEM.

Possible Causes
INTERMITTENT DTC
INCORRECT VIN PROGRAMMED IN THE ECM/PCM
UNPROGRAMMED IGNITION KEYS
SKREEM
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR SKREEM COMMUNICATION AND DTCs

Ignition on, engine not running.

With the scan tool, check for proper communication and active DTCs in the SKREEM.

Are any SKREEM communication problems or DTCs present?

Yes

- Refer to the symptom list for problems related to SKREEM Communication and DTCs before continuing.

No

- Go To [2](#)

2. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, clear all ECM DTCs.

Turn the ignition on and off several times pausing 10 seconds between key cycles.

With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes

- Go to [3](#)

No

- Refer to *CHECKING FOR INTERMITTENT DTC in the symptom list. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. REPROGRAM IGNITION KEYS AND RETEST

Turn the ignition on.

With the scan tool, clear all ignition keys out of SKREEM memory.

With the scan tool, reprogram all ignition keys to the SKREEM.

Turn the ignition on and off several times pausing 10 seconds between key cycles.

With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes

- Go to [4](#)

No

- Test complete.

4. REPLACE THE SKREEM AND RETEST

Replace and program the SKREEM in accordance with the Service Information.

Turn the ignition on.

With the scan tool, clear all ECM DTCs.

Turn the ignition on and off several times pausing 10 seconds between key cycles.

With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes

- Replace and program the Engine Control Module in accordance the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test complete.

P0522-ENGINE OIL PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

At engine start-up.

- **Set Condition:**

The ECM detects that the (G6) Oil Pressure Sensor Signal circuit is below 0.25 volt for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K936) OIL PRESSURE SENSOR GROUND CIRCUIT
(G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K936) OIL PRESSURE SENSOR GROUND CIRCUIT
(K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
OIL PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.
 Disconnect the Oil Pressure Sensor harness connector.
 Turn the ignition on.
 Measure the voltage of the (K357) Oil Pressure Sensor 5 Volt Supply circuit in the Oil Pressure Sensor harness connector.

Is the voltage above 4.5 volts?

Yes

- Go to [6](#)

No

- Go to [3](#)

3. (K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (K357) Oil Pressure Sensor 5 Volt Supply circuit in the Oil Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K357) Oil Pressure Sensor 5 Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K936) OIL PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K357) Oil Pressure Sensor 5 Volt Supply circuit and the (K936) Oil Pressure Sensor Ground circuit in the Oil Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K357) Oil Pressure Sensor 5 Volt Supply circuit for a short to the (K936) Oil Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K357) Oil Pressure Sensor 5 Volt Supply circuit between the Oil Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [10](#)

No

- Repair the (K357) Oil Pressure Sensor 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (G6) Oil Pressure Sensor Signal circuit in the Oil Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [7](#)

No

- Repair the (G6) Oil Pressure Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

7. (G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K936) OIL PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (G6) Oil Pressure Sensor Signal circuit and the (K936) Oil Pressure Sensor Ground circuit in the Oil Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [8](#)

No

- Repair the (G6) Oil Pressure Sensor Signal circuit for a short to the (K936) Oil Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (G6) Oil Pressure Sensor Signal circuit between the Oil Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [9](#)

No

- Repair the (G6) Oil Pressure Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. OIL PRESSURE SENSOR

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Oil Pressure Sensor high voltage or open DTC with the Oil Pressure Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Oil Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [10](#)

10. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oil Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0523-ENGINE OIL PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

At engine start-up.

- **Set Condition:**

The ECM detects that the (G6) Oil Pressure Sensor Signal circuit is above 4.6 volts for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K936) OIL PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K936) OIL PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
OIL PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K357) OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Oil Pressure Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K357) Oil Pressure Sensor 5 Volt Supply circuit in the Oil Pressure Sensor harness connector.

Is there any voltage present?**Yes**

- Repair the (K357) Oil Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

**3. (G6) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

NOTE: The jumper wire should still be in place.

Measure the voltage of the (G6) Oil Pressure Sensor Signal circuit in the Oil Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (G6) Oil Pressure Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K936) OIL PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K936) Oil Pressure Sensor Ground circuit in the Oil Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K936) Oil Pressure Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. OIL PRESSURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the ASD Relay. Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K936) Oil Pressure Sensor Ground circuit and the (G6) Oil Pressure Sensor Signal circuit in the Oil Pressure Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Oil Pressure Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Oil Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (G6) OIL PRESSURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (G6) Oil Pressure Sensor Signal between the Oil Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (G6) Oil Pressure Sensor Signal for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K936) OIL PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K936) Oil Pressure Sensor Ground circuit between the Oil Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K936) Oil Pressure Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oil Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0524- ENGINE OIL PRESSURE IS TOO LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine running.

- **Set Condition:**

The Oil Pressure Sensor indicates low oil pressure for 5 seconds.

Possible Causes
MECHANICAL PROBLEM
OIL PRESSURE SENSOR FAILURE
OIL PRESSURE SENSOR CIRCUIT(S) OPEN OR HIGH RESISTANCE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECKING FOR CURRENT DTC

NOTE: Perform Pre-diagnostic test before continuing

NOTE: Ensure the engine oil level is at the specified level and the engine oil filter is the specified filter for this specific engine application.

NOTE: If there are Engine Oil Pressure Sensor circuit High/Low DTC's, repair the circuit High/Low DTC's before continuing with this test.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Start the engine several times, letting the engine run for at least 30 seconds at a time.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure.

2. MECHANICAL PROBLEM

Refer to the Service Information and perform the Engine Oil Pressure Test.

Is the oil pressure within specification?

Yes

- Go To [3](#)

No

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. CHECKING OP SENSOR CIRCUITS

Turn the ignition off.

Disconnect the Oil Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the each of the Oil Pressure Sensor circuits (3) between the Oil Pressure Sensor and the ECM harness connectors.

Is the resistance below 10.0 ohms for each of the measurements?

Yes

- Replace the Oil Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the Oil Pressure Sensor circuit(s) that measured above 10.0 ohms for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0562-ECM VOLTAGE TOO LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects battery voltage of 10.5 volts or less for 20 seconds.

Possible Causes
CHECKING ECM POWER AND GROUNDS
ECM
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

NOTE: This DTC may be caused by a charging system problem. Refer to the Service Information and verify proper charging system operation before continuing.

Test drive the vehicle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Go To [3](#)

2. CHECK POWER AND GROUNDS

Refer to the symptom list and perform the Checking the ECM Power and Ground test.

Were any problem found with the ECM powers and grounds?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

P0563-ECM VOLTAGE TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine running and vehicle speed above 30 km/h.

- **Set Condition:**

The ECM detects battery voltage of 15.0 volts or greater for 5.0 seconds

Possible Causes
CHECKING ECM POWER AND GROUNDS
ECM
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.
With the scan tool, erase ECM DTCs.

NOTE: This DTC may be caused by a charging system problem. Refer to the Service Information and verify proper charging system operation before continuing.

Test drive the vehicle.
Turn the ignition on.
With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Go To [3](#)

2. CHECK POWER AND GROUNDS

Refer to the symptom list and perform the Checking the ECM Power and Ground test.

Were any problem found with the ECM powers and grounds?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

P0573-BRAKE SWITCH STUCK OFF

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on. VSS indicates increasing and decreasing vehicle speed. APP Sensor indicates increasing and decreasing acceleration demand.

- **Set Condition:**

The ECM determines that the brakes have been applied without the receiving an input from the Primary Brake Switch Signal and Secondary Brake Switches.

Possible Causes
INTERMITTENT CONDITION
(Z914) GROUND CIRCUIT OPEN
STOP LAMP SWITCH
(F941) IGNITION SWITCH START/RUN CIRCUIT
(B15) BRAKE SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
(B15) BRAKE SWITCH 1 SIGNAL CIRCUIT OPEN
(B16) BRAKE SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B16) BRAKE SWITCH 2 SIGNAL CIRCUIT OPEN
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK THE BRAKE SWITCH 2 STATUS

Turn the ignition on.

While observing the BRAKE SWITCH 2 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH 2: PRESSED and NOT PRESSED for the appropriate pedal position?

Yes

- Go To [2](#)

No

- Go To [11](#)

2. CHECK THE BRAKE SWITCH 1 STATUS

While observing the BRAKE SWITCH 1 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH 1: PRESSED and NOT PRESSED for the appropriate pedal position

Yes

- Go To [3](#)

No

- Go To [4](#)

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

4. (B15) BRAKE SWITCH 1 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.
 Disconnect the Stop Lamp Switch harness connector.
 Turn the ignition on.
 Measure the voltage between the (B15) Brake Switch 1 Signal circuit and ground.

Is the voltage above 9.0 volts?

Yes

- Go To [5](#)

No

- Go To [8](#)

5. STOP LAMP SWITCH - SIGNAL 1 CKT OPEN

While monitoring the BRAKE SWITCH 1 status with the scan tool, connect a jumper wire between (Z914) Ground and (B15) Brake Switch 1 Signal circuit.

Does the scan tool display change from PRESSED to NOT PRESSED?

Yes

- Adjust or replace the Brake Lamp Switch in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (Z914) GROUND CIRCUIT OPEN

Turn the ignition off.
Measure the resistance between ground and the (Z914) Ground circuit.

Is the resistance below 10.0 ohms?

Yes

- Go To [7](#)

No

- Repair the (Z914) Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE - INTERNAL

If there are no possible causes remaining, view repair.

Repair

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (B15) BRAKE SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between ground and the (B15) Brake Switch 1 Signal circuit.

Is the resistance above 1000 ohms?

Yes

- Go To [9](#)

No

- Repair the (B15) Brake Switch 1 Signal circuit for a short to ground.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (B15) BRAKE SWITCH 1 SIGNAL CIRCUIT OPEN

Measure the resistance of the (B15) Brake Switch 1 Signal circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [10](#)

No

- Repair the (B15) Brake Switch 1 Signal circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

10. ENGINE CONTROL MODULE - BRAKE SWITCH 1 SIGNAL

If there are no possible causes remaining, view repair.

Repair

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

11. (F941) IGNITION SWITCH START/RUN CIRCUIT OPEN

Turn the ignition off.
Disconnect the Stop Lamp Switch harness connector.
Turn the ignition on.
Using a 12-volt test light connected to ground, check the (F941) Ignition Switch Start/Run circuit.

Does the test light illuminate brightly?

Yes

- Go To [12](#)

No

- Repair the (F941) Ignition Switch Start/Run circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

12. STOP LAMP SWITCH - BRAKE SWITCH 2 SIGNAL OPEN

While monitoring the BRAKE SWITCH 2 status with the scan tool, connect a jumper wire between the Brake Switch 2 Signal circuit and the (F941) Ignition Switch Start/Run circuit.

Does the scan tool display change from PRESSED to NOT PRESSED?

Yes

- Adjust or replace the Brake Lamp Switch in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

81ac2546

No

- Go To [13](#)

13. (B16) BRAKE SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage between the (B16) Brake Switch 2 Signal circuit and ground.

Is the voltage above 1.0 volt?

Yes

- Repair the (B16) Brake Switch 2 Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [14](#)

14. (B16) BRAKE SWITCH 2 SIGNAL CIRCUIT OPEN

81ac261e

Turn the ignition off.

Measure the resistance of the (B16) Brake Switch 2 Signal circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (B16) Brake Switch 2 Signal circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0578-S/C SWITCH #1 SIGNAL CIRCUIT STUCK SWITCH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

(V71) S/C Signal #1 indicates that a switch is pressed for more than 1 minute.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V71) S/C SIGNAL #1 CIRCUIT OPEN
(V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND
(V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
 Disconnect the S/C Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the S/C Switch Voltage.
 While monitoring the scan tool, connect a jumper wire between the (V71) S/C Signal #1 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V71) S/C SIGNAL #1 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V71) S/C Signal #1 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V71) S/C Signal #1 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in

accordance with the Service Information.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V71) S/C Signal #1 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V71) S/C Signal #1 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0579-S/C SWITCH #1 SIGNAL CIRCUIT PLAUSIBILITY

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition switch on and no other S/C Switch DTC's present.

◦ **Set Condition:**

The S/C Signal #1 voltage is not within a valid switch signal range.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V71) S/C SIGNAL #1 CIRCUIT OPEN
(V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND
(V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
 Disconnect the S/C Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the S/C Switch Voltage.
 While monitoring the scan tool, connect a jumper wire between the (V71) S/C Signal #1 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V71) S/C SIGNAL #1 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V71) S/C Signal #1 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V71) S/C Signal #1 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in

accordance with the Service Information.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V71) S/C Signal #1 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V71) S/C Signal #1 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0581-S/C SWITCH #1 SIGNAL CIRCUIT VOLTAGE TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The S/C Switch Signal #1 is above 4.90 volts for 0.35 second.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V71) S/C SIGNAL #1 CIRCUIT OPEN
(V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND
(V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
 Disconnect the S/C Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the S/C Switch Voltage.
 While monitoring the scan tool, connect a jumper wire between the (V71) S/C Signal #1 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V71) S/C SIGNAL #1 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V71) S/C Signal #1 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V71) S/C Signal #1 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in

accordance with the Service Information.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V71) S/C Signal #1 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V71) S/C Signal #1 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0580-S/C SWITCH #1 SIGNAL CIRCUIT VOLTAGE TOO LOW

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The S/C Switch Signal #1 is below 0.60 volt for 0.35 second.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V71) S/C SIGNAL #1 CIRCUIT OPEN
(V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND
(V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
 Disconnect the S/C Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the S/C Switch Voltage.
 While monitoring the scan tool, connect a jumper wire between the (V71) S/C Signal #1 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V71) S/C SIGNAL #1 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V71) S/C Signal #1 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V71) S/C Signal #1 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V71) S/C SIGNAL #1 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in

accordance with the Service Information.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V71) S/C Signal #1 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V71) S/C SIGNAL #1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal #1 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V71) S/C Signal #1 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0585-S/C SWITCH PLAUSIBILITY BETWEEN SWITCH #1 AND #2

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a discrepancy between S/C Signal #1 and S/C Signal #2 for 5.0 seconds.

Possible Causes
INTERMITTENT CONDITION
(V71) S/C SIGNAL #1 CIRCUIT OPEN
(V72) S/C SIGNAL #2 CIRCUIT OPEN
(V937) S/C SWITCH GROUND OPEN
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and activate the Speed Control.

At some point during the test drive, press each of the S/C Switch buttons.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. S/C SIGNALS OPEN

Turn the ignition off.

Disconnect the S/C Switch harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (V71) S/C Signal #1 circuit and the (V72) S/C Signal #2 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes

- Go To [3](#)

No

- Repair the S/C Signal circuit(s) for high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (V937) S/C SWITCH GROUND OPEN

Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [4](#)

No

- Repair the S/C Switch Ground circuit for high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. SPEED CONTROL SWITCH

Replace the S/C Switch.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and activate the Speed Control.

At some point during the test drive, press each of the S/C Switch buttons.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- The repair is complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0590-S/C SWITCH #2 SIGNAL CIRCUIT STUCK SWITCH

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The S/C Switch Signal #2 indicates that a switch is pressed for more than 1 minute.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V72) S/C SIGNAL #2 CIRCUIT OPEN
(V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND
(V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
Disconnect the S/C Switch harness connector.
Turn the ignition on.
Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
Turn the ignition on.
With the scan tool, read the S/C Switch Voltage.
While monitoring the scan tool, connect a jumper wire between the (V72) S/C Signal #2 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V72) S/C SIGNAL #2 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V72) S/C Signal #2 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V72) S/C Signal #2 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V72) S/C Signal #2 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V72) S/C Signal #2 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0591-S/C SWITCH #2 SIGNAL CIRCUIT PLAUSIBILITY

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition switch on and no other S/C Switch DTC's present.

◦ **Set Condition:**

The S/C Switch Signal #2 voltage is not within a valid switch signal range.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V72) S/C SIGNAL #2 CIRCUIT OPEN
(V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND
(V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
 Disconnect the S/C Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the S/C Switch Voltage.
 While monitoring the scan tool, connect a jumper wire between the (V72) S/C Signal #2 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V72) S/C SIGNAL #2 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V72) S/C Signal #2 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V72) S/C Signal #2 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V72) S/C Signal #2 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V72) S/C Signal #2 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0592-S/C SWITCH #2 SIGNAL CIRCUIT VOLTAGE TOO LOW

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The S/C Switch Signal #2 is below 0.60 volt for 0.35 second.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V72) S/C SIGNAL #2 CIRCUIT OPEN
(V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND
(V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
 Disconnect the S/C Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the S/C Switch Voltage.
 While monitoring the scan tool, connect a jumper wire between the (V72) S/C Signal #2 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V72) S/C SIGNAL #2 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V72) S/C Signal #2 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V72) S/C Signal #2 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V72) S/C Signal #2 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V72) S/C Signal #2 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0593-S/C SWITCH #2 SIGNAL CIRCUIT VOLTAGE TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The S/C Switch Signal #2 is above 4.80 volts for 0.35 second.

Possible Causes
(V937) S/C SWITCH GROUND OPEN
(V72) S/C SIGNAL #2 CIRCUIT OPEN
(V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND
(V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE

Diagnostic Test

1. VERIFY S/C SIGNAL CIRCUIT VOLTAGE

KEY	SIGNAL 1		SIGNAL 2

RELEASED	4.49	4.56	4.49	4.56
ON-OFF	0.85	1.00	3.67	3.75
SET	3.29	3.39	1.30	1.45
RESUME-ACCEL	3.98	4.05	2.17	2.29
CANCEL	1.72	1.82	2.98	3.08

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition off.
 Disconnect the S/C Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Select the appropriate voltage reading.

4.5 to 5.5 volts.

- Go To [2](#)

Below 4.5 volts.

- Go To [4](#)

Above 5.5 volts.

- Go To [6](#)

2. (V937) S/C SWITCH GROUND OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance of the (V937) S/C Switch Ground circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (V937) S/C Switch Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ECM - SENSOR GROUND OPEN

Reconnect the S/C Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the S/C Switch Voltage.
 While monitoring the scan tool, connect a jumper wire between the (V72) S/C Signal #2 circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire connected?

Yes

- Replace the Speed Control Switch.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (V72) S/C SIGNAL #2 CIRCUIT OPEN

Turn the ignition off.
Disconnect the ECM harness connectors.
Measure the resistance between of the (V72) S/C Signal #2 circuit between the S/C Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (V72) S/C Signal #2 circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (V72) S/C SIGNAL #2 CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (V72) S/C Signal #2 circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (V72) S/C SIGNAL #2 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Signal #2 circuit at the S/C Switch harness connector.

Is the voltage above 1.0 volt?

Yes

- Repair the (V72) S/C Signal #2 circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0606-ECU INTERNAL FAILURE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Engine Control Module (ECM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

With the scan tool, select View DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the Engine Control Module (ECM) wiring and

connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Check for proper ECM power supply from the ignition switch and the ASD relay. Check the ECM for proper ground supply.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0610-ECU VEHICLE OPTIONS MISMATCH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

There is a transmission coding error in the Engine Control Module (ECM).

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

With the scan tool, select View DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK FOR PROPER SOFTWARE AND VARIANT CODING

Use the scan tool and update the variant coding.

Use the scan tool and check for the proper software level in the ECM.

View Repair.

Test Complete

- Test Complete
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0615-STARTER CONTROL CIRCUIT OPEN

STARTER

MODULE-ENGINE CONTROL C2 (DIESEL)

81a798a8

For a complete wiring diagram Refer to Section 8W

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the Starter Relay Control circuit. When the ignition switch is turned to the Start/Crank position, the ECM grounds this signal to indicate a request for Starter Motor operation.

- **When Monitored:**

With the ignition on and the Starter command off.

- **Set Condition:**

The ECM does not detect voltage on the (T752) Engine Starter Relay Control circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine several times.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

2. (T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the TIPM C2 harness connector.
 Disconnect the Engine Control Module (ECM) harness connectors.
 Measure the resistance between ground and the (T752) Starter Relay Control circuit in the TIPM C2 harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (T752) Starter Relay Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (T752) STARTER RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T752) Starter Relay Control circuit between the TIPM C2 harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (T752) Starter Relay Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**P0616-STARTER CONTROL
CIRCUIT LOW**

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the Starter Relay Control circuit. When the ignition switch is turned to the Start/Crank position, the ECM grounds this signal to indicate a request for Starter Motor operation.

- **When Monitored:**

With the ignition on and the Starter command off.

- **Set Condition:**

The ECM detects a short to ground on the (T752) Engine Starter Relay Control circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine several times.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

2. (T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the TIPM C2 harness connector.
 Disconnect the Engine Control Module (ECM) harness connectors.
 Measure the resistance between ground and the (T752) Starter Relay Control circuit in the TIPM harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (T752) Starter Relay Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (T752) STARTER RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T752) Starter Relay Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (T752) Starter Relay Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**P0617-STARTER CONTROL
CIRCUIT HIGH**

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the Starter Relay Control circuit. When the ignition switch is turned to the Start/Crank position, the ECM grounds this signal to indicate a request for Starter Motor operation.

- **When Monitored:**

With the ignition on and the Starter command on.

- **Set Condition:**

The ECM detects a short circuit on the (T752) Engine Starter Relay Control circuit for at 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(T752) STARTER RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine several times.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

2. (T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the TIPM C2 harness connector.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (T752) Starter Relay Control circuit in the TIPM harness connector.

Is there any voltage present?

Yes

- Repair the (T752) Starter Relay Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance of the (T752) Starter Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (T752) Starter Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0627-FUEL PUMP CONTROL CIRCUIT OPEN

01a75673

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the Fuel Pump Relay Control circuit. The ECM grounds this signal to indicate a request for Fuel Pump operation.

- **When Monitored:**

With the ignition on and the Fuel Pump command off.

- **Set Condition:**

The ECM does not detect voltage on the (K31) Fuel Pump Control circuit for 0.50 second.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Pump.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Disconnect the Engine Control Module (ECM) harness connectors.

Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the TIPM harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K31) Fuel Pump Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0628-FUEL PUMP CONTROL CIRCUIT LOW

01a75673

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the Fuel Pump Relay Control circuit. The ECM grounds this signal to indicate a request for Fuel Pump operation.

- **When Monitored:**

With the ignition on and the Fuel Pump command off.

- **Set Condition:**

The ECM detects a short to ground on the (K31) Fuel Pump Control circuit for 0.50 second.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Pump.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0629-FUEL PUMP CONTROL CIRCUIT HIGH

01a75973

For a complete wiring diagram Refer to Section 8W

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the Fuel Pump Relay Control circuit. The ECM grounds this signal to indicate a request for Fuel Pump operation.

- **When Monitored:**

With the ignition on and the Fuel Pump Relay command on.

- **Set Condition:**

The ECM detects a short circuit on the (K31) Fuel Pump Relay Control circuit for 0.50 second.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(K31) FUEL PUMP RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the TIPM C1 harness connector.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K31) Fuel Pump Control circuit in the TIPM harness connector.

Is there any voltage present?

Yes

- Repair the (K31) Fuel Pump Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0642-SENSOR REFERENCE VOLTAGE 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects low voltage on the Sensor Supply 1 circuit for 0.10 seconds.

Possible Causes
INTERMITTENT DTC
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
BOOST PRESSURE SENSOR
FUEL PRESSURE SENSOR
CAMSHAFT POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 1 provides 5 volts to the Camshaft Position Sensor, Boost Pressure Sensor and the Fuel Pressure Sensor.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

With the scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CAMSHAFT POSITION SENSOR

Turn the ignition off.

Disconnect the CMP Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K844) Camshaft Position Sensor 5 Volt Supply circuit at the CMP Sensor harness connector.

Is the voltage above 4.6 volts?

Yes

- Replace the Camshaft Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. BOOST PRESSURE SENSOR

Turn the ignition off.

Disconnect the Boost Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K356) Boost Pressure Sensor 5 Volt Supply circuit at the Boost Pressure Sensor harness connector.

Is the voltage above 4.6 volts?

Yes

- Replace the Boost Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. FUEL PRESSURE SENSOR

Turn the ignition off.
 Disconnect the Fuel Pressure Sensor harness connector.
 Turn the ignition on.
 Measure the voltage of the (K350) Fuel Pressure Sensor 5 Volt Supply circuit at the Fuel Pressure Sensor harness connector.

Is the voltage above 4.6 volts?

Yes

- Replace the Fuel Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance between ground and the (K356) Boost Pressure Sensor 5 Volt Supply circuit at the Boost Pressure Sensor harness connector.
 Measure the resistance between ground and the (K844) Camshaft Position Sensor 5 Volt Supply circuit at the CMP Sensor harness connector.
 Measure the resistance between ground and the (K350) Fuel Pressure Sensor 5 Volt Supply circuit at the Fuel Pressure Sensor harness connector.

Is the resistance above 1000 ohms for each circuit?

Yes

- Go To [6](#)

No

- Repair the 5 Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Inspect the (K844) Camshaft Position Sensor 5 Volt Supply circuit between the CMP harness connector and the ECM harness connector.

Inspect the (F855) Boost Pressure Sensor 5 Volt Supply circuit between the Boost Pressure Sensor harness connector and the ECM harness connector

Inspect the (F855) Fuel Pressure Sensor 5 Volt Supply circuit between the Fuel Pressure Sensor harness connector and the ECM harness connector

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the ECM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0643-SENSOR REFERENCE VOLTAGE 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a short to voltage on the Sensor Supply 1 circuit for 0.10 seconds.

Possible Causes
INTERMITTENT DTC
(K356) BOOST PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K350) FUEL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 1 provides 5 volts to the Camshaft Position Sensor, Boost Pressure Sensor and the Fuel Pressure Sensor.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.
 With the scan tool, erase ECM DTCs.
 Turn the ignition off for 10 seconds.
 Turn the ignition on.
 With the scan tool, View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K356) BOOST PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Boost Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage on the (K356) Boost Pressure Sensor 5 Volt Supply circuit at the Boost Pressure Sensor harness connector.

**Is the voltage below 1.0 volt?****Yes**

- Go To [3](#)

No

- Repair the (K356) Boost Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Camshaft Position Sensor harness connector.

NOTE: The jumper wire should still be in place.

Turn the ignition on.

Measure the voltage on the (K844) Camshaft Position Sensor 5 Volt Supply circuit at the CMP Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Go To [4](#)

No

- Repair the (K844) Camshaft Position Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K350) FUEL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Pressure Sensor harness connector.

NOTE: The jumper wire should still be in place.

Turn the ignition on.

Measure the voltage on the (K350) Fuel Pressure Sensor 5 Volt Supply circuit at the Fuel Pressure Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Go To [5](#)

No

- Repair the (K350) Fuel Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Remove the jumper wire and install the ASD relay.

Inspect the (K356) Boost Pressure Sensor 5 Volt Supply circuit between the Boost Pressure Sensor harness connector and the ECM harness connector.

Inspect the (K844) Camshaft Position Sensor 5 Volt Supply circuit between the CMP harness connector and the ECM harness connector.

Inspect the (K350) Fuel Pressure Sensor 5 Volt Supply circuit between the Fuel Pressure Sensor harness connector and the ECM harness connector

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0645-A/C CLUTCH CONTROL CONTROL CIRCUIT OPEN

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the A/C Compressor Clutch Control circuit. The ECM grounds this signal to indicate a request for A/C Compressor Clutch operation.

- **When Monitored:**

With the ignition on and the A/C Clutch command off.

- **Set Condition:**

The ECM does not detect voltage on the (C13) A/C Clutch Control circuit for 0.50 second.

Possible Causes
INTERMITTENT DTC
(C13) A/C CLUTCH CONTROL CIRCUIT SHORTED TO GROUND
(C13) A/C CLUTCH CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the A/C Clutch.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C13) A/C CLUTCH CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Disconnect the Engine Control Module (ECM) harness connectors.

Measure the resistance between ground and the (C13) A/C Clutch Control circuit in the TIPM harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (C13) A/C Clutch Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (C13) A/C CLUTCH CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C13) A/C Clutch Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (C13) A/C Clutch Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0646-A/C CLUTCH CONTROL CIRCUIT LOW

01a75673

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the A/C Compressor Clutch Control circuit. The ECM grounds this signal to indicate a request for A/C Compressor Clutch operation.

- **When Monitored:**

With the ignition on and the A/C Clutch command off.

- **Set Condition:**

The ECM detects a short to ground on the (C13) A/C Clutch Control circuit for 0.50 seconds.

Possible Causes
INTERMITTENT DTC
(C13) A/C CLUTCH CONTROL CIRCUIT SHORTED TO GROUND
(C13) A/C CLUTCH CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the A/C Clutch.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C13) A/C CLUTCH CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Disconnect the Engine Control Module (ECM) harness connectors.

Measure the resistance between ground and the (C13) A/C Clutch Control circuit in the TIPM harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (C13) A/C Clutch Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (C13) A/C CLUTCH CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C13) A/C Clutch Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (C13) A/C Clutch Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**P0647-A/C CLUTCH CONTROL
CIRCUIT HIGH**

01a75673

Theory of Operation

When the ignition switch is on, the Totally Integrated Power Module (TIPM) sends a 12 volt signal to the ECM on the A/C Compressor Clutch Control circuit. The ECM grounds this signal to indicate a request for A/C Compressor Clutch operation.

- **When Monitored:**

With the ignition on and the A/C Clutch Relay command on.

- **Set Condition:**

The ECM detects a short circuit on the (C13) A/C Clutch Relay Control circuit for 0.50 second.

Possible Causes
INTERMITTENT DTC
(C13) A/C CLUTCH RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(C13) A/C CLUTCH RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start and idle the engine.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to turn the A/C system on.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C13) A/C CLUTCH CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the TIPM C1 harness connector.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (C13) A/C Clutch Control circuit in the TIPM harness connector.

Is there any voltage present?

Yes

- Repair the (C13) A/C Clutch Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (C13) A/C CLUTCH CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance of the (C13) A/C Clutch Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace and program the TIPM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

No

- Repair the (C13) A/C Clutch Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0652-SENSOR REFERENCE VOLTAGE 2 TOO LOW

With the ignition on.

- **Set Condition:**

The ECM detects low voltage on the Sensor Supply 2 circuit for 0.10 seconds

Possible Causes
INTERMITTENT DTC
ACCELERATOR PEDAL POSITION SENSOR
EXHAUST DIFFERENTIAL PRESSURE SENSOR
INLET AIR PRESSURE SENSOR
OIL PRESSURE SENSOR
MASS AIR FLOW SENSOR
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources and one 8–Volt source. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 2 provides 5 volts to the Inlet Pressure Sensor, Exhaust Differential Pressure Sensor, Engine Oil Pressure Sensor, and the Accelerator Pedal Position Sensor 2 and 8 volts to the Mass Air Flow Sensor.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off for 10 seconds.

Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit at the APP Sensor harness connector.

Is the voltage above 4.6 volts?

Yes

- Replace the Accelerator Pedal Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. EXHAUST DIFFERENTIAL PRESSURE SENSOR

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes

- Replace the Exhaust Differential Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. INLET AIR PRESSURE SENSOR

Turn the ignition off.
 Disconnect the Inlet Air Pressure Sensor harness connector.
 Turn the ignition on.
 Measure the voltage of the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes

- Replace the Inlet Air Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. ENGINE OIL PRESSURE SENSOR

Turn the ignition off.
 Disconnect the Engine Oil Pressure Sensor harness connector.

Turn the ignition on.
 Measure the voltage of the (K357) Engine Oil Pressure
 Sensor 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes

- Replace the Engine Oil Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9
 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. MASS AIR FLOW SENSOR

Turn the ignition off.
 Disconnect the MAF Sensor harness connector.
 Turn the ignition on.
 Measure the voltage of the (F888) MAF Sensor 5 Volt
 Supply circuit.

Is the voltage above 4.6 volts?

Yes

- Replace the MAF Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9
 - ENGINE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Measure the resistance between ground and the (F856)

Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit.

Measure the resistance between ground and the (K354)

Exhaust Differential Pressure Sensor 5 Volt Supply circuit.

Measure the resistance between ground and the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit.

Measure the resistance between ground and the (K357)

Engine Oil Pressure Sensor 5 Volt Supply circuit.

Measure the resistance between ground and the (F888) MAF Sensor 8 Volt Supply circuit.

Is the resistance above 1000 ohms for each circuit?

Yes

- Go To [8](#)

No

- Repair the appropriate 5-Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Inspect the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor and the ECM.

Inspect the (K354) Exhaust Gas Pressure Sensor 5 Volt Supply circuit between the Exhaust Differential Pressure Sensor and the ECM.

Inspect the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit between the Inlet Air Pressure Sensor and the ECM.

Inspect the (K357) Oil Pressure Sensor 5 Volt Supply circuit between the Engine Oil Pressure Sensor and the ECM.

Inspect the (F888) MAF Sensor 8 Volt Supply circuit between the MAF Sensor and the ECM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0653-SENSOR REFERENCE VOLTAGE 2 TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a short to voltage on the Sensor Supply 2 circuit for 0.10 seconds.

Possible Causes
INTERMITTENT CONDITION
(F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K357) ENGINE OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(F888) MASS AIR FLOW SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 2 provides 5 volts to the Inlet Pressure Sensor, Exhaust Differential Pressure Sensor, Engine Oil Pressure Sensor, Mass Air Flow Sensor, and the Accelerator Pedal Position Sensor 2.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off for 10 seconds.

Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?**Yes**

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit at the APP Sensor harness connector.

Is there any voltage present?**Yes**

- Repair the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No**

- Go To [3](#)

3. (K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

NOTE: The jumper wire should still be in place.

Turn the ignition on.

Measure the voltage of the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit at the Exhaust Differential Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (K668) INLET AIR PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Inlet Air Pressure Sensor harness connector.

NOTE: The jumper wire should still be in place.

Turn the ignition on.

Measure the voltage of the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit at the Inlet Air Pressure harness connector.

Is there any voltage present?

Yes

- Repair the Inlet Air Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (K357) ENGINE OIL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Engine Oil Pressure Sensor harness connector.

NOTE: The jumper wire should still be in place.

Turn the ignition on.
Measure the voltage of the (K357) Engine Oil Pressure Sensor 5 Volt Supply circuit at the Oil Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the Engine Oil Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (F888) MASS AIR FLOW SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the MAF Sensor harness connector.

NOTE: The jumper wire should still be in place.

Turn the ignition on.
Measure the voltage of the (F888) MAF Sensor 5 Volt Supply circuit at the MAF Sensor harness connector.

Is there any voltage present?

Yes

- Replace the MAF Sensor 5 Volt Supply circuit for a

- short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [Z](#)

7. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Inspect the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor and the ECM.

Inspect the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit between the Exhaust Differential Pressure Sensor and the ECM.

Inspect the (K668) Inlet Air Pressure Sensor 5 Volt Supply circuit between the Inlet Air Pressure Sensor and the ECM.

Inspect the (K357) Engine Oil Pressure Sensor 5 Volt Supply circuit between the Engine Oil Pressure Sensor and the ECM.

Inspect the (F888) MAF Sensor 5 Volt Supply circuit between the MAF Sensor and the ECM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P065A- GENERATOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects that the Generator output is not within specifications.

Possible Causes
GENERATOR BELT
GENERATOR BELT TENSIONER
GENERATOR B+ CIRCUIT OPEN

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR OTHER DTC'S

Turn the ignition on.

With the scan tool, check the ECM for LIN Bus or System Voltage related DTC's.

Are there any LIN Bus or System Voltage related DTCs?

Yes

- Repair other DTCs before continuing.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)
-

2. GENERATOR B+ CIRCUIT

Turn the ignition off.

Using a test light connected to ground, probe the B+ circuit at the generator.

Does the test light illuminate brightly?

Continue

- Go To [3](#)

No

- Repair the Generator B+ circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. CHECK GENERATOR DRIVE BELT

Visually inspect the generator drive belt for glazing, cracks and other problems.

Inspect the generator drive belt and tensioner for proper tension.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)
-

4. TEST DRIVE THE VEHICLE

Turn the ignition on.

With the scan tool, erase DTC's.

Test drive the vehicle.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

- Replace the Generator.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P066A-CYLINDER 1 GLOW PLUG CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command off.

- **Set Condition:**

The ECM detects an open or shorted to ground on the Cylinder 1 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 1
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Glow Plug 1 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A202) Glow Plug 1 Control circuit between the Glow Plug 1 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (A202) Glow Plug 1 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (A202) Glow Plug 1 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is there voltage present on the (A202) Glow Plug 1 Control circuit?

Yes

- Repair the (A202) Glow Plug 1 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG 1

Turn the ignition off.
Refer to the Service Information and replace the Glow Plug 1.
Turn the ignition on.
With the scan tool, erase ECM DTC's.
Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.
With the scan tool, read ECM DTC's.

Does the scan tool display this DTC?

Yes

- Go to [6](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P066C-CYLINDER 2 GLOW PLUG CIRCUIT LOW

81a70293

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command off.

- **Set Condition:**

The ECM detects an open or shorted to ground on the Cylinder 2 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 2
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Glow Plug 2 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A203) Glow Plug 2 Control circuit between the Glow Plug 2 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (A203) Glow Plug 2 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (A203) Glow Plug 2 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

Is there voltage present on the (A203) Glow Plug 2 Control circuit?

Yes

- Repair the (A203) Glow Plug 2 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG 2

Turn the ignition off.
Refer to the Service Information and replace the Glow Plug 2.
Turn the ignition on.
With the scan tool, erase ECM DTC's.
Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.
With the scan tool, read ECM DTC's.

Does the scan tool display this DTC?

Yes

- Go to [6](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P066E-CYLINDER 3 GLOW PLUG CIRCUIT LOW

81a70293

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command off.

- **Set Condition:**

The ECM detects an open or shorted to ground on the Cylinder 3 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 3
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Glow Plug 3 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A204) Glow Plug 3 Control circuit between the Glow Plug 3 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (A204) Glow Plug 3 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (A204) Glow Plug 3 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

Is there voltage present on the (A204) Glow Plug 3 Control circuit?

Yes

- Repair the (A204) Glow Plug 3 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG 3

Turn the ignition off.
Refer to the Service Information and replace the Glow Plug 3.
Turn the ignition on.
With the scan tool, erase ECM DTC's.
Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.
With the scan tool, read ECM DTC's.

Does the scan tool display this DTC?

Yes

- Go to [6](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**P0670-GLOW PLUG CONTROL MODULE CONTROL CIRCUIT
OPEN**

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects an open on the (K202) Glow Plug Module Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND
(K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Glow Plugs.

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

(K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND

2.

Turn the ignition off.
 Disconnect the Glow Plug Module harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (K202) Glow Plug Module Control circuit in the Glow Plug Module harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (K202) Glow Plug Module Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K202) Glow Plug Module Control circuit between the Glow Plug Module harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Glow Plug Control Module.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K202) Glow Plug Module Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command on.

- **Set Condition:**

The ECM detects an open or short on the Cylinder 1 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 1
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Glow Plug 1 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A202) Glow Plug 1 Control circuit between the Glow Plug 1 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (A202) Glow Plug 1 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (A202) Glow Plug 1 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is there voltage present on the (A202) Glow Plug 1 Control circuit?

Yes

- Repair the (A202) Glow Plug 1 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG 1

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 1.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go to [6](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0672-CYLINDER 2 GLOW PLUG CIRCUIT

81a70293

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command on.

- **Set Condition:**

The ECM detects an open or short on the Cylinder 2 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 2
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Glow Plug 2 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A203) Glow Plug 2 Control circuit between the Glow Plug 2 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (A203) Glow Plug 2 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (A203) Glow Plug 2 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

Is there voltage present on the (A203) Glow Plug 2 Control circuit?

Yes

- Repair the (A203) Glow Plug 2 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG 2

Turn the ignition off.
Refer to the Service Information and replace the Glow Plug 2.
Turn the ignition on.
With the scan tool, erase ECM DTCs.
Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.
With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go to [6](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0673-CYLINDER 3 GLOW PLUG CIRCUIT

81a70293

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command on.

- **Set Condition:**

The ECM detects an open or short on the Cylinder 3 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 3
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Glow Plug 3 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A204) Glow Plug 3 Control circuit between the Glow Plug 3 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (A204) Glow Plug 3 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (A204) Glow Plug 3 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

Is there voltage present on the (A204) Glow Plug 3 Control circuit?

Yes

- Repair the (A204) Glow Plug 3 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG 3

Turn the ignition off.
Refer to the Service Information and replace the Glow Plug 3.
Turn the ignition on.
With the scan tool, erase ECM DTCs.
Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.
With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go to [6](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0674-CYLINDER 4 GLOW PLUG CIRCUIT

81a70293

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command on.

- **Set Condition:**

The ECM detects an open or short on the Cylinder 4 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 4
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect Glow Plug 4 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A208) Glow Plug Control circuit between the Glow Plug 4 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go To [3](#)

No

- Repair the (A208) Glow Plug 4 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A208) Glow Plug Control circuit at the Glow Plug 4 harness connector.

Is the resistance below 1000 ohms for any of the measurements?

Yes

- Repair the (A208) Glow Plug 4 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (A208) Glow Plug 4 Control circuit at the Glow Plug 4 harness connector.

Is there voltage present on any of the Glow Plug Control circuits?

Yes

- Repair the (A208) Glow Plug 4 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG

Turn the ignition off.
Connect each Glow Plug connector.
Connect the Glow Plug Module connector.
Turn the ignition on.
With the scan tool, erase ECM DTCs.
Refer to the Service Information and perform the Glow Plug Test on each Glow plug.

Did each Glow Plug pass the test?

Yes

- Go to [6](#)

No

- Replace the appropriate Glow Plug in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P067A-CYLINDER 4 GLOW PLUG CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on and the Glow Plug Module Glow Plug command off.

- **Set Condition:**

The ECM detects an open or shorted to ground on the Cylinder 4 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 4
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTC's.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Glow Plug 4 harness connector.
 Disconnect the Glow Plug Module harness connector.
 Measure the resistance of the (A208) Glow Plug 4 Control circuit between the Glow Plug 4 harness connector and the Glow Plug Module harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [3](#)

No

- Repair the (A208) Glow Plug 4 Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A208) Glow Plug 4 Control circuit at the Glow Plug 4 harness connector.

Is the resistance below 1000 ohms?

Yes

- Repair the (A208) Glow Plug 4 Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (A208) Glow Plug 4 Control circuit at the Glow Plug 4 harness connector.

Is there voltage present on the (A208) Glow Plug 4 Control circuit?

Yes

- Repair the (A208) Glow Plug 4 Control circuit for a short to voltage
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. GLOW PLUG 4

Turn the ignition off.
Refer to the Service Information and replace the Glow Plug 4.
Turn the ignition on.
With the scan tool, erase ECM DTC's.
Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.
With the scan tool, read ECM DTC's.

Does the scan tool display this DTC?

Yes

- Go to [6](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0683-GLOW PLUG MODULE SIGNAL CIRCUIT MALFUNCTION

81a70293

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a malfunction on the (D330) Glow Plug Module Signal or (K202) Glow Plug Module Control circuit.

Possible Causes
ENGINE CONTROL MODULE
GLOW PLUG MODULE
(D330)/(K202) GLOW PLUG MODULE SIGNAL/CONTROL CIRCUIT OPEN
(D330)/(K202) GLOW PLUG MODULE SIGNAL/CONTROL CIRCUIT SHORTED TO GROUND
(D330)/(K202) GLOW PLUG MODULE SIGNAL/CONTROL CIRCUIT SHORTED TO VOLTAGE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

Turn the ignition on and wait at least 90 seconds.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (D330)/(K202) GLOW PLUG MODULE SIG/CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug Module harness connectors.

Disconnect the ECM harness connectors.

Measure the resistance of the (D330) Glow Plug Module Signal circuit between the Glow Plug Module harness and the ECM harness connector.

Measure the resistance of the (K202) Glow Plug Module Control circuit between the Glow Plug Module harness and the ECM harness connector.

Is the resistance below 10.0 ohms for both measurements?

Yes

- Go To [3](#)

No

- Repair the Glow Plug Module circuit(s) that measured above 10.0 ohms for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (D330)/(K202) GLOW PLUG MODULE SIG/CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D330) Glow Plug Module Signal circuit at the Glow Plug Module harness connector.

Measure the resistance between ground and the (K202) Glow Plug Module Control circuit at the Glow Plug Module harness connector.

Is the resistance above 1000 ohms for both measurements?

Yes

- Go To [4](#)

No

- Repair the Glow Plug Module circuit(s) that measured below 1000 ohms for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (D330)/(K202) GLOW PLUG MODULE SIG/CONTROL CIRCUIT SHORTED TO VOLTAGE

Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage of the (D330) Glow Plug Module Signal circuit at the Glow Plug Module harness connector.
 Measure the voltage of the (K202) Glow Plug Module Control circuit at the Glow Plug Module harness connector.

Is the voltage below 1.0 volt for both measurements?

Yes

- Go To [5](#)

No

- Repair the Glow Plug Module circuit(s) that measured above 1.0 volt for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. GLOW PLUG CONTROL MODULE

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Replace the Glow Plug Module in accordance with the Service Information.

Reconnect all connectors.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

P068A-ECM RELAY OFF TOO EARLY

STARTER

MODULE-ENGINE CONTROL C2 (DIESEL)

81a798a8

For a complete wiring diagram Refer to Section 8W

Theory of Operation

When the ignition switch is turned off (ignition power removed from ECM) the ECM continues to drive the ECM/ASD relay on for approximately 20–40 seconds. This period of time is the After-Run Mode of operation. During After-Run the ECM performs several internal and external checks. When After-Run is complete, the ECM switches off the ECM/ASD relay driver and powers off the engine system.

- **When Monitored:**

When the ignition is turned off, during after-run mode of operation.

- **Set Condition:**

The internal ECM timer determines that the ASD Relay has shut off before the AFTER-RUN mode of operation has been completed.

Possible Causes
CHECK FOR OTHER DTCS
INTERMITTENT CONDITION
SUBSTITUTE ASD RELAY
(K51) ASD RELAY CONTROL CIRCUIT OPEN INTERMITTENTLY
ECM POWER AND GROUND CIRCUITS
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR OTHER DTCS

Turn the ignition on.

With the scan tool, check for additional DTCS.

Are other DTCS present?

Yes

- Refer to the Symptom List for diagnosis of the other DTCS before continuing.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CLEAR CODE AND CHECK IF THE DTC RESETS

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles, pausing for at least 40 seconds between each cycle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. ASD RELAY

Turn the ignition off.

Install a known good relay in place of the ASD Relay.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles, pausing for at least 40 seconds between each cycle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [4](#)

No

- Replace the ASD Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K51) ASD RELAY CONTROL CIRCUIT OPEN INTERMITTENTLY

Turn the ignition off.
 Remove the ASD Relay from the TIPM.
 Disconnect the ECM harness connectors.
 Measure the resistance of the ASD Relay Control circuit while wiggling the wiring harness and connectors between the ECM and the TIPM.

Was the resistance above 10.0 ohms at any time while wiggling the wiring harness and connectors?

Yes

- Repair the ASD Relay Control circuit for an intermittent open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK THE ECM POWER AND GROUND CIRCUITS

Turn the ignition off.
 Install the ASD relay.
 Refer to symptom CHECKING THE ECM POWER AND GROUNDS and verify proper Ignition, Battery and Ground circuits at the ECM.

Were any problem found with the ECM Ignition, Battery or Ground circuits?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P068B-ECM RELAY OFF TOO LATE

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

When the ignition switch is turned off (ignition power removed from ECM) the ECM continues to drive the ECM/ASD relay on for approximately 20–40 seconds. This period of time is the After-Run Mode of operation. During After-Run the ECM performs several internal and external checks. When After-Run is complete, the ECM switches off the ECM/ASD relay driver and powers off the engine system.

- **When Monitored:**

When the ignition is turned off, during AFTER-RUN mode of operation.

- **Set Condition:**

The internal ECM timer determines that the ASD Relay remained on for 2.0 seconds once AFTER-RUN mode of operation has been completed.

Possible Causes
CHECK FOR OTHER DTCS
INTERMITTENT CONDITION
SUBSTITUTE ASD RELAY
(K51) ASD RELAY CONTROL CIRCUIT SHORTED TO GROUND INTERMITTENTLY
ASD RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR OTHER DTCS

Turn the ignition on.
With the scan tool, check for additional DTCS.

Are other DTCS present?

Yes

- Refer to the Symptom List for diagnosis of the other DTCs before continuing.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CLEAR CODE AND CHECK IF THE DTC RESETS

Perform several ignition key cycles, pausing for at least 40 seconds between each cycle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [3](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. ASD RELAY

Turn the ignition off.

Install a known good relay in place of the ASD Relay.

Turn the ignition on.

With the scan tool, erase DTCs.

Perform several ignition key cycles, pausing for at least 40 seconds between each cycle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes

- Go To [4](#)

No

- Replace the ASD Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K51) ASD RELAY CONTROL CIRCUIT SHORTED TO GROUND INTERMITTENTLY

Was the resistance below 1000 ohms at any time while wiggling the wiring harness and connectors?

Yes

- Repair the (K51) ASD Relay Control circuit for an intermittent short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. ASD RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage of the ASD Relay Output circuit.

Is the voltage below 1.00 volt?

Yes

- Go To [6](#)

No

- Repair the ASD Relay Output circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. CHECK THE ECM POWER AND GROUND CIRCUITS

Turn the ignition off.
Install the ASD relay.
Refer to symptom **CHECKING THE ECM POWER AND GROUNDS** and verify proper Ignition, Battery and Ground circuits at the ECM.

Were any problem found with the ECM Ignition, Battery or Ground circuits?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0691-COOLING FAN 1 CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The ECM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects an open in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
LOW SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. COOLING FAN RELAY OPERATION

Ignition on, engine not running.

