VEHICLE DATA

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

The Vehicle Identification Number (VIN) plate is located on the lower windshield fence near the left A-pillar. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the VIN decoding chart to determine the identification of a vehicle.

The Vehicle Identification Number is also imprinted on the:

- Vehicle Safety Certification Label.
- Frame rail.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

VEHICLE IDENTIFICATION NUMBER DECODING CHART

POSITION	INTERPRETATION	CODE = DESCRIPTION
1	Country of Origin	1 = Manufactured By DaimlerChrysler Corporation
2	Make	J = Jeep
3	Vehicle Type	4 = Multipurpose Passenger Vehicle Less Side Air Bags 8 = Multipurpose Passenger Vehicle With Side Air Bags
4	Gross Vehicle Weight Rating	F = 4001 - 5000 lbs. (1815 - 2267 kg) G = 5001 - 6000 lbs. (2268 - 2721 kg)
5	Vehicle Line	A = Wrangler Left Hand Drive (4x4) B = Wrangler Left Hand Drive (4x2) E = Wrangler Right Hand Drive (4x4)
6	Series/Transmission	2 = L (Low Line) 3 = M (Medium) 5 = P (Premium) 6 = S (Sport) B = 4 Speed Automatic VLP - Sales Code (DGV) C = 6 Speed Manual - Sales Code (DEH) E = 5 Speed Automatic - Sales Code (DGQ)
7	Body Style	4 = Open Body (JK 72) 9 = Extended Open Body (JK 74)

8	Engine	1 = 3.8L V-6 CYL Gasoline (EGT) 9 = 2.8L I4 CYL Turbo Diesel Next Gen (ENS)
9	Check Digit	0 through 9 or X
10	Model Year	8 = 2008
11	Assembly Plant	L = Toledo South Assembly
12 – 17	Vehicle Build Sequence	

VEHICLE EMISSION CONTROL INFORMATION (VECI) LABEL

DESCRIPTION

All models have a Vehicle Emission Control Information (VECI) Label. DaimlerChrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

The VECI label contains the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The label also contains an engine vacuum schematic. These labels are permanently attached and cannot be removed without defacing information and destroying label.

VEHICLE CERTIFICATION LABEL

DESCRIPTION

A vehicle certification label is attached to every DaimlerChrysler Corporation vehicle. The label certifies that

the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWRs) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

INTERNATIONAL SYMBOLS

DESCRIPTION

The graphic symbols illustrated in the following International Control and Display Symbols Chart are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

FASTENER IDENTIFICATION

DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 8.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts.

FASTENER USAGE

DESCRIPTION

FASTENER USAGE

WARNING: Use of an incorrect fastener may result in component damage. Failure to follow these instructions may result in personal injury or death.

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

DESCRIPTION - THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

Individual Torque Charts appear within many of the Groups. Refer to the Standard Torque Specifications chart for torque references not listed in the individual torque charts.

0 - LUBRICATION AND MAINTENANCE

INTERNATIONAL SYMBOLS

DESCRIPTION

DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations.

PARTS & LUBRICANT RECOMMENDATION

DESCRIPTION

LUBRICANT RECOMMENDATIONS

Chassis

Component	Fluid, Lubricant, or Genuine Part
Steering Gear & Linkage, Ball Joints, Prop Shafts & Yokes, Wheel Bearings	Mopar® Multi-Purpose Grease NLGI Grade 2 EP, GC-LB

Body

Component	Fluid, Lubricant, or Genuine Part
Hinges:	
Door And Hood	Mopar® Engine Oil
Liftgate	Mopar® Multi-Purpose Grease NLGI Grade 2 EP, GC-LB
Latches:	
Door, Hood/Safety Catch, Liftgate	Mopar® Multi-Purpose Grease NLGI Grade 2 EP, GC-LB

Seat Regulator & Track	Mopar® Multi-Purpose Grease NLGI Grade 2 EP, GC-LB
Window System Components	Mopar® Spray White Lubricant
Lock Cylinders	Mopar® Lock Cylinder Lubricant
Parking Brake Mechanism	Mopar® Wheel Bearing Grease NLGI Grade 1, GC-LBB
Soft Top	Mopar® Soft Top Zipper Cleaner & Lubricant