With a scan tool, actuate the Low Speed Cooling Fan Relay, RAD FAN 1.

Is the Cooling Fan operating?

Yes

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. LOW SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the Low Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit.

Remove the Low Speed Cooling Fan Relay and substitute it with a known good Relay.

Ignition on, engine not running.

With a scan tool, actuate the Low Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the Low Speed Cooling Fan Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.
Pay particular attention to all Power and Ground circuits.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0692-COOLING FAN 1 CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The ECM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects a shorted condition in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
LOW SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. COOLING FAN RELAY OPERATION

Ignition on, engine not running.

With a scan tool, actuate the Low Speed Cooling Fan Relay RAD FAN 1.

Is the Cooling Fan operating?

Yes

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. LOW SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the Low Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit.

Remove the Low Speed Cooling Fan Relay and substitute it with a known good Relay.

Ignition on, engine not running.

With a scan tool, actuate the Low Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the Low Speed Cooling Fan Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.
Pay particular attention to all Power and Ground circuits.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0693-COOLING FAN 2 CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

The ECM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects an open or short to ground in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND
(K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT OPEN
HIGH SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. COOLING FAN RELAY OPERATION

Ignition on, engine not running.

With a scan tool, actuate the High Speed Cooling Fan Relay RAD FAN 2.

Is the Cooling Fan operating?

Yes

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. HIGH SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the High Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit.

Remove the High Speed Cooling Fan Relay and substitute it with a known good Relay.
 Ignition on, engine not running.
 With a scan tool, actuate the High Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the High Speed Cooling Fan Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
 Disconnect the C3 TIPM harness connector.
 Remove the High Speed Cooling Fan Relay.
 Measure the resistance between ground and the (K175) High Speed Cooling Fan Relay Control circuit at the relay connection.

Is the resistance below 100 ohms?

Yes

- Repair the short to ground in the (K175) High Speed Cooling Fan Relay Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (K175) High Speed Cooling Fan Relay Control circuit from the C3 TIPM harness connector to the Relay connection.

Is the resistance above 5.0 ohms?

Yes

- Repair the open or excessive resistance in the (K175) High Speed Cooling Fan Relay Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0694-COOLING FAN 2 CONTROL CIRCUIT HIGH

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

- **Set Condition:**

The ECM is requesting the TIPM to turn on the Cooling Fan On and it is not operating. The TIPM detects a short to voltage in the Relay Coil Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
HIGH SPEED COOLING FAN RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. COOLING FAN RELAY OPERATION

Ignition on, engine not running.

With a scan tool, actuate the High Speed Cooling Fan Relay RAD FAN 2.

Is the Cooling Fan operating?

Yes

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. HIGH SPEED COOLING FAN RELAY

Turn the ignition off.

Verify the High Speed Cooling Fan Relay is installed properly and that the terminals are making a tight fit. Remove the High Speed Cooling Fan Relay and substitute it with a known good Relay.

Ignition on, engine not running.
With a scan tool, actuate the High Speed Cooling Fan Relay.

Is the Cooling Fan operating?

Yes

- Replace the High Speed Cooling Fan Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (K175) HIGH SPEED COOLING FAN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the C3 TIPM harness connector.
Remove the High Speed Cooling Fan Relay.
Ignition on, engine not running.
Measure the voltage on the (K175) High Speed Cooling Fan Relay Control circuit at the relay connection.

Is there any voltage present?

Yes

- Repair the short to voltage in the (K175) High Speed Cooling Fan Relay Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.
Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes

- Repair as necessary.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0698-SENSOR REFERENCE VOLTAGE 3 CIRCUIT LOW

81a754a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a low voltage on the Sensor Supply 3 circuit for 0.10 seconds

Possible Causes
INTERMITTENT DTC
CRANKSHAFT POSITION SENSOR
ACCELERATOR PEDAL POSITION SENSOR
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 2 provides 5 volts to the Crankshaft Position Sensor and the Accelerator Pedal Position Sensor 1.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off for 10 seconds.

Turn the ignition on.

With the scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CRANKSHAFT POSITION SENSOR SHORTED TO GROUND

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K853) Crankshaft Position Sensor 5 Volt Supply circuit at the Crankshaft Position Sensor harness connector.

Is the voltage above 4.6 volts?

Yes

- Replace the Crankshaft Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. ACCELERATOR PEDAL POSITION SENSOR 1 SHORTED TO GROUND

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K855) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit at the Accelerator Pedal Position Sensor harness connector.

Is the voltage above 4.6 volts?

Yes

- Replace the Accelerator Pedal Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (K853) Crankshaft Position Sensor 5 Volt Supply circuit at the Crankshaft Position Sensor harness connector.

Measure the resistance between ground and the (F855) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit at the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 1000 ohms for each circuit?

Yes

- Go To [5](#)

No

- Repair the 5-Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Inspect the (K853) Crankshaft Position Sensor 5 Volt Supply circuit between the Crankshaft Position Sensor harness connector and the ECM harness connector.

Inspect the (F855) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the ECM harness connector.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0699-SENSOR REFERENCE VOLTAGE 3 TOO HIGH

81a754a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a short to voltage on the Sensor Supply 3 circuit for 0.10 seconds.

Possible Causes
INTERMITTENT DTC
(F855) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K853) CRANKSHAFT POSITION SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 2 provides 5 volts to the Crankshaft Position Sensor and the Accelerator Pedal Position Sensor 1.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.
 With the scan tool, erase ECM DTCs.
 Turn the ignition off for 10 seconds.
 Turn the ignition on.
 With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F855) ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Accelerator Pedal Position Sensor harness connector.
 Disconnect the ECM harness connectors.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
 Turn the ignition on.
 Measure the voltage on the (F855) Accelerator Pedal Position Sensor 1 5-Volt Supply circuit at the Accelerator Pedal Position Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Go To [3](#)

No

- Repair the (F855) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Crankshaft Position Sensor harness connector.

NOTE: The jumper wire should still be in place.

Turn the ignition on.
 Measure the voltage of the (K853) Crankshaft Position Sensor 5 Volt Supply circuit at the CKP Sensor harness connector.

Is the voltage below 1.0 volt?

Yes

- Go To [4](#)

No

- Repair the (K853) Crankshaft Position Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Remove the jumper wire and install the ASD relay.

Inspect the (K853) Crankshaft Position Sensor 5 Volt Supply circuit between the Crankshaft Position Sensor and the ECM.

Inspect the (F855) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor and the ECM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0830-CLUTCH PEDAL SWITCH CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

While driving the vehicle and shifting gears.

◦ **Set Condition:**

The Engine Control Module (ECM) does not detect changes in the (T141) Clutch Interlock Switch Signal circuit voltage while CAN messages from the Transmission Control Module indicate transmission gear changes.

Possible Causes
INTERMITTENT DTC
(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(Z905) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLUTCH INTERLOCK SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Press and release the clutch pedal several times.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

2. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.
 Disconnect the Clutch Interlock Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is the voltage above 10.0 volts?

Yes

- Go to [3](#)

No

- Go to [5](#)

3. (Z905) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to 12 volts, check the (Z905) Ground circuit in the Clutch Interlock Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [4](#)

No

- Repair the (Z905) Ground for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. CLUTCH INTERLOCK SWITCH

Turn the ignition off.

Connect a jumper wire between the (Z905) Ground circuit and the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

Turn the ignition on.

With the scan tool, monitor the Clutch Interlock status.

NOTE: The scan tool should display the Clutch Interlock status as pressed with the jumper wire in place and not pressed with the jumper wire removed.

Does the scan tool display the status as described above?

Yes

- Replace the Clutch Interlock Switch in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [8](#)

5. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is there any voltage present?

Yes

- Repair the (T141) Clutch Interlock Switch Signal

circuit for a short to voltage.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [7](#)

No

- Repair the (T141) Clutch Interlock Switch Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T141) Clutch Interlock Switch Signal circuit between the Clutch Interlock Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (T141) Clutch Interlock Switch Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Clutch Interlock Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0833-CLUTCH UPSTOP SWITCH PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Engine Control Module (ECM) detects that the (T26) Clutch Upstop Switch Signal circuit signal is implausible.

Possible Causes
INTERMITTENT DTC
(T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
(T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(Z905) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLUTCH INTERLOCK SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Press and release the clutch pedal several times.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.
Disconnect the Clutch Interlock Switch harness connector.
Turn the ignition on.
Measure the voltage of the (T26) Clutch Upstop Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is the voltage above 10.0 volts?

Yes

- Go to [3](#)

No

- Go to [5](#)

3. (Z905) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to 12 volts, check the (Z905) Ground circuit between the Clutch Interlock Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [4](#)

No

- Repair the (Z905) Ground for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. CLUTCH INTERLOCK SWITCH

Turn the ignition off.

Connect a jumper wire between the (Z905) Ground circuit and the (T26) Clutch Upstop Switch Signal circuit in the Clutch Interlock Switch harness connector.

Turn the ignition on.

With the scan tool, monitor the Clutch Upstop status.

NOTE: The scan tool should display the Clutch Interlock status as not pressed with the jumper wire in place and pressed with the jumper wire removed.

Does the scan tool display the status as described above?

Yes

- Replace the Clutch Interlock Switch in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [8](#)

5. (T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.

Turn the ignition on.

Measure the voltage of the (T26) Clutch Upstop Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is there any voltage present?

Yes

- Repair the (T26) Clutch Upstop Switch Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (T26) Clutch Upstop Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [7](#)

No

- Repair the (T26) Clutch Upstop Switch Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T26) Clutch Upstop Switch Signal circuit between the Clutch Interlock Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (T26) Clutch Upstop Switch Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Clutch Interlock Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P1001-IGNITION KEY OFF TIMER PERFORMANCE - TOO FAST

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
BODY CONTROL MODULE
BODY CONTROL MODULE POWER AND GROUNDS
CHECKING FOR OTHER DTCS
CHECKING THE ECT OPERATION
IGNITION SWITCH
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition on key cycles turning the ignition off for 10 seconds between cycles.

Turn the ignition on.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

Turn the ignition on.

Does the scan tool display all FCM and BCM DTC's.

NOTE: Any ECM communication related DTC's in the FCM or BCM must be diagnosed and corrected before continuing to diagnose this DTC.

Are there any ECM communication related DTC's in the FCM or BCM?

Yes

- Refer to the Symptom List and repair communication DTC's before continuing.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Go To [3](#)

3. CHECKING THE ECT OPERATION

Refer to symptom Checking the ECT Sensor and verify proper ECT Sensor operation.

Is the ECT Sensor operating correctly?

Yes

- Go To [4](#)

No

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. IGNITION SWITCH

Refer to the Wiring Information and verify proper ignition switch operation. Turn the ignition key to each position and verifying correct voltage output by back probing the corresponding ignition switch harness connector cavity.

Is the Ignition Switch functioning properly?

Yes

- Go To [5](#)

No

- Repair or replace Ignition Switch, wiring or connectors as necessary.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. VERIFY THAT THE BCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.
Verify that the BCM is active on the bus.

Is the BCM active on the bus?**Yes**

- The condition that caused the code to set is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

P1002-IGNITION KEY OFF TIMER PERFORMANCE - TOO SLOW

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
BODY CONTROL MODULE
BODY CONTROL MODULE POWER AND GROUNDS
CHECKING FOR OTHER DTCS
CHECKING THE ECT OPERATION
IGNITION SWITCH
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition on key cycles turning the ignition off for 10 seconds between cycles.

Turn the ignition on.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

Turn the ignition on.

Does the scan tool display all FCM and BCM DTC's.

NOTE: Any ECM communication related DTC's in the FCM or BCM must be diagnosed and corrected before continuing to diagnose this DTC.

Are there any ECM communication related DTC's in the FCM or BCM?

Yes

- Refer to the Symptom List and repair communication DTC's before continuing.

- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Go To [3](#)

3. CHECKING THE ECT OPERATION

Refer to symptom Checking the ECT Sensor and verify proper ECT Sensor operation.

Is the ECT Sensor operating correctly?

Yes

- Go To [4](#)

No

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. IGNITION SWITCH

Refer to the Wiring Information and verify proper ignition switch operation. Turn the ignition key to each position and verifying correct voltage output at each ignition switch harness connector cavity.

Is the Ignition Switch functioning properly?

Yes

- Go To [5](#)

No

- Repair or replace Ignition Switch, wiring or connectors as necessary.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. VERIFY THAT THE BCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.
Verify that the BCM is active on the bus.

Is the BCM active on the bus?

Yes

- The condition that caused the code to set is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC

CONTROL MODULES - STANDARD PROCEDURE).

No

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

P1453–DIFFERENTIAL PRESSURE SENSOR HOSE BLOCKED

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Diesel particulate filter is an inline canister filter located in the exhaust system between the engine and the muffler. This filter captures and stores ash particles created by the diesel combustion process. This filter is monitored by the ECM with a Differential Pressure Sensor. This sensor measures the difference in exhaust system pressure before and after the particulate filter through tube connections directly to the exhaust pipe. As ash and soot accumulate in the filter, the exhaust pressure at the inlet side of the filter increases as compared to the pressure at the outlet side of the filter.

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects differential pressure that are lower than expected for certain engine operating conditions for 2.0 seconds.

Possible Causes
DAMAGED EXHAUST SYSTEM
LEAKING EXHAUST SYSTEM
HIGH RESISTANCE IN EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUITS
HOSE/TUBE CONNECTIONS TO THE EXHAUST DIFFERENTIAL PRESSURE SENSOR
EXHAUST DIFFERENTIAL PRESSURE SENSOR
DIESEL PARTICULATE FILTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VISUAL INSPECTION

Turn the ignition off.

Visually inspect the Exhaust Differential Pressure Sensor for physical damage, proper electrical connection and proper mechanical connection. Ensure any tubes and/or hoses connected to the sensor are in good working condition and properly connected at all ends.

Visually inspect the entire exhaust system for bent, crushed or otherwise damaged tubes which may cause an

exhaust system restriction.

Inspect the exhaust system for exhaust leaks.

Were any problems found?

Yes

- Repair or replace as necessary.

No

- Go To [2](#)

2. CHECKING THE DIFFERENTIAL PRESSURE SENSOR HOSES

Turn the ignition off.

Disconnect both Differential Pressure Sensor Hoses at the Differential Pressure Sensor.

Apply Low Pressure shop air to each of the disconnected hose ends.

NOTE: The applied air pressure at each hose should flow through the hoses into the DPF Filter.

Does the applied air pressure flow through both hoses into the DPF Filter.

Yes

- Go To [3](#)

No

- Repair or replace blocked hoses or DPF Filter connection tubes. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. EXHAUST DIFFERENTIAL SENSOR CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of each Exhaust Differential Pressure Sensor circuit between the Exhaust Differential Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go To [4](#)

No

- Repair the circuit(s) that measured above 10.0 ohms for high resistance. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. EXHAUST DIFFERENTIAL PRESSURE SENSOR

Turn the ignition off.

Replace the Exhaust Differential Pressure Sensor.

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Replace the Diesel Particulate Filter.

No

- Test Complete.

P1454-DIFFERENTIAL PRESSURE SENSOR FLOW TOO HIGH

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Diesel particulate filter is an inline canister filter located in the exhaust system between the engine and the muffler. This filter captures and stores ash particles created by the diesel combustion process. This filter is monitored by the ECM with a Differential Pressure Sensor. This sensor measures the difference in exhaust system pressure before and after the particulate filter through tube connections directly to the exhaust pipe. As ash accumulates in the filter, the exhaust pressure at the inlet side of the filter increases as compared to the pressure at the outlet side of the filter. The ECM monitors the sensor to determine when to perform a particulate filter regeneration procedure which is designed to clear “burn-off” the ash collected in the filter.

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects incorrect exhaust flow through the particulate filter during certain engine operating conditions.

Possible Causes
DAMAGED EXHAUST SYSTEM
LEAKING EXHAUST SYSTEM
HIGH RESISTANCE IN EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUITS
HOSE/TUBE CONNECTIONS TO THE EXHAUST DIFFERENTIAL PRESSURE SENSOR
EXHAUST DIFFERENTIAL PRESSURE SENSOR
DIESEL PARTICULATE FILTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VISUAL INSPECTION

Turn the ignition off.

Visually inspect the Exhaust Differential Pressure Sensor for physical damage, proper electrical connection and proper mechanical connection. Ensure any tubes and/or hoses connected to the sensor are in good working

condition and properly connected at all ends.

Visually inspect the entire exhaust system for bent, crushed or otherwise damaged tubes which may cause an exhaust system restriction.

Inspect the exhaust system for exhaust leaks.

Were any problems found?

Yes

- Repair or replace as necessary.

No

- Go To [2](#)

2. PARTICULATE FILTER REGENERATION

Start and idle the engine.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, perform the Diesel Particulate Filter Regeneration procedure.

After this procedure is complete, turn the ignition off for 60 seconds.

Test drive the vehicle.

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Go To [3](#)

No

- Test complete.

3. EXHAUST DIFFERENTIAL SENSOR CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of each Exhaust Differential Pressure Sensor circuit between the Exhaust Differential Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go To [4](#)

No

- Repair the circuit(s) that measured above 10.0 ohms for high resistance. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. EXHAUST DIFFERENTIAL PRESSURE SENSOR

Turn the ignition off.

Replace the Exhaust Differential Pressure Sensor.

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Replace the Diesel Particulate Filter.

No

- Test Complete.

P1648-GLOW PLUG MODULE INTERNAL

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Glow Plug Control Module reports an internal fault to the ECM.

Possible Causes
INTERMITTENT DTC
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs.

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the Glow Plug Module wiring and connectors. Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Glow Plug Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P1649-GLOW PLUG MODULE POWER SUPPLY CIRCUIT

81a70293

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the Glow Plugs commanded on.

- **Set Condition:**

The Glow Plug Control Module reports a power supply circuit fault to the ECM.

Possible Causes
INTERMITTENT DTC
(F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT OPEN OR HIGH RESISTANCE
(A29) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
GLOW PLUG MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose and repair any system voltage or ASD Relay DTCs before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Glow Plugs.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Disconnect the Glow Plug Module harness connector.
 Turn the ignition on.
 Using a 12 volt test light connected to ground, check the (F344) Fused ASD Relay Output 2 circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [3](#)

No

- Repair the (F344) Fused ASD Relay Output 2 circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Using a 12 volt test light connected to B+, check the (Z906) Ground circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [4](#)

No

- Repair the (Z906) Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (A29) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to ground, check the (A29) Fused B+ circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [5](#)

No

- Repair the (A29) Fused B+ circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. GLOW PLUG MODULE

Replace the Glow Plug Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, actuate the Glow Plugs.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plug Module and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P1685-SKIM SYSTEM

With the ignition on.

- **Set Condition:**

A communication error occurs between the ECM and SKREEM.

Possible Causes
INTERMITTENT DTC
INCORRECT VIN PROGRAMMING
SKREEM
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR SKREEM COMMUNICATION AND DTCs

Ignition on, engine not running.

With the scan tool, check for proper communication and active DTCs in the SKREEM.

Are any SKREEM communication problems or DTCs present?

Yes

- Refer to the symptom list for problems related to SKREEM Communication and DTCs before continuing.

No

- Go To [2](#)

2. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, clear all ECM DTCs.

Turn the ignition on and off several times pausing 10 seconds between key cycles.

With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?**Yes**

- Go to [3](#)

No

- Refer to *CHECKING FOR INTERMITTENT DTC in the symptom list. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. REPLACE THE SKREEM AND RETEST

Replace and program the SKREEM in accordance with the Service Information.

Turn the ignition on.

With the scan tool, clear all ECM DTCs.

Turn the ignition on and off several times pausing 10 seconds between key cycles.

With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?**Yes**

- Replace and program the Engine Control Module in accordance the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test complete.

P2002–DIESEL PARTICULATE FILTER EFFICIENCY BELOW THRESHOLD

The Diesel particulate filter is an inline canister filter located in the exhaust system between the engine and the muffler. This filter captures and stores ash particles created by the diesel combustion process. This filter is monitored by the ECM with a Differential Pressure Sensor. This sensor measures the difference in exhaust system pressure before and after the particulate filter through tube connections directly to the exhaust pipe. As ash and soot accumulate in the filter, the exhaust pressure at the inlet side of the filter increases as compared to the pressure at the outlet side of the filter.

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects incorrect exhaust flow through the particulate filter during certain engine operating conditions.

Possible Causes
DAMAGED EXHAUST SYSTEM
LEAKING EXHAUST SYSTEM
HIGH RESISTANCE IN EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUITS
HOSE/TUBE CONNECTIONS TO THE EXHAUST DIFFERENTIAL PRESSURE SENSOR
EXHAUST DIFFERENTIAL PRESSURE SENSOR
DIESEL PARTICULATE FILTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECKING FOR OTHER DTC'S

NOTE: This DTC can be set when vehicle is driven only on short trips where exhaust and engine temperatures do not reach operating temperature for 30 minutes or more.

Turn the ignition on.

With the scan tool, read the ECM DTC's.

Are there other DTC's set in the ECM?

Yes

- Repair other DTC's before continuing with this test.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

Diagnostic Test

2. VISUAL INSPECTION

Turn the ignition off.

Visually inspect the Exhaust Differential Pressure Sensor for physical damage, proper electrical connection and proper mechanical connection. Ensure any tubes and/or hoses connected to the sensor are in good working condition and properly connected at all ends.

Visually inspect the entire exhaust system for bent, crushed or otherwise damaged tubes which may cause an exhaust system restriction.

Inspect the exhaust system for exhaust leaks.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. PARTICULATE FILTER REGENERATION

Start and idle the engine.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, perform the Diesel Particulate Filter Regeneration procedure.

After this procedure is complete, turn the ignition off for 60 seconds.

Test drive the vehicle.

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Go To [4](#)

No

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of each Exhaust Differential Pressure Sensor circuit between the Exhaust Differential Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go To [5](#)

No

- Repair the circuit(s) that measured above 10.0 ohms for high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. EXHAUST DIFFERENTIAL PRESSURE SENSOR

Replace the Exhaust Differential Pressure Sensor.

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Replace the Diesel Particulate Filter.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2032-EXHAUST GAS TEMPERATURE SENSOR CIRCUIT LOW - BANK 1 SENSOR 2

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects that the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit is shorted to ground.

Possible Causes
INTERMITTENT DTC
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
POST-CATALYST EXHAUST TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Post-Catalyst Exhaust Temperature Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit and the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for a short to the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit between the Post-Catalyst Exhaust Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. POST-CATALYST EXHAUST TEMPERATURE SENSOR

Connect the Engine Control Module (ECM) connector.

Turn the ignition on.

With the scan tool, clear DTCs.

With the scan tool, select View DTCs.

Monitor the scan tool for at least two minutes.

NOTE: The scan tool should display a Post-Catalyst Exhaust Temperature Sensor high voltage or open circuit DTC with the Post-Catalyst Exhaust Temperature Sensor connector disconnected.

Does the scan tool display the DTC as described above?

Yes

- Replace the Post-Catalyst Exhaust Temperature Sensor in accordance with the service information.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Post-Catalyst Exhaust Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2033-EXHAUST GAS TEMPERATURE SENSOR CIRCUIT HIGH - BANK 1 SENSOR 2

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The Post-Catalyst Exhaust Temperature Sensor Signal is above 1000°C.

Possible Causes
INTERMITTENT DTC
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
POST-CATALYST EXHAUST TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Post-Catalyst Exhaust Temperature Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit between the Post-Catalyst Exhaust Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit between the Post-Catalyst Exhaust Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

6. POST-CATALYST EXHAUST TEMPERATURE SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Remove the jumper wire from between cavity 30 and cavity 87 of the ASD Relay Connector.

Install the ASD Relay.

Connect a jumper wire between the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit and the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Post-Catalyst Exhaust Temperature Sensor low voltage or short to

ground DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes

- Replace the Post-Catalyst Exhaust Temperature Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Post-Catalyst Exhaust Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2084-EXHAUST GAS TEMPERATURE SENSOR CIRCUIT PERFORMANCE - BANK 1 SENSOR 2

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The Engine Control Module (ECM) detects that the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit voltage is implausible.

Possible Causes
INTERMITTENT DTC
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND
(K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
POST-CATALYST EXHAUST TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Post-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Post-Catalyst Exhaust Temperature Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Go to [3](#)

3. (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit in the Post-Catalyst

Exhaust Temperature Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Go to [4](#)

4. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD relay.

Measure the resistance between ground and the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit and the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit in the Post-Catalyst Exhaust Temperature

Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for a short to the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (K353) POST-CATALYST EXHAUST TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit between the Post-Catalyst Exhaust Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K915) POST-CATALYST EXHAUST TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit between the Post-Catalyst Exhaust Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. POST-CATALYST EXHAUST TEMPERATURE SENSOR

Connect the Engine Control Module (ECM) connector.
Connect a jumper wire between the (K915) Post-Catalyst Exhaust Temperature Sensor Ground circuit and the (K353) Post-Catalyst Exhaust Temperature Sensor Signal circuit in the Post-Catalyst Exhaust Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Post-Catalyst Exhaust Temperature Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes

- Replace the Post-Catalyst Exhaust Temperature Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Go to [9](#)

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Post-Catalyst Exhaust Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2100-EGR AIR FLOW CONTROL VALVE CIRCUIT OPEN

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The EGR Air Flow Control Valve is a two-wire electrically operated throttle valve motor used to assist the EGR system function by creating a vacuum in the intake system to draw exhaust gas into the intake manifold. The Solenoid receives 12 volts from the ECM/ASD relay and a pulse-width modulated ground signal from the ECM. With the solenoid de-energized (off) the throttle valve is in the open (full flow) position. When the ECM energizes (grounds) the throttle motor, the throttle valve closes creating a low pressure (vacuum) in the intake system. This low pressure effect helps draw exhaust gases from the EGR Valve into the intake system.

- **When Monitored:**

With the ignition on and the ECM EGR Air Flow Control Valve command off.

- **Set Condition:**

The ECM detects an open EGR Air Flow Control Valve Control circuit for 0.5 second.

Possible Causes
INTERMITTENT CONDITION
(K344) ASD RELAY OUTPUT CIRCUIT OPEN
(K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND
(K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT OPEN
EGR AIR FLOW CONTROL VALVE
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions

may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition cycles, turning the ignition off for at least 10 seconds between each ignition cycle.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ECM power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. (K344) ECM RELAY OUTPUT CKT OPEN

Turn the ignition off.

Disconnect the EGR Air Flow Control Valve harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (K344) ECM Relay Output circuit at the EGR Air Flow Control Valve harness connector.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (K344) ECM Relay Output circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the EGR Air Flow Control Valve harness connector.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (K54) EGR Air Flow Control Valve Control circuit at the EGR Air Flow Control Valve harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [5](#)

No

- Repair the (K54) EGR Air Flow Control Valve Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT OPEN

LOW

81a754a8

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Accelerator Pedal Position Sensor contains two independent three wire inductive sensors. Each sensor provides independent pedal position signals to the ECM. The raw voltage signal from APP #1 sensor is 2 times the raw voltage signal from APP #2. Although the raw voltage signals differ, the scan tool converts and displays these voltages as matching percentages of pedal travel.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The APP Sensor #1 Signal circuit is below 0.2 volt for 0.3 second.

Possible Causes
INTERMITTENT DTC
(F855) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K167) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(F855) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO GROUND
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO THE (K167) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SENSOR GROUND CIRCUIT
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO THE (K400) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SENSOR GROUND CIRCUIT
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K167) Accelerator Pedal Position Sensor No. 1 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the

Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes

- Go to [3](#)

No

- Repair the appropriate circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between ground and the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the appropriate circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT

Measure the resistance between the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit and the (K167) Accelerator Pedal Position Sensor No. 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit and the (K400) Accelerator Pedal Position Sensor No. 2 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the appropriate circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ACCELERATOR PEDAL POSITION SENSOR

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit and the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor No. 1 high voltage or open DTC with the

Accelerator Pedal Position Sensor connector disconnected.

Does the scan tool display the DTC as described above?

Yes

- Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2123-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT HIGH

81a754a8

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Accelerator Pedal Position Sensor contains two independent three wire inductive sensors. Each sensor provides independent pedal position signals to the ECM. The raw voltage signal from APP 1 sensor is 2 times the raw voltage signal from APP 2. Although the raw voltage signals differ, the scan tool converts and displays these voltages as matching percentages of pedal travel.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The APP Sensor 1 signal circuit is above 4.8 volts for 0.3 second.

Possible Causes
INTERMITTENT DTC
(F855) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K167) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO THE (F855) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5 VOLT SUPPLY CIRCUIT OR (F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT
(F855) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K167) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit in the Accelerator Pedal Position

Sensor harness connector.

Measure the voltage of the (K167) Accelerator Pedal Position Sensor No. 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is there voltage present on any of the circuits?

Yes

- Repair the appropriate circuit that has voltage present for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO THE 5 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit and the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit and the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 10.0 ohms for both of the circuits?

Yes

- Go to [4](#)

No

- Repair the shorted (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K167) Accelerator Pedal Position Sensor No. 1 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes

- Go to [5](#)

No

- Repair the appropriate circuit for an open circuit or

high resistance.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ACCELERATOR PEDAL POSITION SENSOR

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K167) Accelerator Pedal Position Sensor No. 1 Sensor Ground circuit and the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor No. 1 low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes

- Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2127-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT LOW

81a754a6

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Accelerator Pedal Position Sensor contains two independent three wire inductive sensors. Each sensor provides independent pedal position signals to the ECM. The raw voltage signal from APP 1 sensor is 2 times the raw voltage signal from APP 2. Although the raw voltage signals differ, the scan tool converts and displays these voltages as matching percentages of pedal travel.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The APP Sensor #2 Signal circuit is below 0.097 volt for 0.3 second.

Possible Causes
INTERMITTENT DTC
(F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K400) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO GROUND
(K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO THE (K400) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SENSOR GROUND CIRCUIT
(K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO THE (K167) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SENSOR GROUND CIRCUIT
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K400) Accelerator Pedal Position Sensor No. 2 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes

- Go to [3](#)

No

- Repair the appropriate circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between ground and the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the appropriate circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT

Measure the resistance between the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit and the (K400) Accelerator Pedal Position Sensor No. 2 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit and the (K167) Accelerator Pedal Position Sensor No. 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the appropriate circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ACCELERATOR PEDAL POSITION SENSOR

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit and the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor No. 2 high voltage or open DTC with the Accelerator Pedal Position Sensor connector disconnected and the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes

- Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2128-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT HIGH

81a754a6

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Accelerator Pedal Position Sensor contains two independent three wire inductive sensors. Each sensor provides independent pedal position signals to the ECM. The raw voltage signal from APP 1 sensor is 2 times the raw voltage signal from APP 2. Although the raw voltage signals differ, the scan tool converts and displays these voltages as matching percentages of pedal travel.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The APP Sensor #2 signal circuit is above 2.5 volt for 0.3 second.

Possible Causes
INTERMITTENT DTC
(F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K400) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO THE (F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT OR (F855) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5 VOLT SUPPLY CIRCUIT
(F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K400) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO VOLTAGE

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K400) Accelerator Pedal Position Sensor No. 2 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is there voltage present on any of the circuits?

Yes

- Repair the appropriate circuit that has voltage present

for a short to voltage.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K29) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO THE 5 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit and the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit and the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 1000 ohms for both of the circuits?

Yes

- Go to [4](#)

No

- Repair the shorted (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K400) Accelerator Pedal Position Sensor No. 2 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes

- Go to [5](#)

No

- Repair the appropriate circuit for an open circuit or

high resistance.

- o Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ACCELERATOR PEDAL POSITION SENSOR

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K400) Accelerator Pedal Position Sensor No. 2 Sensor Ground circuit and the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor No. 2 low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?**Yes**

- Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2138-ACCELERATOR PEDAL POSITION SENSOR 1 / 2 CORRELATION

81a754a6

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Accelerator Pedal Position Sensor contains two independent three wire inductive sensors. Each sensor provides independent pedal position signals to the ECM. The raw voltage signal from APP 1 sensor is 2 times the raw voltage signal from APP 2. Although the raw voltage signals differ, the scan tool converts and displays these voltages as matching percentages of pedal travel.

- **When Monitored:**

With the ignition on. No other APP DTC's set. No Sensor Reference Voltage DTC's set.

- **Set Condition:**

APP Sensor 1 and APP Sensor 2 signals do not agree for 0.4 second.

Possible Causes
INTERMITTENT DTC
(F855) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K167) ACCELERATOR PEDAL POSITION SENSOR NO. 1 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(F856) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K12) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K400) ACCELERATOR PEDAL POSITION SENSOR NO. 2 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor reference or supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Disconnect the ECM harness connector.

Measure the resistance of the (F855) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K23) Accelerator Pedal Position Sensor No. 1 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K167) Accelerator Pedal Position Sensor No. 1 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (F856) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K29) Accelerator Pedal Position Sensor No. 2 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K400) Accelerator Pedal Position Sensor No. 2 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the

Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes

- Replace the Accelerator Pedal Position Sensor.

No

- Repair the circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2141-EGR AIR FLOW CONTROL VALVE CIRCUIT LOW

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The EGR Air Flow Control Valve is a three-wire electrically operated throttle valve motor used to assist the EGR system function by creating a vacuum in the intake system to draw exhaust gas into the intake manifold. The Solenoid receives 12 volts from the ECM/ASD relay, ground and a pulse-width modulated ground signal from the ECM. With the solenoid de-energized (off) the throttle valve is in the open (full flow) position. When the ECM energizes (grounds) the throttle motor, the throttle valve closes creating a low pressure (vacuum) in the intake system. This low pressure effect helps draw exhaust gases from the EGR Valve into the intake system.

- **When Monitored:**

With the ignition on and the ECM EGR Air Flow Control Valve command off.

- **Set Condition:**

The ECM detects a short ground on the EGR Air Flow Control Valve Control circuit for 0.5 second.

Possible Causes
INTERMITTENT CONDITION
(F344) ASD RELAY OUTPUT CIRCUIT OPEN
(K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND
(K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT OPEN
(Z906) GROUND CIRCUIT OPEN
EGR AIR FLOW CONTROL VALVE
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition cycles, turning the ignition off for at least 10 seconds between each ignition cycle.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

NOTE: An open ECM power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes

- Go To [3](#)

3. (Z906) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the EGR Air Flow Control Valve harness connector.

Using a 12-volt test light connected to 12 volts, check the (Z906) Ground circuit at the EGR Air Flow Control Valve harness connector.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (Z906) Ground circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**4. (F344) ASD RELAY OUTPUT CKT OPEN**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F344) ASD Relay Output circuit at the EGR Air Flow Control Valve harness connector.

Does the test light illuminate brightly?**Yes**

- Go To [5](#)

No

- Repair the (F344) ASD Relay Output circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**5. (K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (K54) EGR

Air Flow Control Valve Control circuit at the EGR Air Flow Control Valve harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [6](#)

No

- Repair the (K54) EGR Air Flow Control Valve Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K54) EGR AIR FLOW CONTROL VALVE CONTROL CIRCUIT OPEN

Measure the resistance of the (K54) EGR Air Flow Control Valve Control circuit between the EGR Air Flow Control Valve harness connector and the ECM C1 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [7](#)

No

- Repair the (K54) EGR Air Flow Control Valve Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. EGR AIR FLOW CONTROL VALVE

Install a substitute EGR Air Flow Control Valve in place of the vehicle's EGR Air Flow Control Valve.

NOTE: Ensure the ECM and EGR Air Flow Control Valve harness connectors are connected.

Turn the ignition on.

With the scan tool, check for this DTC to set again.

Did this DTC set again?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the EGR Air Flow Control Valve.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2142-EGR AIR FLOW CONTROL VALVE CIRCUIT HIGH

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The EGR Air Flow Control Valve is a three-wire electrically operated throttle valve motor used to assist the EGR system function by creating a vacuum in the intake system to draw exhaust gas into the intake manifold. The Solenoid receives 12 volts from the ECM/ASD relay, ground and a pulse-width modulated ground signal from the ECM. With the solenoid de-energized (off) the throttle valve is in the open (full flow) position. When the ECM energizes (grounds) the throttle motor, the throttle valve closes creating a low pressure (vacuum) effect in the intake system. This low pressure effect helps draw exhaust gases from the EGR Valve into the intake system.

- **When Monitored:**

With the ignition on and the ECM EGR Air Flow Control Valve command on.

- **Set Condition:**

The ECM detects excessive current on the EGR Air Flow Control Valve Control circuit for 0.5 second.

Possible Causes
INTERMITTENT CONDITION
EGR AIR FLOW CONTROL VALVE
(K54) EGR AIR FLOW CONTROL VALVE CONTROL SHORTED TO VOLTAGE
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.
With the scan tool, erase ECM DTCs.
Test drive the vehicle and monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. EGR AIR FLOW CONTROL VALVE

Turn the ignition off.
Disconnect the EGR Air Flow Control Valve harness connector.
Turn the ignition on.
With the scan tool, erase ECM DTCs.
Monitor the scan tool for ECM DTCs.

Does the scan tool display P2141?

Yes

- Replace the EGR Air Flow Control Valve.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (K54) EGR AIR FLOW CONTROL VALVE CONTROL SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the EGR Air Flow Control Valve harness connector.
Disconnect the ECM harness connectors.
Remove the ASD Relay from the TIPM.
Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector.
Turn the ignition on.
Measure the voltage of the (K54) EGR Air Flow Control Valve Control circuit at the EGR Air Flow Control Valve harness connector.

Is the voltage below 0.5 volt?

Yes

- Replace and program the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (K54) EGR Air Flow Control Valve Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2146-FUEL INJECTOR GROUP 1 SUPPLY VOLTAGE CIRCUIT OPEN

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

◦ **Set Condition:**

The ECM detects an open circuit error on a fuel injector high-side control circuit.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect each Fuel Injector harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go to [3](#)

No

- Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go to [4](#)

No

- Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance between 150k and 210k ohms for each injector?

Yes

- Go to [5](#)

No

- Replace the Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2147-FUEL INJECTOR GROUP 1 SUPPLY VOLTAGE CIRCUIT LOW

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects a short to ground error on the injector high-side control circuit.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect each Fuel Injector harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the Fuel Injector High-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms for each circuit?

Yes

- Go to [3](#)

No

- Repair the Fuel Injector High-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the Fuel Injector Low-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms for each circuit?

Yes

- Go to [4](#)

No

- Repair the Fuel Injector Low-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the Fuel Injector High-Side Control circuit and the Fuel Injector Low-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms between the circuits in each connector?

Yes

- Go to [5](#)

No

- Repair the Fuel Injector High-Side Control circuit for a short to the Fuel Injector Low-Side Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go to [6](#)

No

- Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance between 150k and 210k ohms for each injector?

Yes

- Go to [8](#)

No

- Replace Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between each Fuel Injector and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2148-FUEL INJECTOR GROUP 1 SUPPLY VOLTAGE CIRCUIT HIGH

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects a short to voltage error on one of the injector high-side control circuits.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect each Fuel Injector harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit in the Fuel Injector harness connector.

Is there voltage present on any of the circuits?

Yes

- Repair the Fuel Injector High-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is there voltage present on any of the circuits?

Yes

- Repair the Fuel Injector Low-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for all circuits?

Yes

- Go to [5](#)

No

- Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for all circuits?

Yes

- Go to [6](#)

No

- Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance between 150k and 210k ohms for each injector?

Yes

- Go to [7](#)

No

- Replace Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injectors and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2149-FUEL INJECTOR GROUP 2 SUPPLY VOLTAGE CIRCUIT OPEN

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

◦ **Set Condition:**

The ECM detects an open circuit error on a fuel injector high-side control circuit.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect each Fuel Injector harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go to [3](#)

No

- Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go to [4](#)

No

- Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance between 150k and 210k ohms for each injector?

Yes

- Go to [5](#)

No

- Replace the Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2150-FUEL INJECTOR GROUP 2 SUPPLY VOLTAGE CIRCUIT LOW

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects a short to ground error on the injector high-side control circuit.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect each Fuel Injector harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the Fuel Injector High-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms for each circuit?

Yes

- Go to [3](#)

No

- Repair the Fuel Injector High-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the Fuel Injector Low-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms for each circuit?

Yes

- Go to [4](#)

No

- Repair the Fuel Injector Low-Side Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the Fuel Injector High-Side Control circuit and the Fuel Injector Low-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms between the circuits in each connector?

Yes

- Go to [5](#)

No

- Repair the Fuel Injector High-Side Control circuit for a short to the Fuel Injector Low-Side Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go to [6](#)

No

- Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance between 150k and 210k ohms for each injector?

Yes

- Go to [8](#)

No

- Replace Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between each Fuel Injector and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2151-FUEL INJECTOR GROUP 2 SUPPLY VOLTAGE CIRCUIT HIGH

81a781a6

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects a short to voltage error on one of the injector high-side control circuits.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect each Fuel Injector harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay in the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector High-Side Control circuit in the Fuel Injector harness connector.

Is there voltage present on any of the circuits?

Yes

- Repair the Fuel Injector High-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is there voltage present on any of the circuits?

Yes

- Repair the Fuel Injector Low-Side Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for all circuits?

Yes

- Go to [5](#)

No

- Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for all circuits?

Yes

- Go to [6](#)

No

- Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance between 150k and 210k ohms for each injector?

Yes

- Go to [7](#)

No

- Replace Fuel Injector in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injectors and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2231-O2 SENSOR 1/1 SIGNAL CIRCUIT SHORTED TO HEATER CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The ECM detects a short between the (K902) O2 1/1 Negative Current Control circuit and the (K79) O2 1/1 Heater Control circuit.

Possible Causes
INTERMITTENT DTC
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL 2 CIRCUIT
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor connector.
 Disconnect the Engine Control Module (ECM) connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K902) O2 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance between ground and the (K902) O2 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Measure the resistance between the (K902) O2 1/1 Negative Current Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K902) O2 1/1 Negative

Current Control circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K902) O2 1/1 Negative Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [8](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2237-O2 SENSOR 1/1 PUMP CELL CURRENT CIRCUIT OPEN

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects an open on the (K89) O2 1/1 Positive Current Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Oxygen Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K89) O2 1/1 Positive Current Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K89) O2 1/1 Positive Current Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and the (K89) O2 1/1 Positive Current Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Measure the resistance between the (K89) O2 1/1 Positive Current Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K89) O2 1/1 Positive

Current Control circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K89) O2 1/1 Positive Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [8](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2238-O2 SENSOR 1/1 PUMP CELL CURRENT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects a short to ground on the (K89) O2 1/1 Positive Current Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Oxygen Sensor connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K89) O2 1/1 Positive Current Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K89) O2 1/1 Positive Current Control circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K89) O2 1/1 Positive Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2239-O2 SENSOR 1/1 PUMP CELL CURRENT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects a short to voltage on the (K89) O2 1/1 Positive Current Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K89) O2 1/1 Positive Current Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K89) O2 1/1 Positive Current Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance between the (K89) O2 1/1 Positive Current Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K89) O2 1/1 Positive Current Control

circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K89) O2 1/1 POSITIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K89) O2 1/1 Positive Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K89) O2 1/1 Positive Current Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2243-O2 SENSOR 1/1 REFERENCE VOLTAGE CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects an open on the (K41) O2 1/1 Reference Signal circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO GROUND
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Oxygen Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K41) O2 1/1 Reference Signal circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K41) O2 1/1 Reference Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.

Measure the resistance between ground and the (K41) O2 1/1 Reference Signal circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Measure the resistance between the (K41) O2 1/1 Reference Signal circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K41) O2 1/1 Reference

Signal circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K41) O2 1/1 Reference Signal circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [Z](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [8](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2245-O2 SENSOR 1/1 REFERENCE VOLTAGE CIRCUIT LOW

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects a short to ground on the (K41) O2 1/1 Reference Signal circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO GROUND
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Oxygen Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K41) O2 1/1 Reference Signal circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K41) O2 1/1 Reference Signal circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K41) O2 1/1 Reference Signal circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2246-O2 SENSOR 1/1 REFERENCE VOLTAGE CIRCUIT HIGH

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on and the O2 1/1 Sensor at operating temperature.

◦ **Set Condition:**

The ECM detects a short to voltage on the (K41) O2 1/1 Reference Signal circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT
(K41) O2 1/1 REFERENCE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K41) O2 1/1 Reference Signal circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K41) O2 1/1 Reference Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance between the (K41) O2 1/1 Reference Signal circuit and the (F344) Fused ASD Relay Output circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for a

- short to the (F344) Fused ASD Relay Output circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K41) O2 1/1 REFERENCE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K41) O2 1/1 Reference Signal circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K41) O2 1/1 Reference Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2280 - AIR FILTER RESTRICTION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the engine running. The ECM compares mass airflow volume/engine rpm to atmospheric pressure.

- **Set Condition:**

The ECM detects a 50% or more drop in airflow through the air filter for 5 minutes.

Possible Causes
INTERMITTENT DTC
CLOGGED AIR FILTER
INTAKE AIR RESTRICTION
INTAKE AIR LEAK

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK THE AIR FILTER

Turn the ignition off.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause air flow restriction.

Were any of these problems found?

Yes

- Replace the Air Filter element

No

- Go to [2](#)

2. CHECK FOR INTAKE SYSTEM RESTRICTIONS

NOTE: Damaged, restricted or poorly connected intake and turbocharger related tubes can cause this DTC to set.

Turn the ignition off.

Inspect all air intake and turbocharger related hoses/tubes and connections for leaks, restrictions and damage..

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go to [3](#)

3. CHECK FOR INTAKE SYSTEM AIR LEAKS

Turn the ignition off.

Remove the Crankcase Vent Heater.

Remove the Mass Air Flow Sensor from the turbocharger inlet tube.

Seal off and/or plug the turbocharger inlet tube where the MAF sensor was removed.

Connect smoke machine 84-04 to the Crankcase Vent Heater port in the intake duct and begin injecting smoke into the intake system.

Observe all intake system components for evidence of smoke leakage.

Is there evidence of smoke leakage?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Test Complete.

P2299- BRAKE PEDAL POSITION/ACCELERATOR PEDAL POSITION INCOMPATIBLE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the engine running (engine speed above 710 rpm). No other APP or Brake Signal DTC's. Vehicle speed above 3 km/h.

- **Set Condition:**

The ECM detects a brake signal input (brakes applied) and Accelerator Pedal Position input is above 3% at the same time for 15.0 seconds.

Possible Causes
ACCELERATOR PEDAL POSITION SENSOR
ACCELERATOR PEDAL OBSTRUCTION
BRAKE SWITCH ADJUSTMENT
BRAKE SWITCH
INTERMITTENT WIRING/CONNECTOR PROBLEM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: This DTC may be set if the vehicle operator is “riding” the brake pedal (driving with both feet).

With the scan tool, clear all ECM DTCs.
Test drive the vehicle performing several stop-and-go operations.
With the scan tool, view active ECM DTCs.

Does the scan tool display this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK BRAKE SWITCH OPERATION

NOTE: This DTC may be set if the Brake Switch is not properly adjusted. Check Brake Switch adjustment before continuing.

Turn the ignition on.
With the scan tool, read the Primary and Secondary Brake Switch Input.

Are the Primary and Secondary Brake Switch inputs operating properly?

Yes

- Go To [3](#)

No

- Refer to the Service Information Wiring to diagnose Brake Switch and/or Brake Switch wiring problem.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. CHECK ACCELERATOR PEDAL MOVEMENT

Turn the ignition off.
Check the Accelerator Pedal for obstructions or other problem that could restrict pedal travel, cause binding or prohibit the pedal from traveling to the complete rest position.

Were any of these problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK ACCELERATOR PEDAL POSITION SENSOR INPUT

Turn the ignition on.

NOTE: The Accelerator Pedal must be at the complete rest position for this test. Ensure the pedal is at rest and free from any obstruction.

With the scan tool, read the APP #1 and APP #2 percentages.

Does the scan tool display below 2% for APP #1 and APP #2 percentages?

Yes

- Go To [5](#)

No

- Replace the Accelerator Pedal Position Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. INTERMITTENT APP SENSOR/BRAKE SWITCH

Turn the ignition on.

With the scan tool, read the APP #1 and APP #2 percentages

Fully depress and release the Accelerator Pedal several times.

With the scan tool, read the Primary and Secondary Brake Switch inputs.

Fully depress and release the Brake Pedal several times.

Were any problems found with the inputs during pedal actuation for the Brakes or Accelerator?

Yes

- Repair or replace as necessary.

No

- Using the wiring diagrams check the connectors and wiring associated with the Accelerator Pedal Sensor and Brake Switch for damage, corrosion or other problems that could cause an intermittent DTC.

P242F–DIESEL PARTICULATE FILTER RESTRICTION — ASH ACCUMULATION

The Diesel particulate filter is an inline canister filter located in the exhaust system between the engine and the muffler. This filter captures and stores ash particles created by the diesel combustion process. This filter is monitored by the ECM with a Differential Pressure Sensor. This sensor measures the difference in exhaust system pressure before and after the particulate filter through tube connections directly to the exhaust pipe. As ash and soot accumulate in the filter, the exhaust pressure at the inlet side of the filter increases as compared to the pressure at the outlet side of the filter.

- **When Monitored:**

With the engine running.

- **Set Condition:**

The Differential Pressure Sensor signal indicates partial clogging of the particulate filter due to the accumulation of ash or other debris.