FLUID TYPES

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a DaimlerChrysler Corporation vehicle:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by DaimlerChrysler Corporation.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

FLUID TYPES

DESCRIPTION

ENGINE OIL

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Européens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range. **Refer to your engine oil filler cap for the recommended engine oil viscosity for your vehicle.**

Engine Oil Viscosity (2.8L Diesel Engines)

For vehicles equipped with a Diesel Particulate Filter (DPF), use a fully synthetic, low ash oil that meets DaimlerChrysler Material Standard MS-11106.

For vehicles not equipped with a DPF, use a fully synthetic oil that meets DaimlerChrysler Material Standard MS-10725.

ACEA Categories

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). DaimlerChrysler only recommends API Certified engine oils. Use Mopar® engine oil or equivalent.

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.

- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded “regular” gasoline having an octane rating of 87. The routine use of premium gasoline is not recommended. Under normal conditions the use of premium fuel will not provide a benefit over high quality regular gasolines and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as “reformulated” gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly support the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number

without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasolines free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

ENGINE COOLANT

GAS ENGINES

WARNING: Antifreeze is an ethylene glycol based coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol based coolant properly, contact your government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol based coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DIESEL ENGINE

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Glysantin G 30–91 Antifreeze/Coolant, 5 Year/150,000 Mile Formula (ASTM D3306), or the equivalent ethylene glycol based coolant. This coolant offers the best engine cooling without corrosion when mixed with 50% coolant and 50% distilled water to obtain a freeze point of -36°C (-34°F). It is dyed purple to distinguish its unique chemistry from traditional green and yellow silicate coolants. If it loses color or becomes

contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The purple coolant **MUST NOT BE MIXED** with the orange, green or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Glystantin G 30–91 Antifreeze/Coolant, 5 Year/150,00 Mile Formula (ASTM D3306) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure.

TRANSFER CASE - NV241

Recommended lubricant for the NV241 transfer case is Mopar® ATF +4, Automatic Transmission Fluid.

MANUAL TRANSMISSION

NOTE: DaimlerChrysler recommends using Mopar® lubricants or lubricants of equal quality.

- NSG370 - Mopar® Manual Transmission Lubricant MS-9224

AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for DaimlerChrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used**. The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

POWER STEERING FLUID

The recommended fluid for the power steering system is Mopar ® ATF +4 and Mopar ® Power Steering Fluid + 4.

Mopar ® ATF+4, when new is red in color. The ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

A/C REFRIGERANT

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear and colorless liquefied gas.

CAUTION: R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure.

The A/C refrigerant system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the charge level should be checked if system performance deteriorates or if a noise or leak is suspected (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS).

OPERATION

AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

FLUID - CAPACITIES & RECOMMENDED SPECIFICATIONS

RECOMMENDED FLUIDS, LUBRICANTS AND GENUINE PARTS

ENGINE

Component	Fluid, Lubricant, or Genuine Part
Engine Coolant	Mopar ® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology)
Engine Oil	API Certified SAE 5W-20 Engine Oil is recommended. Meets the requirements of DaimlerChrysler Material Standard MS-6395. Refer to your engine oil filler cap for correct SAE grade.
Spark Plugs (3.8L Engine)	RE14PLP5 (Gap 0.050 in [1.27 mm])
Oil Filter (3.8L Engine)	Mopar ® Oil Filter (P/N 04105409AC)
Fuel Selection	87 Octane