Possible Causes
DAMAGED EXHAUST SYSTEM
LEAKING EXHAUST SYSTEM
HIGH RESISTANCE IN EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUITS
HOSE/TUBE CONNECTIONS TO THE EXHAUST DIFFERENTIAL PRESSURE SENSOR
EXHAUST DIFFERENTIAL PRESSURE SENSOR
DIESEL PARTICULATE FILTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECKING FOR OTHER DTC'S

NOTE: This DTC can be set when vehicle is driven only on short trips where exhaust and engine temperatures do not reach operating temperature for 30 minutes or more.

Turn the ignition on.

With the scan tool, read the ECM DTC's.

Are there other DTC's set in the ECM?

Yes

- Repair other DTC's before continuing with this test.
- Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. VISUAL INSPECTION

Turn the ignition off.

Visually inspect the Exhaust Differential Pressure Sensor for physical damage, proper electrical connection and proper mechanical connection. Ensure any tubes and/or hoses connected to the sensor are in good working condition and properly connected at all ends.

Visually inspect the entire exhaust system for bent, crushed or otherwise damaged tubes which may cause an exhaust system restriction.

Inspect the exhaust system for exhaust leaks.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. PARTICULATE FILTER REGENERATION

Start and idle the engine.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, perform the Diesel Particulate Filter Regeneration procedure.

After this procedure is complete, turn the ignition off for 60 seconds.

Test drive the vehicle.

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Go To [4](#)

No

Test complete.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of each Exhaust Differential Pressure Sensor circuit between the Exhaust Differential Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Go To [5](#)

No

- Repair the circuit(s) that measured above 10.0 ohms for high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. EXHAUST DIFFERENTIAL PRESSURE SENSOR

Replace the Exhaust Differential Pressure Sensor.

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Replace the Diesel Particulate Filter.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P244B—DIESEL PARTICULATE FILTER DIFFERENTIAL PRESSURE TOO HIGH

The Diesel particulate filter is an inline canister filter located in the exhaust system between the engine and the muffler. This filter captures and stores ash particles created by the diesel combustion process. This filter is monitored by the ECM with a Differential Pressure Sensor. This sensor measures the difference in exhaust system pressure before and after the particulate filter through tube connections directly to the exhaust pipe. As ash and soot accumulate in the filter, the exhaust pressure at the inlet side of the filter increases as compared to the pressure at the outlet side of the filter.

- **When Monitored:**

With the engine running.

- **Set Condition:**

The ECM detects pressure at the particulate filter above 950 hpa for 10.0 seconds.

Possible Causes
DAMAGED EXHAUST SYSTEM
LEAKING EXHAUST SYSTEM
HIGH RESISTANCE IN EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUITS
HOSE/TUBE CONNECTIONS TO THE EXHAUST DIFFERENTIAL PRESSURE SENSOR
EXHAUST DIFFERENTIAL PRESSURE SENSOR
DIESEL PARTICULATE FILTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECKING FOR OTHER DTC'S

NOTE: This DTC indicates that the soot level in the Diesel Particulate Filter is too high. This occurs normally on high mileage vehicles. However, if there is an EGR system problem, turbocharger problem or oil consumption problem with the engine, this DTC can occur on a low mileage vehicle

Turn the ignition on.

With the scan tool, read the ECM DTC's.

Are there other DTC's set in the ECM?

Yes

- Repair other DTC's before continuing with this test.
- Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. VISUAL INSPECTION

Turn the ignition off.

Visually inspect the Exhaust Differential Pressure Sensor for physical damage, proper electrical connection and proper mechanical connection. Ensure any tubes and/or hoses connected to the sensor are in good working condition, clear of any restrictions and properly connected at all ends.

Visually inspect the entire exhaust system for bent, crushed or otherwise damaged tubes which may cause an exhaust system restriction.

Inspect the exhaust system for exhaust leaks.

Were any problems found?

Yes

- Repair or replace as necessary.

No

- Go To [3](#)

3. PARTICULATE FILTER REGENERATION

Start and idle the engine.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, perform the Diesel Particulate Filter Regeneration procedure.

After this procedure is complete, turn the ignition off for 60 seconds.

Test drive the vehicle.

With the scan tool, Read DTCs in the Engine Control Module (ECM).

Is the status Active for this DTC?

Yes

- Go To [4](#)

No

- Test complete.

4. EXHAUST DIFFERENTIAL PRESSURE SENSOR CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of each Exhaust Differential Pressure Sensor circuit between the Exhaust Differential Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each circuit?

Yes

- Replace the Diesel Particulate Filter. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Repair the circuit(s) that measured above 10.0 ohms for high resistance. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2453-DIESEL PARTICULATE FILTER DIFFERENTIAL PRESSURE SENSOR CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Diesel particulate filter is an inline canister filter located in the exhaust system between the engine and the muffler. This filter captures and stores ash particles created by the diesel combustion process. This filter is monitored by the ECM with a Differential Pressure Sensor. This sensor measures the difference in exhaust system pressure before and after the particulate filter through tube connections directly to the exhaust pipe. As ash and soot accumulate in the filter, the exhaust pressure at the inlet side of the filter increases as compared to the pressure at the outlet side of the filter.

- **When Monitored:**

At the beginning of engine crank.

- **Set Condition:**

The Differential Pressure Sensor Signal is below negative 40 hpa or above positive 40 hpa.

Possible Causes
INTERMITTENT DTC
(K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K951) EXHAUST DIFFERENTIAL PRESSURE SENSOR GROUND
(K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K355) EXHAUST DIFFERENTIAL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K951) EXHAUST DIFFERENTIAL PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
EXHAUST DIFFERENTIAL PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor Reference or Sensor Supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit in the Exhaust Differential Pressure Sensor harness connector.

Is the voltage above 4.5 volts?

Yes

- Go to [6](#)

No

- Go to [3](#)

3. (K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit in the Exhaust Differential Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K951) EXHAUST DIFFERENTIAL PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit and the (K951) Exhaust Differential Pressure Sensor Ground circuit in the Exhaust Differential Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit for a short to the (K951) Exhaust Differential Pressure Sensor Ground circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit between the Exhaust

Differential Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [9](#)

No

- Repair the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K355) EXHAUST DIFFERENTIAL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
Disconnect the Engine Control Module (ECM) connector.
Measure the resistance of the (K355) Exhaust Differential Pressure Sensor Signal circuit between the Exhaust Differential Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K355) Exhaust Differential Pressure Sensor Signal circuit for an open circuit or high

resistance.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (K951) EXHAUST DIFFERENTIAL PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K951) Exhaust Differential Pressure Sensor Ground circuit between the Exhaust Differential Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [8](#)

No

- Repair the (K951) Exhaust Differential Pressure Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

8. EXHAUST DIFFERENTIAL PRESSURE SENSOR

Turn the ignition off.
 Connect the Engine Control Module (ECM) harness connector.
 Connect a jumper between the (K355) Exhaust Differential Pressure Sensor Signal circuit and the (K951) Exhaust Differential Pressure Sensor Ground circuit in the Exhaust Differential Pressure Sensor harness connector.
 Turn the ignition on.
 With the scan tool, Clear DTCs.
 With the scan tool, select View DTCs.

NOTE: The scan tool should display an Exhaust Differential Pressure Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes

- Replace the Exhaust Differential Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [9](#)

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Exhaust Differential Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2454-DIESEL PARTICULATE FILTER DIFFERENTIAL PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Diesel particulate filter is an inline canister filter located in the exhaust system between the engine and the muffler. This filter captures and stores ash particles created by the diesel combustion process. This filter is monitored by the ECM with a Differential Pressure Sensor. This sensor measures the difference in exhaust system pressure before and after the particulate filter through tube connections directly to the exhaust pipe. As ash and soot accumulate in the filter, the exhaust pressure at the inlet side of the filter increases as compared to the pressure at the outlet side of the filter.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The (K355) Exhaust Differential Pressure Sensor signal is below 0.15 volts for 0.5 second.

2. (K354) EXHAUST DIFFERENTIAL PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Exhaust Differential Pressure Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the ASD Relay.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit in the Exhaust Differential Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K354) Exhaust Differential Pressure Sensor 5 Volt Supply circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K355) EXHAUST DIFFERENTIAL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K355) Exhaust Differential Pressure Sensor Signal circuit in the Exhaust Differential Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K355) Exhaust Differential Pressure Sensor Signal circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (K951) EXHAUST DIFFERENTIAL PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K951) Exhaust Differential Pressure Sensor Ground circuit in the Exhaust Differential Pressure Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K951) Exhaust Differential Pressure Sensor Ground circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (K355) EXHAUST DIFFERENTIAL PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH

RESISTANCE

Turn the ignition off.

Remove the jumper wire and install the ASD Relay.
Measure the resistance of the (K355) Exhaust Differential Pressure Sensor Signal circuit between the Exhaust Differential Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [6](#)

No

- Repair the (K355) Exhaust Differential Pressure Sensor Signal circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K951) EXHAUST DIFFERENTIAL PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K951) Exhaust Differential Pressure Sensor Ground circuit between the Exhaust Differential Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K951) Exhaust Differential Pressure Sensor Ground circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. EXHAUST DIFFERENTIAL PRESSURE SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K951) Exhaust Differential Pressure Sensor Ground circuit and the (K355) Exhaust Differential Pressure Sensor Signal circuit in the Exhaust Differential Pressure Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Exhaust Differential Pressure Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes

- Replace the Exhaust Differential Pressure Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Exhaust Differential Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P250F-ENGINE OIL LEVEL TOO LOW

For a complete wiring diagram **Refer to Section 8W**

◦ When Monitored:

With the ignition on.

◦ Set Condition:

The engine oil change counter indicates that the engine is overdue for an oil change. The DPF regeneration is disabled to prevent further oil delusion.

Possible Causes
ENGINE OIL CHANGE COUNTER LEVEL TOO LOW

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition off.
Refer to the Service Information and change the engine oil.
With the scan tool, reset the engine oil change counter.

View repair.

Test Complete

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P252F-ENGINE OIL LEVEL TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The engine oil change counter indicates that the engine is overdue for an oil change. The DPF regeneration is disabled to prevent further oil delusion.

Possible Causes
ENGINE OIL CHANGE COUNTER LEVEL TOO HIGH

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition off.

Refer to the Service Information and change the engine oil.

With the scan tool, reset the engine oil change counter.

View repair.

Test Complete

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2533-IGNITION SWITCH RUN/START POSITION CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

CHECK THE ECM POWER AND GROUNDS
ENGINE CONTROL MODULE

Diagnostic Test

1. VERIFY CURRENT DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK POWER AND GROUNDS

Refer to symptom Checking the ECM Power and Grounds.

Are the ECM Power and Ground circuits o.k.?

Yes

- Replace the ECM in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2627-O2 SENSOR 1/1 PUMP CELL CURRENT TRIM CIRCUIT LOW

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a short to ground on the (K103) O2 1/1 Pump Cell Current Trim circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO GROUND
(K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT
(K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Oxygen Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K103) O2 1/1 Pump Cell Current Trim circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [3](#)

No

- Repair the (K103) O2 1/1 Pump Cell Current Trim circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K103) O2 1/1 Pump Cell Current Trim circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K103) O2 1/1 Pump Cell Current Trim circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K103) O2 1/1 Pump Cell Current Trim circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K103) O2 1/1 Pump Cell Current Trim circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2628-O2 SENSOR 1/1 PUMP CELL CURRENT TRIM CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM detects a short to voltage on the (K103) O2 1/1 Pump Cell Current Trim circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO VOLTAGE
(K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO THE (K79) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K103) O2 1/1 Pump Cell Current Trim circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K103) O2 1/1 Pump Cell Current Trim circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT SHORTED TO THE (K79) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance between the (K103) O2 1/1 Pump Cell Current Trim circuit and the (K79) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K103) O2 1/1 Pump Cell Current Trim

circuit for a short to the (K79) Fused ASD Relay Output 2 circuit.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K103) O2 1/1 PUMP CELL CURRENT TRIM CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K103) O2 1/1 Pump Cell Current Trim circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [5](#)

No

- Repair the (K103) O2 1/1 Pump Cell Current Trim circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P2A00-O2 SENSOR 1/1 CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The ECM detects an open or implausible voltage on the (K902) O2 1/1 Negative Current Control for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT
(K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Oxygen Sensor harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Remove the ASD Relay from the TIPM.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (K902) O2 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

Is there any voltage present?

Yes

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Remove the jumper wire and install the ASD Relay.
 Measure the resistance between ground and the (K902) O2 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [4](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT

Measure the resistance between the (K902) O2 1/1 Negative Current Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [5](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (K79) O2 1/1 HEATER CONTROL CIRCUIT

Measure the resistance between the (K902) O2 1/1 Negative

Current Control circuit and the (K79) O2 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 1000 ohms?

Yes

- Go to [6](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for a short to the (K79) O2 1/1 Heater Control circuit.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (K902) O2 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K902) O2 1/1 Negative Current Control circuit between the Oxygen Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go to [7](#)

No

- Repair the (K902) O2 1/1 Negative Current Control circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. OXYGEN SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the Oxygen Sensor in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to [8](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

B10B3 - CABIN HEATER 1 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

A Cabin Heater (PTC) #1 error message has been received over the CAN bus from the Totally Integrated Power Module (TIPM).

Possible Causes
INTERMITTENT DTC
DTC SET IN TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC will set if the Engine Control Module (ECM) receives a message from the Totally Integrated Power Module indicating that a PTC Heater Relay DTC is present.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the PTC Heater Relay 1.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

With the scan tool, select View DTCs in the Totally Integrated Power Module.

Is there a stored or active PTC Heater Relay DTC present in the Totally Integrated Power Module?

Yes

- Refer to 24 - HVAC — ELECTRICAL DIAGNOSTICS for diagnostic procedures and for further possible causes.

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

B10B7 - CABIN HEATER 2 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

A Cabin Heater (PTC) #2 error message has been received over the CAN bus from the Totally Integrated Power Module (TIPM).

Possible Causes
INTERMITTENT DTC
DTC SET IN TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC will set if the Engine Control Module (ECM) receives a message from the Totally Integrated Power Module indicating that a PTC Heater Relay DTC is present.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the PTC Heater Relay 2.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

With the scan tool, select View DTCs in the Totally Integrated Power Module.

Is there a stored or active PTC Heater Relay DTC present in the Totally Integrated Power Module?

Yes

- Refer to 24 - HVAC — ELECTRICAL DIAGNOSTICS for diagnostic procedures and for further possible causes.

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

B1137 - CABIN HEATER 3 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

A Cabin Heater (PTC) #3 error message has been received over the CAN bus from the Totally Integrated Power Module.

Possible Causes
INTERMITTENT DTC
DTC SET IN TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC will set if the Engine Control Module (ECM) receives a message from the Totally Integrated Power Module indicating that a PTC Heater Relay DTC is present.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the PTC Heater Relay 3.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

With the scan tool, select View DTCs in the Totally Integrated Power Module.

Is there a stored or active PTC Heater Relay DTC present in the Totally Integrated Power Module?

Yes

- Refer to 24 - HVAC — ELECTRICAL DIAGNOSTICS for diagnostic procedures and for further possible causes.

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

B1C32- AIRBAG DEPLOYMENT DETECTED

◦ When Monitored:

With the ignition on.

◦ Set Condition:

The ACM sends a CAN Bus message to the ECM indicating that the airbags have been deployed.

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. DTC EXPLANATION

NOTE: This DTC indicates that the vehicle has been in an accident and the airbag module has deployed the airbags.

View Repair.

Yes

Test Complete.

U0002–CAN C BUS OFF PERFORMANCE

INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0101-LOST COMMUNICATION WITH TRANSMISSION CONTROL MODULE

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The ECM doesn't receive a Bus Message from the Transmission Control Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TRANSMISSION CONTROL MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0103-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT

MODULE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM doesn't receive a Bus Message from the Electric Gear Shift Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
ELECTRIC GEAR SHIFT MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

U0106-LOST COMMUNICATION WITH GLOW PLUG CONTROL MODULE

81a70293

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM isn't receiving a LIN bus message from the Glow Plug Control Module.

Possible Causes
INTERMITTENT DTC
(D509) LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE
GLOW PLUG CONTROL MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, View DTCs.

Record all DTC information.

NOTE: If DTC U1008 LIN 1 BUS is active in addition to this DTC, perform the diagnostic procedure for that DTC before continuing with this test.

NOTE: If DTC U1132 GENERATOR COMMUNICATION is active or stored in addition to this DTC, proceed with this diagnostic procedure.

With a scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

Monitor the scan tool for at least 2 minutes.

With a scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. U1132 GENERATOR COMMUNICATION DTC IS PRESENT

With a scan tool, View DTCs.

Is DTC U1132 GENERATOR COMMUNICATION Active in addition to this DTC?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. (D509) LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Generator harness connector.

Disconnect the Glow Plug Module harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (D509) LIN Bus circuit between the Generator harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (D509) LIN Bus circuit between the Glow Plug Module harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10 ohms for both measurements?

Yes

- Go To [6](#)

No

- Repair the (D509) LIN Bus for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (D509) LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Glow Plug Module harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (D509) LIN Bus circuit between the Generator harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10 ohms?

Yes

- Go To [5](#)

No

- Repair the (D509) LIN Bus for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. GLOW PLUG CONTROL MODULE

Ignition off, engine not running.

Connect the Engine Control Module (ECM) harness connector.

Replace the Glow Plug Module in accordance with the Service Information.

Turn the ignition on.

With a scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

Monitor the scan tool for at least 2 minutes.

With a scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go to [6](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

01a79cc9

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM doesn't receive a Bus Message from the Anti-lock Brake Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0141-LOST COMMUNICATION WITH TOTALLY

INTEGRATED POWER MODULE

81a78cck

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM doesn't receive a Bus Message from the Totally Integrated Power Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY MODULE (SKREEM/WCM)

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM doesn't receive a Bus Message from the SKREEM/WCM.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

An error message has been received over the bus from the Transmission Control Module (TCM).

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TRANSMISSION CONTROL MODULE (TCM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. TCM COMMUNICATION RELATED DTC'S IN OTHER MODULES

With a scan tool check for TCM communication related DTCs in other modules on the CAN Bus.

Are there any TCM communication related DTCs in other modules on the CAN Bus at this time?

Yes

- Replace and program the Transmission Control Module (TCM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0407-IMPLAUSIBLE DATA RECEIVED FROM GLOW PLUG CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

An error message has been received over the bus from the Glow Plug Control Module (GPCM).

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
GLOW PLUG CONTROL MODULE (GPCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Replace and program the Glow Plug Control Module (GPCM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0415-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

An error message has been received over the bus from the Anti-lock Brake Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE MODULE (CAB)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. ABS COMMUNICATION RELATED DTC'S IN OTHER MODULES

With a scan tool check for ABS communication related DTCs in other modules on the CAN Bus.

Are there any ABS communication related DTCs in other modules on the CAN Bus at this time?

Yes

- Replace and program the Anti-Lock Brake Control Module (CAB) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0429-IMPLAUSIBLE DATA RECEIVED FROM SCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

An error message has been received over the bus from the Steering Control Module (SCM).

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
STEERING CONTROL MODULE (SCM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SCM COMMUNICATION RELATED DTC'S IN OTHER MODULES

With a scan tool check for SCM communication related DTCs in other modules on the CAN Bus.

Are there any SCM communication related DTCs in other modules on the CAN Bus at this time?

Yes

- Replace and program the Steering Control Module (SCM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0452-INVALID DATA RECEIVED RESTRAINTS CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

An error message has been received over the bus from the Airbag Control Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
AIRBAG CONTROL MODULE (ACM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. ACM COMMUNICATION RELATED DTC'S IN OTHER MODULES

With a scan tool check for ACM communication related DTCs in other modules on the CAN Bus.

Are there any ACM communication related DTCs in other modules on the CAN Bus at this time?

Yes

- Replace and program the Airbag Control Module (ACM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U1004-CAN C BUS TRANSMIT PERFORMANCE

01a79cc9

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

Continuously while the system is active and there are no ECM system voltage DTCs present.

- **Set Condition:**

The ECM is reporting an error condition when attempting to transmit a CAN bus message.

Possible Causes
INTERMITTENT DTC
CAN BUS ERROR CONDITION
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. COMMUNICATION DTCS PRESENT

With a scan tool check for any other communication DTCs present in other modules on the CAN C bus.

Are there any CAN C bus DTCs active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for additional vehicle communication diagnostic procedures.

No

- Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U1008-LIN 1 BUS

01aa210a

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM is receiving a LIN bus error message.

Possible Causes
INTERMITTENT DTC
(D509) LIN BUS CIRCUIT SHORTED TO GROUND
(D509) LIN BUS CIRCUIT SHORTED TO VOLTAGE
GENERATOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, View DTCs.

Record all DTC information.

With a scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

Monitor the scan tool for at least 2 minutes.

With a scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

GENERATOR

2.

Turn the ignition off.
 Disconnect the Generator harness connector.
 Turn the ignition on.
 With a scan tool, Clear DTCs.
 With a scan tool, View DTCs.
 Monitor the scan tool for at least 2 minutes.

NOTE: If the Generator LIN bus circuit is shorted internally, the LIN Bus DTC will not set with the Generator disconnected. If the LIN bus is shorted to voltage or ground, this DTC will remain Active.

Is the status Active for this DTC?

Yes

- Go To [3](#)

No

- Replace the Generator in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. (D509) LIN BUS CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance between ground and the (D509) LIN Bus circuit in the Generator harness connector.

Is the resistance above 1000 ohms?

Yes

- Go To [4](#)

No

- Repair the (D509) LIN Bus for a short to ground.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. (D509) LIN BUS CIRCUIT SHORTED TO VOLTAGE

Remove the ASD Relay.
 Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
 Turn the ignition on.
 Measure the voltage of the (D509) LIN Bus circuit in the Generator harness connector.

Is there any voltage present?

Yes

- Repair the (D509) LIN Bus circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plug Module and the Engine Control Module (ECM).
 Look for any chafed, pierced, pinched, or partially broken wires.
 Look for broken, bent, pushed out or corroded terminals.
 Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
 Look for the data to change or for the DTC to reset during the wiggle test.
 Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U110A-LOST COMMUNICATION WITH SCM - CAN-C

01a79cc9

For a complete wiring diagram Refer to Section 8W

◦ **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM doesn't receive a Bus Message from the Steering Control Module (SCM).

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
STEERING CONTROL MODULE (SCM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U110E-LOST AMBIENT TEMPERATURE MESSAGE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM doesn't receive a Bus Message from the Front Control Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
FRONT CONTROL MODULE (FCM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes related to FCM/TIPM Communication Errors. If there are no other communication errors present, replace and program the ECM in accordance with the Service Information.

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE

- DIAGNOSIS AND TESTING)

U1113-LOST AC PRESSURE MESSAGE

01a783a

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

An invalid message has been received over the bus from the Front Control Module (FCM).

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
FRONT CONTROL MODULE (FCM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. COMMUNICATION DTCS PRESENT IN THE TOTALLY INTEGRATED POWER MODULE (TIPM)

With a scan tool check for DTCs in the TIPM.

Are there any CAN bus DTCs active in the TIPM at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for additional vehicle communication diagnostic procedures.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U1132-GENERATOR COMMUNICATION

01aa210a

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

Continuously while the system is active.

- **Set Condition:**

The ECM isn't receiving a LIN bus message from the Generator.

Possible Causes
INTERMITTENT DTC
(D509) LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.
 With a scan tool, View DTCs.
 Record all DTC information.

NOTE: If DTC U1008 LIN 1 BUS is active in addition to this DTC, perform the diagnostic procedure for that DTC before continuing with this test.

With a scan tool, Clear DTCs.
 Start the engine and allow it to reach normal operating temperature.
 Monitor the scan tool for at least 2 minutes.
 With a scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (D509) LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.
 Disconnect the Generator harness connector.
 Disconnect the Engine Control Module (ECM) harness connector.
 Measure the resistance of the (D509) LIN Bus circuit between the Generator harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for both measurements?

Yes

- Go To [3](#)

No

- Repair the (D509) LIN Bus circuit for an open circuit or high resistance.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. GENERATOR

Ignition off, engine not running.
 Connect the Engine Control Module (ECM) harness connector.
 Replace the Generator in accordance with the Service Information.
 Turn the ignition on.
 With a scan tool, Clear DTCs.
 Start the engine and allow it to reach normal operating temperature.
 Monitor the scan tool for at least 2 minutes.
 With a scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go to [4](#)

No

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plug Module and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?**Yes**

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Engine Control Module (ECM) in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U1421-IMPLAUSIBLE IGNITION KEY OFF TIME RECEIVED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

At ignition on.

- **Set Condition:**

The ECM detects a problem when comparing the current ECT Sensor input to the ECT Sensor input at the last ECM power down and the amount of time that has elapsed based on an internal timer in the TIPM.

Possible Causes
INTERMITTENT CONDITION
IGNITION SWITCH
TIPM POWERS AND GROUNDS
TOTALLY INTEGRATED POWER MODULE (TIPM)

ENGINE COOLANT TEMPERATURE SENSOR

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition cycles, turning the ignition off for at least 10 seconds between each ignition cycle.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes

- Go To [2](#)

No

- Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS

With the scan tool, read other TIPM DTCs.

NOTE: Any ECM communication related DTC's in the TIPM must be diagnosed and corrected before continuing to diagnose this DTC.

Are there any ECM communication related DTC's in the TIPM?

Yes

- Refer to the Symptom List and repair communication DTC's before continuing.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECKING THE ECT SENSOR

Refer to the symptom Checking the ECT Sensor and verify proper ECT Sensor operation.

Is the ECT Sensor operating correctly?**Yes**

- Go To [4](#)

No

- Repair the (K344) ASD Relay Output circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. IGNITION SWITCH

Refer to the Wiring Information and verify proper Ignition Switch operation.

Turn the ignition key to each position and verify correct voltage output at each ignition switch harness connector cavity.

Is the Ignition Switch operating properly?**Yes**

- Go To [5](#)

No

- Repair or replace Ignition Switch, wiring or connectors as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. TIPM POWER AND GROUND CIRCUITS

Refer to the Wiring Information and verify proper battery supply, ignition switch supply and grounds at the TIPM harness connectors.

Are the TIPM power and grounds functioning properly?**Yes**

- Replace the Totally Integrated Power Module in accordance with the Service Information.

- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair power/ground circuit(s) as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

***ENGINE CRANKS BUT WILL NOT START**

For a complete wiring diagram **Refer to Section 8W**

INTAKE SYSTEM RESTRICTION
ECM CODES PRESENT
ECT SENSOR
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE
ENGINE DRIVE BELT
FUEL PRESSURE SENSOR
FUEL SUPPLY CONTAMINATION
SUPPLY SIDE FUEL SYSTEM PRESSURE
FUEL SYSTEM RESTRICTION
GLOW PLUGS
SKREEM CODES PRESENT

Diagnostic Test

1. ECM CODES PRESENT

NOTE: The ECM must have proper power and ground connections for the following tests to be valid. Refer to Checking the ECM Power and Grounds in the symptom list.

Turn the ignition on.
With the scan tool, read the ECM DTCs.

Does the scan tool display any ECM DTCs?

Yes

- Refer to symptom list for problems related to ECM DTC.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. SKREEM CODES PRESENT

With the scan tool, read the SKREEM DTCs.

Does the scan tool display any SKREEM DTCs?

Yes

- Refer to symptom list for problems related to SKREEM DTC.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK FOR INTAKE SYSTEM RESTRICTIONS

Turn the ignition off.

Ensure vehicle has adequate fuel supply in fuel tank.

Inspect all air intake and turbocharger related hoses/tubes and connections.

Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. ECT SENSOR

Using a temperature probe, check the vehicle temperature near the ECT Sensor.

Turn the ignition on.

With the scan tool in Sensors, read the ECT Sensor temperature.

Compare the temperature probe reading with the scan tool reading.

Are the two readings within 10°C of each other?

Yes

- Go To [5](#)

No

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. GLOW PLUGS

NOTE: Prior to performing this test, be sure to check the Glow Plug operation. Refer to CHECKING GLOW PLUG OPERATION for the related symptom(s).

Refer to the Service Information and check the Glow Plugs for proper operation.

Are the Glow Plugs operating properly?

Yes

- Go To [6](#)

No

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. FUEL SYSTEM RESTRICTION

Inspect the fuel system lines for restrictions, leaks or other problems.

NOTE: Refer to the Service Information to ensure that the fuel system is properly primed. A non-primed system or excessive air in the supply system will cause a no-start condition.

Is there any evidence of problems?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. FUEL CONTAMINATION

Inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes

- Refer to the Service Information to remove and replace fuel throughout the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. SUPPLY SIDE FUEL SYSTEM PRESSURE

Refer to and perform the Checking the Low Pressure Fuel Delivery System Test in this section.

Is the fuel pressure within specification?

Yes

- Go To [9](#)

No

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. FUEL PRESSURE SENSOR

Turn the ignition on, engine off.

With the scan tool, read the Fuel Pressure Sensor volts.

Is the Fuel Pressure Sensor voltage 0.45 and 0.60 volt?

Yes

- Go To [10](#)

No

- Refer to the Service Information Wiring to check Fuel Pressure Sensor circuits. If no problems are found, replace the Fuel Pressure Sensor.

10. CHECK FUEL PRESSURE AT ENGINE CRANKING

With the scan tool, read the Fuel Pressure Sensor signal while cranking the engine.

Does the Fuel Pressure Sensor signal increase to above 4300 psi (300 bar) within a few seconds after engine cranking begins?

Yes

- Go To [11](#)

No

- Go To [13](#)

11. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT(S) SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the each Fuel Injector harness connector.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of each Fuel Injector Low-Side Control circuit in the Fuel Injector harness connectors.

Is there any voltage present?

Yes

- Repair the Fuel Injector Low-Side Control circuit(s) for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [12](#)

12. ENGINE DRIVE BELT

Refer to the Service Information to ensure the Engine Drive Belt is installed correctly and the camshaft and crankshaft gears are timed correctly.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace and program the Engine Control Module in accordance with the Service Information.

13. FUEL PRESSURE SOLENOID

Turn the ignition off.

Refer to the Service Information and replace the Fuel Pressure Solenoid.

Turn the ignition on.

With the scan tool, erase the ECM DTC's.

Attempt to start the vehicle.

Does the vehicle start and run?

Yes

- Repair is complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Refer to the Service Information and replace the Fuel Injection Pump assembly.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

***ENGINE WILL NOT CRANK**

For a complete wiring diagram **Refer to Section 8W**

BATTERY CABLE HIGH RESISTANCE
BATTERY CABLES
ECM
MECHANICAL PROBLEM
OPEN FUSED BATTERY (+) CIRCUIT
STARTER COIL DRIVER (INTERNAL TIPM)
SKREEM CODES PRESENT
STARTER MOTOR
STARTER RELAY
(T752) STARTER RELAY CONTROL CIRCUIT OPEN
(T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(T750) STARTER RELAY OUTPUT CIRCUIT OPEN

Diagnostic Test

1. BATTERY CABLES

NOTE: The battery must be fully charged before diagnosing a no crank condition.

Turn the ignition off.

Inspect the battery cables for corrosion, looseness or other problems.

Is there evidence of problems?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. BATTERY CABLE HIGH RESISTANCE

Using the Service Information, check the battery cables for high resistance.

Did either battery cable have a voltage drop greater than 0.2 volts?

Yes

- Replace the battery cable(s).
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. SKREEM CODES PRESENT

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

Does the scan tool display any SKREEM DTCs?

Yes

- Refer to symptom list for problems related to SKREEM.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. TIPM CAN BUS CODES PRESENT

With the scan tool, read the TIPM DTCs.

NOTE: If there are CAN BUS related problems the TIPM will not supply power to the Starter Relay coil.

Does the scan tool display any CAN Bus related DTCs in the TIPM?

Yes

- Refer to symptom list for problems related to CAN Bus communication.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECKING STARTER OPERATION

Turn the ignition off.
Remove the Starter Relay from the TIPM.

WARNING: THE TRANSMISSION MUST BE IN NEUTRAL AND THE PARK BRAKE MUST BE SET FOR THIS TEST.

WARNING: THE ENGINE MAY CRANK IN THE NEXT STEP. WHEN THE ENGINE IS CRANKING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

Momentarily jumper Starter Relay connector cavities 30 and 87 in the TIPM connector.

Did the engine crank?

Yes

- Go To [6](#)

No

- Go To [11](#)

6. STARTER RELAY

Install a known good relay in place of the Starter Relay.
Attempt to start the engine.

Does the engine crank?

Yes

- Replace the Starter Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK POWER AND GROUNDS

Refer to the symptom list and perform the Checking the ECM Power and Ground test.

Were any problem found with the ECM powers and grounds?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. STARTER COIL DRIVE CIRCUIT (INTERNAL TIPM)

Turn the ignition off.

Remove the Starter Relay from the TIPM.

Using a 12-volt test light connected to ground, check the Starter Coil Driver circuit in the Starter Relay connector while turning the ignition switch to the START position.

Does the test light illuminate with the ignition switch in the START position?

Yes

- Go To [9](#)

No

- Check the TIPM ignition supply circuits and fuses. If TIPM fuses and ignition supply circuits are ok, replace the TIPM.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the ASD Relay from the TIPM.

Using a jumper wire, connect ASD Relay connector cavities 30 and 87 in the TIPM.

Turn the ignition on.
Measure the voltage of the (T752) Starter Relay Control circuit.

Is the voltage above 1.0 volt?

Yes

- Repair the (T752) Starter Relay Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [10](#)

10. (T752) STARTER RELAY CONTROL CIRCUIT OPEN

Turn the ignition off.
Remove the jumper wire and install the ASD Relay.
Measure the resistance of the (T752) Starter Relay Control circuit between the ECM harness connector and the Starter Relay connector in the TIPM.

Is the resistance below 10.0 ohms?

Yes

- Replace the Engine Control Module in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (T752) Starter Relay Control circuit for an open.

11. FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, check the Fused B(+) circuit in the Starter Relay connector in the TIPM.

Is the test light on?

Yes

- Go To [12](#)

No

- Repair the Fused B(+) circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

12. (T750) STARTER RELAY OUTPUT CIRCUIT OPEN

Disconnect the (T750) Starter Relay Output wire from the Starter Solenoid.

Connect the (T750) Starter Relay Output wire (at the Starter) to ground.

Using a 12-volt test light connected to 12-volts, check the (T750) Starter Relay Output circuit at the Starter Relay connector in the TIPM.

Does the test light illuminate brightly?

Yes

- Go To [13](#)

No

- Repair the (T750) Starter Relay Output circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

13. MECHANICAL PROBLEM

Turn the ignition off.

Attempt to manually rotate the crankshaft 360°.

Is the crankshaft able to rotate 360°?

Yes

- Replace the Starter Motor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the engine mechanical problem.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

*LACK OF ENGINE POWER

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
AIR IN FUEL SYSTEM

INJECTOR QUANTITY ADJUSTMENT
INTAKE/EXHAUST SYSTEM RESTRICTION
EGR SYSTEM PROBLEM
LOW ENGINE COMPRESSION
INTAKE AIR SYSTEM LEAK
FUEL DELIVERY SYSTEM RESTRICTION
ENGINE DRIVE BELT/CHAIN
FUEL INJECTOR(S)
FUEL PRESSURE SOLENOID
FUEL INJECTION PUMP
FUEL SYSTEM CONTAMINATION
FUEL SYSTEM LEAK
TURBOCHARGER

Diagnostic Test

1. CHECKING FOR ECM DTCS

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Turn the ignition on.

With the scan tool, read the ECM DTCs.

Are there any DTCs present?

Yes

- Refer to symptom list for problems related to this DTC.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. FUEL SYSTEM LEAK

Turn the ignition off.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the entire fuel system for leakage.

Is there any evidence of leakage?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. FUEL SYSTEM CONTAMINATION

NOTE: Mixing any other fuels such as gasoline or kerosine can cause this symptom to occur.

Turn the ignition off.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME

PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the fuel system for contamination.

Is the fuel contaminated?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECKING BOOST PRESSURE

Turn the ignition on.

NOTE: This test requires two people. One person to test drive the vehicle while a technician observes the scan tool readings.

With the scan tool in Sensors, read and compare the Boost Pressure (PSI) with the Boost Pressure Desired/Setpoint (PSI) while test driving the vehicle under various load conditions such as idle, hard acceleration, and cruise.

NOTE: The Boost Pressure reading should directionally follow (trail) the Boost Pressure Desired/Setpoint reading.

Does the Boost Pressure reading follow the Boost Pressure Desired/Setpoint reading?

Yes

- Go To [5](#)

No

- Go To [13](#)

5. CHECKING FUEL PRESSURE

Turn the ignition on.

NOTE: This test requires two people. One person to test drive the vehicle while a technician observes the scan tool readings.

With the scan tool in Sensors, read and compare the Fuel Pressure (PSI) with the Fuel Pressure Desired/Setpoint (PSI) while test driving the vehicle under various load conditions such as idle, hard acceleration, cruise and deceleration.

NOTE: The Fuel Pressure reading should directionally follow (trail) the Fuel Pressure Desired/Setpoint reading.

Does the Fuel Pressure reading directionally follow the Fuel Pressure Desired/Setpoint reading?

Yes

- Go To [6](#)

No

- Go To [10](#)

6. INJECTOR QUANTITY ADJUSTMENT

NOTE: Each Fuel Injector is labeled with a code. This code determines the injector quantity adjustment. Each Injector code must be programmed into the ECM using the scan tool.

Turn the ignition off.

Refer to the Service Information to locate each fuel injector label and check for the correct code for each fuel injector in the ECM.

Are all of the injector codes correct?

Yes

- Go To [7](#)

No

- Using the scan tool, program the correct Fuel Injector code into the ECM.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. ENGINE COMPRESSION

Start and idle the engine.

With the scan tool, perform the Cylinder Compression Test.

Does the Cylinder Compression Test indicate low compression in any of the cylinders?

Yes

- Using the Service Information, repair the engine as necessary to regain proper cylinder compression.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. FUEL INJECTOR

NOTE: An injector that sticks open can cause this symptom. A sticking injector will cause the engine to misfire and emit excessive black smoke from the exhaust system.

Start and idle the engine.

With the scan tool, perform the Cylinder Fuel Quantity Correction Test.

NOTE: A problem injector will be indicated by a significant change in correction quantity as compared to the rest of the injectors.

Are any of the injectors displaying a significant amount of injection quantity correction?

Yes

- Using the Service Information, remove and inspect the Fuel Injectors for signs of damage or debris that may cause the injector to stick. Sticking injectors may cause the combustion chamber to become black and oil soaked. Replace Injector(s) as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. ENGINE DRIVE BELT/CHAIN

Refer to the Service Information to ensure the Engine Drive Belt/Chain is installed correctly and the camshaft and crankshaft gears are timed correctly.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

10. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the Checking the Low Pressure Fuel Delivery System Test and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [11](#)

11. CHECKING FOR AIR IN FUEL SYSTEM

Start the engine.

With the scan tool in Sensors, compare the Fuel Pressure Setpoint with the Actual Fuel Pressure readings.

NOTE: If there is air in the fuel system, the Actual Fuel Pressure will oscillate more than 100 psi (7.0 bar) above and/or below the Fuel Pressure Setpoint.

Does Actual Fuel Pressure oscillate more than 100 psi (7.0 bar) above and/or below the Fuel Pressure Setpoint?

Yes

- Refer to the Service Information to purge air from the fuel system.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [12](#)

12. FUEL PRESSURE SOLENOID

Turn the ignition off.

Replace the Fuel Pressure Solenoid in accordance with the Service Information.
Test drive the vehicle.

Does the vehicle still exhibit a lack of power?

Yes

- Refer to the Service Information and replace the Fuel Injection Pump assembly.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

13. CHECK FOR INTAKE AND EXHAUST SYSTEM RESTRICTIONS

Turn the ignition off.

Inspect the exhaust system for damaged components that could cause exhaust flow blockage.

Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections for damage, air leaks or blockage.

Inspect the Charge Air Cooler hoses/tubes and connections.

Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [14](#)

14. CHECKING FOR AIR LEAKS

NOTE: Inspect all air intake and turbocharger related tubes for damage, restriction or poor connection. Any of these conditions can cause a poor performance/lack of power symptom.

Turn the ignition off.

Remove the Crankcase Vent Heater.

Remove the Mass Air Flow Sensor from the turbocharger inlet tube.

Seal off and/or plug the turbocharger inlet tube where the MAF sensor was removed.

Connect smoke machine 84-04 to the Crankcase Vent Heater port in the intake duct and begin injecting smoke into the intake system.

Observe all intake system components for evidence of smoke leakage.

Is there evidence of smoke leakage?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go To [15](#)

15. EGR SYSTEM

Refer to the symptom list and perform the CHECKING THE EGR SYSTEM test.

Were any problems found during the EGR System test?

Yes

- Repair or replace as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Check for proper linkage connection between the Boost Pressure Servo Motor and the Turbocharge assembly. Repair or replace as necessary. If o.k., refer to the Service Information and replace the Turbocharger assembly.

***CHECKING THE ACCELERATOR PEDAL POSITION SENSOR CALIBRATION**

81a754a6

For a complete wiring diagram **Refer to Section 8W**

APP SENSOR 1
APP SENSOR 2

Diagnostic Test

1. APP SENSOR IDLE VOLTAGE

NOTE: If there are any Accelerator Pedal Position Sensor DTC's active in the ECM, diagnose DTC's before continuing this test.

NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 1 signal should always be double the voltage of the APP Sensor 2 signal.

NOTE: Ensure the accelerator pedal is free from any restriction or binding before continuing.

Turn the ignition on.

With the scan tool, read the APP Sensor 1 and APP Sensor 2 Volts with the accelerator pedal in the at rest position.

Does the scan tool display between 0.20 and 0.61 volt for sensor 1 and 0.10 and 0.30 volt for sensor 2?

Yes

- Go To [2](#)

No

- Check the APP Sensor circuits for proper resistance. If no problems are found, replace the APP Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. APP SENSOR 1

While back probing, measure the voltage of the APP Sensor 1 Signal circuit at the ECM. Monitor the voltmeter while slowly pressing the accelerator pedal completely down.

NOTE: APP signals are displayed in voltage and percentage on the scan tool. Although APP 1 voltage is double APP 2 voltage, the percentage display of APP 1 and APP 2 should be within 2.5% of each other during all phases of accelerator pedal travel.

Did the voltage increase smoothly with pedal travel?

Yes

- Go To [3](#)

No

- Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. APP SENSOR 2

While back probing, measure the voltage of the APP Sensor 2 Signal circuit at the ECM. Monitor the voltmeter while slowly pressing the accelerator pedal completely down.

NOTE: APP signals are displayed in voltage and percentage on the scan tool. Although APP 1 voltage is double APP 2 voltage, the percentage display of APP 1 and APP 2 should be equal during all phases of accelerator pedal travel.

Did the voltage increase smoothly with pedal travel?

Yes

- Go To [4](#)

No

- Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. APP SENSOR WIDE OPEN THROTTLE VOLTAGE

Fully depress the accelerator pedal.
With the scan tool, read the voltage for APP Sensor 1 and APP Sensor 2.

Does the scan tool display between 4.30 and 4.80 volts for sensor 1 and 2.15 and 2.40 volts for sensor 2?

Yes

- Test Complete.

No

- Check the APP Sensor circuits for proper resistance. If o.k., replace the APP Sensor in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

***CHECKING THE BOOST PRESSURE SENSOR CALIBRATION**

For a complete wiring diagram **Refer to Section 8W**

TURBOCHARGER BOOST PRESSURE SENSOR CALIBRATION
--

Diagnostic Test

1. BOOST PRESSURE SENSOR CALIBRATION

Turn the ignition on.

With the scan tool, read the Boost Pressure Voltage and Boost Pressure hpa.

NOTE: The Boost Pressure hpa and Intake/Inlet Air Pressure hpa readings should both match closely to the Atmospheric Pressure hpa reading. These readings will change depending on altitude.

Is the Boost Pressure Voltage between 1.12 and 1.36 volt?

Yes

- Test Complete.

No

- Replace the Turbocharger Boost Pressure Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

***CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR CALIBRATION**

01a77365

For a complete wiring diagram **Refer to Section 8W**

Possible Causes

ECT SENSOR - COLD
ECT SENSOR - HOT

Diagnostic Test

1. ECT SENSOR - COLD

NOTE: The thermostat must be operating correctly for this test to be valid.

With the scan tool in Sensors, read and note the engine coolant temperature.
Using a temperature probe, measure the engine block temperature near the ECT Sensor.

NOTE: The engine temperature should be below 50°C (120°F).

Are the readings within 7°C (13°F) of each other?

Yes

- Go To [2](#)

No

- Check the wiring and connectors associated with the ECT Sensor for corrosion, damage or other problems. Repair as necessary. If no problems are found, replace the Engine Coolant Temperature Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. ECT SENSOR - HOT

NOTE: The thermostat must be operating correctly for this test to be valid.

Start the engine and bring the engine to operating temperature (thermostat open).
Turn the engine off and wait 10 minutes to allow the engine temperature to stabilize.
Using a temperature probe, measure the engine block temperature near the ECT Sensor.
With the scan tool, select Engine, then Sensors and read the engine coolant temperature.

Are the readings within 7°C (13°F) of each other?

Yes

- Test Complete.

No

- Check the wiring and connectors associated with the ECT Sensor for corrosion, damage or other problems. Repair as necessary. If no problems are found, replace the Engine Coolant Temperature Sensor.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

***CHECKING THE EGR SYSTEM**

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
VACUUM SUPPLY TO EGR SOLENOID
EGR SOLENOID
EGR VALVE

Diagnostic Test**1. VACUUM SUPPLY TO EGR SOLENOID**

Turn the ignition off.

Disconnect the vacuum supply hose to the EGR Solenoid.

Connect a vacuum gauge to the disconnected vacuum supply hose to the EGR Solenoid.

Start and idle the engine.

Observe the vacuum gauge reading.

Does the vacuum gauge display vacuum above 24 inches of mercury?

Yes

- Go To [2](#)

No

- Check vacuum pump and vacuum supply system for problems related to low vacuum.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. VACUUM SUPPLY TO EGR VALVE

NOTE: The engine must be at operating temperature for this test.

Turn the ignition off.

Reconnect the vacuum supply hose to the EGR Solenoid.

Disconnect the vacuum hose at the EGR Valve.

Connect a vacuum gauge to the disconnected vacuum hose at the EGR Valve.

Start and idle the engine.

Observe the vacuum gauge reading for at least 10 minutes beginning at engine start up.

Does the vacuum gauge display vacuum above 14 inches of mercury for approximately 10 minutes from engine start up then drop to 0?

Yes

- Go To [3](#)

No

- Check the vacuum hose between the EGR Solenoid and the EGR Valve for crack, kinks cuts, or other damage that may prevent proper vacuum operation. If the hose is functioning properly, replace the EGR Solenoid.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. EGR VALVE

Turn the ignition off.

Reconnect the vacuum hose at the EGR Valve.

Disconnect both vacuum hoses at the EGR Solenoid.

Using a vacuum tee connector, connect both disconnected hose ends at the EGR Solenoid.

NOTE: This test will apply continual vacuum to the EGR Valve. If the EGR Valve is functioning properly, a dramatic loss of engine power will occur when attempting to accelerate and/or load the engine.

Test drive the vehicle.

Does the vehicle exhibit a noticeable loss of power on acceleration?

Yes

- Test Complete.

No

- Replace the EGR Valve in accordance with the Service Information.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

***CHECKING THE ENGINE MECHANICAL SYSTEMS**

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
CHECKING ENGINE MECHANICAL SYSTEMS

Diagnostic Test

1. CHECKING ENGINE MECHANICAL

NOTE: The following items should be checked as a possible cause of a Driveability or No-Start problem.

WARNING: Do not attempt to remove or separate high pressure fuel line. Attempting to do so could result in severe bodily injury or death.

Engine Valve Timing - must be within specification

Engine Compression - must be within specifications

Camshaft Lobes - check for abnormal wear

Camshaft Position Sensor - check the camshaft position sensor tooth for debris and deterioration

Crankshaft Position Sensor - check the crankshaft magnetic strip for debris and deterioration

Engine Exhaust System - must be free of any restriction

Engine Drive Belt and Sprockets - must be properly positioned

Vacuum System - must operate properly and be free of any vacuum leaks

Fuel - must have adequate supply and must be free of contamination (ie. debris, water and gasoline)

Fuel Injectors - must not be plugged or restricted

Fuel Lift Pump - must operate properly (where applicable)

Fuel Injection Pump - must be producing the correct output volume and pressure

Inspect the Fuel Lines, Fuel Filter and Fuel Pressure Relief Valve for signs of restriction and leaks

NOTE: Check for any Technical Service Bulletins that may relate to the problem.

Are there any problems evident?

Yes

- Repair as necessary.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

*CHECKING THE ECM POWER AND GROUND CIRCUITS

Possible Causes
(K51) ASD RELAY CONTROL CIRCUIT OPEN
(F344) ASD RELAY OUTPUT CIRCUIT(S) OPEN
CHECKING THE ASD RELAY SYSTEM
(Z905) ECM GROUND CIRCUIT(S) OPEN
FUSED ASD RELAY BATTERY SUPPLY CIRCUIT OPEN
(F202) FUSED IGNITION SWITCH (START/RUN) OUTPUT CIRCUIT OPEN
SUBSTITUTE ASD RELAY
(K51) ASD RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Diagnostic Test

1. ECM GROUND CIRCUIT(S) OPEN

Turn the ignition off.
 Disconnect the ECM harness connectors.
 Using a 12-volt test light connected to 12-volts, check each of the ECM ground circuits in ECM harness connector C2 cavities 2, 4 and 6.

Did the test light illuminate for each cavity?

Yes

- Go To [2](#)

No

- Repair the ECM Ground circuit(s) for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. (F202) FUSED IGNITION SWITCH START/RUN OUTPUT CIRCUIT OPEN

Turn the ignition to the Start position.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Start/Run Output circuit in ECM harness connector C2 cavity 41.

Turn the ignition to the Run position.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Start/Run Output circuit in ECM harness connector C2 cavity 41.

Is the test light on for both ignition switch positions?

Yes

- Go To [3](#)

No

- Repair the (F202) Fused Ignition Switch Start/Run Output circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. CHECKING THE ASD RELAY SYSTEM

Turn the ignition off.

Connect a jumper wire between ground and the (K51) ASD Relay Control circuit in ECM C2 harness connector cavity 42.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F344) Fused ASD Relay Output circuits at the ECM C2 harness connector cavities 1, 3 and 5.

Does the test light illuminate brightly for each circuit?

Yes

- Test Complete.

No

- Go To [4](#)

4. FUSED ASD RELAY BATTERY SUPPLY CIRCUIT OPEN

Turn the ignition off.
Remove the ASD Relay from the TIPM.
Using a 12-volt test light connected to ground, check both Fused ASD Relay Battery Supply circuits in ASD Relay connector.

Is the test light on?

Yes

- Go To [5](#)

No

- Repair the Fused ASD Relay Battery Supply circuit(s) for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

5. (F344) ASD RELAY OUTPUT CIRCUIT OPEN

Connect a jumper wire between cavity 30 and cavity 87 in the ASD Relay connector.

Using a 12-volt test light connected to ground, check the (F344) ASD Relay Output circuit in ECM harness connector C2 cavities 1, 3 and 5.

Did the test light illuminate for each circuit?

Yes

- Go To [6](#)

No

- Repair the (F344) ASD Relay Output circuit(s) for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. ASD RELAY

Turn the ignition off.

Install a known good relay in place of the ASD Relay.

Connect a jumper wire between ground and the (K51) ASD Relay Control circuit in ECM C2 harness connector cavity 42.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F344) Fused ASD Relay Output circuits at the ECM C2 harness connector cavities 1, 3 and 5.

Did the test light illuminate brightly for each circuit?

Yes

- Replace the ASD Relay.
- Perform the ECM Verification Test Ver. 1. (Refer to 9

- ENGINE - STANDARD PROCEDURE)

No

- Go To [Z](#)

7. (K51) ASD RELAY CONTROL CIRCUIT OPEN

Turn the ignition off.
Remove the ASD Relay from the TIPM.
Measure the resistance of the (K51) ASD Relay Control circuit between the TIPM connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [8](#)

No

- Repair the (K51) ASD Relay Control circuit for an open.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (K51) ASD RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay connector in the TIPM.
Turn the ignition on.
Measure the voltage on the (K51) ASD Relay Control circuit.

Is the voltage above 1.0 volt?

Yes

- Repair the (K51) ASD Relay Control circuit for a short to voltage.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Test Complete.

*CHECKING THE FUEL SUPPLY SYSTEM

For a complete wiring diagram **Refer to Section 8W.**

Diagnostic Test

1. CHECKING THE FUEL PUMP CIRCUITS

Turn the ignition on.

NOTE: Diagnose and repair any fuel pump control circuit or relay DTCs before continuing with this test.

Disconnect the Fuel Pump Module harness connector.

Connect a test light between the (N1) Fuel Pump Control Output circuit and the (Z905) Ground circuit at the Fuel Pump Module harness connector (body side).

With a scan tool, actuate the fuel pump control to ON (100%).

CAUTION: Stop all actuation tests before continuing.

Does the test light illuminate brightly?

Yes

- Go to [2](#)

No

- Go to [8](#)

2. CHECKING THE FUEL PRESSURE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system Line, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Disconnect the Low Pressure Fuel Supply Line from the inlet port of the Fuel Injection Pump.

Install a fuel pressure gauge in the disconnected Low Pressure Fuel Supply Line.

Turn the ignition on.

With the scan tool, actuate the fuel pump relay control. Observe the fuel pressure gauge.

NOTE: The fuel pressure specification is between 4.5 and 6.0 bar (65 and 87 psi.).

CAUTION: Stop all actuation tests before continuing.

Select the conclusion that best matches the result of the test:

Fuel pressure is within the stated specification

- Go to [6](#)

Fuel pressure is below the stated specification

- Go to [3](#)

Fuel pressure is above the stated specification

- Replace the Fuel Filter/Water Separator.
- Perform the PCM Verification Test. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. RESTRICTED LOW PRESSURE FUEL SUPPLY LINE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure, even with the engine off. Before testing or servicing any fuel system Line, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Reconnect the Low Pressure Fuel Supply Line from the inlet port of the Fuel Injection Pump
Disconnect the Low Pressure Fuel Supply Line from the inlet port of the Fuel Filter/Water Separator.
Install a fuel pressure gauge in the disconnected Low Pressure Fuel Supply Line.
Turn the ignition on.

With the scan tool, actuate the fuel pump relay control. Observe the fuel pressure gauge.

NOTE: The fuel pressure specification is between 4.5 and 6.0 bar (65 and 87 psi.).

CAUTION: Stop all actuation tests before proceeding.

Is the fuel pressure within specification?

Yes

- Replace the Fuel Filter/Water Separator.
- Perform the PCM Verification Test. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. RESTRICTED INJECTOR BACK FLOW LINE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure, even with the engine off. Before testing or servicing any fuel system Line, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Disconnect the Injector Back Flow Pressure Fuel Line from the Low Pressure Fuel Supply Line.

NOTE: The Injector Back Flow Pressure Fuel Line is connected to the Low Pressure Fuel Supply Line approximately six inches away from the Fuel Filter/Water Separator.

Install a cap to block the port where the Injector Back Flow Pressure Fuel Line was connected.

Install a fuel pressure gauge in the disconnected Low Pressure Fuel Supply Line.

Turn the ignition on.

With the scan tool, actuate the fuel pump relay control. Observe the fuel pressure gauge.

NOTE: The fuel pressure specification is between 4.5 and 6.0 bar (65 and 87 psi.).

CAUTION: Stop all actuation tests before proceeding.

Is the fuel pressure within specification?

Yes

- Go to [6](#)

No

- Go to [5](#)

5. FUEL PUMP MODULE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system Line, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Reconnect the Low Pressure Fuel Supply Line from the inlet port of the Fuel Filter/Water Separator.

Reconnect the Injector Back Flow Pressure Fuel Line.

Disconnect the Low Pressure Fuel Supply Line from the outlet port of the Fuel Module on top of the Fuel Tank.

Install a fuel pressure gauge in the outlet port of the Fuel Pump Module.

Turn the ignition on.

With the scan tool, actuate the fuel pump relay control. Observe the fuel pressure gauge.

NOTE: The fuel pressure specification is between 4.5 and 6.0 bar (65 and 87 psi.).

CAUTION: Stop all actuation tests before proceeding.

Is the fuel pressure within specification?

Yes

- Replace the Fuel Pump Module.
- Perform the PCM Verification Test. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. FUEL PRESSURE SOLENOID BACK FLOW RETURN LINE

Turn the ignition off.

Disconnect the Back Flow Return Line at the Fuel Pressure Solenoid.

Disconnect the Back Flow Return Line at the Fuel Pump Module on top of the Fuel Tank

Apply air pressure to the Solenoid end of the Back Flow Return Line.

Is air movement evident at the Fuel Pump Module end of the Back Flow Return Line?

Yes

- Test Complete

No

- Go to [7](#)

7. HIGH PRESSURE PUMP BACK FLOW RETURN LINE

Turn the ignition off.

Reconnect the Back Flow Return Line at the Fuel Pressure Solenoid.

Disconnect the Back Flow Return Line at the High Pressure Fuel Pump.

Apply air pressure to the High Pressure Pump end of the Back Flow Return Line.

Is air movement evident at the Fuel Pump Module end of the Back Flow Return Line?

Yes

- Test Complete

No

- Repair the Back Flow Return Line for kinks or broken line.
- Perform the PCM Verification Test. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

8. (Z905) FUEL PUMP GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Fuel Pump Module harness connector.

Using a 12 volt test light connected to 12 volts, check the (Z905) Fuel Pump Motor Ground circuit at the Fuel Pump Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to [9](#)

No

- Repair the (Z905) Fuel Pump Ground circuit for an open circuit or high resistance.
- Perform the PCM Verification Test. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

9. (N1) FUEL PUMP CONTROL OUTPUT CIRCUIT CHECK

Using a 12 volt test light connected to 12 volts, check the (N1) Fuel Pump Motor Ground circuit at the Fuel Pump Module harness connector.

Turn the ignition on.

With a scan tool, actuate the fuel pump control to ON (100%).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Replace the Fuel Pump Module in accordance with the Service information.
- Perform the PCM Verification Test. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Repair the (N1) Fuel Pump Control Output circuit for an open, short to ground or short to voltage. If the Fuel Pump Control Output circuit is o.k., replace the Totally Integrated Power Module.
- Perform the PCM Verification Test. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

*INTERMITTENT DTC

For a complete wiring diagram **Refer to Section 8W**

Diagnostic Test

1. INTERMITTENT DTC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

The conditions necessary to set this DTC are not present at this time.

Review the scan tool environmental data. If possible, try to duplicate the conditions under which the DTC set.

If applicable, actuate the component with the scan tool.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change, the actuation to be interrupted, or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Perform a voltage drop test on the related circuits between the suspected component and the ECM.

Inspect and clean all ECM, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits.

For intermittent Misfire DTCs check for restrictions in the Intake and Exhaust system, proper installation of Sensors, vacuum leaks, and binding components that are run by the accessory drive belt.

Use the scan tool to perform a System Test if one applies to the component.

A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes

- Perform the necessary repairs.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No

- Test Complete.

PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. NO RESPONSE

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red.

Does the scan tool display a Vehicle Network problem or NO RESPONSE condition?

Yes

- Refer to the appropriate BUS Communication test in Section 8 ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS.

No

- Go To [2](#)

2. NO START

Does the vehicle have a NO START condition?

Yes

- Check the vehicle for any DTC(s), including Vehicle Theft Security related DTC(s), that may cause a no-start condition.
- If no DTC(s) are present that relate to a no-start condition, refer to the Non DTC Diagnostic Procedures that relate to Fuel and Starting.

No

- Go To [3](#)

3. VEHICLE REPAIR HISTORY AND TSB(s)

Check the vehicle repair history for repairs that may relate to the current condition.
 Inspect the vehicle for aftermarket accessories that may have been installed incorrectly.
 Check for any TSB(s) related to the condition or DTC(s).
 If a TSB applies, follow the procedure outlined in the TSB.

Select the appropriate response for the condition that applies:

Performing a TSB procedure repaired the condition.

- Test Complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

A DTC is present, no TSB applies, or the TSB didn't repair the condition.

- Go To [4](#)

No DTC(s) or conditions are present.

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

4. VEHICLE INSPECTION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

Based on the diagnostic condition that applies, review the following list and perform any tests that relate to the condition:

If multiple DTCs are set in the ECM, review the wiring schematics for problems in any shared supply or ground circuits. Refer to the diagnostic procedure for Checking the ECM Power and Ground Circuits.

Inspect the air intake system and turbocharger related tubes for damage, restriction, or poor connection.

Inspect the exhaust system and related tubes for damage, restriction, or poor connection.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause an air flow restriction.

If the ECM detects and stores a DTC, the ECM also stores the environmental conditions under which the DTC was set.

Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, Clear the stored DTC(s).

Attempt to duplicate the environmental conditions under which the DTC was set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the vehicle conditions under which the DTC conditions will be monitored. Operate the vehicle under those conditions.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the component and the module.

If the DTC(s) are fuel or air related, check the fuel level and quality.

Were any repairs made that corrected the DTC or condition?

Yes

- Test complete.
- Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Refer to the diagnostic test procedure related to the DTC.

STANDARD PROCEDURE

ECM VERIFICATION TEST

For a complete wiring diagram **Refer to Section 8W.**

Diagnostic Test

1. SELECT THE PROPER VERIFICATION TEST

Select the verification test for the repair that has been completed:

Speed Control repair

- Go To [2](#)

Charging System repair

- Go To [3](#)

No Start repair

- Go To [4](#)

Diesel Particulate Filter repair

- Go To [5](#)

Differential Pressure Sensor repair

- Go To [6](#)

DTC and all other repairs

- Go To [7](#)

2. SPEED CONTROL VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. With the scan tool, erase all diagnostic trouble codes (DTCs).
3. Road test the vehicle at a speed above 60 km/h (35 MPH).
4. Turn the speed control ON/OFF switch on.
5. Depress and release the SET switch. If the speed control does not engage, the repair is not complete, continue with step 12.
6. Quickly depress and release the RESUME/ACCEL switch. If the vehicle speed does not increase by 3 km/h (2 MPH), the repair is not complete, continue with step 12.
7. Using caution, depress and release the brake pedal. If the speed control does not disengage, the repair is not complete, continue with step 12.
8. With the vehicle speed at least 60 km/h (35 MPH), depress the RESUME/ACCEL switch. If the speed control does not resume at the previously set speed, the repair is not complete, continue with step 12.

9. Hold down the COAST switch. If the vehicle does not decelerate, the repair is not complete, continue with step 12.
10. While still holding down the COAST switch, ensure the vehicle speed is at least 60 km/h (35 MPH) and release the COAST switch. If the vehicle does not adjust and set a new vehicle speed, the repair is not complete, continue with step 12.
11. With the speed control engaged, depress the ON/OFF switch. If the speed control does not disengage, the repair is not complete, continue with step 12.
12. If the vehicle did not successfully perform all of the previous steps, check for Technical Service Bulletins (TSBs) that pertain to this speed control problem and then, if necessary, return to the Symptom List.
13. If the vehicle successfully performed all of the previous steps, the speed control system is now functioning as designed. The repair is now complete.

Are any DTCs or symptoms remaining?

Yes

- Repair is not complete, refer to the appropriate diagnostic procedure.

No

- Repair is complete.

3. CHARGING SYSTEM VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. With the scan tool, erase all diagnostic trouble codes (DTCs).
3. Start the engine.
4. Raise the engine speed to 2000 RPM for at least 30 seconds.
5. Allow the engine to idle.
6. Turn the ignition off for 20 seconds.
7. Turn the ignition on.
8. With the scan tool, read ECM DTCs.
9. If this DTC has set again, or another DTC has set, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
10. If the charging system is functioning correctly and there are no DTCs, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes

- Repair is not complete, refer to the appropriate diagnostic procedure.

No

- Repair is complete.

4. NO START VERIFICATION TEST

NOTE: IMPORTANT! If the Engine Control Module or Sentry Key Immobilizer Module has been

replaced, ensure the programming procedure for the module has been performed in accordance with the Service Information.

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter.
3. With the scan tool, erase all diagnostic trouble codes (DTCs).
4. Turn the ignition off for at least 10 seconds.
5. Attempt to start the engine.
6. If the engine is unable to start, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
7. If the engine starts and continues to run, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes

- Repair is not complete, refer to the appropriate diagnostic procedure.

No

- Repair is complete.

5. DIESEL PARTICULATE FILTER VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. This procedure should be performed after the Diesel Particulate Filter has been replaced
3. With the scan tool, erase all diagnostic trouble codes (DTCs).
4. With the scan tool, perform the Diesel Particulate Filter Replacement procedure located in the Engine Misc. Function section.
5. Attempt to start the vehicle.
6. If the engine is unable to start, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
7. If the engine starts and continues to run, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes

- Repair is not complete, refer to the appropriate diagnostic procedure.

No

- Repair is complete.

6. DIFFERENTIAL PRESSURE SENSOR VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.

2. This procedure should be performed after the Differential Pressure Sensor has been replaced
3. With the scan tool, erase all diagnostic trouble codes (DTCs).
4. With the scan tool, perform the Differential Pressure Sensor Replacement procedure located in the Engine Misc. Function section.
5. Attempt to start the vehicle.
6. If the engine is unable to start, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
7. If the engine starts and continues to run, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes

- Repair is not complete, refer to the appropriate diagnostic procedure.

No

- Repair is complete.

7. ROAD TEST VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. If not, proceed to step 5.
3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and testing is now complete.
4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the Symptom List if necessary.
5. For previously read DTCs that have not been dealt with, return to the Symptom List and follow the diagnostic path for that DTC; otherwise, continue.
6. If the Engine Control Module (ECM) has been replaced, continue with step 9.
7. With the scan tool, erase all diagnostic trouble codes (DTCs), then disconnect the scan tool.
8. Turn the ignition off for at least 10 seconds.
9. If equipped with a Transfer Case Position Switch, perform step 10, otherwise, continue with step 11.
10. With the ignition switch on, place the Transfer Case Shift Lever in each gear position, stopping for 15 seconds in each position.
11. Road test the vehicle. For some of the road test, go at least 64 km/h (40 MPH). If this test is for an A/C Relay Control Circuit, drive the vehicle for at least 5 minutes with the A/C on.
12. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue.
13. Upon completion of the road test, turn the engine off and check for DTCs with the scan tool.
14. If the repaired DTC has set again, the repair is not complete. Check for any pertinent Technical Service Bulletins (TSBs) and return to the Symptom List. If there are no DTCs, the repair was successful and is now complete.

Are any DTCs or symptoms remaining?

Yes

- Repair is not complete, refer to the appropriate diagnostic procedure.

No

- Repair is complete.

ENGINE 3.8L

ENGINE 3.8L

DESCRIPTION

The 3.8 Liter (231 cu. in.) engine is 60° V-6 engines with cast iron cylinder blocks and aluminum cylinder heads. The engine uses a single, block mounted camshaft, roller lifters with pushrods to actuate the valves and either cracked cap, or standard cap, forged connecting rods. The engine does not have provisions for a free wheeling valve train.

The firing order is 1-2-3-4-5-6. The left cylinder bank is numbered 2, 4, and 6. The right cylinder bank is numbered 1, 3, and 5.

The engine identification number is located on the rear of the cylinder block just below the cylinder head.

DIAGNOSIS AND TESTING

INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Hydraulic Lash Adjuster Noise Diagnosis

Engine Oil Leak Inspection

PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing belt/chain.
ENGINE STALLS OR IDLES ROUGH	1. Idle speed too low.	1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)
	2. Incorrect fuel mixture.	2. (Refer to Appropriate Diagnostic Information)
	3. Intake manifold leakage.	3. Inspect intake manifold, manifold gasket, and vacuum hoses.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head	5. Replace cylinder head gasket.

	gasket.	
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil pressure problem.

	5. Dirt in hydraulic lifters/lash adjusters.	5. Replace hydraulic lifters/lash adjusters.	
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms.	
	7. Worn hydraulic lifters/lash adjusters.	7. Replace hydraulic lifters/lash adjusters.	
	8. Worn valve guides.	8. Replace cylinder head assembly.	
	9. Excessive runout of valve seats on valve faces.	9. Grind valve seats and valves.	
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.	
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.	
	3. Thin or diluted oil.	3. Change oil to correct viscosity.	
	4. Thick oil	4. (a) Change engine oil and filter.	
		(b) Run engine to operating temperature.	
		(c) Change engine oil and filter again.	
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.	
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.	
	7. Misaligned connecting rods.	7. Replace bent connecting rods.	
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.	
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.	
	3. Thin or diluted oil.	3. Change oil to correct viscosity.	
	4. Thick oil	4. (a) Change engine oil and filter.	
		(b) Run engine to operating temperature.	
		(c) Change engine oil and filter again.	
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.	
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.	

	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure sensor/switch.	2. Replace oil pressure sensor/switch.
	3. Low oil pressure.	3. Check oil pressure sensor/switch and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.

4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
5. Worn valve guide(s).	5. Replace cylinder head assembly.
6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil level indicator to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.
5. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:
 - Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the outlet on the cover.
 - Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve outlet on the cover.
 - Attach an air hose with pressure gauge and regulator to the oil level indicator tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
 - If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
6. If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.
 7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the oil level indicator tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.
 - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - b. Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.
4. If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.
7. After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Check engine oil level and add oil if necessary.
2. Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.
3. Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
4. Remove the Auto Shutdown (ASD) relay from the PDC.
5. Be sure throttle blade is fully open during the compression check.
6. Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
7. Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.
8. Repeat the previous step for all remaining cylinders.
9. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
10. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

11. If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

STANDARD PROCEDURE

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes. (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap/bed plate bolts of the bearing being checked to the proper specifications.

3. Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare the clearance measurements to specifications found in the engine specifications table (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

4. Install the proper crankshaft bearings to achieve the specified bearing clearances.

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is

specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

1. Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
2. Remove negative battery cable.
3. Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.
4. With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
5. Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).
6. Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
7. Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

8. Install new spark plugs.
9. Drain engine oil and remove oil filter.
10. Install a new oil filter.
11. Fill engine with specified amount of approved oil.
12. Connect negative battery cable.
13. Start engine and check for any leaks.

REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug .

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately. .

REMOVAL

1. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
2. Disconnect negative battery cable.
3. Disconnect the Inlet Air Temp Sensor (IAT) (2), and remove air cleaner hose (1) and housing.

4. Evacuate and recover the air conditioning.
5. Disconnect the throttle control connectors (3) from the throttle body.

6. Disconnect the PCV hose (1) at the left cylinder head cover.

819cd5ef

7. Remove the front splash shield (1).
8. Drain the cooling system.
9. Disconnect the upper radiator hose from the thermostat housing and the lower radiator hose from the radiator.
10. Disconnect the heater hoses and coolant reservoir hose.

11. Disconnect the generator electrical connectors (1,2).

81910df4

12. Disconnect the throttle position (TP), idle air control (IAC) motor, oxygen (HO2), cam position (CMP), manifold absolute pressure (MAP) (2) and the two engine wiring

harness connectors. Free the harness from the cover studs and set harness aside.

13. Disconnect the purge solenoid harness connector.

81920e96

14. Disconnect the EVAP hose from the throttle body.

15. Remove the EGR tube (1) (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - REMOVAL).

819257fe

16. Remove the drive belts.

17. Remove the generator (3).

18. Disconnect the fuel line from fuel rail (4).
19. Remove engine wiring harness retainer from left cylinder head cover and oil level indicator tube.

20. Disconnect the knock sensor wiring harness connector.
21. Remove the upper intake manifold (3).

81920e96

22. Disconnect the A/C electrical connector.
23. Disconnect the A/C discharge line (2) from the compressor. Cover and seal all openings of hoses and compressor.

818fca2f

24. Disconnect the A/C suction line (2) from the compressor. Cover and seal all openings of hoses and compressor.

818fce2b

- 25. Disconnect the oil pressure sending unit (OPS).
- 26. Disconnect the coolant hose at the engine oil cooler.
- 27. Remove the crankshaft sensor (2), (CKP).

- 28. Disconnect the in block heater (if equipped).
- 29. Disconnect the starter wiring (1) and remove starter.

- 30. Remove the starter (1).
- 31. Remove the flex plate inspection cover. (If equipped).
- 32. Rotate the engine at the crankshaft pulley bolt and remove the torque converter bolts. (If equipped).

33. Disconnect the left side oxygen sensors (1,2).

- 34. Disconnect the right side oxygen sensors (1,2).
- 35. Disconnect the exhaust pipes from the manifolds.
- 36. Remove the left and right exhaust manifolds.

81921950

37. Remove the power steering pump mounting bolts (2) and pump, with hoses attached.

38. Remove the engine mount thru bolts.

818b3c1d

39. Remove the structural cover mounting bolts (1,2), and cover. (If equipped).

40. Support the transmission using a suitable jack.

41. Connect engine lifting chain to engine, and lift the engine using a suitable hoist.

42. Lift the engine using a suitable hoist.

43. Separate the transmission from the engine.

INSTALLATION - ENGINE ASSEMBLY

819426e9

1. Position the engine in the vehicle.
2. Install the transmission bellhousing to engine mounting bolts (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION) (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION).
3. Tighten the engine mount thru bolts (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - INSTALLATION).
4. Install the torque converter bolts. (If equipped) (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION).
5. Install the structural cover (1) (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

6. Install the crank position sensor (2) (CKP).

7. Install the starter (1) (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

8. Install the flex plate inspection cover. (If equipped).
9. Connect the starter wiring (1) (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

10. Connect the knock sensor electrical connector.
11. Install the left and right exhaust manifolds.
12. Connect the exhaust system and connect the right side O2 sensors (1,2).

13. Connect the left side O2 sensors (1,2).
14. Connect the in block heater (if equipped).
15. Connect the coolant hose at the engine oil cooler.

16. Connect the oil pressure sending unit (OPS) wiring harness connector.
17. Install the upper intake manifold (3) (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

81920e96

18. Install the EGR tube (1) (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - INSTALLATION).

19. Connect the engine vacuum harnesses.

819257fe

20. Route the engine harness to the left cylinder head and attach the purge solenoid.

21. Connect the throttle position (TP), idle air control (IAC) motor, oxygen (H02), cam position (CMP), manifold absolute pressure (MAP) (2), and the engine wiring harness connectors.

22. Connect the A/C discharge line (2) at the compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

23. Connect the A/C suction line (2) at the compressor and compressor electrical connector (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

24. Install the power steering pump (1) (Refer to 19 - STEERING/PUMP - INSTALLATION).

25. Connect the fuel line (4) to the fuel rail.

26. Install the generator (3) (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

27. Reconnect the generator wiring. (1,2) (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

28. Install the drive belt.

29. Connect the radiator, coolant reservoir and heater hoses.

30. Connect the throttle wiring harness (ETC) (3).

31. Install the PCV hose (1).
32. Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

33. Install the air cleaner housing, inlet hose (1) and inlet air temp sensor (IAT) (2) (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).
34. Evacuate and recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE).
35. Install new oil filter. Fill engine crankcase with proper oil to correct level (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

81920ee6

819cd5ef

36. Install the front splash shield (1).
37. Connect negative cable to battery.
38. Start engine and run until operating temperature is reached.

SPECIFICATIONS

3.8L ENGINE

GENERAL DESCRIPTION

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Engine Type	60° V-6 Engine	
Number of Cylinders	6	
Displacement 3.8L	3.8 Liters	231 cu. in.
Bore 3.8L	96.0 mm	3.779 cu.in.
Stroke	87 mm	3.425 in.
Compression Ratio 3.8L	-	9.6:1
Firing Order	-	1-2-3-4-5-6
Compression Pressure-Minimum	689.5 kPa	100 psi.
Cylinder Compression (Max. Difference Between Cylinders)	-	25%

ELEMENT-AIR CLEANER

REMOVAL

1. Disconnect the IAT sensor (2).
2. Disconnect the CCV hose.
3. Separate the air inlet tube from the throttle body.
4. Remove the air cleaner cover bolts.
5. Lift cover and pull toward the engine and remove cover tabs from air cleaner housing.
6. Lift cover and remove the filter.

INSTALLATION

1. Install the air filter element into air box.
2. Move cover so that the tabs insert into the air cleaner housing.
3. Position the cover down over the element and lower housing and tighten the fasteners.
4. Connect the air inlet tube to the throttle body and tighten the clamp.
5. Connect the IAT sensor (2).
6. Connect the CCV hose.

HOUSING-AIR CLEANER

REMOVAL

1. Disconnect the negative battery cable.
2. Disconnect the inlet air temperature sensor (2).
3. Disconnect the CCV hose from the air cleaner cover.
4. Remove the air inlet tube to throttle body.
5. Remove the bolt for air cleaner housing at upper radiator cross member.
6. Pull air box up and off over the single locating pin.
7. Remove air box from vehicle.

INSTALLATION

81920ee6

1. Install air cleaner housing into vehicle and onto the locating pin.
2. Install bolt to hold air cleaner housing to the upper radiator cross member.
3. Install the air inlet tube to the throttle body and tighten clamp.
4. Connect the IAT sensor (2).
5. Connect the CCV hose to the air cleaner cover.
6. Connect the negative battery cable.

CYLINDER HEAD

DESCRIPTION

81920ee6

The aluminum cylinder heads (6) are designed to create high flow combustion chambers to improve performance, while minimizing the change to the burn rate in the chamber. The cylinder head incorporates the combustion chamber. Two valves (7,8) per-cylinder are used with inserted valve seats (5) and guides. A multi-layer steel (MLS) type gasket is used between the cylinder head and engine block.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

1. Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
2. Disconnect negative cable from battery.
3. Remove upper and lower intake manifolds.

WARNING: INTAKE MANIFOLD GASKET IS MADE OF VERY THIN METAL AND MAY CAUSE

PERSONAL INJURY, HANDLE WITH CARE.

81b19156

4. Remove the cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
5. Remove the spark plugs from cylinder head.
6. Remove the oil level indicator and tube.

80a3fca6

7. Remove exhaust manifold(s). (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL)
8. Remove rocker arm and shaft assemblies (2). (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL) Remove push rods and **mark positions to ensure installation in original locations.**

80a1ed3c

9. Remove the eight head bolts from each cylinder head and remove cylinder heads.

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

1. Before cleaning, check for leaks, damage and cracks.
2. Clean cylinder head and oil passages.
3. Check cylinder head for flatness .
4. Cylinder head must be flat within:
 - Standard dimension = less than 0.05 mm (0.002 inch.)
 - Service Limit = 0.2 mm (0.008 inch.)
 - Grinding Limit = Maximum of 0.2 mm (0.008 inch.) is permitted.

CAUTION: 0.20 mm (0.008 in.) MAX is a combined total dimension of the stock removal limit from cylinder head and block top surface (Deck) together.

INSTALLATION

1. Clean all sealing surfaces of engine block and cylinder heads. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. Position new gasket(s) on engine block . The left bank gasket is identified with the “L” stamped in the exposed area of the gasket located at front of engine (shown in). The right bank gasket is identified with a “R” stamped in the exposed area of the gasket also, but is located at the rear of the

engine.

3. The cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts must be replaced .

4. Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt should be replaced.

5. Tighten the cylinder head bolts 1–8 in the sequence shown in . Using the 4 step torque turn method, tighten according to the following values:

- Step 1: Bolts 1 – 8 to 61 N·m (45 ft. lbs.)
- Step 2: Bolts 1 – 8 to 88 N·m (65 ft. lbs.)
- Step 3: Bolts 1 – 8 (again) to 88 N·m (65 ft. lbs.)
- Step 4: Bolts 1 – 8 turn an additional 1/4 Turn. **(Do not use a torque wrench for this step.)**

NOTE: Bolt torque after 1/4 turn should be over 122 N·m (90 ft. lbs.). If not, replace the bolt.

6. Inspect and replace worn or bent push rods.
7. Install the push rods.
8. Install the rocker arm and shaft assemblies (2). (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)
9. Install the cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

10. Install the exhaust manifolds. (Refer to 9 -

ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION)

11. Install new O-ring on oil level indicator tube. Install oil level indicator tube assembly .

12. Install upper and lower intake manifolds. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

13. Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

14. Connect negative cable to battery.

COVER(S)-CYLINDER HEAD

DESCRIPTION

The cylinder head covers (1) are made of composite material. The covers are sealed with steel reinforced silicon rubber gaskets. The cylinder head cover uses rubber isolators at each fastener location.

NOTE: Due to the tight packaging near the cylinder head covers, which makes spill clean-up difficult, a spill during an engine oil change may be misinterpreted as an oil leak. When investigating an oil leak in the location of the cylinder head covers and intake manifold, follow the procedure found in Oil Leak Diagnosis for determining the source of a leak.

COVER-CYLINDER HEAD- RIGHT

REMOVAL

1. Disconnect negative cable from battery.
2. Disconnect spark plug wires from plugs.
3. Disconnect CCV hose from cylinder head cover.
4. Remove cylinder head cover bolts.
5. Remove cylinder head cover (1) and gasket (4).

INSTALLATION

1. Clean cylinder head and cylinder head cover mating surfaces. Inspect cylinder head cover surface for flatness. Replace gasket as necessary.
2. Inspect seal on the cover bolt for wear or damage. Replace bolt assembly (2) as necessary.
3. Inspect the PCV hose for damage. replace as necessary.

NOTE: The cylinder head cover bolts (2) contain a torque limiter sleeve and a seal . The seal and torque sleeve is replaced with the bolt.

4. Assemble gasket to cylinder cover by inserting the bolt assemblies through each bolt hole on the cover and gasket (4).

5. Install cylinder head cover and bolts (2).
6. Tighten cylinder head cover bolts to 12 N·m (105 in. lbs.).
7. Connect CCV hose to cylinder head cover.
8. Connect spark plug wires to spark plugs.
9. Connect negative cable to battery.

COVER-CYLINDER HEAD-LEFT

REMOVAL

1. Remove the ignition coil pack (1).
2. Disconnect spark plug wires from spark plugs.

3. Disconnect PCV hose (1) from cylinder head cover.

4. Remove the generator support bracket (1,2).

5. Remove cylinder head cover bolts.

6. Remove cylinder head cover and gasket.

INSTALLATION

1. Clean cylinder head and cylinder head cover mating surfaces. Inspect cylinder head cover surface for flatness. Replace gasket as necessary.

2. Assemble gasket to cylinder cover by inserting the fasteners through each bolt hole on cover and gasket.

3. Install the cylinder head cover and bolts.

4. Tighten cylinder head cover bolts to 12 N·m (105 in. lbs.).

5. Connect PCV hose (1).

6. Install the ignition coil pack (1) and plug wires.

7. Install the generator support bracket (1,2).

8. Connect spark plug wires to spark plugs.

VALVES & SEATS- INTAKE/EXHAUST

DESCRIPTION

The valves have chrome plated valve stems with four-bead lock grooves. The valve stem seals are made of Viton rubber.

OPERATION

The two valves per cylinder are opened using roller hydraulic lifters, push rods, and rocker arms.

STANDARD PROCEDURE - REFACING VALVES AND VALVE SEATS

The intake and exhaust valves and seats are machined to specific angles .

VALVES

1. Inspect the remaining margin after the valves are refaced .

(Refer to 9 - ENGINE - SPECIFICATIONS)

VALVE SEATS

CAUTION: Remove metal from valve seat only. Do not remove material from cylinder head .

1. When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

2. Measure the concentricity of valve seat using dial indicator . Total runout should not exceed 0.051 mm (0.002 in.) total indicator reading.

3. Inspect the valve seat using Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to top edge of valve face, lower valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of valve face raise valve seat with a 65 degrees stone.

NOTE: Valve seats which are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise cylinder head must be replaced.

4. When seat is properly positioned the width of intake and exhaust seats should be 1.50–2.00 mm (0.059–0.078 in.) .

5. After grinding the valve seats or faces, install the valve in cylinder head and check valve installed height by measuring from valve tip to spring seat . Remove valve from cylinder head and grind valve tip until within specifications. Check valve tip for scoring. The tip chamfer should be reground (if necessary) to prevent seal damage when the valve is installed.

6. Check the valve spring installed height after refacing the valve and seat . **If valves and/or seats are reground, measure the installed height of springs , make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than specifications, install a 0.794 mm (0.0312 in.) spacer in head counterbore to bring spring height back within specifications.**

REMOVAL

1. With cylinder head removed, compress valve springs using Valve Spring Compressor Tool C-3422-D with adapter 8464 .

2. Remove valve retaining locks .
3. Slowly release valve spring compressor. Remove valve spring retainer, valve spring, and valve stem seal.
4. Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides**. Identify valves to insure installation in original location.

CLEANING

1. Clean all valves thoroughly and discard burned, warped and cracked valves.

INSPECTION

VALVES

1. Clean and inspect valves thoroughly. Replace burned, warped and cracked valves.
2. Measure valve stems for wear . For valve specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: Valve stems are chrome plated and should not be polished .

VALVE GUIDES

1. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
2. Measure valve stem-to-guide clearance as follows:
3. Install valve into cylinder head so it is 15 mm (0.590 inch.) off the valve seat. A small piece of hose may be used to hold valve in place.
4. Attach dial indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured .
5. Move valve to and from the indicator. For clearance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: Replace cylinder head if stem-to-guide clearance exceeds specifications, or if guide is loose in cylinder head.

INSTALLATION

1. Coat valve stems with clean engine oil and insert them in cylinder head .
2. Install valve spring seat on head .

3. Install new seals on all valve stems and over valve guides
Install valve springs and valve retainers
4. Install the valve springs. (Refer to 9 -
ENGINE/CYLINDER HEAD/VALVE SPRINGS -
INSTALLATION)

SPRINGS-VALVE

DESCRIPTION

There are two interchangeable, floating (spring rotates during operation), valve spring designs. Type A may be identified by the counterclockwise (spring spirals down and to the left) appearance, And Type B may be identified by the clockwise (spring spirals down and to the right) appearance. Both of the valve springs are a bee-hive shaped design but have different specifications.

The springs are seated on a steel washer on the cylinder head with retainers and locks retaining the springs . The springs are installed with the smaller diameter against spring retainer .

OPERATION

The valve spring returns the valve against its seat for a positive seal of the combustion chamber.

REMOVAL

REMOVAL - CYLINDER HEAD OFF

1. With the cylinder head on a bench, position Special Tool C-3422-D with 8464 Adapter on the valve and spring retainer .
2. Compress the spring only enough to remove the valve retainer locks.
3. Slowly release the spring tension and remove the valve spring and retainer.
4. For removal of the valve stem seal (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL).

REMOVAL-IN VEHICLE

1. Disconnect negative cable from battery.
2. Remove spark plug wires and all spark plugs.
3. Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

4. Remove rocker arms and shaft (1). (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)
5. Rotate engine until the piston in the cylinder bore requiring spring removal is at TDC.

6. Install Special Tool 8453 (1) to the cylinder head. Tighten the attaching bolts to 23 N·m (200 in. lbs.).
7. Install a spark plug adapter (3) in the spark plug hole. Connect air hose that can supply 620.5–689 kPa (90–100 psi)

of air pressure to adapter. This is to hold valves in place while servicing components.

8. Locate the forcing screw and spring retainer adapter assembly over the spring requiring removal.
9. Slowly turn the forcing screw clockwise (compressing the valve spring) until the valve keepers can be removed.
10. Turn forcing screw counterclockwise to relieve spring tension. Remove retainer and valve spring.
11. Repeat procedure for each cylinder requiring valve spring removal.

INSPECTION

NOTE: There are two different types of valve springs used that are interchangeable, but have different specifications (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - DESCRIPTION).

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. **As an example;** the compression length of a spring to be tested is 38.00 mm (1.496 in.). Turn the table of Tool C-647 until surface is in line with the 38.00 mm (1.496 in.) mark on the threaded stud and the zero mark on the front. Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain specified height and allowable tensions (Refer to 9 - ENGINE - SPECIFICATIONS). Replace any springs that do not meet specifications.

INSTALLATION

INSTALLATION - CYLINDER HEAD OFF

1. If removed, install a new valve stem seal (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - INSTALLATION).
2. Position valve spring and retainer on spring seat.

3. Using Special Tool C-3422-D with 8464 Adapter , compress the spring only enough to install the valve retainer locks. Install valve retainer locks.

4. Slowly release the spring tension. Ensure the retainer locks are seated properly .

INSTALLATION- IN VEHICLE

1. The intake valve stem seals should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide. When installing the valve retainer locks, compress the spring **only enough** to install the locks.

CAUTION: Do not pinch seal between retainer and top of valve guide.

2. Follow the same procedure on the remaining 5 cylinders using the firing sequence 1-2-3-4-5-6. **Make sure piston in cylinder is at TDC on the valve spring that is being covered.**

3. Remove spark plug adapter tool (3).

4. Install rocker arms and shaft assembly (1).
5. Install cylinder head covers.

6. Install spark plugs and connect wires.
7. Connect negative cable to battery.

ARMS-ROCKER

DESCRIPTION

DESCRIPTION

The rocker arms are installed on the rocker arm shaft. The rocker arms and shaft assembly is attached to the cylinder head with seven billeted bolts and retainers. The rocker arms are made of stamped steel.

DESCRIPTION - PUSH ROD

The pushrods are made of steel and are a hollow design. The pushrods are positioned between the hydraulic lifter and the rocker arm.

OPERATION

OPERATION

The rocker arm pivots are on the rocker shaft. Rocker arms are used to translate up and down motions provided by the camshaft, hydraulic roller lifter, and pushrod on one end, into a down and up motions on the valve stem on the opposing end.

OPERATION - PUSH ROD

The pushrod is a solid link between the hydraulic roller lifter and the rocker arm. Also, the pushrod supplies engine oil from the hydraulic lifter to the rocker arm.

REMOVAL

1. Remove the cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

NOTE: Rocker arm shaft bolts are captured to the shaft.

2. Loosen the rocker shaft bolts , rotating one turn each, until all valve spring pressure is relieved.
3. Remove the rocker arms and shaft assembly .

4. For rocker arm disassembly procedures, (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - DISASSEMBLY).

DISASSEMBLY

CAUTION: Do not attempt to drive the billeted bolt from the rocker shaft. This can damage the rocker arm retainer and bolt assembly.

1. Remove the rocker arm retainer and bolt by performing the following procedure:
 - a. Using adjustable pliers, grip the edges of the retainer .
 - b. Apply an upward force with a slight rocking motion until the retainer disengages from shaft .

2. Remove rocker arms . Identify the component locations for reassembly in original locations.

ASSEMBLY

1. Install rocker arms on the shaft. Install in the original positions if re-used. **Ensure** the rocker shaft, all the retainers and washers are properly positioned and installed in the correct locations.
2. Install rocker arms and shaft to the cylinder head. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)

INSTALLATION

CAUTION: Ensure the longer shaft retaining bolt is installed in the proper location on the rocker shaft. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - ASSEMBLY)

1. Position the rocker arm and shaft assemblies on the pedestal mounts.

CAUTION: Ensure all pushrods are properly located on the lifter and the rocker arm socket.

2. Align each rocker arm socket with each pushrod end.

CAUTION: The rocker arm shaft should be tightened down slowly, starting with the center bolts. Allow 20 minutes lifter bleed down time after installation of the rocker shafts before engine operation.

3. Slowly tighten rocker shaft bolts evenly until shaft is seated. Tighten bolts to 23 N·m (200 in. lbs.) .
4. Install the cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION.)

SEALS-VALVE STEM

DESCRIPTION

The valve stem seals are made of Viton rubber. The seals are positioned over the valve stem and seated on the valve guide .

REMOVAL

1. Remove the valve springs. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - REMOVAL)
2. Remove the valve stem seal.

INSTALLATION

1. Install the valve stem seal squarely over the valve guide, using the valve stem as a guide. Do not force the seal against top of the valve guide.
2. Install the valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

ENGINE BLOCK

DESCRIPTION

The cylinder block is made of cast iron and is a deep skirt design.

STANDARD PROCEDURE - CYLINDER BORE HONING

1 - CROSS-HATCH PATTERN
2 - 40°–60°

1. Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.
2. Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.
3. Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40–60 degrees (2), the cross hatch angle is most satisfactory for proper seating of rings.
4. A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.
5. After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.
2. If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).
3. Examine block and cylinder bores for cracks or fractures.
4. Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B . Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

TAPPETS-HYDRAULIC-(CAM IN BLOCK)

DESCRIPTION

1 - YOKE RETAINER
2 - BOLT - YOKE RETAINER
3 - ALIGNING YOKE
4 - HYDRAULIC LIFTER

The hydraulic lifters are a roller type design and are positioned in the cylinder block with the lubrication whole facing upward. The lifters are aligned and retained by a yoke (3) and a retainer (1).

Lifter alignment is maintained by machined flats on lifter body. Lifters are fitted in pairs into six aligning yokes. The aligning yokes (3) are secured by a yoke retainer (1).

DIAGNOSIS AND TESTING - HYDRAULIC LIFTERS

HYDRAULIC LIFTERS DIAGNOSIS - PRELIMINARY STEP

Before disassembling any part of the engine to correct lifter noise, check the engine oil pressure. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)

Check engine oil level. The oil level in the pan should never be above the MAX mark on dipstick, or below the MIN mark. Either of these two conditions could cause noisy lifters.

OIL LEVEL TOO HIGH

If oil level is above the MAX mark on dipstick, it is possible for the connecting rods to dip into the oil while engine is running and create foaming. Foam in oil pan would be fed to the hydraulic lifters by the oil pump causing them to become soft and allow valves to seat noisily.

OIL LEVEL TOO LOW

Low oil level may allow pump to take in air which when fed to the lifters it causes them to become soft and allows valves to seat noisily. Any leaks on intake side of pump, through which air can be drawn, will create the same lifter noise. Check the lubrication system from the intake strainer to the oil pump cover, including the relief valve retainer cap. When lifter noise is due to aeration, it may be intermittent or constant, and usually more than one lifter will be noisy. When oil level and leaks have been corrected, the engine should be operated at fast idle to allow all of the air inside of the lifters to be bled out.

VALVE TRAIN NOISE

To determine source of valve train noise, operate engine at idle with cylinder head covers removed and listen for

source of the noise.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy lifters. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

Valve lifter noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger which will necessitate replacing the lifter, or by the plunger partially sticking in the lifter body cylinder. A heavy click is caused either by a lifter check valve not seating, or by foreign particles becoming wedged between the plunger and the lifter body causing the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, lifter assembly should be removed for inspection.

REMOVAL

1 - YOKE RETAINER
2 - BOLT - YOKE RETAINER
3 - ALIGNING YOKE
4 - HYDRAULIC LIFTER

1. Remove the cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)
2. Remove the yoke retainer (1) and aligning yokes (3).
3. Remove the hydraulic lifters. If necessary use Special Tool C-4129, or equivalent to remove lifters from bores. If lifters are to be reused, identify each lifter to ensure installation in original location.

INSTALLATION

1. Lubricate the lifters with engine oil.

NOTE: Position the lifter in bore with the lubrication hole facing upward.

2. Install the hydraulic lifters with the lubrication hole facing upward towards middle of block. Install lifters in original positions, if reused.

1 - YOKE RETAINER
2 - BOLT - YOKE RETAINER
3 - ALIGNING YOKE
4 - HYDRAULIC LIFTER

3. Install lifter aligning yokes (3).
4. Install yoke retainer (1) and torque screws (2) to 12 N·m (105 in. lbs.).
5. Install the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)
6. Start and operate engine. Warm up to normal operating temperature.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic lifters have filled with oil and have become quiet.

CAMSHAFT & BEARINGS (IN BLOCK)

DESCRIPTION

1 - CAMSHAFT
2 - THRUST PLATE
3 - BOLT
4 - CAMSHAFT BEARINGS (SERVICED WITH BLOCK)

The nodular iron camshaft (1) is mounted in the engine block and supported with four steel backed aluminum bearings (4). A thrust plate (2), located in front of the first bearing, is bolted to the block and controls the camshaft end play.

OPERATION

The camshaft is driven by the crankshaft through a timing chain and sprockets. The camshaft has precisely machined (egg-shaped) lobes to provide accurate valve timing and duration.

REMOVAL

HYDRAULIC LIFTERS

1 - YOKE RETAINER
2 - BOLT - YOKE RETAINER
3 - ALIGNING YOKE
4 - HYDRAULIC LIFTER

1. Remove the radiator and cooling fans from the vehicle.
2. Remove the cylinder heads (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
3. Remove the timing chain and camshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
4. Remove the yoke retainer (1).
5. Remove the hydraulic lifters (4) (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - REMOVAL). Identify each tappet for reinstallation in original location.

1 - OIL GALLERY CUP PLUGS
2 - CAMSHAFT THRUST PLATE
3 - OIL FEED GALLERY FROM PUMP

6. Remove camshaft thrust plate (2).

NOTE: Slowly remove the camshaft from the engine taking precautions not to damage the camshaft bearings.

7. Install a long bolt into front of camshaft to facilitate removal of the camshaft.

8. Carefully remove the camshaft,

NOTE: The camshaft bearings are serviced with the engine block.

INSPECTION

1 - UNWORN AREA
2 - ACTUAL WEAR

3 - BEARING JOURNAL
4 - LOBE
5 - WEAR ZONE

1. Check the cam lobes (4) and bearing surfaces (3) for abnormal wear and damage. Replace camshaft as required.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the lifters.

2. Measure the lobe (2) actual wear (unworn area - wear zone = actual wear) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

INSTALLATION

1 - CAMSHAFT
2 - THRUST PLATE
3 - BOLT
4 - CAMSHAFT BEARINGS (SERVICED WITH BLOCK)

1. Lubricate camshaft lobes (1) and camshaft bearing journals (4) with engine oil.
2. Install a long bolt into the camshaft to assist in the installation of the camshaft.
3. Carefully install the camshaft (1) in engine block.
4. Install camshaft thrust plate (2) and bolts (3). Tighten to 12 N·m (105 in. lbs.) torque.
5. Measure camshaft end play. (Refer to 9 - ENGINE - SPECIFICATIONS) If not within specifications, replace thrust plate.
6. Install the timing chain and sprockets. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

NOTE: When camshaft is replaced, all of the hydraulic lifters must be replaced.

7. Install the hydraulic lifters with lubrication hole in the upward position (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - INSTALLATION).
8. Install the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)
9. Install the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)
10. Install the cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)
11. Install the lower and upper intake manifolds. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
12. Install the radiator and cooling fan.

ROD-CONNECTING-PISTON

DESCRIPTION

CAUTION: DO NOT STAMP the connecting rods during identification. The use of a scribe or a paint mark is acceptable.