ENGINE - EXPORT

Component	Fluid, Lubricant, or Genuine Part
Engine Coolant	Mopar ® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology)
Engine Oil - Gasoline (Non ACEA Categories)	Use API Certified SAE 5W-20 engine oil, meeting the requirements of DaimlerChrysler Material Standard MS-6395. Refer to your engine oil filler cap for correct SAE grade. SAE 5W-30 engine oil approved to MB 229.31 or MB 229.51 may be used when SAE 5W-20 engine oil is not available.
Engine Oil - Gasoline (ACEA Categories)	For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3, and approved to MB 229.31 or MB 229.51. SAE 5W-30 engine oil approved to MB 229.31 or MB 229.51 may be used when SAE 5W-20 engine oil is not available.
Engine Oil - Diesel (without Particulate Filter)	Use SAE 0W-40 diesel engine oils confirming to API Quality CI-4 or CJ-4. For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3 and approved to MB 229.31 or MB 229.51.
Engine Oil - Diesel (with Particulate Filter)	Use SAE 5W-30 diesel engine oils conforming to API Quality CI-4 or CJ-4. For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3 (LOW ASH) and approved to MB 229.31 or MB 229.51.
Spark Plugs (3.8L Engine)	RE14PLP5 (Gap 0.050" [1.27 mm])
Oil Filter (2.8L)	Mopar ® Oil Filter (P/N 5003558AA)

Diesel Engine)	
Oil Filter (3.8L Engine)	Mopar ® Oil Filter (P/N 04105409AC)
Fuel Selection (Gasoline Engines)	91 Octane
Fuel Selection (Diesel Engines)	50 Cetane or higher (Less than 15 ppm Sulfur)

CHASSIS

Component	Fluid, Lubricant, or Genuine Part
Automatic Transmission	Mopar ® ATF+4 Automatic Transmission Fluid
Manual Transmission	Mopar ® Manual Transmission Lubricant or equivalent (meeting the requirements of DaimlerChrysler Material Standard MS-9224)
Transfer Case	Mopar ® ATF+4 Automatic Transmission Fluid or equivalent.
Brake Master Cylinder	Mopar ® DOT 3 Brake Fluid, SAE J1703 should be used. If DOT 3, SAE J1703 brake fluid is not available, then DOT 4 is acceptable. Use only recommended brake fluids.
Power Steering Reservoir	Mopar ® ATF+4 Automatic Transmission Fluid Mopar ® Power Steering Fluid + 4, Mopar ® ATF+4 Automatic Transmission Fluid

CHASSIS - EXPORT

Component	Fluid, Lubricant, or Genuine Part
Automatic Transmission	Mopar ® ATF+4 Automatic Transmission Fluid
Manual Transmission	Mopar ® Manual Transmission Lubricant or equivalent (meeting the requirements of DaimlerChrysler Material Standard MS-9224)
Transfer Case	Mopar ® ATF+4 Automatic Transmission Fluid or equivalent.
Brake Master Cylinder	Mopar ® DOT 3 Brake Fluid, SAE J1703 should be used. If DOT 3, SAE J1703 brake fluid is not available, then DOT 4 is acceptable. Use only recommended brake fluids.
Power Steering Reservoir	Mopar ® ATF+4 Automatic Transmission Fluid Mopar ® Power Steering Fluid + 4, Mopar ® ATF+4 Automatic Transmission Fluid

AXLES

FRONT AXLE		U.S.	Metric
186 FBI (Model 30)	Mopar ® Gear Lubricant 80W-90	2.1 Pints	1.0 Liters
216 FBI (Model 44)	Mopar ® Gear Lubricant 80W-90	2.7 Pints	1.3 Liters
REAR AXLE			
226 FBI (Model 44)	Mopar ® Gear Lubricant 80W-90 (Trailer Towing Mopar ® Synthetic Gear Lubricant 75W-140)	4.75 Pints*	2.25 Liters
Trac-lok ® equipped axles require 0.1 L (3.4 ounces) of Limited Slip Additive in the lubricant.			