NOTE: The 3.8L may have any combination of forged or cracked cap connecting rods. The cracked cap design is easily identified by the connecting rod cap bolts rather than the traditional forged connecting rod cap nuts. The cracked cap design also has a different tightening procedure and specification. The connecting rod caps must be paint marked or scribed to identify the accompanying connecting rod. All connecting rod caps ARE NOT interchangeable between connecting rods.

The pistons are made of cast aluminum alloy and are a strutless, short skirt design. The connecting rods have either the standard forged caps or forged cracked cap design. Both the cracked cap and forged cap connecting rod designs are interchangeable and may be found in any combination when mounted to the crankshaft. The difference between the two different rod caps, aside from design, is the tightening procedure and specification. The piston rings consist of two compression rings and a three piece oil ring. Piston pins connect the piston to the forged steel connecting rods. The piston pins are a press fit into the connecting rod small bore. The piston, pin and connecting rod are serviced as an assembly.

STANDARD PROCEDURE

FITTING CONNECTING RODS

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

NOTE: The connecting rod cap bolts (4) should be examined before reuse. Bolt stretch can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt (1) must be replaced.

1 - PAINT MARK OR SCRIBE

The bearing caps are not interchangeable or reversible, and should be marked (1) at removal to ensure correct reassembly. Cracked bearing caps stay with the cracked rod. The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Install cap with the tangs on the same side as the rod. For connecting rod bearing fitting (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE). Fit all connecting rods on one bank until complete.

1. Before installing the bolts, the threads should be oiled with engine oil.
2. Install bolts finger tight then alternately torque each bolt to assemble the cap properly.
3. Tighten the cracked cap bolts to 28 N·m PLUS 90 degrees (20 ft.lbs.) plus 90 degrees.
4. Using a feeler gauge, check connecting rod side clearance. Refer to Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

FITTING PISTONS

NOTE: Pistons and connecting rods are machined to tight weight tolerances and need not be sorted in any way.

The piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line. Refer to Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).**

REMOVAL

1 - PAINT MARK OR SCRIBE

NOTE: Refer to the connecting rod Description before beginning repair. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - DESCRIPTION).

1. Disconnect negative cable from battery.
2. Remove the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)
3. Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

4. Remove the top ridge of cylinder bores with a reliable ridge reamer, if necessary, before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so that each connecting rod is centered in cylinder bore.**
5. Inspect connecting rods and connecting rod caps for cylinder identification (1). Identify them (1), if necessary.

1 - "F" TOWARD FRONT OF ENGINE
2 - RING COMPRESSOR
3 - SPECIAL TOOL 8189
4 - OIL SQUIRT HOLE

6. Remove connecting rod cap. Install connecting rod bolt protectors special tool #8189 (3) on connecting rod to guide cracked connecting rod (4).
7. Remove each piston (1) and connecting rod assembly (4) out of the cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

8. After removal, install bearing cap on the mating rod.

INSTALLATION

1 - SIDE RAIL UPPER
2 - NO. 1 RING GAP
3 - PISTON PIN
4 - SIDE RAIL LOWER
5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

NOTE: Refer to the connecting rod Description before beginning repair. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - DESCRIPTION).

1. Before installing pistons and connecting rod assemblies into the bore, ensure that compression ring gaps (2,5) are staggered so that neither is in line with oil ring rail gap (1,4).

2. Before installing pistons and connecting rod assemblies into the bore, ensure that the arrow (1) on top of the piston is facing the front of the engine, if equipped.

1 - "F" TOWARD FRONT OF ENGINE

2 - RING COMPRESSOR

3 - SPECIAL TOOL 8189

4 - OIL SQUIRT HOLE

3. Lubricate the piston (1) and rings with clean engine oil. Position a ring compressor (2) over the piston and rings, and tighten the compressor (2). **Be sure position of rings does not change during this operation.**
4. Position upper bearing onto connecting rod. Lubricate bearing with oil.
5. Install connecting rod protectors special tool #8189 (3) on the connecting rod,

6. The pistons are marked with an arrow (1) on top of the piston. Install piston with this mark positioned to front of engine on both cylinder banks. The connecting rod oil squirt hole faces the major thrust (right) side of the engine block.

1 - "F" TOWARD FRONT OF ENGINE
2 - RING COMPRESSOR
3 - SPECIAL TOOL 8189
4 - OIL SQUIRT HOLE

7. Rotate crankshaft until the connecting rod journal is located in the center of the cylinder bore. Insert connecting rod and piston into cylinder bore by tapping down on the piston (1) using a hammer handle. At the same time, guide connecting rod (4) into position on connecting rod journal.
8. Install lower bearing shell and the appropriate connecting rod cap.
9. Install connecting rod bolts and tighten to 7 N·m (5 ft. lbs) initially. Tighten the bolts an additional 21 N·m (15 ft. lbs.) and then turn each bolt 90° to final clamping load.
10. Repeat procedure for each piston and connecting rod installation.
11. Install the cylinder heads. (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)
12. Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)
13. Fill engine crankcase with proper oil to correct level.
14. Connect negative cable to battery.

BEARINGS-CONNECTING ROD

STANDARD PROCEDURE - MEASURING CONNECTING ROD BEARING CLEARANCE

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Install cap with the tangs on the same side as the rod. Fit all rods on one bank until complete. Connecting rod bearings are available in the standard size and the following undersizes: 0.025 mm (0.001 in.) and 0.250 mm (0.010 in.).

CAUTION: Install the bearings in pairs. Do not use a new bearing half with an old bearing half. Do not file the rods or bearing caps.

Measure connecting rod journal for taper and out-of-round.

The connecting rod bearing clearances can be determined by use of Plastigage or the equivalent. The following is the recommended procedure for the use of Plastigage:

1. Rotate the crankshaft until the connecting rod to be checked is at the bottom of its stroke.
2. Remove oil film from surface to be checked. Plastigage is soluble in oil.
3. Place a piece of Plastigage across the entire width of the bearing shell in the bearing cap approximately 6.35 mm (1/4 in.) off center and away from the oil hole. In addition, suspect areas can be checked by placing Plastigage in that area.
4. Assemble the rod cap with Plastigage in place. Tighten the rod cap to the specified torque. **Do not rotate the crankshaft while assembling the cap or the Plastigage may be smeared, giving inaccurate results.**
5. Remove the bearing cap and compare the width of the flattened Plastigage with the scale provided on the package. Locate the band closest to the same width. This band indicates the amount of oil clearance. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Refer to Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS) . **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale. If the bearing clearance exceeds wear limit specification, replace the bearing.**

RINGS-PISTON

STANDARD PROCEDURE - PISTON RING FITTING

1 - FEELER GAUGE

1. Wipe cylinder bore clean. Insert the ring and push down with piston to ensure squareness in bore to approximately 12 mm (0.50 in.) from top of cylinder bore. Check ring gap with a feeler gauge (1). For clearance specification (Refer to 9 - ENGINE - SPECIFICATIONS).

1 - FEELER GAUGE

2. Check piston ring to groove side clearance (1). For clearance specification (Refer to 9 - ENGINE - SPECIFICATIONS)

REMOVAL

1. Remove piston and connecting rod. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL)
2. Remove No. 1 and No.2 piston rings from piston using a ring expander tool.
3. Remove upper oil ring side rail.
4. Remove lower oil ring side rail.
5. Remove oil ring expander.

INSTALLATION

1 - NO. 1 PISTON RING
2 - NO. 2 PISTON RING
3 - SIDE RAIL
4 - OIL RING
5 - SPACER EXPANDER

1. Install rings with manufacturers I.D. mark (if present) facing up, to the top of the piston.

CAUTION: Install piston rings in the following order:

- Oil ring expander (5).
- Lower oil ring side rail (4).
- Upper oil ring side rail.
- No. 2 Intermediate piston ring (2).
- No. 1 Upper piston ring (1).

1 - SIDE RAIL END

2. Install the side rail by placing one end between the piston ring groove and the expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander.**
3. Install lower side rail first and then the upper (1) side rail.
4. Install No. 2 piston ring and then No. 1 piston ring.

1 - SIDE RAIL UPPER
2 - NO. 1 RING GAP
3 - PISTON PIN
4 - SIDE RAIL LOWER
5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

5. Position piston ring end gaps.
6. Position oil ring expander gap (5) at least 45° from the side rail gaps (1,4) but **not** on the piston pin (3) center or on the thrust direction. Staggering ring gap is important for oil control.

BEARINGS-CRANKSHAFT MAIN

STANDARD PROCEDURE - MAIN BEARING FITTING

Bearing caps are not interchangeable and should be marked at removal to insure correct assembly. Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of 1, 3 and 4 are interchangeable. Upper main bearing halves of 1, 3 and 4 are interchangeable.

Upper and lower main bearing, position 2 bearing halves are flanged to carry the crankshaft thrust loads and are NOT interchangeable with any other bearing halves in the engine. All bearing cap bolts removed during service procedures are to be cleaned and lubricated with engine oil before installation. Bearing shells are available in standard and the following undersizes: 0.025 mm (0.001 in.) and 0.254 mm (0.010 in). Never install an undersize bearing that will reduce clearance below specifications.

CRANKSHAFT BEARING OIL CLEARANCE

Inspect the crankshaft bearing journals.

Engine crankshaft bearing clearances can be determined by use of Plastigage (1) or the equivalent. The following is the recommended procedures for the use of Plastigage with the engine in the vehicle or engine on a repair stand.

PLASTIGAGE METHOD—ENGINE IN-VEHICLE

NOTE: The total clearance of the main bearings can only be determined with the engine in the vehicle by removing the weight of the crankshaft. This can be accomplished by either of two following methods:

1. Preferred method:

- Shim the bearings adjacent to the bearing to be checked in order to remove the clearance between upper bearing shell and the crankshaft. This can be accomplished by placing a minimum of 0.254 mm (0.010 in.) shim (e. g. cardboard, matchbook cover, etc.) between the bearing shell and the bearing cap on the adjacent bearings and tightening bolts to 14–20 N·m (10–15 ft. lbs.).
 - When checking #1 main bearing shim #2 main bearing.
 - When checking #2 main bearing shim #1 & #3 main bearing.
 - When checking #3 main bearing shim #2 & #4 main bearing.
 - When checking #4 main bearing shim #3 main bearing.

NOTE: Remove all shims before reassembling engine.

2. Alternative Method:

- Support the weight of the crankshaft with a jack under the counterweight adjacent to the bearing being checked.

3. Remove oil film from surface to be checked. Plastigage is soluble in oil.

4. Place a piece of Plastigage (1) across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes. (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.

5. Remove the bearing cap and compare the width of the flattened Plastigage (1) with the scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. (Refer to 9 - ENGINE - SPECIFICATIONS) **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

PLASTIGAGE METHOD—ENGINE OUT-OF-VEHICLE

1. With engine in the inverted position (crankshaft up) and mounted on a repair stand, remove main journal cap.
2. Remove oil from journal and bearing shell.
3. Cut Plastigage (1) to same length as width of the bearing and place it in parallel with the journal axis (1).
4. Carefully install the main bearing cap and tighten the bolts to specified torque (Refer to 9 - ENGINE - SPECIFICATIONS).

CAUTION: Do not rotate crankshaft or the Plastigage

will be smeared.

5. Carefully remove the bearing cap and measure the width of the Plastigage (1) at the widest part using the scale on the Plastigage package. Refer to Engine Specifications for proper clearances (Refer to 9 - ENGINE - SPECIFICATIONS). If the clearance exceeds the specified limits, replace the main bearing(s) with the appropriate size, and if necessary, have the crankshaft machined to next undersize.

REMOVAL - CRANKSHAFT MAIN BEARINGS

1. Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
2. Identify main bearing caps before removal.
3. Remove bearing caps one at a time. Remove upper half of bearing by inserting Special Main Bearing Tool C-3059 into the oil hole of crankshaft.
4. Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

INSTALLATION - CRANKSHAFT MAIN BEARINGS

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

NOTE: One main bearing should be selectively fitted while all other main bearing caps are properly tightened.

1. For main bearing fitting procedure, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)
2. Start bearing in place, and insert Main Bearing Tool C-3059 into oil hole of crankshaft.
3. Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Special Main Bearing Tool C-3059.
4. Inspect main cap bolts (4) for stretching. Replace bolts that are stretched.

NOTE: The main cap bolts (4) should be examined before reuse. Bolt stretch can be checked by holding a scale or straight edge against the threads (2). If all the threads do not contact the scale (2) the bolt must be replaced.

5. Install each main cap and tighten bolts finger tight.
6. Tighten number 1, 3 and 4 main cap bolts to 41 N·m + 1/4 Turn (30 ft. lbs.+ 1/4 Turn).
7. Rotate the crankshaft until the number 6 piston is at TDC.
8. To ensure correct thrust bearing alignment the following procedure must be done:
 - Move crankshaft all the way to the rear of its travel.
 - Then, move crankshaft all the way to the front of its travel.
 - Wedge an appropriate tool between the rear of the cylinder block and rear crankshaft counterweight. This will hold the crankshaft in it's most forward position.
 - Tighten the #2 Thrust Bearing cap bolts to 41 N·m + 1/4 Turn (30 ft. lbs.+ 1/4 Turn). Remove the holding tool.

9. Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)
10. Fill engine crankcase with proper oil to correct level.

CRANKSHAFT

DESCRIPTION - 3.8L

1 - MAIN BEARING CAP No. 4
2 - MAIN BEARING CAP No. 3
3 - MAIN BEARING CAP No. 2
4 - MAIN BEARING CAP BOLT
5 - MAIN BEARING CAP No. 1
6 - THRUST MAIN BEARING - LOWER
7 - THRUST MAIN BEARING - UPPER
8 - MAIN BEARING CAP CROSS BOLT
9 - ENGINE BLOCK
10 - MAIN BEARING - UPPER
11 - CRANKSHAFT
12 - MAIN BEARING - LOWER

The nodular iron crankshaft is supported by four main bearings, with number two position (3) providing thrust bearing location. Each main bearing cap has two vertical retaining bolts. The two center main caps have horizontal bolts (8) to add increased rigidity to the lower engine block. Crankshaft end sealing is provided by

front and rear rubber seals.

STANDARD PROCEDURE - MEASURING CRANKSHAFT END PLAY

1. Mount a dial indicator to front of engine with the locating probe on nose of crankshaft.
2. Move crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

REMOVAL

1 - PAINT MARK OR SCRIBE

1. Remove the engine assembly (Refer to 9 - ENGINE - REMOVAL).
2. Mount engine on an engine stand.
3. Remove the oil filter.
4. Remove the oil pan and oil pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
5. Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).
6. Remove timing chain and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND

SPROCKETS - REMOVAL).

7. Remove crankshaft rear oil seal and retainer (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - REMOVAL).

8. Rotate the crankshaft until connecting rod cap is accessible.

9. Paint mark or scribe the connecting rod cap position (1).

10. Remove connecting rod bearing cap. Use care to prevent damage to the crankshaft bearing surfaces.

11. Repeat removal procedure for each connecting rod cap.

1 - MAIN BEARING CAP No. 4
2 - MAIN BEARING CAP No. 3
3 - MAIN BEARING CAP No. 2
4 - MAIN BEARING CAP BOLT
5 - MAIN BEARING CAP No. 1

10 - MAIN BEARING - UPPER
11 - CRANKSHAFT
12 - MAIN BEARING - LOWER

5. Install the main bearing caps (1,2,3,5) and bolts. Tighten bolts to 41 N·m (30 ft. lbs.) plus j turn.

NOTE: Install new cross bolt and washer assembly upon reassembly.

6. Install and tighten the NEW cross bolts and washer assemblies (8) to 61 N·m (45 ft. lbs.).
7. Position and install the connecting rod and bearing caps on the crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).
8. Install the crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - INSTALLATION)
9. Install the crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - INSTALLATION).
10. Install the timing chain and camshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - INSTALLATION).
11. Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - INSTALLATION).
12. Install the oil pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
13. Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).

OIL SEAL-CRANKSHAFT-FRONT

REMOVAL

1 - SEAL
2 - SPECIAL TOOL 6341A

1. Disconnect negative cable from battery.
2. Remove accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
3. Remove crankshaft damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)
4. Position Special Tool 6341A (2) on crankshaft nose. Carefully screw the tool into the seal (1) until it engages firmly. Be careful not to damage that crankshaft seal surface of cover

1 - SEAL
2 - SPECIAL TOOL 6341A

5. Remove oil seal (1) by turning the forcing screw until the seal disengages from the cover.

INSTALLATION

1 - SPECIAL TOOL C-4992-1
2 - SEAL
3 - SPECIAL TOOL C-4992-2
4 - CRANKSHAFT

1. Position Special Tool C-4992-2 Guide (3) , on the crankshaft nose.
2. Position new seal (2) over the guide with the seal spring in the direction of the engine front cover.
3. Install seal using Special Tool C-4992-1 (1) until seal is flush with cover.
4. Install crankshaft damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

5. Install accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
6. Lower vehicle and connect negative cable to battery.

RETAINER-OIL SEAL-CRANK REAR

REMOVAL

NOTE: Any time the rear crank oil seal has been removed from the engine block, a new seal assembly must be installed. Do not re-use a real crank oil seal assembly once it has been removed.

1. Remove the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL) or (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - REMOVAL).
2. Remove the flex plate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL) or for vehicles equipped with a manual transmission, the flywheel (Refer to 6 - CLUTCH/FLYWHEEL - REMOVAL).

3. Remove oil seal retainer bolts (1).
4. Remove oil seal retainer (2).
5. Clean engine block and retainer of oil and gasket material. Make sure surfaces are clean and free of oil.

INSTALLATION

CAUTION: Before installing a new rear oil seal assembly, ensure that the plastic installation sleeve (1) is present in the seal assembly. The new seal cannot be properly installed without the plastic installation sleeve, and if the seal assembly is installed without it, oil leakage will result.

1. Remove any original sealer, oil, or debris from the rear oil seal retainer assembly mounting area.
2. Place a bead (approximately 1/4 in. diameter) of Mopar® Engine RTV GEN II in the lower corners of the rear crankshaft oil seal retainer mounting surface, where the seal retainer meets the oil pan (the T-Joint).
3. Place a bead (approximately 1/4 in. diameter) of Mopar® Engine RTV GEN II around the inside edge of the rear crankshaft oil seal retainer assembly recess in the engine block.

4. Place the rear crankshaft oil seal assembly over the rear crankshaft flange. Do not press seal assembly over the rear crankshaft flange at this time.
5. Using both hands, one on each side of the rear crankshaft flange, press the rear crankshaft oil seal over the rear crankshaft flange.
6. Ensure that the extruded dowels in the rear crankshaft oil seal are seated in the locating holes in the rear of the engine block.
7. Install the five rear crankshaft oil seal fasteners. Do not tighten at this time.
8. Remove and discard the plastic installation sleeve.
9. Tighten the five rear crankshaft oil seal fasteners to 11.8 Nm (105 in-lbs).
10. Install the flex plate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - INSTALLATION) or flywheel (Refer to 6 - CLUTCH/FLYWHEEL - INSTALLATION).
11. Install the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION) or (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION).

COVER-STRUCTURAL

REMOVAL

1. Raise vehicle on hoist.
2. Remove the bolts retaining structural cover to transmission (1,2).
3. Remove the bolts retaining structural cover to engine.
4. Remove the structural cover.

INSTALLATION

CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover or the oil pan.

1. Position the structural cover in the vehicle.
2. Install the bolts retaining the cover-to-oil pan (1). DO NOT tighten the bolts at this time.
3. Install the cover-to-transmission bolts (2). Do NOT tighten at this time.

CAUTION: The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause

damage to the cover.

4. Tighten the two cover-to-transmission bolts to less than 25 lb. in. The cover must be flush to the transmission bellhousing machined surface.

5. Starting with the cover-to-oil pan bolts (1), tighten bolts to 54 N·m (40 ft. lbs.).

6. Tighten the cover-to-transmission bolts to 54 N·m (40 ft. lbs.).

DAMPER-VIBRATION

REMOVAL

1 - SPECIAL TOOL 8450 - INSERT

2 - SPECIAL TOOL 1026 - 3 JAW PULLER

1. Disconnect negative cable from battery.

2. Raise vehicle on hoist.

3. Remove the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

4. Remove vibration damper bolt.
5. Insert Special Tool 8450 (2) into crankshaft nose.
6. Position 3-jaw puller Special Tool 1026 (2) on damper. Turn puller forcing screw until damper releases from crankshaft.
7. Remove the crankshaft vibration damper.

INSTALLATION

1 - FORCING SCREW / NUT FROM SPECIAL TOOL 8452
--

2 - VIBRATION DAMPER

3 - THRUST BEARING / WASHER

1. Install crankshaft vibration damper using the forcing screw, nut, and thrust bearing/washer (3) from Special Tool 8452 (1).

NOTE: To minimize friction and prolong tool life, lubricate the threads on the forcing screw of Special Tool 8452.

2. Position vibration damper on crankshaft.
3. Screw Special Tool 8452 (1) into crankshaft until the bolt seats. Turn the nut to install damper until it seats fully.
4. Remove Special Tool 8452.
5. Install vibration damper bolt. Torque bolt to 54 N·m (40 ft. lbs.).
6. Install the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
7. Connect negative cable to battery.

FLEXPLATE

REMOVAL

1 - FLEX PLATE
2 - BOLT (QTY. 8)
3 - BACKING PLATE

1. Remove the transmission.
2. Remove flex plate attaching bolts.
3. Remove the flex plate (1).

INSTALLATION

1 - FLEX PLATE
2 - BOLT (QTY. 8)

3 - BACKING PLATE

1. Position flex plate (1) with backing plate on the crankshaft.
2. Apply Mopar® Lock & Seal Adhesive to the flex plate bolts.
3. Install flex plate bolts. Tighten bolts to 95 N·m (70 ft. lbs.).
4. Install the transmission.

MOUNT-FRONT

REMOVAL

1. Disconnect the negative cable from the battery.
2. Remove the engine oil filter.
3. Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.
4. Remove the cylinder block-to-insulator mount bolts and the nut from the engine insulator mount through bolt.
5. Using the jack, raise the engine high enough to remove the engine insulator mount thru bolt and the insulator mount.

INSTALLATION

1. Position the insulator mount and install the insulator mount through bolt.
2. Lower the engine until the cylinder block-to-insulator mount bolts can be installed.
3. Remove the jack and block of wood.
4. Torque the cylinder block-to-insulator mount bolts to 61 N·m (45 ft. lbs.).
5. Install and torque the through bolt retaining nut to 61 N·m (45 ft. lbs.).

MOUNT-REAR

REMOVAL

MANUAL TRANSMISSIONS

1. Disconnect negative cable from battery.
2. Raise the vehicle and support the transmission.
3. Remove the nuts holding the support cushion to the skid plate.
4. Remove nuts holding support cushion to transmission support bracket.
5. Remove the support cushion (2) .

6. Remove bolts holding transmission support bracket to transmission.
7. Remove the transmission support bracket.

AUTOMATIC TRANSMISSIONS

1. Disconnect negative cable from battery.
2. Raise the vehicle and support the transmission.
3. Remove the nuts holding the support cushion to the skid plate.
4. Remove nuts holding support cushion to transmission support bracket. Remove the support cushion (2) .
5. Remove the bolts holding the transmission support bracket to transmission.
6. Remove the transmission support bracket.

INSTALLATION

MANUAL TRANSMISSION

1. Position the skid plate to the studs of the support cushion and install the nuts. Tighten the nuts to 28 N·m (21 ft. lbs.) torque.
2. Install the skid plate bolts to the sill and tighten to 75 N·m (55 ft. lbs.) torque.
3. Remove the transmission support.
4. Lower the vehicle.
5. Connect negative cable to battery.
6. Position the transmission mount bracket to the transmission and install the bolts.
7. Tighten the bolts to 54 N·m (40 ft. lbs.) torque.
8. Position the support cushion (2) to the transmission mount bracket and install nuts.

AUTOMATIC TRANSMISSION

1. Position the skid plate to the studs of the support cushion and install the nuts. Tighten the nuts to 28 N·m (21 ft. lbs.) torque.
2. Install the skid plate bolts to the sill and tighten to 75 N·m (55 ft. lbs.) torque.
3. Remove the transmission support.
4. Lower the vehicle.
5. Connect negative cable to battery.
6. Position the transmission mount bracket to the transmission and install the bolts. Tighten the bolts to 54 N·m (40 ft. lbs.) torque.
7. Position the support cushion (2) to the transmission mount bracket and install nuts. Tighten the nuts to 41 N·m (30 ft. lbs.) torque.
8. If the support cushion bracket was removed from the skid plate, position the bracket on the skid plate and install the nuts and bolts. Tighten the nuts to 28 N·m (21 ft. lbs.) torque.

LUBRICATION

DESCRIPTION

The lubrication system is a full flow filtration pressure feed type. The oil pump is mounted in the timing chain cover and is driven by the crankshaft

OPERATION

Oil from the oil pan is pumped by a internal gear type oil pump directly coupled to the crankshaft. The pressure is regulated by a relief valve located in the timing chain cover. The oil is pumped through an oil filter and feeds a main oil gallery. This oil gallery feeds oil under pressure to the main and rod bearings, camshaft bearings. Passages in the cylinder block feed oil to the hydraulic lifters and rocker shaft brackets which feeds the rocker arm pivots .

DIAGNOSIS AND TESTING - ENGINE OIL PRESSURE

1. Disconnect and remove oil pressure switch (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL).
2. Install Special Tools C-3292 Gauge with 8406 Adaptor. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
3. Start engine and record oil pressure. Refer to Oil Pressure in Engine Specifications for the correct pressure (Refer to 9 - ENGINE - SPECIFICATIONS).

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Run engine until achieving normal operating temperature.

1. Open hood, remove oil fill cap.
2. Place a suitable drain pan under crankcase drain.
3. Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
4. Remove oil filter (2).
5. Install and tighten drain plug in crankcase.
6. Install new oil filter (2).
7. Lower vehicle and fill crankcase with specified type and amount of engine oil.
8. Install oil fill cap.
9. Start engine and inspect for leaks.
10. Stop engine and inspect oil level.

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

STANDARD PROCEDURE - ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Add engine oil only when the level is at or below the ADD mark on the indicator.

FILTER-OIL

REMOVAL

CAUTION: When servicing the oil filter avoid deforming

the filter can be installed by installing the remove/install tool band strap against the can-to-base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

1. Using suitable oil filter wrench, turn filter (2) counterclockwise to remove from oil filter adapter. Properly discard used oil filter.

INSTALLATION

1. Wipe oil filter adapter base clean and inspect gasket contact surface.
2. Lubricate gasket of new filter with clean engine oil.
3. Install new filter (2) until gasket contacts base. Tighten filter 1 turn or 20 N·m (15 ft. lbs.). Use filter wrench if necessary.
4. Start engine and check for leaks.

PAN-OIL

REMOVAL

1. Disconnect negative cable from battery and remove engine oil level indicator tube.
2. Remove engine oil level indicator tube.

3. Raise vehicle on hoist and drain engine oil, and remove the oil filter (2).

4. Remove the structural cover fasteners (1,2) and structural cover. (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL)

NOTE: Do not remove the lower oil pan bolts. Only remove the upper oil pan-to-engine block bolts (1).

5. Remove the oil pan fasteners (1), oil pan and gasket.

CLEANING

1. Clean oil pan with solvent and wipe dry with a clean cloth.
2. Clean all gasket material from mounting surfaces of pan and block.
3. Clean oil screen and pick-up tube in clean solvent.

INSPECTION

1. Inspect oil drain plug and plug hole for stripped or damaged threads and repair as necessary. Install a new drain plug gasket. Tighten to 27 N·m (20 ft. lbs.).
2. Inspect oil pan mounting flange for bends or distortion. Straighten flange if necessary.
3. Inspect condition of oil screen and pick-up tube, clean or replace as necessary.

INSTALLATION

1. Thoroughly clean sealing surfaces of any oil, dirt, or original sealer, and apply a 1/8 inch bead (1) of Mopar® Engine RTV GEN II at the parting line of the chain case cover (1) and the rear seal retainer (1).
2. Position a new pan gasket on oil pan.

3. Install oil pan and tighten fasteners (1) to 12 N·m (105 in. lbs.).

81d45529

4. Install the structural cover and tighten fasteners (1,2)
(Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL
COVER - INSTALLATION).
5. Lower vehicle and install oil level indicator.

81d45983

6. Install new oil filter (2).
7. Fill crankcase with oil to proper level.
8. Connect negative cable to battery.

RELIEF VALVE-OIL PRESSURE REMOVAL

1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Drill a 3.175 mm (1/8 in.) hole in the center of the retainer cap . Insert a self-threading sheet metal screw into the cap.
3. Using suitable pliers, remove cap and discard.
4. Remove spring and relief valve .

INSTALLATION

1. Clean relief valve, spring and bore.

NOTE: Lubricate relief valve with clean engine oil before installing.

2. Install relief valve (1) and spring (2) into housing.
3. Install new retainer cap until flush with sealing surface.
4. Install oil pan.
5. Fill crankcase with proper oil to correct level.

SWITCH-OIL PRESSURE

DESCRIPTION

The engine oil pressure switch is located on the timing cover, in front of the engine. The normally closed switch

provides an input through a single wire to the low pressure indicator light on the instrument cluster.

OPERATION

The oil pressure switch provides a ground for the instrument cluster low oil pressure indicator light. The switch receives oil pressure input from the engine main oil gallery. When engine oil pressure is greater than 27.5 Kpa (4 psi), the switch contacts open, providing an open circuit to the low pressure indicator light. For wiring circuits and diagnostic information, (Refer to Appropriate Wiring/Diagnostic Information).

REMOVAL

1. Raise vehicle on hoist.
2. Disconnect electrical connector from switch.
3. Remove oil pressure switch (1).

INSTALLATION

1. Install oil pressure switch (1). Torque oil pressure switch to 23 N·m (200 in. lbs.).
2. Connect electrical connector to switch.
3. Lower the vehicle.
4. Start engine and check for leaks.
5. Check engine oil level. Adjust as necessary.

PUMP-OIL

DESCRIPTION

The oil pump is located in the timing chain cover. It is driven by the crankshaft.

REMOVAL

The oil pump (1) is contained within the timing chain cover housing.

1. Remove oil pan.
2. Remove the timing chain cover.
3. Disassemble oil pump from timing chain cover.
4. Clean and Inspect oil pump components.

DISASSEMBLY

1. Remove oil pump cover screws (2), and lift off cover (5).
2. Remove oil pump rotors (3,4).
3. Clean and inspect oil pump components.

CLEANING

1. Clean all parts thoroughly in a suitable solvent.

INSPECTION

1. Inspect mating surface of the chain case cover. Surface should be smooth. Replace cover if scratched or grooved.
2. Lay a straightedge across the pump cover surface . If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

3. Measure thickness and diameter of outer rotor. If outer rotor thickness measures 7.64 mm (0.301 in.) or less , or if the diameter is 79.95 mm (3.148 in.) or less, replace outer rotor.

4. If inner rotor thickness measures 7.64 mm (0.301 in.) or less, replace inner rotor .

5. Install outer rotor into chain case cover. Press rotor to one side with fingers and measure clearance between rotor and chain case cover . If measurement is 0.39 mm (0.015 in.) or more, replace chain case cover, only if outer rotor is in specification.

6. Install inner rotor into chain case cover. If clearance between inner and outer rotors is 0.203 mm (0.008 in.) or more, replace both rotors.

7. Place a straightedge across the face of the chain case cover, between bolt holes. If a feeler gauge of 0.10 mm (0.004 in.) or more can be inserted between rotors and the straightedge, replace pump assembly . **ONLY** if rotors are in specs.

8. Remove oil pressure relief valve. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE RELIEF VALVE - REMOVAL)

9. Inspect oil pressure relief valve and bore. Inspect for scoring, pitting and free valve operation in bore . Small marks may be removed with 400-grit wet or dry sandpaper.

10. The relief valve spring has a free length of approximately

49.5 mm (1.95 inches) it should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet specifications.

11. If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

ASSEMBLY

1. Assemble pump, using new parts as required. **Install the inner rotor with chamfer facing the cast iron oil pump cover.**
2. Prime oil pump before installation by filling rotor cavity with engine oil.
3. Install cover and tighten screws to 12 N·m (105 in. lbs.).
4. If removed, install the oil pressure relief valve. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE RELIEF VALVE - INSTALLATION).

INSTALLATION

1. Install oil pump assembly (2,4,5).
2. Install timing chain cover.

MANIFOLD-INTAKE

DESCRIPTION

The intake system is made up of an upper and lower intake manifold. The upper intake manifold is made of a composite material for the 3.8L engine. The lower intake manifold also provides coolant crossover between cylinder heads and houses the coolant thermostat.

The intake manifold utilizes a compact design with very low restriction and outstanding flow balance. This design allows the engine to perform with a wide torque curve while increasing higher rpm horsepower.

If, for some reason, the molded-in vacuum ports break, the composite manifold can be salvaged. The vacuum ports are designed to break at the shoulder, if overloaded. Additional material in the shoulder area provides sufficient stock to repair. Also, if the special screws that attach the MAP sensor, power steering reservoir, and the EGR tube become stripped, an oversized screw is available to repair the stripped-out condition.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

1. Start the engine.
2. Spray a small stream of water (Spray Bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

MANIFOLD-INTAKE

STANDARD PROCEDURE

STANDARD PROCEDURE - MANIFOLD STRIPPED THREAD REPAIR

The composite upper intake manifold thread bosses, if stripped out, can be repaired by utilizing a repair screw available through Mopar® parts. Repair screws are available for the following manifold attached components:

- MAP sensor
- Power steering reservoir
- EGR tube
- Throttle cable bracket

The repair screws require a unique tightening torque specification from the original screw. Refer to the following

chart for specification.

DESCRIPTION	TORQUE*
STRIP-OUT REPAIR SCREWS ONLY	
MAP Sensor Repair Screw	4 N·m (35 in. lbs.)
Power Steering Reservoir Repair Screw	9 N·m (80 in. lbs.)
EGR Tube Attaching Repair Screw	9 N·m (80 in. lbs.)
Throttle Cable Bracket Repair Screw	9 N·m (80 in. lbs.)
*Install Slowly Using Hand Tools Only	

STANDARD PROCEDURE - INTAKE MANIFOLD VACUUM PORT REPAIR

NOTE: While performing this procedure, avoid getting the manifold material residue into the plenum chamber.

The composite intake manifold vacuum ports can be repaired. Although, if the manifold plenum chamber is damaged or cracked, the manifold must be replaced.

To repair a broken or damaged vacuum port on the composite intake manifold, perform the following procedure:

PARTS REQUIRED	TOOLS REQUIRED
· Brass Port – 1/4" O.D. x 1/8" pipe thread (LDP/Speed Control Port)	· Pipe Tap – 1/8" - 18 NPT
	· Drill Bit – 11/32"
	· File/Sandpaper

· Brass Port – 1/2" O.D. x 1/4" pipe thread (Brake Booster Port)	· Pipe Tap – 1/4" - 18 NPT
	· Drill Bit – 7/16"
	· File/Sandpaper

1. File or sand the remaining port back until a flat surface is obtained (plane normal to port axis).
2. Drill out the port base using a 7/16" (brake booster port) or 11/32" (LDP/speed control port) drill bit.
3. Using a 1/4"–18 NPT (brake booster port) or 1/8"–18 NPT (LDP/speed control port) pipe tap, cut internal threads. Use caution to start tap in a axis same as original port.
4. Apply Mopar® Thread Sealant to threads of repair port (s).
5. Install repair port (s). Do not over torque repair port (s).

REMOVAL - UPPER INTAKE MANIFOLD

1. Disconnect battery negative cable.
2. Disconnect inlet air temperature (IAT) sensor electrical connector (2).
3. Remove air inlet resonator to throttle body hose assembly (1).

4. Disconnect the throttle connectors (ETC) (3) from the throttle body.
5. Disconnect the EVAP hose at the throttle.

6. Remove the EGR tube (1).
7. Disconnect the idle air control (IAC) motor and throttle position sensor (TPS) wiring.

8. Disconnect the manifold absolute pressure (MAP) sensor electrical connector (2).

81920e96

9. Disconnect the PCV hose (1).

819221c3

10. Remove intake manifold bolts and remove the manifold.

11. Cover the lower intake manifold with a suitable cover while the upper manifold is removed.

12. Clean and inspect the upper intake manifold.

CLEANING

1. Discard gasket(s).

2. Clean all sealing surfaces.

INSPECTION

Check manifold for:

- Damage and cracks.
- Mounting surface distortion by using a straightedge and thickness gauge.

81b19156

INSTALLATION - UPPER INTAKE MANIFOLD

1. Remove covering on lower intake manifold and clean surfaces.
2. Inspect manifold gasket condition. Gaskets can be re-used, if not damaged. Position new gasket in seal channel and press lightly in-place. Repeat procedure for each gasket position.
3. Position upper manifold on lower manifold.
4. Apply Mopar® Lock & Seal Adhesive (Medium Strength Threadlocker) to each upper intake manifold bolt. Install and tighten bolts to 12 N·m (105 in. lbs.) using torque sequence.

CAUTION: The special screws used for the composite manifold attached components must be installed slowly using hand tools only. This requirement is to prevent the melting of material that causes stripped threads. If threads become stripped, an oversize repair screw is available.

81b19156

5. Install the MAP sensor (1), and torque fasteners to 1.7 N·m (15 in. lbs.).
6. Connect the MAP sensor electrical connector (2).

CAUTION: The special screws used for attaching the EGR tube to the manifold must be installed slowly using hand tools only. This requirement is to prevent the melting of material that causes stripped threads. If threads become stripped, an oversize repair screw is available.

7. Install the EGR tube (1).

8. Connect the throttle (ETC) (3) connector to throttle body

9. Connect the EVAP hose to the throttle body.

10. Connect the wiring connectors to the throttle position sensor (TPS) and idle air control (IAC) motor.
11. Connect the PCV hose (1).

12. Install air cleaner and air inlet hose assembly (1).
13. Connect the inlet air temperature (IAT) sensor electrical connector (2).
14. Connect battery negative cable.

INTAKE MANIFOLD - LOWER

REMOVAL - LOWER INTAKE MANIFOLD

81920ee6

1. Perform fuel system pressure release procedure (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
2. Drain the cooling system.
3. Remove the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

81b19156

4. Remove the fuel line (4) (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
5. Remove ignition coil and bracket.
6. Disconnect heater supply hose and engine coolant temperature sensor.

8191ec71

7. Disconnect the fuel injector wire harness.
8. Remove the fuel injectors and rail assembly (3) (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - REMOVAL).
9. Remove radiator upper hose.

8191ec71

10. Remove the intake manifold bolts.
11. Remove lower intake manifold.

WARNING: INTAKE MANIFOLD GASKET IS MADE OF VERY THIN METAL AND MAY CAUSE PERSONAL INJURY, HANDLE WITH CARE.

12. Remove intake manifold seal retainers screws. Remove intake manifold gasket.

80a25e15

CLEANING

1. Discard gasket(s).
2. Clean all sealing surfaces.

INSPECTION

Check for:

- Damage and cracks of each section.
- Clogged water passages in end cross-overs (if equipped).
- Check for cylinder head mounting surface distortion using a straightedge and thickness gauge. (Refer to 9 - ENGINE/CYLINDER HEAD - INSPECTION)

INSTALLATION - LOWER INTAKE MANIFOLD

1. Place a bead (approximately 1/4 in. diameter) of Mopar® Engine RTV GEN II onto each of the **four** manifold to cylinder head gasket corners (1).
2. Carefully install the new intake manifold gasket. Tighten end seal retainer screws to 12 N·m (105 in. lbs.).

3. Install lower intake manifold. Install the bolts and torque to 1 N·m (10 in. lbs.). Then torque bolts to 22 N·m (200 in. lbs.) in sequence shown. Then torque again to 22 N·m (200 in. lbs.). After intake manifold is in place, **inspect to make sure seals are in place.**

4. Install the fuel injectors and rail assembly (3) (Refer to 14

- FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION).

5. Connect fuel injector electrical harness.

6. Connect the engine coolant temperature sensor.

7. Connect the heater supply and radiator upper hoses to manifold.

8. Connect the fuel line (4) (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

9. Install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

10. Connect negative battery cable.

11. Fill the cooling system.

12. Connect the negative battery cable.

MANIFOLD-EXHAUST-RIGHT

REMOVAL

81b19156

1. Disconnect battery negative cable.
2. Separate the exhaust pipe at the exhaust manifold.
3. Remove the air cleaner hose (1) and housing.

81920ee6

4. Disconnect the TPS, IAC and purge vacuum hose from the throttle body.
5. Disconnect the spark plug wires at the spark plugs.
6. Disconnect the oxygen sensors (1,2).
7. Remove bolts attaching exhaust manifold to cylinder head and remove manifold.
8. Inspect and clean manifold.

CLEANING

1. Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

Inspect exhaust manifolds for damage or cracks and check distortion of the cylinder head mounting surface and exhaust crossover mounting surface with a straightedge and thickness gauge.

Manifold surface flatness limits should not exceed 1.0 mm (0.039 in.).

INSTALLATION

1. Position exhaust manifold on cylinder head and install bolts to center runner (cylinder # 3) and initial tighten to 2.8 N·m (25 in. lbs.).
2. Install the remaining manifold attaching bolts. Tighten all bolts to 23 N·m (200 in. lbs.).
3. Connect the oxygen sensors (1,2).
4. Connect the spark plug wires to the spark plugs.

5. Connect the IAC, TPS and the EVAP hose to the throttle body.

6. Attach exhaust pipe to exhaust manifold.
7. Install the air cleaner housing and hose (1).
8. Connect battery negative cable.

MANIFOLD-EXHAUST-LEFT REMOVAL

1. Disconnect battery negative cable.
2. Remove the fresh air hose (1).
3. Disconnect left cylinder bank spark plug wires.

4. Remove heat shield attaching bolts.
5. Remove bolts attaching exhaust to manifold.
6. Disconnect the left side oxygen sensors (1,2).
7. Remove bolts attaching exhaust manifold to cylinder head.
8. Remove the exhaust manifold.

CLEANING

1. Discard gasket (if equipped) and clean all surfaces of

manifold and cylinder head.

INSPECTION

Inspect exhaust manifolds for damage or cracks and check distortion of the cylinder head mounting surface and exhaust crossover mounting surface with a straightedge and thickness gauge.

Manifold surface flatness limits should not exceed 1.0 mm (0.039 in.).

INSTALLATION

1. Position exhaust manifold (1) on cylinder head. Install bolts to center runner (cylinder #4) and initial tighten to 2.8 N·m (25 in. lbs.).
2. Position heat shield (2) on manifold.
3. Install the remaining manifold attaching bolts. Tighten all bolts to 23 N·m (200 in. lbs.).
4. Install and tighten heat shield attaching nut (3) to 12 N·m (105 in. lbs.).

5. Attach exhaust pipe to exhaust manifold and tighten bolts to 41 N·m (30 ft. lbs.).
6. Connect the left side oxygen sensors (1,2).
7. Connect battery negative cable.

VALVE TIMING

STANDARD PROCEDURE

STANDARD PROCEDURE - VALVE TIMING VERIFICATION

1. Remove front cylinder head cover and all 6 spark plugs.
2. Rotate engine until the #2 piston is at TDC of the compression stroke.
3. Install a degree wheel on the crankshaft pulley.
4. With proper adaptor, install a dial indicator into #2 spark plug hole. Using the indicator find TDC on the compression stroke.
5. Position the degree wheel to zero.
6. Remove dial indicator from spark plug hole.
7. Place a 5.08 mm (0.200 in.) spacer between the valve stem tip of #2 intake valve and rocker arm pad. Allow tappet to bleed down to give a solid tappet effect.
8. Install a dial indicator so plunger contacts the #2 intake valve spring retainer as nearly perpendicular as possible. Zero the indicator.
9. Rotate the engine clockwise until the intake valve has lifted .254 mm (0.010 in.).

CAUTION: Do not turn crankshaft any further clockwise as intake valve might bottom and result in serious damage.

10. Degree wheel should read 6 degrees BTDC to 6 degrees ATDC.

STANDARD PROCEDURE - MEASURING TIMING CHAIN WEAR

1. Position a scale next to timing chain so that any movement of chain may be measured.
2. Position a torque wrench and socket on the camshaft sprocket attaching bolt. Apply force in the direction of crankshaft rotation to take up slack to the following torque:
 - 41 N·m (30 ft. lb.) with cylinder heads installed
 - 20 N·m (15 ft. lb.) with cylinder heads removed

NOTE: With torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block crankshaft to prevent rotation.

3. Holding a measuring scale along edge of chain links.
 4. Apply force in the reverse direction to the following torque:

- 41 N·m (30 ft. lb.) with cylinder heads installed
- 20 N·m (15 ft. lb.) with cylinder heads removed

5. Measure amount of sprocket/chain movement.

6. Install a new timing chain and sprockets if movement exceeds 3.175 mm (1/8 in.).

COVER-TIMING CHAIN

REMOVAL

1. Perform the fuel pressure relief procedure (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
2. Disconnect negative cable from battery.
3. Drain cooling system.
4. Remove the air cleaner hose (1) and housing assembly.

5. Remove the accessory drive belt and belt tensioner.
6. Remove the generator (3).
7. Remove the oil level indicator tube.
8. Drain engine oil.

9. Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
10. Remove the oil filter (2).
11. Disconnect the oil pressure switch (1).

12. Remove power steering pump fasteners (2) and set pump (1) aside.
13. Disconnect the lower radiator hose.
14. Separate the air conditioning compressor from the engine and set aside.

15. Remove crankshaft vibration damper using special tool #8454 and insert #8450. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)
16. Remove camshaft position sensor (CMP) (4) from timing chain cover (Refer to 8 - ELECTRICAL/IGNITION CONTROL/CAMSHAFT POSITION SENSOR - REMOVAL).

1,7 - BOLT - M8 x 1.25 x 80	4 - BOLT - M10 x 1.5 x 85
2 - BOLT - M10 x 1.5 x 85	5 - BOLT - M8 x 1.25 x 80
3 - BOLT - M8 x 1.25 x 80	6 - BOLT - M10 x 1.5 x 85

17. Remove the timing chain cover fasteners (1–7) and remove timing chain cover.

INSTALLATION

1,7 - BOLT - M8 x 1.25 x 80	4 - BOLT - M10 x 1.5 x 85
-----------------------------	---------------------------

2 - BOLT - M10 x 1.5 x 85	5 - BOLT - M8 x 1.25 x 80
3 - BOLT - M8 x 1.25 x 80	6 - BOLT - M10 x 1.5 x 85

CAUTION: Crankshaft oil seal must be removed to insure correct oil pump engagement.

1. Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs.

NOTE: DO NOT USE SEALER ON COVER GASKET

2. Position new gasket on timing cover. Adhere new gasket to chain case cover, making sure that the lower edge of the gasket is 0.5 mm (0.020 in.) beyond the lower edge of the cover.

3. Rotate crankshaft so that the oil pump drive flats are in the vertical position.

4. Position oil pump inner rotor so the mating flats are in the same position as the crankshaft drive flats.

CAUTION: Make sure the oil pump is engaged on the crankshaft correctly or severe damage may result.

5. Install timing cover.

NOTE: Torque the M10 bolts (2,4,6,) first, then the M8 (1,3,5,7).

6. Install timing chain cover bolts. Tighten the M10 bolts (2,4,6) to 54 N·m (40 ft. lbs.) and M8 bolts (1,3,5,7) to 28 N·m (21 ft. lbs.).

7. Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

8. Install crankshaft front oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION)

9. Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

10. Install a new oil filter (2) and connect the oil pressure switch (1).

11. Connect the coolant hoses.

12. Install camshaft position sensor (CMP).

13. Install A/C compressor.

14. Install the oil level indicator tube.

15. Install the generator (3).

16. Install the power steering pump (1).

17. Install the accessory drive belt and idler pulley.

18. Fill crankcase with engine oil to proper level.

19. Install the Air cleaner housing and hose (1).

20. Fill cooling system.

21. Connect negative cable to battery.

CHAIN & SPROCKETS-TIMING

REMOVAL

REMOVAL - TIMING CHAIN AND CAMSHAFT SPROCKET

1,7 - BOLT - M8 x 1.25 x 80	4 - BOLT - M10 x 1.5 x 85
2 - BOLT - M10 x 1.5 x 85	5 - BOLT - M8 x 1.25 x 80
3 - BOLT - M8 x 1.25 x 80	6 - BOLT - M10 x 1.5 x 85

1. Disconnect negative cable from battery.
 2. Remove the timing chain cover bolts (1–7), and timing cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

3. Rotate engine by turning crankshaft until the timing marks are aligned as shown (4).
 4. Remove camshaft sprocket attaching bolt.
 5. Remove the timing chain with camshaft sprocket.
 6. Remove the crankshaft sprocket.

REMOVAL - CRANKSHAFT SPROCKET

1. Remove the timing chain.
2. Using Special Tools 8539 (5), 5048-6 (1), and 5048-1, remove the crankshaft sprocket while holding the crankshaft from turning. Be careful not to damage the crankshaft surfaces.

INSTALLATION

INSTALLATION - CRANKSHAFT SPROCKET

1. Position the sprocket on the crankshaft (timing mark out) with the timing slot aligned with the timing pin.
2. Install sprocket using Special Tool 8452 (1,2). Install sprocket until it is fully seats on the crankshaft.
3. Install the timing chain and camshaft sprocket.