CAPACITIES

	U.S.	Metric
Fuel (Approximate) — 2 Door Models	18.5 Gallons	70 Liters
Fuel (Approximate) — 4-Door Models	22.5 Gallons	85 Liters
Engine Oil with Filter		
3.8 Liter Engine (SAE 5W-20, API Certified Engine Oil)	6 Quarts	5.7 Liters
Cooling System *		
3.8 Liter Engine (Mopar ® Antifreeze/Engine Coolant 5 Year/100,000 Mile (160 000 km) Formula)	13 Quarts	12 Liters
POWER STEERING SYSTEM		
Power steering fluid capacities are dependent on engine/chassis options as well as steering gear/cooler options. Depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these capacities may vary. Refer to 19, Steering for proper fill and bleed procedures.		
A/C REFRIGERANT SYSTEM		
Single Unit	1.125 lbs	0.51 kg
AUTOMATIC TRANSMISSION		

Service Fill - 45RFE/545RFE	4X2 - 5.5 Quarts)	4X2 - 5.2 Liters
	4X4 - 6.5 Quarts	4X4 - 6.2 Liters
Overhaul - 45RFE/545RFE	14.8–16.9 Quarts ¹	14-16 Liters
Service Fill - 42RLE	8.0 Pints	3.8 Liters
Overhaul Fill - 42RLE	17.6 Pints ¹	8.3 Liters
¹ Dry fill capacity. Depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these figures may vary (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/FLUID - STANDARD PROCEDURE) (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/FLUID - STANDARD PROCEDURE).		
TRANSFER CASE		
NV241	4.2 Pints	2.0 Liters
MANUAL TRANSMISSION		
NSG 370 Approximate dry fill or fill to bottom edge of the fill plug hole.	3.17 Pints	1.5 Liters
****Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.		
* Includes heater and coolant recovery bottle filled to MAX level.		

CAPACITIES - EXPORT

MAINTENANCE SCHEDULES

DESCRIPTION

MAINTENANCE SCHEDULES - NAFTA

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Non-EVIC equipped vehicles “CHANGE OIL” will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions the oil change indicator message will illuminate, this means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicles oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 6,000 miles (10,000 km) or 6 months, whichever comes first.**

Your dealer will reset the oil change indicator message after completing the scheduled oil change. If this scheduled oil change is performed by someone other than your dealer the message can be reset by referring to the steps described under “Odometer/Trip Odometer” in the “Instrument Cluster Description” section of this manual.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Check the manual transmission fluid level.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

Required Maintenance Intervals

	Perform Maintenance Every
--	---

	(Where time and mileage are listed, follow the interval that occurs first.)
--	--

Maintenance Items	Miles	Kilometers	or Months
Change the engine oil and engine oil filter.	6,000	10 000	6
Rotate tires.	6,000	10 000	6
If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter, replace if necessary.	12,000	20 000	12
Inspect the brake linings, replace if necessary.	12,000	20 000	12
Replace the air conditioning filter.	12,000	20 000	12
Inspect the front & rear axle fluid, change if using your vehicle for police, taxi, fleet, off-road or frequent trailer towing.	18,000	30 000	18
Inspect the CV Joints. Perform the first inspection at 12,000 miles (20 000 km) or 12 months.	24,000	40 000	24
Inspect exhaust system. Perform the first inspection at 12,000 miles (20 000 km) or 12 months.	24,000	40 000	24
Inspect the front suspension, tie rod ends and boot seals, replace if necessary.	24,000	40 000	24
Replace the engine air cleaner filter.	30,000	50 000	30
Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, snow plowing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more then 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).	30,000	50 000	30
Inspect the transfer case fluid.	30,000	50 000	30
Change the automatic transmission fluid and main sump filter if using your vehicle for any of the following: police, taxi, fleet or frequent trailer towing.	60,000	100 000	60
Change the transfer case fluid if using your vehicle for any of the following: police, taxi, fleet, off-road or frequent trailer towing.	60,000	100 000	60
Inspect and replace PCV valve if necessary.	90,000	150 000	90
Flush and replace the engine coolant.	102,000	170 000	60
Replace the ignition cables.	102,000	170 000	102
Replace the spark plugs.	102,000	170 000	102
Change the automatic transmission fluid, main sump filter, and spin-on cooler return filter (if equipped).	120,000	200 000	120
Replace accessory drive belt(s).	120,000	200 000	120

WARNING:

You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE SCHEDULES - EXPORT - GAS

To help you have the best driving experience possible, the manufacturer has identified the specific vehicle maintenance service intervals that are required to keep your vehicle operating properly and safely.