INSTALLATION - TIMING CHAIN AND CAMSHAFT SPROCKET

1. Rotate crankshaft so the timing arrow is to the 12 o'clock position (4).

NOTE: Lubricate timing chain and sprockets with clean engine oil before installation.

2. While holding camshaft sprocket and chain in hand, place timing chain around the sprocket, aligning the plated link (2) with the dot on the sprocket. Position the timing arrow to the 6 o'clock position .
3. Place timing chain around crankshaft sprocket with the plated link (2) lined up with the dot on the sprocket. Install camshaft sprocket into position.
4. Use a straight edge to check alignment of timing marks.
5. Install camshaft sprocket bolt and washer. Tighten bolt to 54 N·m (40 ft. lbs.).
6. Rotate crankshaft 2 revolutions and check timing mark alignment. If timing marks do not line up, remove camshaft sprocket and realign.

1,7 - BOLT - M8 x 1.25 x 80	4 - BOLT - M10 x 1.5 x 85
2 - BOLT - M10 x 1.5 x 85	5 - BOLT - M8 x 1.25 x 80
3 - BOLT - M8 x 1.25 x 80	6 - BOLT - M10 x 1.5 x 85

7. Install the timing chain cover, and bolts (1–7). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

8. Connect negative cable to battery.

ENGINE - 2.8L DIESEL - SERVICE INFORMATION

ENGINE - 2.8L DIESEL - SERVICE INFORMATION

DESCRIPTION

2.8L COMMON RAIL DIESEL ENGINE

The 2.8L (2776cc) four-cylinder “common rail” direct injection engine is an in-line overhead valve design. The engine utilize a cast iron cylinder block. The engine has a one piece aluminum cylinder head with four valves per cylinder and dual overhead cam shafts. The 2.8L is turbocharged, intercooled and also equipped with a EGR cooler.

The identification stamp for the 2.8L is located on the left side of the engine block, above the starter. The engine code label is located on the front timing cover and is the same as the engine I.D. and serial number. There is also a fuel system label on the front timing cover used for fuel system identification during ECM programming.

REMOVAL

ENGINE - 2.8L DIESEL

1. Remove the intake air box.
2. Remove the turbocharger air inlet.

3. Disconnect the battery cables. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL)
4. Remove the battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL)

5. Remove the front lower splash shield.
6. Drain the coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE)
7. Drain the engine oil.
8. Evacuate the A/C system.
9. Remove the lower air deflector from the radiator.

10. Remove the retainers (1) Disconnect the exhaust system (2) from the catalytic converter. (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - REMOVAL)
11. Disconnect the oxygen sensors.
12. Remove the catalytic converter to engine bolts.

13. Remove the starter. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)

14. Remove the front tires. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE)

15. Remove the right front inner fender well. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL)

16. Remove the left front inner fender well. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL)

17. Disconnect the coolant hoses (1) from the heater core connection at the bulkhead.

18. Remove the coolant recovery container hose. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL)

- 19. Remove the cooling module.
- 20. Remove the fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

- 21. Remove the torque converter to flex plate bolts.

- 22. Remove the bell housing bolts.
- 23. Remove the transmission line bracket at the oil pan.

- 24. Remove the bolt from the left engine mount.
- 25. Remove the bolt from the right engine mount.

- 26. Remove the A/C lines at the condenser.

27. Remove the A/C suction line at the compressor.
28. Remove the A/C discharge line at the compressor.
29. Disconnect the A/C compressor connector.
30. Remove the A/C compressor.

31. Remove the left side charge air cooler hose.

- 32. Remove the right side charge air cooler hose.
- 33. Remove the transmission cooler lines at the transmission cooler.
- 34. Remove the EGR vacuum control solenoid.

- 35. Remove the power steering pump pulley (1).

36. Remove the power steering pump (1) and position aside.

- 37. Remove the generator.
- 38. Disconnect the oil pressure sender connector.
- 39. Disconnect the EGR solenoid connector.

40. Disconnect the engine harness connector from the camshaft position sensor (1).

41. Disconnect the boost pressure solenoid harness connector.

42. Disconnect the fuel injector connectors.

- 43. Disconnect the fuel pressure sensor harness connector.
- 44. Disconnect the fuel pressure regulator harness connector.
- 45. Remove the high pressure feed fuel line bracket.
- 46. Remove the high pressure fuel feed line (2).

NOTE: Any time the high pressure fuel line(s) are removed, the fuel line must be replaced.

- 47. Disconnect the EGR airflow control valve solenoid harness connector.

- 48. Disconnect the IAT/BPS harness connector (1).

- 49. Disconnect the ground strap between the cowl and hood.
- 50. Position the engine wiring harness aside.

- 51. Disconnect the glow plug harness connectors.
- 52. Remove the vacuum tube.
- 53. Remove the vacuum tube from the EGR valve.

- 54. Disconnect the fuel lines (1).

55. Disconnect the fuel rail fuel return line (1).

56. Disconnect the fuel pump fuel return line (1).
 57. Remove the transmission vent hose retainer.

58. Install the engine lift, and support the weight of the engine.
59. Remove the engine mount through bolts.
60. Remove the engine.

INSTALLATION

ENGINE - 2.8L DIESEL

1. Install the engine.
2. Install the engine mount through bolts.
3. Remove the engine lift.
4. Install the fuel return lines.
5. Install the transmission vent hose retainer.

6. Install the fuel lines (1).

CAUTION: The glow plugs operate on a 4.4-volt system. The glow plugs **DO NOT** tolerate any over voltage. Full battery voltage will destroy the glow plug immediately. **DO NOT** test the glow plugs with a 12V source as damage will occur to the glow plug.

7. Install the glow plugs. Torque each glow plug to 14 Nm (10 lbs. ft.).
8. Connect the glow plug harness connectors.
9. Install the vacuum tube. Torque the nuts to 11 Nm (97 lbs. in.).
10. Install the vacuum line to the EGR valve.

11. Connect the IAT/BPS harness connector (1).

12. Connect the ground strap between the cowl and hood.
13. Position the engine wiring harness.

14. Connect the fuel injector connectors.
15. Connect the fuel pressure connector.
16. Connect the fuel regulator connector.
17. Connect the throttle control solenoid connector.

18. Install the generator. Torque the generator bolts to 33 Nm (24 lbs. ft.).
19. Connect the oil pressure sender connector.
20. Connect the EGR solenoid connector.
21. Connect the camshaft position sensor connector.
22. Connect the turbocharger actuator connector.

23. Install the power steering pump. Torque the bolts to 33 Nm (24 lbs. ft).

24. Install the power steering pump pulley. Torque the pulley bolts to 33 Nm (24 lbs ft.).

25. Install the A/C compressor. Torque the bolts to 32 Nm (23 lbs. ft).
26. Install the A/C suction line at the compressor.
27. Install the A/C discharge line at the compressor.
28. Connect the A/C compressor connector.

29. Install the left side charge air cooler hose.

B1ada110

- 30. Install the right side charge air cooler hose.
- 31. Install the transmission cooler lines at the transmission cooler.
- 32. Install the EGR vacuum control solenoid.

B1ada118

- 33. Install the A/C lines at the condenser.

- 34. Install the bolt to the left engine mount.
- 35. Install the bolt to the right engine mount.

- 36. Install the bell housing bolts.
- 37. Install the transmission line bracket at the oil pan.

38. Install the torque converter to flex plate bolts.

39. Install the cooling module.

40. Install the fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

- 41. Install the coolant hoses (1) to the heater core.
- 42. Install the coolant recovery container hose. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL)

- 43. Install the starter. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
- 44. Install the left front inner fender well. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL)
- 45. Install the right front inner fender well. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL)
- 46. Install the front tires. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE)

81911895

- 47. Connect the exhaust system (2) to the catalytic converter.
(Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - REMOVAL)
- 48. Connect the oxygen sensors.
- 49. Install the catalytic converter to engine bolts.

81dad28b

- 50. Install the front lower splash shield.
- 51. Fill the coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- 52. Fill the engine oil.
- 53. Charge the A/C system.
- 54. Install the lower air deflector from the radiator.

55. Install the battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL)

56. Connect the battery cables. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL)

57. Install the turbocharger air inlet.

58. Install the intake air box.

SPECIFICATIONS

ENGINE INFORMATION

818254bd

2.8L Engine Specifications

Engine	2.8L JK/KA
Engine Type	2.8L — 16 Valves
Displacement	2777 cc
Bore	94.00
Stroke	100.05
Power (VGT)	130 kW (177CV)@3800 RPM
Torque (ATX)	400 Nm @ 2000 RPM
Torque (MTX)	410 Nm @ 2000 RPM
Cylinders	4 In line
Injection Order	1-3-4-2
Compression Ratio	17.0:1
Maximum compression pressure variation between two cylinders.	5 bar (72.5 psi)
Vacuum at idle	680 mm/HG (27.5 In/HG)
Idle Speed (ATX)	760 +/- 50 RPM
Idle Speed (MTX)	875 +/- 50 RPM

Maximum RPM in Gear	4500 RPM
Maximum RPM in neutral	ATX 2800 MTX 3500
Belt tension	Automatic Belt Tensioner
Thermostat opening	80°C +/- 2°C
Generator Rating	Denso 12V-180A
Emissions Level	EU4
Block configuration/Material	Open/Cast Iron
Cylinder Head	Dual Overhead Cam
Timing System	Belt
Fuel System	CP3.2+ 1,600 bar Fuel Pump, Piezo Injectors
Fuel Supply	Electric Fuel Pump In the Fuel Tank
Electronic Control Unit	EDC 16
Timing System	Belt Driven DOHC Overhead Camshaft
Air Intake	Dry Filter With turbocharger and Charge Air Cooler
Fuel System	Direct Fuel Injection Common Rail System
Emission devices	Cooled EGR (pneumatic) Electric Intake Throttle Fast Metallic Glow plugs
Combustion Cycle	4 Stroke
Cylinder Compression Difference Between Cylinders	10 bar (145 psi)
Cooling System	Water Cooling
Turbocharging:	Single VGT with REA
Intake Ports	Aluminum heads with traditional dual side intake and exhaust ports. One intake port is helical and the other has a directed entry.
Crankshaft	8 Counterweights with an incorporated balance shaft gear.
Camshafts	2 overhead camshafts with axial front bearings and identical camshaft caps, finger followers, and hydraulic lifters.
Intake & Exhaust Valves	Flat with fire deck face.

Intake Manifold	Aluminum, with Cast-in EGR passages, intake mixer, vacuum actuated EGR valve, electric intake throttle and a U-type EGR cooler
Lubrication	Pressure Lubricated By Rotary Pump
Minimum Oil Pressure (warm)	0.7 BAR at idle / 2.5 BAR at 3800 rpm
Engine Rotation	Clockwise Viewed From Front Cover

9992 CRANKSHAFT LOCKING TOOL**9993 CRANKSHAFT SEAL INSTALLER****CYLINDER HEAD****DESCRIPTION**

The 2.8L aluminum, overhead valve cylinder head is torqued in a cross pattern. The cylinder head itself is not resurfacable.

8199b560

1. The cylinder head uses a selectable Multi-layered Steel gasket that is available in three sizes.

STANDARD PROCEDURE

VALVE SEALS - IN VEHICLE

81aba770

1. Disconnect the negative battery cable.
2. Remove the intake manifold/cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

NOTE: Rocker arms and lifters must be kept in order of removal and stored in the up right position.

3. Position the rocker arms aside. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).

4. Install special tool VM.1072A, compression tester adaptor into the injector hole and retain with an injector hold down (2) bolt .

5. Prepare special tool MD998772A (1) for usage by inverting the tool to cylinder head holding screws so that the thread size matches the cylinder head.

6. Install special tool MD998772A (1) onto cylinder head and using adaptor MD998772A-15 (2), place the adaptor over the valve spring.

7. Connect a regulated air supply (3) to VM.1072A (4), and pressurize the cylinder.

8. Place shop towels around the working area of the cylinder head to prevent valve locks from accidentally entering the engine.

9. Using adaptor MD998772A-15 (1), collapse the valve spring (2) and remove the locks .

10. Remove the valve spring (2) assembly.

11. Remove the valve seal.

12. Repeat this procedure for all cylinders.

VALVE SERVICE

This procedure is done with the engine cylinder head removed from the block.

DISASSEMBLY

1. Remove the engine cylinder head from the cylinder block (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
2. Use Valve Spring Compressor Tool and compress each valve spring.
3. Remove the valve locks, retainers, and springs.
4. Use a smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.
5. Remove the valves, and place them in a rack in the same order as removed.

VALVE CLEANING

1. Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.
2. Clean all residue and gasket material from the engine cylinder head machined gasket surface.

INSPECTION

1. Inspect for cracks in the combustion chambers and valve ports.
2. Inspect for cracks on the exhaust seat.
3. Inspect for cracks in the gasket surface at each coolant passage.
4. Inspect valves for burned, cracked or warped heads.
5. Inspect for scuffed or bent valve stems.
6. Replace valves displaying any damage.
7. Check valve spring height .

VALVE SEAT REFACING

1. Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.
2. Use tapered stones to obtain the specified seat width when required.

VALVE GUIDES

1. Valve Guides height requirement.
2. Measurement A and B: 13.50 mm - 14.00 mm. (0.570 in — 0.590 in)

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

1. Measure and record internal diameter of valve guides. Valve guide internal diameter is 6.0 to 6.012 mm (0.2362 to 0.2366 in.).
2. Measure valve stems and record diameters. Intake valve stem diameter 5.952 to 5.97 mm (0.2343 to 0.2350 in). Exhaust valve stem diameter 5.942 to 5.96 mm (0.2339 to 0.2346 in).
3. Subtract diameter of valve stem from internal diameter of its respective valve guide to obtain valve stem clearance in valve guide. Clearance of inlet valve stem in valve guide is 0.03 to 0.06 mm (.0011 to .0023 in). Clearance of exhaust valve stem in valve guide is 0.04 to 0.07 mm (.0015 to .0027 in).
4. If valve stem clearance in valve guide exceeds tolerances, new valve guides must be installed.

REMOVAL

1. Disconnect the battery.
2. Remove the battery.

3. Remove the accessory drive belt.
4. Remove the intake air housing.
5. Drain the cooling system.

6. Remove the charge air cooler outlet hose.

7. Remove the charge air cooler inlet hose.

8. Remove the high pressure fuel feed line (2).
9. Remove the generator brace bolt (1).

10. Disconnect the fuel return lines (1) and (2).

11. Disconnect the crankcase vent hose from the oil separator (4).

12. Remove the EGR cooler.

13. Remove the EGR cooler coolant lines.

14. Remove the fuel block (1).

15. Disconnect the heater coolant lines (1) and (2) from the thermostat housing (3).

16. Remove the thermostat housing (3).

17. Disconnect the IAT/BPS sensor harness connector (1).
18. Remove the IAT/BPS sensor.
19. Remove the generator brace bolt (2).
20. Remove the EGR Airflow Control valve.

21. Remove the generator support bracket (2).
22. Remove the generator.
23. Disconnect the generator harness connectors (4).
24. Disconnect the battery positive cable from the generator output (3).

25. Disconnect the high pressure fuel line (2).
26. Remove the injector fuel lines (3) from the injectors and the fuel rail.
27. Disconnect the fuel rail solenoid harness connector.
28. Disconnect the fuel rail pressure sensor harness connector.
29. Remove the fuel rail (5).

30. Disconnect and position aside the glow plug harness (10).

31. Remove the intake manifold fasteners (2).

32. Remove the intake manifold (1) and the gasket (3).

33. Disconnect the boost pressure solenoid harness connector.

81abecd6

34. Remove the turbocharger oil return line (1).

81dc58b5

35. Remove the turbocharger nuts.

36. Remove the turbocharger oil feed line.

81abecdd

37. Remove the turbocharger oil lines from the engine block.

38.
Remove
the
exhaust
manifold.

81969610

39.

81abeccf

Disconnect the vacuum line (2) from the vacuum pump.

40. Disconnect the vacuum line (1).

41. Remove the exhaust manifold gasket (3).

42. Disconnect the fuel injector harness connectors (1) from the fuel injectors.

43. Remove the fuel injectors (1).

44. Disconnect the Camshaft Position Sensor (CMP) harness connector.

45. Remove the camshaft position sensor (3).

46. Remove the front engine lifting bracket (2).

47. Remove the idler pulley and cooling fan pulley bracket assembly (1).

48. Remove the five bolts (3) and the upper front timing belt cover (4).

49. Remove the twelve fasteners (8) and the cylinder head cover (7).

NOTE: The crankshaft sprocket bolt is a L.H. thread.

50. Remove the crankshaft damper bolts (1), and the crankshaft damper (2).

51. Remove the nine fasteners (1), and lower front cover (2).

52. Rotate the engine by hand until the crankshaft 90° ATDC marks are aligned.

53. Verify the camshaft timing alignment holes on the camshaft gears are aligned horizontally.

54. Remove the exhaust camshaft cap (1).

55. Install the camshaft locking tool VM 9991 (1).

56. Install the crankshaft locking tool VM 9992 (1).

57. Remove the timing belt.

58. Remove the intake camshaft sprocket (2) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

59. Remove the inner timing belt cover.

60. Remove the front camshaft journal (2).

61. Remove the intake camshaft oil seal (2).

62. Using a circular pattern, loosen the camshaft cap bolts.

81ab85d5

NOTE: Observe the position marks on the cylinder head and camshaft cap. Always replace the camshaft cap to its original location. The illustration is an example of the camshaft markings.

63. Remove the camshaft caps (2).

81dec8c2

NOTE: Observe the position of the rocker arms and lifters. Always return the rocker arms and lifters to their original location.

64. Remove the rocker arms (1) and hydraulic lifters (2).

65. Remove the cylinder head.

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

INSPECTION

CAUTION: The cylinder head surface and straight edge must be absolutely clean before the flatness measurement is taken. DO NOT check flatness across the combustion chamber area or on the marks left by the gasket stopper.

Use a cleaned straight edge (2) and feeler (1) gauge to check the flatness. Lie the straight edge (2) parallel across the cooling ports. Measure before each combustion chamber toward the outer edge of the cylinder head, above and below each combustion chamber, between each combustion chamber, top and bottom, on the cylinder head and block mating surfaces. The **maximum** allowed warpage is 0.075mm (0.003 in.).

The minimum cylinder head thickness is 135.5 mm (5.33 in.).

INSTALLATION

1. Remove the crankshaft locking tool.

2. Set the number one piston to top dead center (TDC).

81ab861e

3. Zero the dial indicator on the top of the piston at location shown (1).

4. Use the dial indicator to measure the height of the piston at top dead center.

5. Zero the dial indicator on the top of the piston at location shown (2).

6. Use the dial indicator to measure the height of the piston at top dead center.

7. Repeat the procedure for each cylinder.

8. Average the 4 piston protrusion readings to determine the required gasket thickness.

9. Select the appropriate cylinder head gasket from the cylinder head gasket chart.

81dcdb25

Cylinder Head Gasket Selection

	Millimeters	Inches
DISTANCE FROM PISTON AT TDC TO CYLINDER BLOCK	0.300 - 0.399	0.0119 - 0.0158
CYLINDER HEAD GASKET THICKNESS	1.10	0.0434
PISTON CLEARANCE	0.701 - 0.800	0.0276 - 0.0315
DISTANCE FROM PISTON AT TDC TO CYLINDER BLOCK	0.400 - 0.499	0.0158 - 0.0197
CYLINDER HEAD GASKET THICKNESS	1.20	0.0473
PISTON CLEARANCE	0.701 - 0.800	0.0276 - 0.0315

DISTANCE FROM PISTON AT TDC TO CYLINDER BLOCK	0.500 - 0.600	0.0197 - 0.0237
CYLINDER HEAD GASKET THICKNESS	1.30	0.0512
PISTON CLEARANCE	0.700 - 0.800	0.0276 - 0.0315

10. Return piston #1 to 90° ATDC, and align the crankshaft timing marks.

11. Reinstall the crankshaft locking tool (1).

12. Install the head gasket (1).
 13. Install the cylinder head.

NOTE: Always use new cylinder head bolts whenever the existing bolts have been removed.

14. Install the cylinder head bolts in the illustrated pattern. Torque the bolts to 30 Nm (22 lbs. ft.).
15. Repeat the pattern, turning the bolts an additional 85°. Repeat the pattern twice more, turning 85° each time for a total of 255°.

16. Install the rocker arms (1) and hydraulic lifters (2). Make sure to return the lifters and arms to their original position.

17. Set the camshafts in place.
18. Make sure that the timing dimples on the back of the camshaft gears are lined up horizontally.

NOTE: The engine is not in time with the camshaft dots facing each other. The camshafts are set so that the dots face each other and then rotated until the camshaft locking tool can be bolted to the cylinder head. The camshaft locking tool properly positions the camshafts at 90° ATDC. The dots on the camshafts are used during assembly to quickly orient the camshafts so that the camshaft locking tool can be installed.

19. Turn the camshafts so that the 90° ATDC camshaft tool can be correctly installed.

20. Make a mark (2) across the CMP reluctor wheel (1) and the exhaust camshaft (3). This mark will be used to verify that the CMP reluctor wheel did not rotate on the camshaft during assembly.

21. Install the camshaft locking tool (1).

22. The camshaft caps have several markings. The die identification number (1) is used during manufacturing, and is not necessary for assembly.

23. The progressive part number (1) is printed on the intake side of the cylinder head. The last 2 digits are the same as the number on the camshaft caps.

81b53063

24. The last two digits of the progressive part number (1) are printed on the camshaft caps and will match the last two digits of the number on the side of the cylinder head and front camshaft cap. These numbers are stamped after the machining process and match the camshaft caps to the cylinder head.

81b5305e

25. The camshaft cap locations are marked on the cylinder head near each camshaft cap. The exhaust side (1) are marked with a number and the letter "S". The intake side (2) is marked with a number and the letter "A".

81b53062

26. The camshaft cap must be aligned with the mark (1) aligned in the same direction as the cylinder head mark (2). In the illustration, the camshaft cap is the first cylinder (indicated by the 1) on the exhaust side of the cylinder head (indicated by the S).

81b5304a

27. The first cylinder on the intake side is marked with the code 1A. Each camshaft cap location is marked in this manner on both the camshaft cap and cylinder head. It is critical that all of the camshaft caps are returned to their correct locations.

28. Apply a thin bead of Loctite 510 to the front camshaft cap (2) in the location shown (1).

29. Loosely install the camshaft bolts finger tight.

NOTE: When the camshaft caps are removed, always replace the camshaft cap bolts.

30. The camshaft bolts have 3 different bolt sizes.

- Bolts A are M6 35
- Bolts B are M6 45
- Bolts C are M6 stud bolts.

31. Following the illustrated pattern, torque the camshaft cap bolts to 11 Nm (98 lbs. in.).

8199ade6

32. Use the 9937-1 Seal Installer (1) to install the intake camshaft oil seal.

81dec33e

33. Install the inner front cover. Torque the bolts to 11 Nm (97 lbs. in.).

81aba73a

NOTE: The crankshaft sprocket bolt is a L.H. thread.

34. Install the crankshaft sprocket. Torque the bolt to 100 Nm (74 lbs. ft.) and then an additional 120 degrees.

81abec7

35. Align the high pressure fuel pump sprocket timing mark (2) with the timing mark (3) on the block.

36. Install the timing belt tensioner (3). Do not tighten at this time. Verify that the slot in the tensioner alignment plate (1) is aligned with the boss (2) in the rear timing belt cover.

37. Install the camshaft sprocket (2). Do not tighten the bolt at this time.

38. Turn the timing belt tensioner (1) clockwise to unload the tensioner enough for the timing belt to be installed.

NOTE: DO NOT remove the timing belt from the package until it is going to be installed. DO NOT expose timing belt to oil, grease or water contamination. DO NOT crimp belt at a sharp angle. DO NOT clean belt, pulleys or tensioner with solvent. Check that pulleys and bearings are not seized or damaged before installing belt.

39. Install timing belt.

81abec7

40. Adjust timing belt tensioner by lining up the arrow and the notch as illustrated.

81b330f8

41. Verify the tensioner load indicator (1) is centered in the tensioner load gage (2).

42. Tighten the timing belt tensioner bolt to 28 Nm (21 lb ft).

43. Verify the tensioner load indicator (1) is still centered in the tensioner load gage (2). If the indicator is not centered

in the gage as shown, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).

44. Use VM 1055 Gear Holder (1) to hold the camshaft sprocket while torquing. Torque the intake camshaft sprocket bolt to 64 Nm (47 lbs. ft.)

45. Remove the camshaft locking tool (1).

46. Verify that the reluctor wheel (1) has not moved on the camshaft. If the witness marks are not aligned, the reluctor wheel (1) has spun on the camshaft (3) during the assembly process, and the exhaust camshaft must be replaced.

47. Use VM 1057 Seal Installer (1) to install the exhaust camshaft cap.

48. Install the lower front cover (2). torque the bolts to 11 Nm (97 lbs. in.).

49. Install the upper front cover (3). torque the bolts to 11 nm (97 lbs. in.).

NOTE: The crankshaft sprocket bolt is a L.H. thread.

50. Install the crankshaft damper (2). Torque the bolts (1) to 32 Nm (23 lbs. ft.).

51. Install the idler pulley bracket (1) and torque the bolts to 45 Nm (33 lbs. ft.).

52. Install the front engine lifting bracket (2) and torque the bolts to 45 Nm (33 lbs. ft.).

53. Install the cam position sensor (3). Torque the cam position sensor bolt (1) to 11 Nm (97 lbs. in.).
54. Connect the cam position sensor harness connector.

55. Install the vacuum supply line (2) to the vacuum pump.
56. Install the vacuum line (1) to the fitting on the cylinder head cover.

57. Reconnect the crankcase vent hose to the oil separator (4).

81aa4cb8

58. Install the exhaust manifold gasket (3).

81abee8c

59. Install the exhaust manifold using the torque sequence shown. Torque the bolts to 35 nm (29 lbs. ft.)
 60. Repeat the tightening procedure.

81ad7d48

61. Install the turbocharger oil lines to the engine block. Torque the bolt to 32 Nm (23 lbs. ft.).

81abeccf

62. Install the turbocharger nuts and torque to 32 Nm (23 lbs. ft.).

63. Install the turbocharger oil feed line. Torque the oil feed line bolt to 24 Nm (18 lbs. ft.).

64. Install the turbocharger oil return line. Torque the oil return line bolts to 15 Nm (133 lbs. in.).

65. Connect the boost pressure solenoid harness connector.

66. Install the intake manifold gasket (3).
67. Install the intake manifold (2).
68. Install the intake manifold fasteners (2). Torque the intake manifold bolts to 25 Nm (19 lbs. ft.).
69. Repeat the tightening procedure.

70. Reposition the glow plug harness (10), and reconnect the glow plug harness connectors.

71. Install injectors and injector retainer claw and washer.
72. Install the injector clamp bolts. Do not tighten at this time.

73. Install the fuel rail (6). Do not tighten fuel rail retainers at this time.

NOTE: High pressure fuel lines must be replaced with new lines any time they are removed.

74. Loosely install the high pressure fuel lines onto the fuel injectors and the fuel rail.
75. Loosely install the high pressure fuel feed line to the high pressure pump and the fuel rail.
76. Torque injector clamp bolts to 32.4 Nm (23.8 Ft lbs).
77. Tighten the fuel rail nuts to 24.5 Nm (18 ft. lbs).
78. Torque the fuel lines at the fuel injectors to 28 Nm (20 ft lbs.).
79. Torque the fuel lines to at the fuel rail to 20 Nm (14.75 Ft lbs).
80. Torque the high pressure line at the fuel pump to 28 Nm (20 ft lbs).
81. Install the high pressure fuel line bracket bolt and torque to 15 Nm (133 lbs. in.).

82. Connect the fuel injector harness connectors (1).
83. Connect the fuel pressure solenoid harness connector.
84. Connect the fuel rail pressure sensor harness connector.

- 85. Install the generator bracket. Torque the bolts to 45 Nm (33 lbs. ft.).
- 86. Install the generator. Torque the bolts to 33 Nm (24 lbs. ft.).
- 87. Connect the generator connectors (4).
- 88. Connect the generator feed wire (3).

- 89. Install the intake air pressure and temperature sensor (1).
- 90. Connect the intake air pressure and temperature sensor harness connector (1).
- 91. Install the generator brace bolt (2).
- 92. Install the EGR airflow valve assembly.

93. Install the thermostat housing (3).

94. Connect the coolant lines from the thermostat housing.

95. Install the EGR cooler. Torque the bolts to 15 Nm (132 lbs. in.)

96. Install the EGR cooler coolant lines.

97. Install the fuel block (1).

98. Connect the fuel return lines (1) and (2).

99. Install the support bracket bolt to the generator bracket (1).

100. Install the charge air cooler inlet hose.

101. Install the charge air cooler outlet hose.

81adaf18

- 102. Install the accessory drive belt.
- 103. Install the intake air housing.
- 104. Fill the cooling system.
- 105. Connect the battery.

SEAL(S)-CAMSHAFT OIL

REMOVAL

- 1. Disconnect negative battery cable.
- 2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) .

818254bd

- 3. Loosen the accessory drive belt tension by rotating the accessory drive belt tensioner until holes 3 and 4 are lined up.

4. When the holes in the accessory drive belt tensioner are aligned, use a drift to lock the tensioner in place.

5. Remove the accessory drive belt.

6. Remove the front engine lifting bracket (2) and the idler pulley and cooling fan pulley bracket assembly (1).

7. Disconnect the fuel injector harness connectors (1) from the fuel injectors.

8. Disconnect the fuel return lines (1) and (2).

9. Disconnect the crankcase vent hose from the oil separator (4).

10. Disconnect the vacuum line (1) from the fitting on the cylinder head cover.

11. Disconnect the vacuum supply tube (2).

12. Remove the fuel lines (2) from the injectors and the fuel rail, and remove the fuel injectors (1).

13. Disconnect the Camshaft Position Sensor (CMP) harness connector.

14. Remove the camshaft position sensor (3).

15. Remove the five bolts (3) and the upper front timing belt cover (4).
16. Remove the twelve fasteners (8) and the cylinder head cover (7).

NOTE: The crankshaft sprocket bolt is a L.H. thread.

17. Remove the crankshaft damper bolts (1), and the crankshaft damper (2).

18. Remove the nine fasteners (1), and lower front cover (2).

19. Rotate the engine by hand until the crankshaft 90° ATDC marks are aligned.

20. Verify the camshaft timing alignment holes on the camshaft gears are aligned horizontally.

21. Remove the exhaust camshaft cap (1).

22. Install the camshaft locking tool VM 9991 (1).

23. Install the crankshaft locking tool VM 9992 (1).

24. Loosen the timing belt tensioner bolt, release tension, and remove the timing belt.

25. Remove the intake camshaft sprocket (2) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

26. Remove the front camshaft bearing journal (2).

27. Remove the intake camshaft oil seal (2).

INSTALLATION

1. Apply a thin bead of Loctite 510 to the front camshaft bearing journal (2) in the location shown (1).
2. Install the front camshaft bearing journal (2). Tighten bolts to 11 Nm (8 lb. ft).

3. Use the 9973-1 seal installer (1) to install the intake camshaft oil seal.

4. If the crankshaft locking tool was removed for any reason, re-align the 90° ATDC marks on the crankshaft timing belt drive sprocket and rear timing belt cover.

5. If necessary, install the crankshaft locking tool (1).

6. With the crankshaft locking pin installed, verify the 90° ATDC marks on the crankshaft timing belt drive sprocket and rear timing belt cover are aligned. Otherwise, damage to the engine can occur during installation of the timing belt.

7. Make sure the camshafts are correctly timed in relation to each other by rotating the camshafts until the dots on the cam gears line up as shown.

NOTE: The camshafts are correctly timed to each other when the dots line up as shown. Use the camshaft locking tool to set and lock the camshafts to 90° ATDC during timing belt installation.

8. If the camshaft dots line up, rotate the camshafts until the camshaft locking tool can be installed.

9. Make sure that the camshaft locking tool is correctly installed, and the camshafts are locked in position.

81b2fbba

10. Align the high pressure fuel pump sprocket timing mark (2) with the timing mark (3) on the block.

81b49665

11. Install the timing belt tensioner (3). Do not tighten at this time. Verify that the slot in the tensioner alignment plate (1) is aligned with the boss (2) in the rear timing belt cover.

12. Install the camshaft sprocket (2). Do not tighten the bolt at this time.

13. Turn the timing belt tensioner (1) clockwise to unload the tensioner enough for the timing belt to be installed.

NOTE: DO NOT remove the timing belt from the package until it is going to be installed. DO NOT expose timing belt to oil, grease or water contamination. DO NOT crimp belt at a sharp angle. DO NOT clean belt, pulleys or tensioner with solvent. Check that pulleys and bearings are not seized or damaged before installing belt.

14. Install timing belt.

15. Use VM 1055 Gear Holder (1) to hold the camshaft sprocket while torquing. Torque the intake camshaft sprocket bolt to 64 Nm (47 lbs. ft.)

16. Adjust timing belt tensioner by lining up the arrow and the notch as illustrated.

17. Verify the tensioner load indicator (1) is centered in the tensioner load gage (2).

18. Tighten the timing belt tensioner bolt to 28 Nm (21 lb ft).

19.
Verify
the
tensioner
load
indicator
(1) is still
centered
in the
tensioner

load gage
(2). If the
indicator
is not
centered

in the gage as shown, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).

20. Remove the camshaft locking tool (1).

21. Verify that the reluctor wheel (1) has not moved on the camshaft. If the reluctor wheel (1) has spun on the camshaft (3) during the assembly process, replace the camshaft.

22. Use VM 1057-2 Seal Installer (1) to install the exhaust camshaft oil seal.

23. Install the cam position sensor (3), and connect the harness connector.

24. Install the lower front cover (2). Torque the bolts to 11 N·m (97 lbs. in.)

25. Install the crankshaft damper (1). Torque the bolts to 32 N·m (23 lbs. ft.)

26. Install the upper front cover (3). Torque the bolts to 11 N·m (97 lbs in.).

27. Install the cylinder head cover (7). Torque the bolts to 11 N·m (97 lbs in.).

28. Install the vacuum line (2) to the vacuum pump.
29. Install the vacuum line (1) to the fitting on the cylinder head cover.

30. Install injectors (1) and injector retainer claw and washer.
31. Install the injector clamp bolts. Do not tighten at this time.
32. Loosely install the high pressure fuel lines onto the fuel injectors and the fuel rail.
33. Torque injector clamp bolts to 32.4 Nm (23.8 Ft lbs).
34. Tighten the fuel rail nuts to 24.5 Nm (18 ft. lbs).
35. Torque the fuel lines at the fuel injectors to 28 Nm (20 ft lbs.).
36. Torque the fuel lines at the fuel rail to 20 Nm (14.75 Ft lbs).
37. Install the high pressure fuel line bracket bolt and torque to 15 Nm (133 lbs. in.).

38. Connect the fuel injector harness connectors (1).

39. Connect the fuel return lines (1) and (2).

40. Connect the crankcase vent hose to the oil separator (4).

41. Install the idler pulley bracket (1).
42. Install the front engine lifting bracket (2). Torque the bolts to 45 N·m (33 ft.lbs.)

43. Remove crankshaft locking tool (1).
44. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) .
45. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
46. Connect negative battery cable.

CAMSHAFT(S)

DESCRIPTION

The camshafts are made of cast iron with eight machined lobes and four bearing journals.

81ab85e1

1. The exhaust camshaft (1) incorporates the CMP sensor reluctor wheel.

81ab85d1

2. The dots on the back of the camshaft gears are for initial timing only. These dots are for timing the camshafts to each other. To correctly set engine timing, the camshafts must be set to 90° ATDC. The camshaft locking tool is used to correctly set the camshafts to their proper location.

REMOVAL - CAMSHAFTS

81ad10c7

1. Disconnect negative battery cable.
2. Remove engine cover. (Refer to 9 - ENGINE - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove the cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

818254bd

5. Remove the front engine lifting bracket (2).
6. Remove the idler pulley and cooling fan pulley bracket assembly (1).

NOTE: The crankshaft sprocket bolt is a L.H. thread.

7. Remove the crankshaft damper bolts (1), and the crankshaft damper (2).

8. Remove the five bolts (3) and the upper front timing belt cover (4).

9. Remove the nine bolts (1) and the lower front timing belt cover (2).

10. Disconnect the fuel return lines (1) and (2).

11. Disconnect the vacuum line (2) from the vacuum pump.
12. Disconnect the vacuum line (1).

13. Disconnect the fuel injector harness connectors from the fuel injectors (1).

14. Remove the injector fuel lines (3) from the injectors and the fuel rail.

15. Remove the fuel injectors (1).

16. Remove the twelve fasteners (8) and the cylinder head cover (7).

17. Disconnect the Camshaft Position Sensor (CMP) harness connector.
18. Remove the camshaft position sensor (3).

CAUTION: Before removing the cylinder head cover/intake manifold or timing belt the engine must be rotated to the 90° ATDC. The camshafts and the crankshaft must all be set to the correct position. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

19. Rotate the engine by hand until the crankshaft 90° ATDC marks are aligned.

20. Remove the plug from the engine block, and install the crankshaft locking tool VM 9992 (1).

21. Verify the camshaft timing alignment holes on the camshaft gears are aligned horizontally.

22. Remove the exhaust camshaft oil seal (1).

23. Install the camshaft locking tool VM 9991 (1).

24. Loosen the timing belt tensioner bolt, release tension from the timing belt tensioner, and remove the timing belt.

25. Remove the intake camshaft sprocket (2) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

26. Remove the front cam bearing journal.

27. Using a circular pattern, loosen the camshaft caps.

NOTE: The camshaft caps must be installed in the same location and direction as they were removed. Match the marks on the camshaft cap to the marks on the cylinder head. The illustration is an example of a camshaft cap mark.

28. Remove the camshaft caps.
29. Remove the camshafts.

INSTALLATION - CAMSHAFTS

1. Lubricate the camshaft journals with Mopar® Engine Oil Supplement, or equivalent.
2. Make sure that the three small orientation dots marks on the back side of the camshaft gears are horizontal and facing each other.
3. Carefully install camshafts onto the camshaft journals.

NOTE: The dots on the back of the camshaft gears are for initial timing only. These dots are for timing the camshafts to each other. To correctly set engine timing, the camshafts must be set to 90° ATDC. The camshaft locking tool is used to correctly set the camshafts to their

proper location.

81ad10c7

4. Apply a thin bead of Loctite 510 to the front camshaft bearing journal (2) in the location illustrated (1).
5. Install the front camshaft bearing journal. Tighten bolts to 11 Nm (8 lb. ft).

81b56e89

6. Rotate the camshafts so that the camshaft locking tool fits into place.

7. Install the camshaft locking tool.

8. When the camshaft locking tool is bolted in place, the camshafts are locked at 90° ATDC.

9. If the crank locking tool was removed for any reason, verify the crankshaft 90° ATDC marks are aligned. Align the crankshaft 90° ATDC marks if necessary

10. If necessary, install the crankshaft locking tool (1).

The camshaft caps have several markings. The die identification number (1) is used during manufacturing, and is not necessary for assembly.

The progressive part number (1) is printed on the intake side of the cylinder head. The last 2 digits are the same as the number on the camshaft caps.

The last two digits of the progressive part number (1) are printed on the camshaft caps and will match the last two digits of the number on the side of the cylinder head. These numbers are stamped after the machining process and match the camshaft caps to the cylinder head.

The camshaft cap locations are marked on the cylinder head near each camshaft cap. The exhaust side (1) are marked with a number and the letter "S". The intake side (2) is marked with a number and the letter "A".

81b53062

The camshaft cap must be aligned with the mark (1) aligned in the same direction as the cylinder head mark (2). In the illustration, the camshaft cap is the first cylinder (indicated by the 1) on the exhaust side of the cylinder head (indicated by the S).

81b5304a

The first cylinder on the intake side is marked with the code 1A. Each camshaft cap location is marked in this manner on both the camshaft cap and cylinder head. It is critical that all of the camshaft caps are returned to their correct locations.

11. Loosely install the camshaft bolts finger tight.

NOTE: When the camshaft caps are removed, always replace the camshaft cap bolts.

12. The camshaft bolts have 3 different bolt sizes.

- Bolts A are M6 35
- Bolts B are M6 45
- Bolts C are M6 stud bolts.

13. Put a thin bead of silicone on the front camshaft cap (the cap that are secured by bolts “b”).

14. Following the illustrated pattern, torque the camshaft cap bolts to 11 Nm (98 lbs. in.).

15. Using the 9937-1 seal installer (1), install the intake camshaft oil seal.

16. Align the high pressure fuel pump sprocket timing mark (2) with the timing mark (3) on the block.

17. Install the timing belt tensioner (3). Do not tighten at this time. Verify that the slot in the tensioner alignment plate (1) is aligned with the boss (2) in the rear timing belt cover.

18. Install the camshaft sprocket (2). Do not tighten the bolt at this time.

19. Turn the timing belt tensioner (1) clockwise to unload the tensioner enough for the timing belt to be installed.

NOTE: DO NOT remove the timing belt from the package until it is going to be installed. DO NOT expose timing belt to oil, grease or water contamination. DO NOT crimp belt at a sharp angle. DO NOT clean belt, pulleys or tensioner with solvent. Check that pulleys and bearings are not seized or damaged before installing belt.

20. Install timing belt.

21. Use VM 1055 Gear Holder (1) to hold the camshaft sprocket while torquing. Torque the intake camshaft sprocket bolt to 64 Nm (47 lbs. ft.)

22. Adjust timing belt tensioner by lining up the arrow and the notch as illustrated.

23. Verify the tensioner load indicator (1) is centered in the tensioner load gage (2).

24. Tighten the timing belt tensioner bolt to 28 Nm (21 lb ft).

25.
Verify
the
tensioner
load
indicator
(1) is still
centered
in the
tensioner

load gage
(2). If the
indicator
is not
centered

in the gage as shown, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).

26. Remove the camshaft locking tool (1).

27. Verify that the reluctor wheel (1) has not moved on the camshaft. If the reluctor wheel (1) has spun on the camshaft (3) during the assembly process, replace the camshaft.

28. Use VM 1057-2 Seal Installer (1) to install the exhaust camshaft oil seal.

29. Install the cam position sensor (3), and connect the harness connector.

30. Install the lower front cover (2). Torque the bolts to 11 N·m (97 lbs. in.)

31. Install the crankshaft damper (1). Torque the bolts (1) to 32 N·m (23 lbs. ft.)

32. Install the upper front cover (3). Torque the bolts to 11 N·m (97 lbs in.)
33. Install the cylinder head cover (7).

34. Install the vacuum line to the vacuum pump.
35. Install the vacuum line (2) to the camshaft cover.

36. Install injectors and injector retainer claw and washer.
37. Install the injector clamp bolts. Do not tighten at this time.
38. Loosely install the high pressure fuel lines onto the fuel injectors and the fuel rail.
39. Torque injector clamp bolts to 32.4 Nm (23.8 Ft lbs).
40. Tighten the fuel rail nuts to 24.5 Nm (18 ft. lbs).
41. Torque the fuel lines at the fuel injectors to 28 Nm (20 ft lbs.).
42. Torque the fuel lines at the fuel rail to 20 Nm (14.75 Ft lbs).
43. Install the high pressure fuel line bracket bolt and torque to 15 Nm (133 lbs. in.).

44. Connect the fuel injector harness connectors.

45. Connect the fuel return lines (1) and (2).

46. Install the idler pulley bracket (1).
 47. Install the front engine lifting bracket (2). Torque the bolts to 45 N·m (33 ft.lbs.)

48. Remove crankshaft locking tool (1).
49. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) .
50. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
51. Connect negative battery cable.

CHECKING CAMSHAFT ENDPLAY

1. After camshafts are properly installed in cylinder head cover check end play of camshafts with a dial indicator. The end play should be between 0.10 mm - 0.55 mm .

NOTE: If the camshaft endplay is not within specification, replace the cylinder head.

2. Measure the camshaft end play with a dial indicator. The end play should be between 0.15 mm 0.35 mm (0.006 in — 0.0138 in.).

COVER-CYLINDER HEAD

DESCRIPTION

The cylinder head cover and the intake manifold on this engine are made of cast aluminum. The cylinder head cover also incorporates a oil drain back hole for the crankcase ventilation (CCV) system.

REMOVAL

1. Disconnect the fuel return lines (1) and (2).

2. Disconnect the vacuum line (2) from the vacuum pump.
3. Disconnect the vacuum line (1).

4. Disconnect the crankcase vent hose from the oil separator (4).

5. Disconnect the fuel injector harness connectors from the fuel injectors (1).

6. Remove the injector fuel lines (3) from the injectors and the fuel rail.

7. Remove the fuel injectors (1).

8. Remove the twelve fasteners (8) and the cylinder head cover (7).

INSTALLATION

1. Install the upper front cover (3). Torque the bolts to 11 N·m (97 lbs in.)
2. Install a new cylinder head cover gasket, and install the cylinder head cover (7).

3. Install the vacuum line to the vacuum pump.
4. Install the vacuum line (1) to the fitting.

5. Reconnect the crankcase vent hose to the oil separator (4).

6. Install injectors and injector retainer claw and washer.
7. Install the injector clamp bolts. Do not tighten at this time.
8. Loosely install the high pressure fuel lines onto the fuel injectors and the fuel rail.
9. Torque injector clamp bolts to 32.4 Nm (23.8 Ft lbs).
10. Tighten the fuel rail nuts to 24.5 Nm (18 ft. lbs).
11. Torque the fuel lines at the fuel injectors to 28 Nm (20 ft lbs.).
12. Torque the fuel lines at the fuel rail to 20 Nm (14.75 Ft lbs).
13. Install the high pressure fuel line bracket bolt and torque to 15 Nm (133 lbs. in.).

14. Connect the fuel injector harness connectors (1).

15. Connect the fuel return lines (1) and (2).

16. Connect the battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL)
17. Install the air cleaner housing.
18. Install the upper air deflector.
19. Install the fan.

ARMS-ROCKER

DESCRIPTION

The rocker arms (1) are made of stamped steel and serviced as an assembly along with the lifter.

The rocker arms (1) are used as a link between the camshaft and valves. As the camshaft rotates, the lobes of the camshafts apply downward pressure on the rocker arms (1). This pressure is then applied to the hydraulic lifter (2) which opens the valve.

REMOVAL

CAUTION: Before removing the cylinder head cover/intake manifold (2) the engine must rotated to 90° after TDC to assure proper alignment of the engine timing components. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)

1. Disconnect negative battery cable.
2. Rotate the crankshaft to 90 degrees ATDC (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).

3. Remove the camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL)

4. Remove rocker arms (1) and lifters (2).

INSTALLATION

1. Clean and inspect gasket sealing surfaces.

2. Lubricate lifter ball end of lifter(s), valve(s), and rocker arm roller(s) with Mopar® Engine Oil Supplement or equivalent.

3. Connect rocker arm(s) to lifter and reposition on valve(s).

4. Install the camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

5. Connect negative battery cable.

LIFTERS-HYDRAULIC

DESCRIPTION

Valve lash is controlled by hydraulic tappets (2) located inside the cylinder head, in tappet bores below the camshafts.

REMOVAL

1. Remove the cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
2. Remove the camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL)

NOTE: Always return the hydraulic lifters to their original location in the cylinder head.

3. Remove the rocker arms (1) and hydraulic lifters (2).

INSPECTION

Clean each lifter assembly (1) in cleaning solvent to remove all varnish and sludge deposits. Inspect for indications of scuffing on the side and base of each lifter body.

INSTALLATION

1. Install the rocker arms (1) and hydraulic lifters (2) into their original locations.
2. Install the camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL)

BLOCK-ENGINE

DESCRIPTION

The 2.8L CRD Diesel engine uses a cast iron engine block. The cylinder block has increased stiffness that reduces structural flexing and a fractured connecting rod cap design that can not distort connecting rod cap fit.

STANDARD PROCEDURE - BEARING SELECTION CHARTS

Connecting Rod Bearings — Large End

Connecting Rod Journal Diameter — Connecting Rod Large End		Connecting Rod Journal Diameter — Crankshaft

CRANKSHAFT DESCRIPTION

The crankshaft for the 2.8L is a forged steel type design with five main bearing journals. The crankshaft is located at the bottom of the engine block.

STANDARD PROCEDURE - CHECKING CRANKSHAFT END PLAY

1. Mount a dial indicator to a stationary point at rear of engine. Locate the probe perpendicular against the flywheel.
2. Move the crankshaft all the way to the front of its travel.
3. Zero the dial indicator).
4. Move the crankshaft all the way to the rear and read dial indicator. For crankshaft end play clearances (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL - CRANKSHAFT

1. Remove the lower oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Remove the upper oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
3. Remove the balance shaft assembly (Refer to 9 - ENGINE/ENGINE BLOCK/BALANCE SHAFT MODULE - REMOVAL).
4. Remove the rear crankshaft oil seal carrier (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).
5. Remove the front cover and front crank oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - FRONT -

REMOVAL).

6. Remove the bearing caps from the piston rods.
7. Remove the bearing caps from the crankshaft journals.
8. Remove the crankshaft.

INSTALLATION

1. Use the crankshaft bearing selection chart for main bearing selection. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)

2. Lubricate and install the crankshaft bearings. Make sure the thrust washer is not touching the engine block.

3. Install the crankshaft.

4. Install the main bearing caps in the same location as they were removed. The notches on the top of the bearing caps indicate their proper position. The front cap has one notch, the next cap two, etc.

5. Using the black number bubbles in the torque pattern, torque the crankshaft bolts to 50 Nm (36 lbs. ft.)

6. Using the white number bubbles in the torque pattern, Turn the bolts an additional 90°.

7. Measure the crankshaft end play. Crankshaft end play must be between 0.1mm and 0.33mm (0.004in — 0.13in).

8. Install the connecting rod bearings.

9. Install the connecting rods. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSTALLATION)

10. Install the balance shaft assembly. (Refer to 9 - ENGINE/ENGINE BLOCK/BALANCE SHAFT MODULE - INSTALLATION)

11. Install the upper oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

12. Install the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

13. Install the front main seal carrier. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION)

14. Install the rear main seal carrier. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)

BEARINGS-CRANKSHAFT MAIN

INSTALLATION

1. Locate the crankshaft journal size (1) stamp on the crankshaft weight.

2. Locate the engine block crankshaft journal size stamp on the engine block (1).

3. Use the crankshaft stamp and engine block stamp to select the correct crankshaft bearing sizes from the bearing chart. The letters stamped into the block are in the same order as the cylinders (5). The first letter corresponds to the first

- cylinder, the second to the second, etc. (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE)
4. If the crankshaft was removed to install the bearings, install the crankshaft. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - INSTALLATION)
 5. Install the balance shaft assembly (Refer to 9 - ENGINE/ENGINE BLOCK/BALANCE SHAFT MODULE - INSTALLATION).
 6. Install the oil pan.

CRANKSHAFT OIL SEAL - FRONT REMOVAL

1. Remove the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/BELT-TIMING - REMOVAL).
2. Remove the crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

NOTE: Do not gouge or scratch the surface of the crankshaft when removing the front crankshaft oil seal.

3. Remove the front crankshaft oil seal (1).

INSTALLATION

1. Use the 9937 seal installer to install the front crankshaft oil seal (1) into the rear timing belt cover.
2. Install the crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
3. Install the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/BELT - TIMING - INSTALLATION).

SEAL-CRANKSHAFT OIL - REAR

DESCRIPTION

The rear crankshaft seal consists of a seal and a seal carrier (1). The rear seal is inserted into the carrier. Once assembled the rear main seal assembly should not be separated to reduce the possibility of damage to the internal rear seal lip.

REMOVAL

This must be done with either the engine or transmission removed from vehicle.

1. Remove flywheel assembly.
2. Pry out old crankshaft oil seal.

INSTALLATION

1. Make sure the rear main seal sealing surfaces are free of oil and debris.
2. Make sure the crankshaft sensor wheel is positioned correctly on the crankshaft.

3. Position the rear main seal carrier gasket (2).
4. Using special tool VM. 9993, install rear crankshaft oil seal into the rear main seal carrier (1).
5. Using special tool VM 9993 install the rear main seal carrier onto the engine block (3).

6. Use special tool VM9990 (1) to set the depth of the rear main seal (2).

7. Use the illustrated pattern to torque the rear cover bolts to 15 Nm (133 lbs. in.).

8. Install the upper oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
9. Install the Crankshaft Position Sensor (CKP). Torque the CKP bolt to 11 Nm (97 lbs. in.).
10. Install the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
11. Connect the CKP sensor.
12. Install engine or transmission in vehicle.

FLEX PLATE/FLYWHEEL

REMOVAL

1. Remove the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - REMOVAL).
2. Paint mark the flex plate hub to flex plate relation.
3. Remove the 40 mm flex plate bolts (1) and flex plate (2).

4. Inspect flex plate (2) for damage.

INSTALLATION

NOTE: Always use new flex plate or flywheel bolts.

1. Install the flex plate/flywheel hub and hand tighten the fasteners.

NOTE: Do not lubricate new bolts as they are already coated with an anti-scuff treatment. Align the flex plate to hub paint marks, where applicable.

2. Install the flex plate or flywheel bolts. Use a cross pattern to torque the bolts to 50 N·m (37 lbs. ft.).
 3. Loosen one flex plate/flywheel bolt at a time and tighten to 25 N·m (18 lbs. ft.).

- For 40 mm length bolts turn each bolt an additional 60°.
- For 50 mm length bolts turn each bolt an additional 75°.
- For 60 mm length bolts turn each bolt an additional 90°.

4. Install the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION).

ROD-PISTON AND CONNECTING DESCRIPTION

The pistons (2) are of a free floating design. Oil jets in the engine block lubricate and cool the piston and piston pin (3) assembly. The connecting rods (1) have a pressed in place wrist pin bushing which is lubricated by the oil jets. Connecting rod (7) and bearing caps have cracked mating surfaces and are not interchangeable.

STANDARD PROCEDURE -

PISTON RING FITTING

81abebb4

1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore. Check gap with feeler gauge. Top compression ring gap .30 to .45mm (.0118 to .0177 in.). Second compression ring gap .30 to .45mm (.0118 to .0177 in.). Oil control ring gap .25 to .50mm (.0098 to .0196 in.).
2. If ring gaps exceed dimension given, new rings or cylinder liners must be fitted. Keep piston rings in piston sets.

3. Check piston ring to groove clearance. Top compression ring gap .080 to .130mm (.0031 to .0051 in.). Second compression ring gap .070 to .110mm (.0027 to .0043 in.). Oil control ring gap .040 to .080mm (.0015 to .0031 in.).

REMOVAL

NOTE: Both the connecting rod and the connecting rod cap are paint marked to aid during assembly. Paint marks disappear after time. If the rod and the cap are not marked with paint, paint mark or scribe them before disassembly.

1. Disconnect negative battery cable.

2. Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

3. Raise vehicle on hoist.

4. Remove the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

5. Remove upper oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

6. Remove the oil jets. (Refer to 9 - ENGINE/LUBRICATION/OIL JET - REMOVAL)

7. Remove balance shaft assembly. (Refer to 9 - ENGINE/ENGINE BLOCK/BALANCE SHAFT MODULE - REMOVAL)

8. Remove top ridge of cylinder bores with a ridge reamer before removing pistons from cylinder block. **Be sure to keep top of pistons covered during this operation.**

9. Piston and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

NOTE: Be careful not to nick or scratch crankshaft journals

10. After removal, install bearing cap on the mating rod and mark pistons with matching cylinder number when removed from engine block.

PISTON PIN - REMOVAL

1. Secure connecting rods (1) in a soft jawed vice.

2. Remove 2 snap rings securing piston pin (3).

3. Push piston pin (3) out of piston (2) and connecting rod (1).

PISTON RING - REMOVAL

1. ID mark on face of top and second piston rings must point toward piston crown.
2. Using a suitable ring expander, remove top and second piston rings.
3. Remove upper oil ring side rail, lower oil ring side rail and then the oil expander from piston.
4. Carefully clean carbon from piston crowns, skirts and ring grooves ensuring the 4 oil holes in the oil control ring groove are clear.

INSPECTION

PISTONS

1. Piston Diameter: Size: 91.912-91.928mm (3.6185-3.6192 in.) Maximum wear limit .05mm (.0019 in.).
2. Check piston pin bores in piston for roundness. Make 3 checks at 120° intervals. Maximum out of roundness .05mm (.0019in.).
3. The piston diameter should be measured approximately 15 mm (.590 in.) up from the base.

4. Skirt wear should not exceed 0.1 mm (.00039 in.).
5. The clearance between the cylinder liner and piston should not exceed 0.065-0.083 mm (.0025-.0032 in.).

CONNECTING RODS

CAUTION: Connecting rod bolts must be replaced when disassembled. When assembling the connecting rod (2), be sure that the connecting rod pawl (1) on each of the connecting rod caps is facing the rear (fly wheel) side of the engine.

NOTE: Do Not lubricate the new connecting rod bolts. They are already coated with a anti scuff treatment.

1. Assemble connecting rod bearings (4) and bearing caps to their respective connecting rods (2) ensuring that the serrations on the cap and reference marks are aligned.
2. Tighten connecting cap bolts to 10 N·m (88 in. lbs.).
3. Without loosening connecting rod bolts, tighten all bolts to 30N·m (22 ft.lbs.).
4. Using a torque angle gauge, tighten each bolt an additional 40°.
5. Recheck all bolt tightening with a torque wrench set to 88N·m (65 ft.lbs.).
6. Check and record internal diameter of crank end of connecting rod (2).

CAUTION: When changing connecting rods (2), DO NOT use a stamp to mark the cylinder location. Identify the connecting rods (2) and caps location using a paint marker. All four must have the same weight and the same number. Replacement connecting rods (2) will only be supplied in sets of four.

Connecting rods (2) are supplied in sets of four since they all must be of the same weight category. Max allowable weight difference is 5 gr.

PISTON PINS

1. Measure the diameter of piston pin in the center and both ends. For specification, (Refer to 9 - ENGINE - SPECIFICATIONS), (Refer to 9 - ENGINE - SPECIFICATIONS).

INSTALLATION

PISTON PIN INSTALLATION

1. Secure connecting rod (1) in soft jawed vice.
2. Lubricate piston pin (3) and piston (2) with clean engine oil.
3. Position piston (2) on connecting rod (1).

CAUTION: Ensure arrow on piston crown and the bearing cap numbers on the connecting rod are on the opposite side.

4. Install piston pin (1).
5. Install snap ring in piston (2) to retain piston pin (3)..
6. Remove connecting rod (1) from vice.

PISTON RINGS - INSTALLATION

1. Install rings on the pistons using a suitable ring expander.

2. Top compression ring is tapered and chromium plated. The second ring is of the scraper type and must be installed with scraping edge facing bottom of the piston. The third is an oil control ring. Ring gaps must be positioned, before inserting piston into the liners, as follows.

3. Top ring gap must be positioned at the #3 position (looking at the piston crown from above).

4. Second piston ring gap should be positioned at the #1 position.

5. Oil control ring gap should be positioned at the #2 position.

6. When assembling pistons check that components are installed in the same position as before disassembly, determined by the numbers stamped on the crown of individual pistons. Engine cylinders are numbered starting from gear train end of the engine. **Face arrow on top of piston toward front of engine.** Therefore, the numbers stamped on connecting rod big end should face toward the injection pump side of engine. To insert piston into cylinder use a ring compressor as shown in.

INSTALLATION

1. Before installing pistons, and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.
2. Before installing the ring compressor, make sure the oil ring expander ends are butted together.
3. Immerse the piston head and rings in clean engine oil, slide the piston ring compressor, over the piston and tighten. **Ensure position of rings does not change during this operation.**
4. Face arrow on piston towards front of engine.

5. The connecting rod bearing size (1) is stamped on the connecting rod.

6. Compare the connecting rod diameter (1) and the crankshaft journal diameter (2) with the bearing selection chart to determine the correct bearing size for each cylinder. (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE)

NOTE: The connecting rod bolts must be replaced every time they are loosened or removed.

- 7.

CAUTION: Care must be taken not to nick crankshaft

journal when installing pistons.

8. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

9. Guide the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

10. Install connecting rod caps. Install rod bolts and torque to 10N·m (88 lbs. in.). Torque bolts the next stage to 30N·m (22 ft.lb.) plus 40°. Then with a torque wrench set at torque to 88N·m (65 ft.lb), make a tightening check.

11. Install the oil jets. (Refer to 9 - ENGINE/LUBRICATION/OIL JET - INSTALLATION)

12. Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

13. Install balance shaft assembly. (Refer to 9 - ENGINE/ENGINE BLOCK/BALANCE SHAFT MODULE - INSTALLATION)

14. Install upper oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

15. Install the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

16. Connect negative battery cable.

DAMPER-VIBRATION

REMOVAL

1. Disconnect negative battery cable.
2. Remove viscous cooling fan and shroud.
3. Remove accessory drive belt (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
4. Remove vibration damper retaining bolts (1) and damper (2).

INSTALLATION

1. Install vibration damper (2) and retaining bolts (1). Torque the bolts to 32 N·m. (23 ft.lbs.).
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Install viscous fan and fan shroud. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)
4. Connect negative battery cable.

PUMP-INTERNAL VACUUM

DESCRIPTION

The diesel engine uses a internal vacuum pump (7). This vacuum pump (7) is mounted in the engine front cover (2). The vacuum pump is driven by a sprocket (6) on the crankshaft.

REMOVAL

81b56e28

1. Remove the cooling fan module.
2. Remove the accessory drive belt.

81b4a203

3. Remove the four crankshaft damper (1) bolts and remove the crankshaft damper.

4. Remove the oil pressure relief front cover (1) bolts.

5. Remove the front cover. (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL)

6. Remove the vacuum pump from the front cover.

INSTALLATION

1. Install the vacuum pump into the front cover.

2. Install the special tool 9990 Front Cover Align Tool (1).

3. Install the front cover to the engine block (1). (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION)

4. Install the oil pressure relief valve cover (1).
5. Install the oil pressure relief valve cover bolts and tighten to 32 Nm (23 lbs. ft.).

6. Install the crankshaft damper.
7. Install and torque the crankshaft damper bolts to 32 Nm (23 lbs. ft.).

81aba764

8. Install the accessory drive belt.
9. Install the cooling fan module.

COVER-ENGINE - FRONT

DESCRIPTION

81b4a203

The oil pump cover assembly on this engine is an aluminum cover that incorporates the oil pump.

REMOVAL

81b3293d

1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) .
4. Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

81abecc7

NOTE: The crankshaft sprocket bolt is a left handed thread.

5. Remove the crankshaft sprocket (1).

6. Remove the high pressure fuel pump (4) sprocket.
7. Remove the oil pump cover assembly (1).

INSTALLATION

1. Install the oil pump gasket.
2. Install the oil pump cover assembly (1).

NOTE: The crankshaft sprocket bolt is a left handed thread.

3. Install the crankshaft sprocket (1).
4. Install the high pressure pump (4) sprocket.

5. Install the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
6. Install the cooling fan and fan drive viscous clutch assembly.
7. Install the accessory drive belt.
8. Connect negative battery cable.

BALANCE SHAFT MODULE

DESCRIPTION

The balance shaft is gear-driven and is used to counteract engine vibration and roughness. The balance shaft assembly includes balancers on two shafts. It is only serviced as an assembly. Balance shafts must be timed to the crankshaft.

REMOVAL

1. Disconnect the battery.
2. Drain the engine oil.

3. Install the TDC locking tool.

4. Remove the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

5. Remove the upper oil pan.
6. Remove the oil pickup tube.

7. Place a dowel rod through the holes in the balance shaft axles to keep the balance shafts in the correct position for reassembly.

8. Insert the balance shaft locking pin (2) into the balance shaft assembly to lock the split gears together.

WARNING: The balance shaft pin must be installed before the balance shaft assembly is removed from the engine. The balance shaft pin must always remain in the balance shaft assembly while the assembly is removed from the engine. Do not remove the balance shaft pin until the balance shaft assembly is completely installed on the engine.

9. Remove the balance shaft housing (1).

INSTALLATION

1. The balance shafts must remain aligned by the alignment dowel and the balance shaft pin must remain in the balance shaft assembly until the assembly is completely installed to the engine.

2. The balance shaft pin should never be removed from the balance shaft assembly when the balance shaft assembly is not installed in the engine. If the balance shaft was removed from the vehicle without the pin, or the pin was removed, use the dowel to load the spring while pressing the tool into place as shown.

3. Install the balance shaft housing (1).

4. Use torque sequence in the graphic to torque the balance shaft bolts to 33 Nm (24 lbs. ft.).
5. Remove the balance shaft assembly dowel and the balance shaft pin.

6. Install the upper oil pan gasket.

7. Install the oil pickup tube.
8. Install the upper oil pan.

9. Use the illustrated torque sequence and torque the M6 bolts to 15 Nm (132 lbs. in.).
10. Install the upper oil pan bolts in positions one and two, then follow the sequence illustrated for the remaining bolts. Once all of the bolts are installed, tighten the M6 bolts to 15 Nm (133 lbs. in.) and M8 bolts to 32 Nm (23 lbs ft.).
11. Loosen all of the upper oil pan bolts and studs by 90 degrees and retighten the M6 bolts to 15 Nm (133 lbs. in.) and M8 bolts to 32 Nm (23 lbs ft.).

12. Install bolts 1 and 2 into the lower oil pan and torque to 15 Nm (133 lbs. in.).
13. Install the remaining bolts in the sequence illustrated.
14. Torque the oil pan bolts in sequence to 15 Nm (133 lbs. in.).
15. Loosen each bolt 90° and use the illustrated sequence to torque the bolts to 15 Nm (133 lbs. in.).

16. Fill the engine oil.
17. Remove the TDC locking tool.
18. Reconnect the battery.

TRANSMISSION ADAPTER PLATE

DESCRIPTION

The transmission plate adapter is the component that allows the transmission to be bolted to the engine.

REMOVAL

1. Remove the transmission from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - REMOVAL)

2. Remove the flex plate or flywheel. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - REMOVAL)

NOTE: Do not use any magnetic tools near the crankshaft tone ring.

3. Remove the flex plate adapter bolts.

INSTALLATION

NOTE: Do not use any magnetic tools near the crankshaft tone ring.

1. Install the flex plate adapter.
2. Install the flex plate adapter hex head bolts and tighten to 45 nm (ft. lbs.)
3. Install the flex plate torx head bolts and tighten to 78 nm (ft. lbs.)
4. Install the flex plate or flywheel. (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - INSTALLATION)

5. Install the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION)

MOUNT-LEFT ENGINE

REMOVAL

1. Disconnect the negative battery cable. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL)
2. Install the engine lift fixture.
3. Support the engine with the lift fixture.

4. Remove the left front tire. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE)
5. Remove the inner fender. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL)
6. Remove the engine mount.

INSTALLATION

1. Position the engine mount and hand tighten the retaining bolts.
2. Lower the engine mount and through bolts into the engine mount support.
3. Lower the vehicle.
4. Install the left upper engine mount bolt. Tighten bolt to 54 N·m (40 lbs. ft.)
5. Raise and support the vehicle.
6. Tighten remaining mount to engine bolts to 54 N·m (40 lbs. ft.)
7. Tighten engine mount through bolts to 54 N·m (40 lbs. ft.)

8. Lower the vehicle.
9. Install the left inner fender. (Refer to 23 -

BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - INSTALLATION)

10. Install the left front wheel. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE)
11. Remove the engine support.
12. Connect the negative battery cable. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION)

RIGHT ENGINE MOUNT

REMOVAL

1. Disconnect the negative battery cable. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL)
2. Loosen the upper engine mount fastener at the engine mount bracket

3. Raise and support the vehicle.
4. Loosen the lower engine mount fastener.
5. Install the engine support and support the engine.
6. Remove the engine mount bolts and engine mount.

INSTALLATION

1. Position the engine mount and install the engine mount bolts. Tighten bolts to 54 N·m (40 lbs. ft.).
2. Lower the engine and remove the engine support.
3. Tighten the engine mount through bolts to 54 N·m (40 lbs. ft.).
4. Lower the vehicle.
5. Connect the negative battery cable. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION)

OIL

DESCRIPTION

Refer to the Lube and Maintenance section for oil specifications (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

ADAPTER-OIL FILTER

DESCRIPTION

An oil filter adapter is used on this vehicle to relocate the oil filter for easier access when servicing.

REMOVAL

1. Disconnect the battery.
2. Drain the engine oil.
3. Remove the oil filter housing adapter cap (2).
4. Remove the oil filter (1).

INSTALLATION

1. Install the oil filter (1).
2. Install the oil filter housing adapter cap (2).
3. Tighten to 25 Nm (18 ft. lbs.).
4. Fill the engine oil.
5. Connect the battery.

OIL COOLER & LINES

DESCRIPTION

81ad6265

1. The engine oil cooler, located on the right side of the engine, is an oil to coolant cooler.

REMOVAL

81abeb60

1. Disconnect the battery.
2. Drain the engine oil.
3. Remove the upper (2) and lower (3) dipstick bolts and remove the dipstick (1).

4. Remove the oil filter.

5. Disconnect the engine oil coolant line (1).

6. Remove the oil cooler.

INSTALLATION

1. Install the oil cooler.

2. Connect the engine oil coolant line (1).

3. Install the oil filter.

4. Install the dipstick (1).
5. Connect the battery.
6. Fill the engine oil.

PAN-OIL

REMOVAL

UPPER OIL PAN

1. Disconnect the battery.
2. Drain the engine oil.
3. Remove the lower oil pan.

4. Remove the oil pickup tube bolt.
5. Remove the upper oil pan.

LOWER OIL PAN

1. Disconnect the battery.
2. Drain the engine oil.
3. Remove the lower oil pan (1) bolts.

INSTALLATION

UPPER OIL PAN

1. Lubricate the oil pickup tube O-ring.
2. Install the oil pickup tube. Torque the bolt to 15 Nm (133 lbs. in.).

3. Install the upper oil pan gasket.

81abeda6

4. Install the upper oil pan gasket.
5. Install the upper oil pan bolts in positions one and two, then follow the sequence illustrated for the remaining bolts. Once all of the bolts are installed, tighten the M6 bolts to 15 Nm (133 lbs. in.) and M8 bolts to 32 Nm (23 lbs ft.).
6. Loosen all of the upper oil pan bolts and studs by 90 degrees and retighten the M6 bolts to 15 Nm (133 lbs. in.) and M8 bolts to 32 Nm (23 lbs ft.).

8199b3b6

7. Install the lower oil pan gasket.

8. Install bolts one and two into the lower oil pan, then follow the sequence for the remaining bolts.
9. Torque the oil pan bolts in sequence to 15 Nm (133 lbs. in.).
10. Loosen the oil pan bolts 90°.
11. Torque the oil pan bolts in sequence to 15 Nm (133 lbs. in.).
12. Refill engine oil to proper level.

13. Connect the crankshaft position sensor (CKP).
14. Connect negative battery cable.

LOWER OIL PAN

1. Make sure that the lower oil pan sealing surface is free of oil, debris and silicone.
2. Apply a 1/8 bead of silicone gasket to the lower oil pan (1) sealing surface.

3. Install bolts 1 and 2 into the lower oil pan and torque to 15 Nm (133 lbs. in.).
4. Install the remaining bolts in the sequence illustrated.
5. Torque the oil pan bolts in sequence to 15 Nm (133 lbs. in.).
6. Loosen each bolt 90° and use the illustrated sequence to torque the bolts to 15 Nm (133 lbs. in.).
7. Refill engine oil to proper level.

UNIT-OIL PRESSURE SENDING

DESCRIPTION

The oil pressure sending unit uses three circuits. They are:

- A signal circuit to the ECM.
- A sensor ground circuit through the ECM.
- A 5 volt reference circuit from the ECM.

The oil pressure sending unit returns a voltage signal back to the ECM relating oil pressure. Ground for the sensor is supplied by the ECM.

The oil pressure switch (1) is located on the right side of the engine block. The switch screws into the engines main oil gallery.

PUMP-OIL

REMOVAL

REMOVAL - OIL PUMP PICKUP TUBE

1. Drain the oil.
2. Disconnect negative battery cable. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL)
3. Raise vehicle on hoist.
4. Remove the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

81aba76b

5. Remove the upper oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
6. Remove oil pump pickup tube retaining bolt and pull pickup tube from engine block. Discard O-rings.

REMOVAL - OIL PUMP

81abeb6e

1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) .
3. Remove the front cover. (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL)
4. Remove the oil pump (5) from the front cover (2).

INSTALLATION

INSTALLATION - OIL PUMP

PICKUP TUBE

1. Lubricate o-ring on oil pump pickup tube with engine oil.
2. Install pickup tube in engine block and install retaining bolt. Torque bolt to 32.4N·m. (24 ft.lbs.).
3. Install the upper oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

4. Install the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)
5. Refill engine oil to proper level.
6. Connect negative battery cable (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - INSTALLATION).

INSTALLATION - OIL PUMP

1. Make sure that the gasket surfaces are free of oil and debris.
2. Lubricate oil pump rotor with engine oil.
3. Install the oil pump gasket.
4. Install front cover assembly (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).

JET-OIL

DESCRIPTION

There are four oil jets installed in the engine block. These oil jets are used to cool and lubricate the piston assemblies.

REMOVAL

81abeb67

CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage. Care must be taken not to damage the crankshaft tone ring when removing cylinder number four oil jet.

NOTE: To prevent damage to the oil jets, remove the oil jets before removing the pistons.

1. Disconnect negative battery cable.
2. Raise vehicle on hoist.
3. Remove the lower oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
4. Remove the oil pickup tube.
5. Remove the upper oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
6. Remove the balance shaft assembly.
7. Remove the oil jet.

81abeb67

INSTALLATION

CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage.

1. Lubricate o-ring on oil jet.
2. Install oil jet retaining bolt. Torque bolt to 10.8N·m.(96 in.lbs.).

3. Install the balance shaft assembly.

4. Lubricate the oil pickup tube oring before installation.
5. Install the oil pickup tube and torque the bolt to 15 Nm (12 lbs.ft).

6. Install the upper oil pan gasket.
7. Install the upper oil pan bolts in positions one and two, then follow the sequence illustrated for the remaining bolts. Once all of the bolts are installed, torque the m6 bolts to 15 Nm (133 lbs. in.) and M8 bolts to 32 Nm (23 lbs ft.).

8. Install the lower oil pan gasket.

81aba76b

9. Install bolts one and two into the lower oil pan, then follow the sequence for the remaining bolts.
10. Torque the oil pan bolts in sequence to 15 Nm (133 lbs. in.).
11. Turn each bolt an additional 90°.
12. Refill engine oil to proper level.

81b0d865

13. Connect the crankshaft position sensor (CKP).
14. Connect negative battery cable.

SEPARATOR-OIL

REMOVAL

1. Remove the engine cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

NOTE: Inspect the oil drain back access hole in the intake manifold/cylinder head cover to assure that it is free of obstruction.

2. Remove the oil separator fasteners and oil separator (4).

INSTALLATION

NOTE: Inspect the oil drain back access hole in the intake manifold/cylinder head cover to assure that it is free of obstruction.

1. Lubricate the oil separator o-rings with clean engine oil.
2. Carefully position and push down on the oil separator to seat.
3. Install the oil separator retaining fasteners. Tighten fasteners to 10.8 N·m (96 lbs. in.).
4. Install the camshaft cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

OIL PRESSURE RELIEF VALVE

DESCRIPTION

The oil pressure relief valve is built into the front cover (1). The oil pressure relief valve assembly (2) consists of several components. The plunger (4) is held in place by the spring (5). The plug (6) keeps the plug and spring in place, and the o-ring (7) prevents oil from leaking past the plug (6).

In the case of excessively high oil pressure, the oil pressure on the piston (4) overcomes the spring (5) pressure and the piston is forced off its seat. When the piston is forced off its seat, a drain back passage is opened and the excess oil pressure is vented back into the crankcase.

MANIFOLD-INTAKE

REMOVAL

1. Remove the engine cover.
2. Disconnect the battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL)
3. Remove the silencer.
4. Drain the coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE)
5. Remove the upper radiator hose.

6. Disconnect the generator connector (4).
7. Remove the battery feed wire from the generator (3).
8. Remove the generator bolts (1), and remove the generator.

9. Remove the generator brace (1).

10. Remove the high pressure fuel line from the fuel rail.

11. Remove the fuel lines (3).
12. Remove the fuel rail (6)..

13. Disconnect the glow plug connectors.

- 14. Disconnect the fuel return lines (1).
- 15. Remove the fuel return line junction block.

16. Remove the heater hoses (1) from the engine block.

17. Remove the EGR cooler.

18. Remove the thermostat housing (3).

19. Remove the coolant hose from the water pump.
20. Disconnect the coolant temperature sensor.

21. Remove the front engine lift bracket (2).
22. Remove the cooling fan and idler pulley assembly (1).
23. Remove the fuel filter lines.
24. Remove the fuel filter.

25. Remove the intake manifold.

26. Remove the intake manifold gasket (2).

INSTALLATION

1. Clean and inspect the gasket surface of the intake manifold.
2. Clean and inspect the gasket surface of the cylinder head.
3. Install the intake manifold gasket (2).

4. Install the intake manifold.
5. Using the torque sequence in the illustration, torque the intake manifold bolts to 25 nm (18.4 ft. lbs.).

81adb13b

6. Install the front engine lift bracket (2).
7. Install the cooling fan and idler pulley assembly (1).
8. Install the fuel filter.
9. Install the fuel filter lines.

81dcb3a7

10. Connect the glow plug connectors.

11. Install the EGR cooler.

- 12. Install the fuel return line junction block.
- 13. Connect the fuel return lines (1).

14. Install the heater hoses (1).

- 15. Install the coolant hose to the water pump.
- 16. Install the cooling lines to the water pump outlet.
- 17. Connect the coolant temperature sensor.

18. Install the thermostat housing (3).
19. Install the coolant lines to the thermostat housing.

20. Install the fuel rail (6).
21. Install the fuel lines (3).

22. Install the generator brace (1).
23. Install the high pressure fuel line (2) to the fuel rail.

- 24. Install the generator.
- 25. Connect the generator connector (4).
- 26. Install the battery feed wire to the generator (3).

- 27. Remove the upper radiator hose.
- 28. Fill the coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- 29. Install the silencer.
- 30. Connect the battery. (Refer to 7 - COOLING - STANDARD PROCEDURE)
- 31. Install the engine cover.

MANIFOLD-EXHAUST

REMOVAL

818254bd

1. Remove the engine cover (2).
2. Remove the silencer.
3. Remove the air cleaner housing (1).

81a9dd39

4. Disconnect the inlet temperature sensor connector.
5. Remove the inlet air tube from the turbocharger.

6. Remove the air conditioning bracket bolt.

7. Remove the bolts from the exhaust manifold heat shield.
8. Remove the exhaust manifold heat shield.

9. Disconnect the turbocharger module connector.
10. Remove the right front tire.
11. Remove the right front inner fender well.

12. Remove the bolts from the downstream flange of the turbocharger.
13. Remove the bolts from the turbocharger to engine bracket.
14. Remove the bolts from the upstream side of the muffler.
15. Remove the forward diesel particulate filter pressure tube.
16. Remove the bolts from the bottom of the maniverter.
17. Remove the diesel particulate filter.

18. Remove the turbocharger to exhaust manifold bolts.
19. Remove the turbocharger oil lines.

20. Remove the exhaust manifold.

INSTALLATION

81a9782c

1. Clean the exhaust manifold surface and remove all debris.
2. Install a new exhaust manifold gasket.
3. Install the exhaust manifold.
4. Torque the following the correct exhaust manifold sequence torque the exhaust manifold nuts to 36 N.m (25.8 lbs. ft.).
5. Repeat the tightening procedure at the same torque.

81ad7d48

6. Install the turbocharger oil lines.

7. Install the turbocharger (1) to exhaust manifold bolts.

- 8. Install the diesel particulate filter.
- 9. Install the bolts from the bottom of the maniverter.
- 10. Install the forward diesel particulate filter pressure tube.
- 11. Install the bolts from the upstream side of the muffler.
- 12. Install the bolts from the turbocharger to engine bracket.

13. Install the bolts from the downstream flange of the turbocharger.

14. Connect the turbocharger module connector.

15. Install the air conditioning bracket bolt.

16. Install the exhaust manifold heat shield.
17. Install the bolts from the exhaust manifold heat shield.

18. Install the inlet air tube from the turbocharger.
19. Install the air cleaner housing.
20. Install the silencer.
21. Install the engine cover.

VALVE TIMING

STANDARD PROCEDURE - LOCKING ENGINE 90 DEGREES AFTER TDC

1. Disconnect negative battery cable.
2. Remove the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

3. Remove the front lifting bracket (2).
4. Remove the Idler pulley bracket.

5. Disconnect the camshaft position sensor harness connector, and remove the camshaft position sensor (5).
6. Remove the upper (4) and lower (2) front covers.

7. Rotate the engine until the 90° ATDC marks on the crankshaft timing belt drive sprocket and timing belt cover are aligned.

8. Install the VM 9892 Crankshaft locking tool into the left side of the engine block, slightly rearward of the left engine mount. Make sure that the outer portion of the tool threads into the block and the bolt threads into the crankshaft. If the bolt does not thread into the crankshaft, the crankshaft is not at 90° ATDC. If necessary, realign the 90° ATDC marks on the crankshaft timing belt drive sprocket and timing belt cover.

9. Remove the camshaft cap (1) to expose the camshaft reluctor.

10. Make a mark (2) across the CMP reluctor wheel (1) and the exhaust camshaft (3). This mark is to verify that the CMP reluctor wheel did not rotate on the camshaft during assembly.

11. Install the camshaft locking tool onto the camshaft position sensor tone wheel.

NOTE: 90° after TDC pin must be installed.

12. The camshafts and crankshaft are now locked in the 90° ATDC position.

NOTE: If it is suspected that the camshafts are not correctly timed to each other, the valve cover must be removed to allow the verification of camshaft timing. When the dots on the back of the camshafts are lined up, the camshafts are correctly timed to each other. The engine is NOT timed to 90° ATDC with the camshaft dots lined up. Use the camshaft timing tool to set the camshafts to 90° ATDC.

NOTE: When the camshafts are correctly timed to each other and turned to 90° ATDC, the camshaft marks are positioned as shown in the illustration to the right.

COVER(S)-TIMING BELT AND CHAIN

REMOVAL

REMOVAL - TIMING BELT INNER

COVER

1. Disconnect the battery.
2. Remove the accessory drive belt.
3. Remove the upper and lower outer front covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)
4. Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/BELT-TIMING - REMOVAL).

REMOVAL - UPPER AND LOWER TIMING BELT OUTER COVERS

1. Disconnect negative battery cable.
2. Disconnect the CMP sensor (1).
3. Remove the upper front cover (2).

4. Remove the accessory drive belt.
5. Remove the front engine lift bracket (2).
6. Remove the accessory drive idler pulley bracket (1).

7. Remove the bolts (1) and the crankshaft damper (2).

8. Remove the lower front cover (2).

INSTALLATION

INSTALLATION - TIMING BELT INNER COVER

1. Install the inner front cover. Torque the bolts to 11 Nm (97 lbs. in.).
2. Install the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/BELT-TIMING - INSTALLATION).
3. Install the upper and lower outer front covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)
4. Connect negative battery cable.

INSTALLATION - UPPER AND LOWER OUTER TIMING BELT COVERS

1. Install the lower front cover (2). Torque the bolts to 11 Nm (97 lbs. in.).

2. Install the crankshaft damper (1). Torque the bolts to 32 Nm (23 lbs. in.).

3. Install the upper front cover (2). Torque the bolts to 11 Nm (97 lbs. in.).
4. Install the CMP sensor. Torque the bolt to bolt to 11 Nm (97 lbs. in.).
5. Connect the CMP sensor (1).

6. Install the accessory drive idler pulley bracket. Torque the bolts to 45 Nm (33 Lbs. ft.)
7. Install the front engine lift bracket (2). Torque the bolts to 45 Nm (33 Lbs. ft.)
8. Install the accessory drive belt.
9. Connect negative battery cable.

SPROCKET(S)-TIMING BELT AND CHAIN

REMOVAL

1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
3. Remove the front engine lifting bracket (2) and pulley assembly (1).

4. Loosen the accessory drive belt tension by rotating the accessory drive belt tensioner until holes 3 and 4 are lined up.

5. When the holes in the accessory drive belt tensioner are aligned, use a drift to lock the tensioner in place.

6. Remove the accessory drive belt.

CAUTION: BEFORE REMOVING THE TIMING BELT, THE ENGINE MUST BE PLACED AT 90° AFTER TDC. FAILURE TO DO SO MAY RESULT IN VALVE AND/OR PISTON DAMAGE DURING ASSEMBLY.

7. Remove the 4 bolts from the vibration damper (1).
8. Remove the vibration damper (1).
9. Unscrew the lower front cover bolts. The lower front cover bolts remain in the lower front cover.
10. Remove the lower front cover (2).

11. Bring piston #1 to 90° ATDC by turning crankshaft clockwise until the mark on the crankshaft lines up with the mark on the front cover.

12. Remove the plug for the crankshaft locking tool. The crankshaft locking tool is installed in the left side of the engine slightly rearward of the engine mount.

13. Install the crankshaft locking tool (1) into the engine block. Make sure that the crankshaft locking tool body is threaded into the engine block and the bolt is threaded into the crankshaft.

- 14. Disconnect the CMP sensor (1).
- 15. Remove the CMP sensor bolt.
- 16. Remove the CMP (1) sensor.
- 17. Remove the upper front cover (2).

18. Remove the exhaust camshaft seal (1) from the cylinder head.

19. Use a paint pen to mark the location of the reluctor wheel (1) on the camshaft (2).

20. Install the camshaft locking tool on the exhaust camshaft.

21. Use VM 1055 to hold the intake camshaft sprocket.

22. Remove the bolt from the intake camshaft sprocket.

81b4a227

- 23. Loosen timing belt tensioner and remove timing belt.
- 24. Remove the camshaft sprocket bolt.
- 25. Remove the camshaft sprocket.

NOTE: The crankshaft sprocket is a left handed thread.

- 26. Remove the crankshaft sprocket bolt.
- 27. Remove the crankshaft sprocket.

INSTALLATION

81abec7

- 1. Install VM 1055 on the intake camshaft sprocket.
- 2. Using VM 1055 to secure the camshaft sprocket, torque the camshaft sprocket (2) bolt to 64 N·m (47 ft.lbs.).

81b4a227

3. Install the inner front cover. Torque the bolts to 11 Nm (97 lbs. in.).

81aba73a

NOTE: The crankshaft sprocket bolt is a left handed thread.

4. Install the crankshaft sprocket.
5. Install the crankshaft sprocket bolt. Torque the crankshaft sprocket bolt to 100 Nm (74 lbs. ft.) + 120 degrees.
6. Install the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/BELT-TIMING - INSTALLATION).
7. Install the lower front cover. Torque the bolts to 11 N·m (97 in. lbs.)
8. Install the crankshaft damper. Torque the bolts to 32 Nm

(23 lbs. ft.).

9. Install the upper front cover (2). Torque the bolts to 11 N·m (97 in. lbs.)
10. Install the camshaft position sensor. Torque the bolt to 11 Nm (97 lbs. in.).
11. Connect the CMP sensor.

12. Install the accessory drive idler pulley bracket (1). Torque the bolts to 45 Nm (33 Lbs. ft.)
13. Install the front engine lift bracket (2). Torque the bolts to 45 Nm (33 Lbs. ft.)

14. Remove crankshaft locking tool (1).

15. Install the accessory drive belt.

16. Remove the drift (2) from the accessory drive tensioner (1).
17. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION) .
18. Connect negative battery cable.

TENSIONER AND PULLEY- TIMING BELT AND CHAIN

REMOVAL

1. Disconnect negative battery cable.
2. Remove the radiator cooling fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
3. Remove the accessory drive belt.

4. Rotate the engine until the VM 9992 Crankshaft locking tool (1) can be installed. Install the VM 9992 Crankshaft locking tool (1) into the left side of the engine block, slightly rearward of the left engine mount. Make sure that the outer portion of the tool threads into the block and the bolt threads into the crankshaft. If the Crankshaft locking tool (1) does not thread into the crankshaft, the crankshaft is not at 90° ATDC.

5. Remove the front lifting bracket (2).
6. Remove the Idler pulley bracket (1).

7. Remove the CMP sensor (1).
8. Remove the upper front cover (2).

9. Remove the camshaft cap (1) to expose the camshaft reluctor.

10. Install the camshaft locking tool onto the camshaft position sensor reluctor.
11. The crankshaft and camshafts are now locked at 90° ATDC.

12. Remove the crankshaft damper (1).
13. Remove the lower front cover (2).

14. Remove the timing belt tensioner bolt, and the timing belt tensioner.

INSTALLATION

1. Return piston #1 to 90° ATDC, and align the crankshaft timing marks.

2. Reinstall the crankshaft locking tool (1).
3. Make sure that the timing dimples on the back of the camshaft gears are lined up horizontally.

NOTE: The engine is not in time with the camshaft dots facing each other. The camshafts are set so that the dots face each other and then rotated until the camshaft locking tool can be bolted to the cylinder head. The camshaft locking tool properly positions the camshafts at 90° ATDC. The dots on the camshafts are used during assembly to quickly orient the camshafts so that the camshaft locking tool can be installed.

4. Turn the camshafts so that the 90° ATDC camshaft tool can be correctly installed.

5. Make a mark (2) across the CMP retractor wheel (1) and the exhaust camshaft (3). This mark will be used to verify that the CMP retractor wheel did not rotate on the camshaft during assembly.

6. Install the camshaft locking tool (1).

7. Verify the high pressure fuel pump sprocket timing mark (2) is aligned with the timing mark (3) on the block.

8. Install the timing belt tensioner (3). Do not tighten at this time. Verify that the slot in the tensioner alignment plate (1) is aligned with the boss (2) in the rear timing belt cover.

9. Turn the timing belt tensioner (1) clockwise to unload the tensioner enough for the timing belt to be installed over the tensioner pulley.

NOTE: DO NOT remove the timing belt from the package until it is going to be installed. DO NOT expose timing belt to oil, grease or water contamination. DO NOT crimp belt at a sharp angle. DO NOT clean belt, pulleys or tensioner with solvent. Check that pulleys and bearings are not seized or damaged before installing belt.

10. If the timing belt was removed from the sprockets, install the timing belt on the components in the following order. Otherwise, go to [STEP 11](#).

- Crankshaft sprocket (1).
- High pressure fuel pump (2).
- Water pump pulley (3).
- Intake camshaft pulley (4).
- Timing belt tensioner (5).

11. Adjust timing belt tensioner by lining up the arrow and the notch as illustrated.

12. Verify the tensioner load indicator (1) is centered in the tensioner load gage (2).

13. Tighten the timing belt tensioner bolt to 28 Nm (21 lb ft).

14. Verify the tensioner load indicator (1) is still centered in the tensioner load gage (2). If the indicator is not centered

in the gage as shown, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).

15. Remove the camshaft locking tool (1).

16. Verify that the reluctor wheel (1) has not moved on the camshaft. If the witness marks are not aligned, the reluctor wheel (1) has spun on the camshaft (3) during the assembly process, and the exhaust camshaft must be replaced.

17. Use VM 1057-2 seal installer to install the exhaust cam cap.

18. Install the lower front cover (2). torque the bolts (1) to 11 Nm (97 lbs. in.).

19. Install the upper front cover (4). torque the bolts (3) to 11 Nm (97 lbs. in.).

NOTE: The crankshaft sprocket bolt is a L.H. thread.

20. Install the crankshaft damper (2). Torque the bolts (1) to 32 Nm (23 lbs. ft.).

21. Install the idler pulley bracket (1) and torque the bolts to 45 Nm (33 lbs. ft.).
22. Install the front engine lifting bracket (2) and torque the bolts to 45 Nm (33 lbs. ft.).

23. Install the cam position sensor (3). Torque the cam position sensor bolt (1) to 11 Nm (97 lbs. in.).
24. Connect the cam position sensor harness connector.

25. Install the vacuum line to the vacuum pump.
26. Install the vacuum line (2) to the camshaft cover.
27. Position the glow plug harness (10) and connect the glow plug harness connectors.

28. Install injectors (1) and injector retainer claw and washer.

29. Install the injector clamp bolts. Do not tighten at this time.

30. Install the fuel rail (5). Do not tighten fuel rail retainers at this time.

NOTE: High pressure fuel lines must be replaced with new lines any time they are removed.

31. Loosely install the high pressure fuel lines onto the fuel injectors and the fuel rail.

32. Torque injector clamp bolts to 32.4 Nm (23.8 Ft lbs).

33. Tighten the fuel rail nuts to 24.5 Nm (18 ft. lbs).

34. Torque the fuel lines at the fuel injectors to 28 Nm (20 ft lbs.).

35. Torque the fuel lines to at the fuel rail to 20 Nm (14.75 Ft lbs).

36. Install the high pressure fuel line bracket bolt and torque to 15 Nm (133 lbs. in.).

37. Connect the fuel injector harness connectors (1).

38. Install the accessory drive belt.

39. Install the intake air housing.

40. Connect the battery.

ADJUSTMENTS

ADJUSTMENT - TIMING BELT TENSIONER

1. With the upper and lower front covers removed and the timing belt installed, loosen timing belt tensioner.

2. Align timing belt tensioner pointer so that it is centered in the notch and torque timing belt tensioner retaining bolt to 28 Nm (21 lb ft).

3. Rotate engine 2 complete revolutions and then recheck tensioner alignment. Verify that the tension indicator (1) is centered in the slot on the tensioner gage (2) slot as shown. Readjust tensioner alignment as necessary.

BELT-TIMING

REMOVAL

1. Disconnect the battery.
2. Remove the accessory drive belt.
3. Remove the intake air housing.

4. Disconnect the fuel return lines (1) and (2).

5. Disconnect the high pressure fuel line (2).
6. Remove the injector fuel lines (3) from the injectors and the fuel rail.

7. Disconnect the vacuum line (2) from the vacuum pump.
8. Disconnect the vacuum line (1).

9. Disconnect the fuel injector harness connectors (1) from the fuel injectors.

10. Remove the fuel injectors (1).

11. Disconnect the Camshaft Position Sensor (CMP) harness connector.
12. Remove the camshaft position sensor (3).

13. Remove the front engine lifting bracket (2).
14. Remove the idler pulley and cooling fan pulley bracket assembly (1).

15. Remove the five bolts (3) and the upper front timing belt cover (4).
16. Remove the twelve fasteners (8) and the cylinder head cover (7).

NOTE: The crankshaft sprocket bolt is a L.H. thread.

17. Remove the crankshaft damper bolts (1), and the crankshaft damper (2).

18. Remove the nine fasteners (1), and lower front cover (2).

19. Rotate the engine by hand until the crankshaft 90° ATDC marks are aligned.

20. Verify the camshaft timing alignment holes on the camshaft gears are aligned horizontally.

21. Install the crankshaft locking tool VM 9992 (1).

22. Remove the exhaust camshaft oil seal (1).

23. Install the camshaft locking tool VM 9991 (1).

24. Loosen the timing belt tensioner bolt, and remove the timing belt.

INSTALLATION

1. Return piston #1 to 90° ATDC, and align the crankshaft timing marks.

2. Reinstall the crankshaft locking tool (1).
3. Make sure that the timing dimples on the back of the camshaft gears are lined up horizontally.

NOTE: The engine is not in time with the camshaft dots facing each other. The camshafts are set so that the dots face each other and then rotated until the camshaft locking tool can be bolted to the cylinder head. The camshaft locking tool properly positions the camshafts at 90° ATDC. The dots on the camshafts are used during

assembly to quickly orient the camshafts so that the camshaft locking tool can be installed.

4. If necessary, turn the camshafts so that the 90° ATDC camshaft tool can be correctly installed.

5. Make a mark (2) across the CMP reluctor wheel (1) and the exhaust camshaft (3). This mark will be used to verify that the CMP reluctor wheel did not rotate on the camshaft during assembly.

6. Install the camshaft locking tool (1).

7. Align the high pressure fuel pump sprocket timing mark (2) with the timing mark (3) on the block.

8. Install the timing belt tensioner (3). Do not tighten at this time. Verify that the slot in the tensioner alignment plate (1) is aligned with the boss (2) in the rear timing belt cover.

9. Turn the timing belt tensioner (1) clockwise to unload the tensioner enough for the timing belt to be installed.

NOTE: DO NOT remove the timing belt from the package until it is going to be installed. DO NOT expose timing belt to oil, grease or water contamination. DO NOT crimp belt at a sharp angle. DO NOT clean belt, pulleys or tensioner with solvent. Check that pulleys and bearings are not seized or damaged before installing belt.

10. Install the timing belt on the components in the following order.

- Crankshaft sprocket (1).
- High pressure fuel pump (2).
- Water pump pulley (3).
- Intake camshaft pulley (4).
- Timing belt tensioner (5).

11. Adjust timing belt tensioner by lining up the arrow and the notch as illustrated.

12. Verify the tensioner load indicator (1) is centered in the tensioner load gage (2).

13. Tighten the timing belt tensioner bolt to 28 Nm (21 lb ft).

14. Verify the tensioner load indicator (1) is still centered in the tensioner load gage (2). If the indicator is not centered

in the gage as shown, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).

15. Remove the camshaft locking tool (1).

16. Verify that the reluctor wheel (1) has not moved on the camshaft. If the witness marks are not aligned, the reluctor wheel (1) has spun on the camshaft (3) during the assembly process, and the exhaust camshaft must be replaced.

17. Use VM 1057-2 seal installer to install the exhaust cam cap.

18. Install the lower front cover (2). Torque the bolts (1) to 11 Nm (97 lbs. in.).

19. Install the upper front cover (4). Torque the bolts (3) to 11 Nm (97 lbs. in.).

20. Install the the cylinder head cover (7) and the twelve fasteners (8). Torque the bolts (1) to 11 Nm (97 lbs. in.).

NOTE: The crankshaft sprocket bolt is a L.H. thread.

21. Install the crankshaft damper (2). Torque the bolts (1) to 32 Nm (23 lbs. ft.).

22. Install the idler pulley bracket (1) and torque the bolts to 45 Nm (33 lbs. ft.).
23. Install the front engine lifting bracket (2) and torque the bolts to 45 Nm (33 lbs. ft.).

24. Install the cam position sensor (3). Torque the cam position sensor bolt (1) to 11 Nm (97 lbs. in.).
25. Connect the cam position sensor harness connector.

26. Install the vacuum line to the vacuum pump.
27. Install the vacuum line (2) to the camshaft cover.
28. Position the glow plug harness (10) and connect the glow plug harness connectors.