DaimlerChrysler Corporation recommends that these maintenance intervals be performed at your selling dealer. The technicians at your dealership know your vehicle best, and have access to factory trained information, genuine Mopar parts, and specially designed electronic and mechanical tools that can help prevent future costly repairs.

The maintenance intervals shown should be performed as indicated in this section.

NOTE: Under no circumstances should oil change intervals exceed 7,500 miles (12 000 km) or 6 months, whichever comes first.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Check the manual transmission fluid level.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

Severe Duty

If your vehicle is operated under the Severe Duty conditions listed below change your engine oil and filter every 3,000 miles (5 000 km) or 3 months as indicated in the Maintenance Schedule.

- Stop and go driving.

- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

Required Maintenance Intervals

	Perform Maintenance Every		
	(Where time and mileage are listed, follow the interval that occurs first.)		
Maintenance Items	Miles	Kilometers	or Months
Change the engine oil and engine oil filter if using your vehicle under any of the severe duty conditions: Short trips, stop and go driving, dusty or off-road conditions, police, taxi, fleet, or frequent trailer towing.	3,000	5 000	3
	or	or	or
Change the engine oil and engine oil filter if your vehicle is NOT operated under any of the conditions listed under Severe Duty .	7,500	12 000	6
Rotate tires.	7,500	12 000	6
If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter, replace if necessary.	15,000	24 000	12
Inspect the brake linings, replace if necessary.	15,000	24 000	12
Inspect the front & rear axle fluid, change if using your vehicle for police, taxi, fleet, off-road or frequent trailer towing.	15,000	24 000	12
Inspect the CV Joints. Perform the first inspection at 15,000 miles (24 000 km) or 12 months.	22,500	36 000	18
Inspect Exhaust System. Perform the first inspection at 15,000 miles (24 000 km) or 12 months.	22,500	36 000	18
Inspect the front suspension, tie rod ends and boot seals, replace if necessary.	22,500	36 000	18
Replace the engine air cleaner filter.	30,000	50 000	30
Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, snow plowing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more then 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).	30,000	50 000	30

Inspect the transfer case fluid.	30,000	50 000	30
Change the automatic transmission fluid & filter if using your vehicle for any of the following: police, taxi, fleet or frequent trailer towing.	60,000	100 000	60
Change the transfer case fluid if using your vehicle for any of the following: police, taxi, fleet, off-road or frequent trailer towing.	60,000	100 000	60
Inspect and replace PCV valve if necessary.	90,000	150 000	90
Flush and replace the engine coolant.	102,000	170 000	60
Replace the ignition cables.	102,000	170 000	102
Replace the spark plugs.	102,000	170 000	102
Change the automatic transmission fluid, main sump filter, and spin-on cooler return filter (if equipped).	120,000	200 000	120
Replace Accessory Drive Belt(s).	120,000	200 000	120

WARNING:

You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE SCHEDULES - EXPORT - DIESEL

Change Oil Message (Diesel Models with DPF (Diesel Particulate Filter) Only)

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Non-EVIC equipped vehicles “CHANGe OIL” will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions, the oil change indicator message will illuminate, this means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

Your dealer will reset the oil change indicator message after completing the scheduled oil change. If this scheduled oil change is performed by someone other than your dealer the message can be reset by referring to the steps described under “Odometer/Trip Odometer” in the “Instrument Cluster Description” section of this manual.

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule “**A**”. It is for vehicles that are not operated under any of the conditions listed under Schedule “**B**.”

Second is Schedule “**B**”. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

Once a Month

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, clean and tighten the terminals as required.
- Check the fluid levels of engine coolant/antifreeze deaeration bottle, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/antifreeze level, hoses, and clamps.
- Inspect engine accessory drive belts. Replace as necessary.
- Inspect for the presence of water in the fuel filter/water separator unit.