29. Install injectors (1) and injector retainer claw and washer.

30. Install the injector clamp bolts. Do not tighten at this time.

31. Install the fuel rail (5). Do not tighten fuel lines and retainers at this time.

NOTE: High pressure fuel lines must be replaced with new lines any time they are removed.

32. Loosely install the high pressure fuel lines onto the fuel injectors and the fuel rail.

33. Torque injector clamp bolts to 32.4 Nm (23.8 Ft lbs).

34. Tighten the fuel rail nuts to 24.5 Nm (18 ft. lbs).

35. Torque the fuel lines at the fuel injectors to 28 Nm (20 ft lbs.).

36. Torque the fuel lines to at the fuel rail to 20 Nm (14.75 Ft lbs).

37. Install the high pressure fuel line bracket bolt and torque to 15 Nm (133 lbs. in.).

38. Connect the fuel injector harness connectors (1).

39. Install the accessory drive belt.

40. Install the intake air housing.

41. Connect the battery.

HOUSING-AIR CLEANER

REMOVAL

1. Disconnect the IAT sensor.
2. Remove the intake air housing.

INSTALLATION

1. Install the intake air housing.
2. Install the air cleaner element.
3. Connect the IAT sensor.

11 - EXHAUST SYSTEM

EXHAUST SYSTEM

DESCRIPTION

GAS ENGINES

EXHAUST SYSTEM - TYPICAL - GAS ENGINES

1 - EXHAUST FLANGE
2 - CATALYTIC CONVERTER
3 - FRONT EXHAUST PIPE ASSY-TO-MUFFLER FLANGE
4 - MUFFLER
5 - INSULATOR

The basic exhaust system consists of a exhaust pipe assembly with catalytic converters (2), muffler (4) and tailpipe assembly and heat shields.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. Minimum clearance

between any exhaust component and the body or frame is 25 mm (1.0 in.). If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or equivalent). This will assure proper engine function and system alignment.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

2.8L DIESEL

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, EGR valve with intercooler, front exhaust pipe with catalytic converter, muffler and tailpipe assembly.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. The exhaust components should be kept a minimum of 25.4 mm (1.0 in.) away from the body and frame. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

DIAGNOSIS AND TESTING

GAS ENGINE

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten clamps/bolts to specified torque at leaking joints.
	2. Rusted or blown out muffler.	2. Replace muffler. Inspect exhaust system.
	3. Broken or rusted out exhaust pipe.	3. Replace exhaust pipe.
	4. Exhaust pipe leaking at manifold flange.	4. Tighten/replace flange attaching nuts/bolts.
	5. Exhaust manifold cracked or broken.	5. Replace exhaust manifold.
	6. Leak between exhaust manifold and cylinder head.	6. Tighten exhaust manifold to cylinder head bolts.

	7. Catalytic converter rusted or blown out.	7. Replace catalytic converter assy.
	8. Restriction in exhaust system.	8. Remove restriction, if possible. Replace restricted part if necessary.
CAUTION: When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and oxygen sensor.		

DIESEL ENGINE

CAUTION: On high mileage vehicles it is normal to see some exhaust staining around the turbocharger control rod area. This is not a sign of turbocharger failure.

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten clamps/bolts at leaking joints.
	2. Rusted or blown out muffler.	2. Replace muffler. Inspect exhaust system.
	3. Broken or rusted out exhaust pipe.	3. Replace exhaust pipe.
	4. Exhaust pipe leaking at manifold flange.	4. Tighten/replace flange attaching nuts/bolts.
	5. Exhaust manifold cracked or broken.	5. Replace exhaust manifold.
	6. Leak between exhaust manifold and cylinder head.	6. Tighten exhaust manifold to cylinder head bolts. Replace gasket if necessary.
	7. Turbocharger mounting flange cracked.	7. Remove turbocharger and inspect. (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).
	8. Restriction in exhaust system.	8. Remove restriction, if possible. Replace restricted part if necessary.
	9. EGR pipe(s) leak.	9. Tighten bolts. Replace gasket.
	10. EGR assembly leak.	10. Tighten bolts. Replace gaskets.

Drivability Concern - Turbo	1. Vacuum hose disconnected.	1. Check connections, replace as necessary.
	2. Vacuum system leaks.	2. Inspect for damage. Check for leaks, replace as necessary.
	3. Boost pressure solenoid filter clogged.	3. Replace the filter.

CONVERTER-CATALYTIC

REMOVAL

3.8L ENGINE

WARNING: If torches are used when working on the exhaust system, do not allow the flame near the fuel lines.

1. Raise and support the vehicle.
2. Saturate the bolts (1) and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Disconnect oxygen sensor electrical connectors.
4. Remove the nuts from the front exhaust pipe and catalytic converter assembly to muffler flange.
5. Remove bolts (1) and flanged nuts at the manifold.
6. Lower the front exhaust pipe/catalytic converter assembly (3) and slide out of the mount at the transmission (if equipped).
7. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.

2.8L DIESEL ENGINE - W/DPF

WARNING: If torches are used when working on the exhaust system, do not allow the flame near the fuel lines.

1. Raise and support the vehicle.
2. Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Remove diesel particulate filter (DPF), if equipped (Refer to 11 - EXHAUST SYSTEM/PARTICULATE FILTER - REMOVAL).
4. Remove two bracket bolts (2).
5. Remove the nuts (1) from the front catalytic converter to turbocharger flange.
6. Lower the catalyst assembly (2) and slide out of the mount at the transmission (if equipped).
7. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.

2.8L DIESEL ENGINE

WARNING: If torches are used when working on the exhaust system, do not allow the flame near the fuel lines.

1. Raise and support the vehicle.
2. Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Remove the nuts from the front exhaust pipe and catalytic converter to muffler flange.

NOTE: The front exhaust pipe and catalytic converter to turbocharger clamp is not reusable. Always use a new clamp when reinstalling the catalytic converter.

4. Remove the nut from the front exhaust pipe and catalytic converter to turbocharger clamp (1). Spread the clamp.
5. Lower the catalyst assembly (2) and slide out of the mount at the transmission (if equipped).
6. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.
7. Discard the front exhaust pipe and catalytic converter to turbocharger clamp (1). Discard clamp.

INSTALLATION

3.8L ENGINE

1. Position the front exhaust pipe and catalytic converter assembly (3) into the mount at the transmission (if equipped) and onto the exhaust manifold flange connection.
2. Install the nuts at the front exhaust pipe and catalytic converter assembly to muffler flange. Do not tighten.
3. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
4. Tighten the bolt (1) at exhaust manifold to 27 N·m (19 in. lbs.) torque.
5. Tighten the front exhaust pipe and catalytic converter assembly to muffler flange nuts to 27 N·m (19 ft. lbs.) torque.
6. Position the front pipe onto the exhaust manifold flange connection. Tighten the clamp to 10 N·m (95 in. lbs.) torque.

7. Connect oxygen sensor electrical connectors.
8. Lower the vehicle.
9. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
10. Check the exhaust system for contact with the body panels. Make adjustments, if necessary.

2.8L DIESEL - W/DPF

1. Position the front catalytic converter assembly (3) onto the turbocharger.
2. Install two catalytic converter mounting bolts. Tighten bolts to 27 N·m (19 ft. lbs.) torque.
3. Install DPF, if equipped (Refer to 11 - EXHAUST SYSTEM/PARTICULATE FILTER - REMOVAL).
4. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
5. Lower the vehicle.
6. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make adjustments, if necessary.

2.8L DIESEL

1. Position new turbocharger to front exhaust pipe and catalytic converter clamp (1) on turbocharger.
2. Position the front exhaust pipe and catalytic converter assembly (2) into the mount at the transmission (if equipped) and onto the turbocharger.
3. Install the nuts at the front exhaust pipe and catalytic converter assembly to muffler flange. Do not tighten.
4. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
5. Tighten turbocharger to front exhaust pipe and catalytic converter assembly clamp nut to 27 N·m (19 ft. lbs.) torque.
6. Install the bolts at the front exhaust pipe and catalytic converter assembly (2) to muffler flange. Tighten the nuts to 27 N·m (19 ft. lbs.) torque.
7. Lower the vehicle.
8. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
9. Check the exhaust system for contact with the body panels. Make adjustments, if necessary.

PIPE-EXHAUST

REMOVAL

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

WARNING: If torches are used when working on the exhaust system, do not allow the flame near the fuel lines.

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and/or sensor.

1. Raise and support the vehicle.
2. Saturate the studs and nuts with a Mopar® rust penetrant. Allow 5 minutes for penetration.
3. Disconnect oxygen sensor connectors and remove sensors from the exhaust pipe and the catalytic converter.
4. Disconnect the catalytic converter from the engine exhaust manifold.
5. Remove exhaust pipe to muffler flange retaining nuts.
6. Slide exhaust pipe forward until exhaust pipe hanger disengages from transmission support. Remove exhaust pipe and catalytic converter from vehicle.

INSTALLATION

1. Position exhaust pipe and catalytic converter into vehicle.
2. Insert exhaust pipe hanger into transmission support.
3. Make sure the exhaust system is aligned and has the proper clearance. The minimum clearance is 25mm (1 inch).
4. Tighten muffler to catalytic converter flange retaining nuts to 28 N·m (21 ft. lbs.).
5. Tighten exhaust pipe to exhaust manifold mounting bolts to 31 N·m (23 ft. lbs.).
6. Install the oxygen sensors in the exhaust pipe and catalytic converter and connect oxygen sensor connectors.
7. Lower vehicle.
8. Start engine and inspect for leaks. Repair exhaust leaks as necessary.
9. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

SHIELDS-HEAT

DESCRIPTION

Heat shields are made of stamped/formed steel, or metal foil.

Exhaust heat shields are needed to protect both the vehicle and the environment from the high temperatures developed by the catalytic converter. The catalytic converter releases additional heat into the exhaust system. Under severe operating conditions, the temperature increases in the area of the converter. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency.

REMOVAL

1. Raise and support the vehicle.
2. Remove the screws or nuts holding the heat shields to the frame or floor pan.

3. When removing muffler heat shield, the muffler front support bracket must be removed first.
4. Slide the shields out around the exhaust system.

INSTALLATION

1. Position the heat shields to the floor pan or the frame and install the screws or nuts

2. Tighten the nuts or screws to 45 N·m (33 ft. lbs.).
3. Lower the vehicle.

MUFFLER

DESCRIPTION

All engines use a stainless steel muffler and tailpipe assembly to control exhaust noise levels and exhaust back pressure.

REMOVAL

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

WARNING: If torches are used when working on the exhaust system, do not allow the flame near the fuel lines.

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and oxygen sensor.

All original equipment exhaust systems are manufactured with the exhaust tailpipe welded to the muffler. Service replacement mufflers and exhaust tailpipes are either clamped together or welded together.

1. Raise the vehicle and support the rear of the vehicle by the side rails and allow the axle to hang free.
2. Remove the tailpipe hangers from the insulators.
3. Remove muffler to catalytic converter flange retaining nuts.

4. Remove muffler and tailpipe assembly from vehicle.

INSTALLATION

1. Position muffler and tailpipe assembly into vehicle.
2. Position muffler and catalytic converter flanges together and install nuts. **DO NOT** tighten nuts at this time.
3. Install tailpipe hangers into the insulators.
4. Make sure the muffler and tailpipe are correctly positioned and properly aligned. The minimum clearance between components is 25mm (1 inch).
5. Tighten muffler to catalytic converter flange nuts to 28.5 N·m (21 ft. lbs.).
6. Lower vehicle.
7. Start engine and inspect for leaks. Repair exhaust leaks as necessary.
8. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

TAILPIPE

DESCRIPTION

The tailpipe is made of stainless steel.

OPERATION

The tailpipe channels the exhaust out of the muffler and out from under the vehicle to control noise and prevent exhaust gas fumes from entering the passenger compartment. The tail pipe and muffler are serviced as an assembly.

FILTER-DIESEL PARTICULATE

DESCRIPTION

A diesel particulate filter (DPF) is installed for exhaust gas after-treatment. The DPF is located downstream of the main oxidation catalyst. The DPF filters, stores and burns particulate matter (soot) that is generated during the combustion process. The soot is oxidized to carbon dioxide CO₂ at exhaust temperatures over 600°C (1,112°F).

OPERATION

The oxidation catalysts raise the exhaust gas temperatures to regenerate the DPF, which is passive regeneration. If the passive regeneration cannot keep up with the build up of soot in the DPF, the ECM will actively regenerate the DPF to burn off the soot. Residue remains inside the DPF in the form of non burnable ash. Ash comes from the oils and other materials that are trapped in the oils and are present in the soot. Ash is not eliminated by the regeneration cycle. Excessive ash accumulation requires the replacement of the DPF. The DPF uses a silicon carbide wall-flow monolith with a platinum coating to trap particulates. The monolith contains a large number of square parallel channels, which run in the axial direction and are separated by thin porous walls. The channels are alternatively open at one end, but plugged at the other. The exhaust gases flow through the walls and escape through the pores in the wall material. Particulates, however, are too large to escape and are trapped in the monolith walls. The ECM starts the regeneration of the DPF if the soot load exceeds a performance map value. The ECM determines the load condition of the DPF based upon the exhaust gas pressure upstream and downstream of the DPF. A pressure differential sensor provides the pressure input to the ECM. During the regeneration process, the ECM raises the temperature in the DPF to burn off the soot accumulated. Under normal operation, the engine does not produce enough heat to oxidize the soot inside the DPF. This process requires temperatures above 550 °C (1,022 °F). After regeneration, the ECM reads the actual pressure difference at the DPF and compares it with a reference value. From this comparison, the ECM determines the ash quantity inside the DPF.

DIAGNOSIS AND TESTING

The engine Electronic Control Module (ECM) monitors the soot load in the diesel particulate filter. Under normal operating conditions the diesel particulate filter is self-cleaning, where accumulated soot is converted to ash. Under light load operating conditions, the driver may be notified via the vehicle's Electronic Vehicle Information Center (EVIC). The ECM will set a fault if it detects that the soot level has exceeded the normal desoot trigger threshold by a sufficient amount to indicate that the driver intervention is required. If the MIL light comes on, refer to the Engine Electrical Diagnosis and follow the procedure for the retrieved code.

REMOVAL

1. Disconnect negative battery cable.
2. Raise and support vehicle.
3. Disconnect differential pressure hoses from pressure sensor tubing (3).
4. Disconnect oxygen sensor electrical connector.
5. Remove muffler and tail pipe to DFP flange nuts.
6. Remove the DFP to exhaust manifold nuts.
7. Remove steady rest mounting bolts (4).
8. Remove the diesel particulate filter assembly.

INSTALLATION

1. Position diesel particulate filter assembly in vehicle.
2. Install DPF to exhaust manifold bolts. Do not tighten at this time.
3. Install muffler/tailpipe to DPF flange nuts. Tighten nut to 32 N·m. (24 ft. lbs.).
4. Tighten DPF to exhaust manifold bolts to 32 N·m (24 ft. lbs.) Tighten muffler/tailpipe to DPF flange nuts to 34 N·m (24 ft. lbs.).
5. Lower vehicle.
6. Using scan tool, under ENGINE MISC. FUNCTIONS, perform DIESEL PARTICULATE FILTER REPLACEMENT function.

TURBOCHARGER

REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover.
3. Disconnect the inlet air pressure sensor wiring harness connector, disconnect the air outlet duct from the turbocharger, and remove air cleaner assembly.
4. Remove air inlet tube from turbocharger.

5. Remove air conditioning bracket bolt.

6. Remove the bolts from the exhaust manifold heat shield.
7. Remove the exhaust manifold heat shield.

8. Disconnect the turbocharger module connector.
9. Remove the right front tire.
10. Remove the right front inner fender well.

11. Remove the bolts from the downstream flange of the turbocharger.
12. Remove the bolts from the turbocharger to engine bracket.
13. Remove the bolts from the upstream side of the muffler.
14. Remove the bolts from the bottom of the maniverter.

15. Remove the turbocharger oil lines.
16. Remove the turbocharger to exhaust manifold bolts.
17. Remove turbocharger.

INSTALLATION

1. Position turbocharger to exhaust manifold with new gasket. Tighten retaining nuts to 32 N·m.
2. Install the turbocharger oil lines.

3. Install turbocharger return line. Tighten bolts to 11 N·m (11 in. lbs.).

4. Install the diesel particulate filter.
5. Install the bolts from the bottom of the maniverter.
6. Install the forward diesel particulate filter pressure tube.
7. Install the bolts from the upstream side of the muffler.
8. Install the bolts from the turbocharger to engine bracket.

9. Install the bolts from the downstream flange of the turbocharger.
10. Connect the turbocharger module connector.

11. Install the air conditioning bracket bolt.

12. Install the exhaust manifold heat shield.
13. Install the exhaust manifold heat shield bolts.

14. Install the inlet air tube from the turbocharger.
15. Install the air cleaner housing.
16. Install the silencer.
17. Install the engine cover.

13 - FRAME & BUMPERS

FRAME & BUMPERS

SPECIFICATIONS

TORQUE

Description	N·m	Ft. Lbs	In. Lbs.
Front bumper support bolts	90	66.5	—
Fuel tank skid plate to crossmember bolts	99	73	—
Rear bumper support bolts	25	18.5	—
Rear bumper support bracket to frame bolts	55	40.5	—
Trailer hitch/rear tow hook bolts	81	60	—
Transfer case skid plate crossmember bolts	65	48	—
Transfer case skid plate support bracket bolts	65	48	—
Transmission crossmember bolts	122	90	—
Transmission skid plate support crossmember bolts	65	48	—
Transmission skid plate to crossmember bolt	65	48	—

BUMPER - FRONT

REMOVAL

819cd5ef

1. Remove the push pin fasteners (2) and release the splash shield (1) from the bumper.

819cd5f3

2. Remove the push pin fasteners (3) and remove the splash shield.
3. Disconnect the electrical connectors (1).
4. Remove the outer (4) and inner support bolts (2) and remove the front bumper.

INSTALLATION

1. Install the bumper and install the inner (2) and outer support bolts (4).
2. Tighten the support bolts to 90 N·m (66.5 ft. lbs.).
3. Connect the electrical connectors (1).
4. Install the splash shield and install the push pin fastener (3).

5. Position the splash shield (1) onto the bumper and install the push pin fasteners (2).

BUMPER - REAR

REMOVAL

1. Remove the bumper bracket bolts (3).
2. Remove the bumper support bolts (1) and remove the bumper (4).

INSTALLATION

1. Install the bumper (4) and install the bolts (1) and (3).
2. Tighten the bolts (1) and (3) to 25 N·m (18.5 ft. lbs.).

FRAME

WARNING

Use of Heat During Repair

WARNING: Chrysler Group engineering's position on the use of heat during collision repair is as follows:

- Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.
- During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer. Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle. Failure to follow these instructions may result in serious or fatal injury. This statement supersedes any previously released information by the Chrysler Group.

STANDARD PROCEDURE

FRONT FRAME RAIL TIP REPLACEMENT

1 - FONT END SHEET METAL (FESM) BRACKET
2 - CROSS-FRAME TUBE
3 - FESM BRACKET
4 - LEFT FRAME RAIL
5 - COMPATIBILITY BEAM
6 - BUMPER MOUNTING BRACKETS
7 - RIGHT FRAME RAIL

1. Mount the vehicle on appropriate frame correction equipment (“frame rack”) and using a three-dimensional measuring system measure frame/body and correct to vehicle specifications.
2. Release welds holding compatibility beam (5) brackets to rails (4 and 7) and remove – if compatibility beam is to be replaced also, the brackets only need to be removed from the undamaged rail.

3. At the centerline of the cross-frame tube, use a reciprocating saw to make a vertical cut (3) through the frame rail to the tube (2) from both the top and bottom.
4. Using either a reciprocating saw or a plasma cutter, cut forward of the tube (4) to release the rail (1) from the tube (2).
5. Grind off any remaining rail or weld attached to the tubular crossmember forward of the original vertical cuts in preparation for the replacement part.
6. Any cuts into the tubular crossmember should be welded and dressed smooth before proceeding.

7. From the removed rail, cut weld-backers (1) which will fit snugly into the original frame at the cut location. Position these backers so 12.7 mm (1/2 inch) protrudes from the section location.
8. Cut the service part vertically at the same location as the original frame.
9. Clean and de-burr all cut edges, remove e-coat within 25.4 mm (1 inch) of the joint from the inside and outside of all the surfaces.
10. Make sure that a slight bevel is created at the butt-weld joint to allow complete weld penetration.
11. Refer to the weld chart (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS) for proper weld rod and approximate welder settings, and adjust the welder to create a proper weld bead.

12. Position new (cut) rail tip (2) in proper position and tack-weld in place (1).
13. Weld replacement tip in place using a skip-stitch process – welding in 50.8 mm (2 inch) increments, weld the rail on opposing sides to avoid distortion, Also allow the rail to cool between the welding operations.

14. Position and tack-weld FESM bracket (2), bumper mounting bracket (1), and compatibility beam (3).
15. When dimensional accuracy is confirmed, finish weld all components using the original weld locations as a guideline.
16. If the FESM brackets and bumper mounting brackets were not pierced, create the appropriate piercings at this time. Refer to [Bracket Locations And Modifications](#) for correct dimensions.

17. Cosmetically dress welds without removing any base metal – a skim coat of filler may be utilized for an

improved cosmetic appearance.

18. Refinish all components to a production appearance.

19. On all areas (1) inaccessible to the refinish operation, apply a creeping type rust proofing material ensuring 100% coverage. Be especially focused on those areas where welding may have burned off the original corrosion protection.

Bracket Locations And Modifications

BRACKET HOLES - PLAN VIEW

1 - 20 mm HOLE (13/16 inch)
2 - 27.7 mm (1.09 inch)
3 - 15 mm HOLE (5/8 inch)
4 - 869.2 mm (34.2 inch)
5 - 359.6 mm (14.2 inch)

6 - 453.8 mm (17.9 inch)
7 - 354.8 mm (14 inch)
8 - 12.5 mm HOLE (1/2 inch)

BRACKET LOCATIONS - SIDE VIEW

1 - FESM BRACKET
2 - 239.6 mm (9.43 inch)
3 - 335.1 mm (13.2 inch)
4 - FRAME RAIL TIP

REAR CROSSMEMBER

1. Mount the vehicle on appropriate frame correction equipment (“frame rack”) and using a three-dimensional measuring system measure frame/body and correct to vehicle specifications, (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS).
2. Remove rear bumper components, (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - REMOVAL).
3. Remove hitch receiver or tow hook if equipped, (Refer to 13 - FRAME & BUMPERS/FRAME/TRAILER HITCH - REMOVAL).
4. Release rear body mount fasteners, and loosen remaining body fasteners to allow lifting the body upward providing work access, (Refer to 23 - BODY/EXTERIOR/BODY ISOLATORS - REMOVAL).

5. Using a reciprocating saw, or equivalent, cut the crossmember close to the welds to the side rails and body mount brackets (1) and remove (each side of crossmember has a total of 7 welds).
6. Using an angle grinder, grind off remaining crossmember and weldments.
7. Dress new crossmember at weld locations so that a very shallow bevel is created and remove any e-coat, inside and out, on replacement part within 25.4 mm (1") of weld zones as best possible.
8. Refer to the weld chart for proper weld rod and approximate welder settings, then using the old crossmember adjust the welder to create a proper weld bead, (Refer to 13 - FRAME & BUMPERS/FRAME - SPECIFICATIONS).

9. Install the crossmember and locate using three-dimensional measuring equipment.
10. When proper, tack-weld crossmember securely in position (1).
11. Complete weld installation of crossmember ensuring proper weld penetration.
12. Clean welded area of any burned coatings or spatter.
13. Apply refinish materials to exterior of crossmember and side rails (2) to restore appearance and corrosion protection.
14. Apply inner panel anti-corrosion material inside crossmember.
15. Install the rear body mount fasteners and tighten all fasteners, (Refer to 23 - BODY/EXTERIOR/BODY ISOLATORS - INSTALLATION).
16. Install hitch receiver/tow hook, (Refer to 13 - FRAME & BUMPERS/FRAME/TRAILER HITCH - INSTALLATION).
17. Install bumper components, (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - INSTALLATION).

WELD NUT SERVICE

819cd620

SERVICE LOCATIONS

1 - THREE M10 FUEL VAPOR CANISTER CROSSMEMBER NUTS	- ACCESS HOLES LOCATED ON TOP OF CROSSMEMBERS
2 - TWO M12 TRANSMISSION SKID PLATE CROSSMEMBER NUTS	- ACCESS HOLES LOCATED ON INSIDE OF FRAME RAILS
3 - M12 FUEL TANK CROSSMEMBER NUTS (SWB has 2, LWB has 3)	- ACCESS HOLES LOCATED ON TOP OF CROSSMEMBERS
4 - M12 FUEL TANK FRAME RAIL NUTS	- ACCESS HOLES LOCATED ON OUTSIDE OF FRAME RAIL

5 - TWO M10 REAR STABILIZER NUTS	- ACCESS HOLES LOCATED ON THE OUTSIDE OF FRAME RAILS
6 - FOUR M10 STANDARD REAR BUMPER BRACKET NUTS	- ACCESS THROUGH REAR OF FRAME RAILS

Vapor Canister

TYPE 1 NUT

M10 Locations:
Vapor Canister (1)
M12 Locations:
Fuel Tank Crossmember (3)

NOTE: Refer to (Fig. [SERVICE LOCATIONS](#)) for service locations.

1. Using a cut off wheel or equivalent, remove the vapor canister support bolt with the damaged weld nut.
2. Remove the damaged weld nut from the access hole in the top of the crossmember (1).
3. Position a new M10 type 1 nut into the access hole and install the vapor canister bolt, (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/VAPOR CANISTER - INSTALLATION).

Fuel Tank

TYPE 1 NUT

M10 Locations:
Vapor Canister (1)
M12 Locations:
Fuel Tank Crossmember (3)

NOTE: Refer to (Fig. [SERVICE LOCATIONS](#)) for service locations.

1. Using a cut off wheel or equivalent, remove the fuel tank support bolt with the damaged weld nut.
2. If necessary remove the damaged weld nut from the access hole in the top of the crossmember (3).
3. If necessary remove the damaged weld nut from the access hole in the frame rail (4).
4. If necessary, position a new M12 type 1 nut into the access hole in the crossmember (3) and install the fuel tank bolt, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION).

TYPE 2 NUT

M10 Locations:
Stabilizer bar (5)
M12 Locations:
Fuel Tank Frame Rail (4)
Transmission Skid Plate (2)

5. If necessary, position a new M12 type 2 nut into the access hole in the frame rail (4) and install the fuel tank bolt.

Rear Bumper Bracket

NOTE: Refer to (Fig. [SERVICE LOCATIONS](#)) for service locations.

1. Remove the rear bumper, (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - REMOVAL).
2. Using a cut off wheel or equivalent, remove the rear bumper support bracket bolt (4) with the damaged weld nut.
3. Remove the damaged weld nut from the rear of the frame rail.
4. Install a standard M10 nut into the end of the frame rail using a box end wrench and install the bracket bolt.
5. Tighten the bolt to 55 N·m (40.5 ft. lbs.).
6. Install the rear bumper, (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER -

INSTALLATION).

Rear Stabilizer Bar

TYPE 2 NUT

M10 Locations:

Stabilizer bar (5)

M12 Locations:

Fuel Tank Frame Rail (4)

Transmission Skid Plate (2)

NOTE: Refer to (Fig. [SERVICE LOCATIONS](#)) for service locations.

1. Using a cut off wheel or equivalent, remove the rear stabilizer bolt with the damaged weld nut.
2. Remove the damaged weld nut from the access hole in the in the frame rail (5).
3. Position a new M10 type 2 nut into access hole in the frame rail and install the stabilizer bar bolt, (Refer to 2 - SUSPENSION/REAR/STABILIZER BAR - INSTALLATION).

Transmission Skid Plate

TYPE 2 NUT

M10 Locations:
Stabilizer bar (5)
M12 Locations:
Fuel Tank Frame Rail (4)
Transmission Skid Plate (2)

NOTE: Refer to (Fig. [SERVICE LOCATIONS](#)) for service locations.

1. Using a cut off wheel or equivalent, remove the transmission skid plate bolt with the damaged weld nut.
2. Remove the damaged weld nut from the access hole in the frame rail (2).
3. Position a new M12 type 2 nut into the access hole in the frame rail and install the skid plate bolt, (Refer to 13

- FRAME & BUMPERS/FRAME/TRANSMISSION SKID PLATE - INSTALLATION)

SPECIFICATIONS

FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principle Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

WELD PROCESS

CAUTION: All welds should conform to DaimlerChrysler vehicle engineering process standard “PS 9472”.

WELDING PARAMETERS

WELDING PROCESS	FLUX CORED ARC	GAS METAL ARC (MIG)*	SHIELDED METAL ARC (STICK)
Material Thickness	3.7 mm to 4.2 mm	3.7 mm to 4.2 mm	3.7 mm to 4.2 mm
Electrode Type	Lincoln Electrical Co. Product #: NR-211 MP (Do Not Substitute)	AWS ER70S-6 (Do Not Substitute)	** AWS E 7018
Electrodes Size Inches	.045 Tubular	.035 Solid	3/32"
Electrode Stick Out	3/8" - 1/2"	1/2" - 5/8"	N/A

Polarity	Electrode "-" Work Piece "+"	Electrode "+" Work Piece "-"	Electrode "+" Work Piece "-"
Shielding Gas	Self Shielded	75% Ar 25% CO2	Self Shielded
Gas Flow Rate	N/A	25 - 35 CFM	N/A
Wire Feed Speed (inches per minute)	110 - 130 Vertical Down 70 - 90 Flat & Overhead	245 - 250 Vertical Down 210 - 225 Flat & Overhead	N/A
Approximate Amperage			
Vertical	110 - 130	175	85 (3/32" Diameter)
Flat & Overhead	70 - 90	155	90 (3/32" Diameter)
Voltage	15 - 18	19 - 20	N/A
Direction of Welding			
Vertical	Vertical Down Hill (only)	Vertical Down Hill (only)	Vertical - Up Hill (only)
Flat & Overhead	Flat - Push or Drag	Flat - Push or Drag	Flat - Drag

***First choice - Gas Metal Arc Welding Process:** Butt joints - apply two layers (passes) of weld metal. First pass should only fill approximately 5 the thickness. Vertical position welds - maintain electrode wire at leading edge of weld puddle while traveling down hill to produce maximum penetration into the sleeve. These techniques work for FCAW as well.

****E7018** new electrodes may be exposed to the atmosphere for up to ten hours with no harmful effect. Reconditioning schedules should come from the manufacturer.

CROSSMEMBER - TRANSMISSION

REMOVAL

1. Remove the transmission skid plate (1), (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSMISSION SKID PLATE - REMOVAL).
2. Remove the transercase skid plate (4), (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION).

3. Remove the left side bolts (1).

4. Remove the fuel tank skid plate bolts (2).
5. Remove the right side bolts (1) and remove the crossmember (3).

INSTALLATION

1. Install the crossmember (2) and install the bolts (1).

2. Install the right side bolts (1) and tighten all four crossmember bolts to 122 N·m (90 ft. lbs.).
 3. Install the fuel tank skid plate bolts (2) and tighten to 99 N·m (73 ft. lbs.).

4. Install the transmission skid plate (1), (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSMISSION SKID PLATE - INSTALLATION).
5. Install the transfer case skid plate (4), (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION).

HITCH - TRAILER

REMOVAL

1. Separate the wire harness (2) from the trailer hitch (1).

2. Remove the trailer hitch bolts (1) and remove the hitch (2).

INSTALLATION

1. Install the hitch (2) and install the bolts (1).
2. Tighten the bolts to 81 N·m (60 ft. lbs.)

3. Install the wire harness connector (2) onto the hitch (1).

SKID PLATE - FUEL TANK

REMOVAL

1. Remove the fuel tank, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL).

INSTALLATION

1. Install the fuel tank, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION).

SKID PLATE - TRANSFER CASE

REMOVAL

1. Raise and support the vehicle, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
2. Remove the crossmember bolts (2).
3. Remove the bracket bolts (3) and remove the transfercase skid plate (4).

INSTALLATION

1. Install the skid plate (4).
2. Install the bracket bolts (3) and tighten to 65 N·m (48 ft. lbs.).
3. Install the crossmember bolts (2) and tighten to 65 N·m (48 ft. lbs.).

SKID PLATE - TRANSMISSION

REMOVAL

1. Raise and support the vehicle, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
2. Remove the crossmember bolt (5).
3. Remove the skid plate support crossmember bolts (6) and remove the transmission skid plate (1).

INSTALLATION

1. Install the skid plate (1).
2. Install the support crossmember bolts (6) and tighten to 65 N·m (48 ft. lbs.).
3. Install the crossmember bolts (5) and tighten to 65 N·m (48 ft. lbs.).

14 - FUEL SYSTEM

FUEL SYSTEM

STANDARD PROCEDURE

STANDARD PROCEDURE - DRAINING FUEL TANK

1. Disconnect negative battery cable.
2. Remove fuel fill cap.
3. Raise and support vehicle.
4. Remove fuel fill hose clamp (2) at rear of tank (3).
5. Remove fuel fill hose (1) from fuel tank.
6. Position a drain hose into the fuel fill hose opening. Note that a small flapper valve is installed into the opening.
7. Drain fuel tank using an approved gasoline, or diesel fuel draining station.

FUEL SYSTEM PRESSURE RELEASE

Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.

1. Remove fuel fill cap.
2. Disconnect wiring harness leading to fuel pump module at top of fuel tank. Refer to Wiring Diagrams for connector location.
3. Start and run engine until it stalls.
4. Attempt restarting engine until it will no longer run.
5. Turn ignition key to OFF position.
6. Place a rag or towel below fuel line quick-connect fitting at fuel rail.
7. Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings.
8. After performing service procedure, reconnect fuel pump module.
9. One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to the disconnection of fuel pump module. A diagnostic scan tool must be used to erase a DTC.

SPECIFICATIONS

TORQUE - 3.8L GAS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.

FUEL DELIVERY - 3.8L GAS ENGINE

SENSOR - FUEL LEVEL SENDING UNIT

DESCRIPTION

The fuel level sending unit is separately non-serviceable. The fuel pump module must be replaced.

LINES-FUEL

DESCRIPTION

WARNING: The fuel system may be under a constant pressure (even with the engine off). Before servicing any fuel system hoses, fittings, lines, or most components, fuel system pressure must be released. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

FITTING - QUICK CONNECT

DESCRIPTION

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic

retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)

CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used by referring to Quick-Connect Fitting Removal. This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal.

DISCONNECTING

WARNING: The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released. Refer to fuel system pressure release procedure.

CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used by referring to Quick-Connect Fitting Removal. This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

1. Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure.
2. Disconnect negative battery cable from battery.
3. Clean fitting of any foreign material before disassembly.

4. Single-Button Type Fitting: This type of fitting is equipped with a single push-button (2) located on the quick-connect fitting.

5. The push-button is attached to two internal latches (1). To disconnect, press on push-button with your thumb and unlatch fitting from fuel line. Special tools are not required for disconnection. **DO NOT ATTEMPT TO PRY OR PULL UP ON PUSH-BUTTON. LATCHES WILL BE BROKEN.**

6. Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure.
 7. Disconnect negative battery cable from battery.
 8. Clean fitting of any foreign material before disassembly.
 9. **2-Button Type Fitting:** This type of fitting (1) is equipped with a push-button located on each side of quick-connect fitting (2). Press on both buttons simultaneously for removal. Special tools are not required for disconnection.

10. **Pinch-Type Fitting:** This fitting (1) is equipped with two finger tabs (2). Pinch both tabs together while removing fitting. Special tools are not required for disconnection.

11. **Single-Tab Type Fitting:** This type of fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component. Special tools are not required for disconnection.

12. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

13. While pressing release tab on side of fitting, use screwdriver (2) to pry up pull tab.

14. Raise pull tab until it separates from quick-connect fitting.

15. **Two-Tab Type Fitting:** This type of fitting (2) is equipped with tabs located on both sides of fitting (1). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.

- a. To disconnect quick-connect fitting, squeeze plastic retainer tabs (1) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.
- b. Pull fitting from fuel system component being serviced.
- c. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

16. **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (4) usually black in color.

- a. To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (6). With plastic ring depressed, pull fitting from component.

The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.

- b. After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.
- c. Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

17. **Latch Clips — Type 1:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 (4) is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

18. Pry up on latch clip with a screwdriver (3).

19. Slide latch clip toward fuel rail while lifting with screwdriver.

20. Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (1). Use tool to

release locking fingers in end of line.

21. With special tool still inserted, pull fuel line from fuel rail.

22. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

23. Disconnect quick-connect fitting from fuel system component being serviced.

24. **Latch Clips — Type 2:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

25. Type 2: Separate and unlatch small arms on end of clip and swing away from fuel line.

26. Slide latch clip toward fuel rail while lifting with screwdriver.

27. Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (1). Use tool to release locking fingers in end of line.

28. With special tool still inserted, pull fuel line from fuel rail.

29. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

30. Disconnect quick-connect fitting from fuel system component being serviced.

31. **Wing Type:** A special tool will not be necessary to disconnect this type of fitting (2). This line is used on different fuel and emission components. The graphic shows the fitting used on an EVAP canister.

32. Use two fingers to push on fitting wings (2)

33. Pull and disconnect fitting while holding wings.

34. After disconnection, locking fingers will remain within quick-connect fitting.

CONNECTING

1. Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.
2. Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.
4. Continue pushing until a click is felt.
5. Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.
6. Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).
7. Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**
8. Connect negative cable to battery.
9. Start engine and check for leaks.

MOTOR-FUEL PUMP

DESCRIPTION

The electric fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump. The electric fuel pump is not a separate, serviceable component.

MODULE-FUEL PUMP

REMOVAL

WARNING: The fuel system is under a constant pressure (even with the engine off). Before servicing the fuel pump module, the fuel system pressure must be released. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

1. Drain and remove fuel tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL) .
2. Note rotational position of module before attempting removal. An indexing arrow is located on top of module for this purpose.
3. Position special Lockring Remover/Installer tool 9340 (3) into notches on outside edge of lockring (5).
4. Install 1/2 inch drive breaker bar (1) to special Lockring Remover/Installer tool 9340 (3).
5. Rotate breaker bar counter-clockwise to remove lockring.
6. Remove lockring. The module will spring up slightly when lockring is removed.
7. Remove module from fuel tank. Be careful not to bend float arm while removing.

INSTALLATION

CAUTION: Whenever the fuel pump module is serviced, the rubber seal (gasket) must be replaced.

1. Using a new seal (gasket), position fuel pump module into opening in fuel tank.
2. Position lockring (5) over top of fuel pump module.
3. Rotate module until embossed alignment arrow points to center alignment mark. This step must be performed to prevent float from contacting side of fuel tank.
4. Install Lockring Remover/Installer 9340 (3) to lockring.
5. Install 1/2 inch drive breaker (1) into Lockring Remover/Installer 9340 (3).
6. Tighten lockring (clockwise) until all seven notches have engaged.
7. Install fuel tank.

RAIL - FUEL

REMOVAL - 3.8L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel rail, fuel system pressure must be released. Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE

1. Remove fuel tank filler tube cap.
2. Perform Fuel System Pressure Release Procedure. Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE
3. Remove negative battery cable at battery.
4. Remove upper half of intake manifold. Refer to ENGINE section.

5. Disconnect electrical connectors at all six fuel injectors. Refer to graphic. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

6. Disconnect fuel line latch clip (4) and fuel line at fuel rail.
7. Remove four fuel rail mounting bolts (2).
8. Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in cylinder head. Gently rock and pull **right** side of rail until injectors just start to clear cylinder head holes. Repeat this procedure (left/right) until all injectors have cleared cylinder head holes.
9. Remove fuel rail (3) (with injectors attached) from engine.
10. If fuel injectors are to be removed, refer to Fuel Injector Removal.

INSTALLATION - 3.8L

1. If fuel injectors are to be installed, refer to Fuel Injector Installation.
2. Clean out fuel injector machined bores in intake manifold.
3. Apply a small amount of engine oil to each fuel injector O-ring. This will help in fuel rail installation.
4. Position fuel rail/fuel injector assembly to machined injector openings in cylinder head.
5. Guide each injector into cylinder head. Be careful not to tear injector O-rings.
6. Push **right** side of fuel rail down until fuel injectors have bottomed on cylinder head shoulder. Push **left** fuel rail down until injectors have bottomed on cylinder head shoulder.

7. Install four fuel rail mounting bolts (2) and tighten. Refer to Torque Specifications.

8. Connect fuel line latch clip (4) and fuel line to fuel rail.

8191ec71

9. Connect electrical connectors at fuel injectors. Refer to graphic. Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

10. Install upper half of intake manifold. Refer to ENGINE section.

11. Connect battery cable to battery.

12. Start engine and check for leaks.

TANK - FUEL

REMOVAL

80b6f033

GAS POWERED

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel rail, fuel system pressure must be released.

1. Remove fuel tank filler tube cap.

2. Perform Fuel System Pressure Release Procedure.
3. Remove fuel fill cap.
4. Raise and support vehicle.
5. Remove fuel fill hose clamp (2) at rear of tank (3).
6. Remove fuel fill hose (1) from fuel tank.
7. Position a drain hose into the fuel fill hose opening. Note that a small flapper valve is installed into the opening.
8. Drain fuel tank using an approved gasoline fuel draining station.

818d3f33

8191f55b

The fuel tank skid plate and the fuel tank assembly are removed at the same. They share common fasteners.

9. Disconnect quick-connect fitting (2).
10. Disconnect quick-connect fitting (9).
11. Disconnect quick-connect fitting (10).
12. Remove hose clamp (3) and disconnect hose (4) at tank.
13. Support tank with a hydraulic jack.
14. Disconnect quick-connect fittings at front of tank.
15. Remove two tank mounting bolts at rear of fuel tank.
16. Remove three tank mounting bolts at right side of fuel tank.
17. Remove three tank mounting bolts at left side of fuel tank.
18. Partially lower tank to gain access to pump module electrical connector.
19. Disconnect electrical connector at fuel pump module.

Disconnect quick-connect fitting (2).
10. Support tank with a hydraulic jack.

11. Disconnect quick-connect fittings (1) and (4) for fuel supply and return lines at front of tank.
12. Remove two tank mounting bolts at rear of fuel tank.
13. Remove three tank mounting bolts at right side of fuel tank.
14. Remove three tank mounting bolts at left side of fuel tank.

15. Partially lower tank to gain access to pump module electrical connector (4).
16. Disconnect electrical connector (4) at fuel pump module.
17. Continue lowering tank for removal.
18. Lift fuel tank from skid plate.

19. If fuel tank is to be replaced, remove fuel pump module from tank.

INSTALLATION

GAS POWERED

The fuel tank skid plate and the fuel tank assembly are installed at the same. They share common fasteners.

1. If fuel pump module had been removed, install module to tank.
2. Position fuel tank into skid plate.
3. Support tank with a hydraulic jack.
4. Partially raise tank to allow connections at top of tank.

5. Connect electrical connector to fuel pump module.
6. Continue raising tank snugly to body.
7. Connect quick-connect fitting (2).
8. Connect quick-connect fitting (9).
9. Connect quick-connect fitting (10).
10. Install hose (4) to tank and install clamp (3).
11. Connect quick-connect fittings at front of tank.
12. Install two tank mounting bolts at rear of fuel tank.
13. Install three tank mounting bolts at right side of fuel tank.
14. Install three tank mounting bolts at left side of fuel tank.

DIESEL POWERED

1. If fuel pump module had been removed, install module to tank.
2. Position fuel tank into skid plate.
3. Support tank with a hydraulic jack.

4. Partially raise tank to gain access to pump module electrical connector (4).
5. Connect electrical connector (4) to fuel pump module.
6. Continue raising tank snugly to body.

7. Connect quick-connect fittings (1) and (4) for fuel supply and return lines at front of tank.
8. Install two tank mounting bolts at rear of fuel tank.
9. Install three tank mounting bolts at right side of fuel tank.
10. Install three tank mounting bolts at left side of fuel tank.

5142

Both fuel filters are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

REGULATOR-FUEL PRESSURE

DESCRIPTION

The fuel pressure regulator is located within the fuel pump module. It is serviced by replacing the fuel pump module assembly.

FILTER-FUEL

DESCRIPTION

Two fuel filters are used. One is located at the bottom of the fuel pump module. The other is located inside the module. A separate frame mounted fuel filter is not used with any engine.

Both fuel filters are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

FUEL INJECTION - 3.8L GAS ENGINE

PEDAL - ACCELERATOR

REMOVAL

The accelerator pedal and APPS (Accelerator Pedal Position Sensor) are serviced as a complete assembly including the bracket.

1. Disconnect electrical connector (3) at APPS.
2. Remove two accelerator pedal mounting bracket nuts (2).
3. Remove accelerator pedal/APPS assembly (1) from vehicle.

INSTALLATION

The accelerator pedal and APPS (Accelerator Pedal Position Sensor) are serviced as a complete assembly including the bracket.

1. Position accelerator pedal/APPS assembly over two mounting studs.
2. Install two accelerator pedal mounting bracket nuts (2).
3. Connect electrical connector (3) at APPS.
4. Before starting engine, operate accelerator pedal to check for any binding.

SENSOR - ACCELERATOR PEDAL POSITION

DESCRIPTION

The accelerator pedal and APPS (Accelerator Pedal Position Sensor) are serviced as a complete assembly including the bracket. Refer to Accelerator Pedal Removal and Installation procedures.

SENSOR - CRANKSHAFT POSITION

REMOVAL

The Crankshaft Position (CKP) sensor (2) is mounted into the right side of the transmission bellhousing (4). It is positioned and bolted into a machined hole.

1. Raise vehicle.
2. Disconnect sensor electrical connector (3).
3. Remove sensor mounting bolt (1).
4. Carefully twist sensor (2) from cylinder block.
5. Check condition of sensor o-ring.

INSTALLATION

1. Clean out machined hole in transmission bellhousing.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor (2) into transmission with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt (1), be sure sensor is completely flush to transmission bellhousing. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt (1) and tighten to 28 N·m (21 ft. lbs.).
5. Connect electrical connector (3) to sensor.
6. Lower vehicle.

INJECTOR - FUEL

REMOVAL

The fuel rail must be removed to gain access to the fuel injectors. Refer to Fuel Rail Removal.

1. Disconnect injector wiring connector from each injector.
2. Rotate injector (2) and pull out of fuel rail. The clip will stay on injector.
3. Check injector O-ring for damage. If O-ring is damaged, it must be replaced. If injector is reused, a protective cap must

be installed on injector tip to prevent damage. Replace injector clip if it is damaged.

4. Repeat procedures for remaining injectors.

INSTALLATION

1. If same injector(s) is being reinstalled, install new O-ring(s).
2. Apply a small amount of clean engine oil to each injector O-ring. This will aid in installation.
3. Push fuel injector(s) into fuel rail assembly (3) until clip has latched.
4. Install fuel rail. Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION).
5. Start engine and check for fuel leaks.

RELAY - FUEL PUMP

DESCRIPTION

The fuel pump relay is located in the TPIM (Totally Integrated Power Module).

SENSOR - INTAKE AIR TEMPERATURE

REMOVAL

The intake manifold air temperature (IAT) sensor (2) is installed into the rubber air intake tube (1) near the throttle body.

1. Disconnect electrical connector from IAT sensor.
2. Clean dirt from IAT sensor base.

3. Pull up on IAT sensor while rotating for removal.
4. Check condition of sensor O-ring.

INSTALLATION

The intake manifold air temperature (IAT) sensor (2) is installed into the rubber air intake tube (1) near the throttle body.

1. Clean mounting hole.
2. Check condition of sensor O-ring.
3. Push IAT sensor into rubber intake tube while rotating for installation.
4. Connect electrical connector to IAT sensor.

SENSOR - MAP

REMOVAL

The MAP sensor (1) is installed into the rear of the upper intake manifold (3).

1. Disconnect electrical connector from MAP sensor.
2. Clean dirt from MAP sensor base.
3. Pull up on MAP sensor while rotating counterclockwise about 1/4 turn for removal.
4. Check condition of sensor O-ring.

INSTALLATION

81920e96

The MAP sensor (1) is installed into the rear of the upper intake manifold (3).

1. Check condition of sensor O-ring.
2. Clean dirt from MAP sensor base.
3. Push down on MAP sensor while rotating clockwise about 1/4 turn for installation.
4. Disconnect electrical connector from MAP sensor.

SENSOR - OXYGEN

REMOVAL

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

WARNING: The exhaust manifold, exhaust pipes and catalytic converter become very hot during engine operation. Allow engine to cool before removing oxygen sensor.

81920e96

Sensor (1) is referred to as the 2/2 sensor. Sensor (2) is referred to as the 1/2 sensor.

Sensor (1) is referred to as the 1/1 sensor. Sensor (2) is referred to as the 1/2 sensor.

1. Raise and support vehicle.
2. Disconnect wire connector from O2S sensor.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

3. Remove O2S sensor (1) or (2) with an oxygen sensor removal and installation tool. Certain sensors may be removed with a 22mm or 7/8" wrench.
4. Clean threads in exhaust pipe using appropriate tap.

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT** add any additional anti-seize compound to threads of a new oxygen sensor.

1. Install O2S sensor. Tighten to 41 N·m (30 ft. lbs.) torque.
2. Connect O2S sensor wire connector.
3. Lower vehicle.