Schedule “A”

Kilometers	20 000	40 000	60 000	80 000	100 000
(Miles)	(12,500)	(25,000)	(37,500)	(50,000)	(62,500)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X		X		X
Replace the engine air filter element.		X		X	
Drain the fuel filter/water separator unit.	X	X	X	X	X

Replace the fuel filter/water separator unit.		X		X	
Replace the engine accessory drive belt.					X
Inspect the brake linings.		X		X	
Inspect the manual transmission fluid, add if necessary.		X		X	
Inspect the transfer case fluid, add if necessary.				X	

Kilometers	120 000	140 000	160 000	180 000	200 000
(Miles)	(75,000)	(87,500)	(100,000)	(112,500)	(125,000)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.		X		X	X
Replace the engine air filter element.	X		X		X
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.	X		X		X
Flush and replace the engine coolant.			X		X
Replace the engine accessory drive belt.					X
Replace the engine timing belt, and timing belt tensioner.					X
Inspect the brake linings.	X		X		X
Inspect the manual transmission fluid, add if necessary.	X		X		X
Inspect the transfer case fluid, add if necessary.			X		

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).

- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Kilometers	10 000	20 000	30 000	40 000	50 000
(Miles)	(6,250)	(12,500)	(18,750)	(25,000)	(31,250)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X		X		X
Replace the engine air filter element.		X		X	
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.				X	
Drain and refill the front and rear axle fluid.		X		X	
Inspect the brake linings.		X		X	
Inspect the manual transmission fluid, add if necessary.					X
Inspect the transfer case fluid, add if necessary.		X		X	
Drain and refill the front and rear axle fluid.		X		X	

Kilometers	60 000	70 000	80 000	90 000	100 000
(Miles)	(37,500)	(43,750)	(50,000)	(56,250)	(62,500)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.		X		X	
Replace the engine air filter element.	X		X		X
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.			X		
Replace the engine accessory drive belt.	X				
Inspect the brake linings.	X		X		X

Drain and refill the front and rear axle fluid.	X		X		X
Inspect the transfer case fluid, add if necessary.	X		X		X
Inspect the manual transmission fluid, add if necessary.					X
Drain and refill the automatic transmission fluid. Replace main sump filter and spin-on cooler return filter (if equipped).					X

Kilometers	110 000	120 000	130 000	140 000	150 000
(Miles)	(68,750)	(75,000)	(81,250)	(87,500)	(93,750)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X	X	X	X	X
Replace the engine air filter element.		X		X	
Replace the engine accessory drive belt.		X			
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.		X			
Inspect the brake linings.		X		X	
Inspect the manual transmission fluid, add if necessary.					X
Inspect the transfer case fluid, add if necessary.		X		X	
Drain and refill the front and rear axle fluid.		X		X	

Kilometers	160 000	170 000	180 000	190 000	200 000
(Miles)	(100,000)	(106,250)	(112,500)	(118,750)	(125,000)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.		X		X	
Replace the engine air filter element.	X		X		X
Replace the engine accessory drive belt.			X		
Replace the engine timing belt, and timing belt tensioner.					X

Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.	X				X
Flush and replace the engine coolant/anti-freeze.	X				
Inspect the brake linings.	X		X		X
Inspect the manual transmission fluid, add if necessary.					X
Drain and refill the automatic transmission fluid. Replace main sump filter and spin-on cooler return filter (if equipped).					X
Inspect the transfer case fluid, add if necessary.	X		X		X
Drain and refill the front and rear axle fluid.	X		X		X

! Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

HOISTING

STANDARD PROCEDURE - HOISTING RECOMMENDATIONS

Refer to the Owner's Manual for emergency vehicle lifting procedures.

When properly positioned, a floor jack can be used to lift a Jeep vehicle. Support the vehicle in the raised position with jack stands at the front and rear ends of the frame rails.

CAUTION: Do not attempt to lift a Jeep vehicle with a floor jack positioned under:

- A body side sill.
- A steering linkage component.
- A drive shaft.
- The engine or transmission oil pan.
- The fuel tank.
- A front suspension arm.
- Transfer case.

NOTE: Use the correct sub-frame rail or frame rail lifting locations only.

HOIST

Refer to the Owner's Manual for emergency vehicle lifting procedures.

A vehicle can be lifted with:

- A single-post, frame-contact hoist.
- A twin-post, chassis hoist.
- A ramp-type, drive-on hoist.

NOTE: When a frame-contact type hoist is used, verify that the lifting pads are positioned properly.

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When a chassis or drivetrain component is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist.

TOWING

STANDARD PROCEDURE - TOWING RECOMMENDATIONS

DaimlerChrysler Corporation recommends that a 4WD vehicle be transported on a flat-bed device. A Wheel-lift device can be used provided all the wheels are lifted off the ground using tow dollies.

SAFETY PRECAUTIONS

- Secure loose and protruding parts.
- Always use a safety chain system that is independent of the lifting and towing equipment.
- Do not allow towing equipment to contact the disabled vehicle's fuel tank.
- Do not allow anyone under the disabled vehicle while it is lifted by the towing device.
- Do not allow passengers to ride in a vehicle being towed.
- Always observe state and local laws regarding towing regulations.
- Do not tow a vehicle in a manner that could jeopardize the safety of the operator, pedestrians or other motorists.
- Do not attach tow chains, T-hooks, J-hooks, or a tow sling to a bumper, steering linkage, drive shafts or a non-reinforced frame hole.

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums.

A towed vehicle should be raised until lifted wheels are a minimum 100 mm (4 in) from the ground. Be sure there is adequate ground clearance at the opposite end of the vehicle, especially when towing over rough terrain or steep rises in the road. If necessary, remove the wheels from the lifted end of the vehicle and lower the vehicle closer to the ground, to increase the ground clearance at the opposite end of the vehicle. Install lug nuts on wheel attaching studs to retain brake drums.

FLAT-BED TOWING RAMP ANGLE

If a vehicle with flat-bed towing equipment is used, the approach ramp angle should not exceed 15 degrees.

VEHICLE TOWING

WARNING: When towing a disabled vehicle and the drive wheels are secured in a wheel lift or tow dollies, ensure the transmission is in the park position (automatic transmission) or a forward drive gear (manual transmission). Do not use sling-type towing equipment for this vehicle.

TOWING-FRONT END LIFTED (WHEEL LIFT)

1. Raise the rear of the vehicle off the ground and install tow dollies under rear wheels.
2. Attach the wheel lift to the front wheels.

TOWING-REAR END LIFTED (WHEEL LIFT ONLY)

1. Raise the front of the vehicle off the ground and install tow dollies under front wheels.
2. Attach the wheel lift to the rear wheels.

RECREATIONAL TOWING

Refer to the Owners Manual for towing procedures.

EMERGENCY TOW HOOKS

WARNING: Remain at a safe distance from a vehicle that is being towed via its tow hooks. The tow straps/chains could break and cause serious injury.

Some Jeep vehicles are equipped with front emergency tow hooks. The tow hooks should be used for **EMERGENCY** purposes only.

CAUTION: DO NOT use emergency tow hooks for tow truck hook-up or highway towing.

JUMP STARTING

STANDARD PROCEDURE - JUMP STARTING PROCEDURE

WARNING: Review all safety precautions and warnings in the battery system section of the service manual. (refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE)

- Do not jump start a frozen battery, personal injury can result.
- If equipped, do not jump start when maintenance free battery indicator dot is yellow or bright color.
- Do not jump start a vehicle when the battery fluid is below the top of lead plates.
- Do not allow jumper cable clamps to touch each other when connected to a booster source.
- Do not use open flame near battery.
- Remove metallic jewelry worn on hands or wrists to avoid injury by accidental arcing of battery current.
- When using a high output boosting device, do not allow battery voltage to exceed 16 volts. Refer to instructions provided with device being used.

Failure to follow these instructions may result in personal injury.

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

TO JUMP START A DISABLED VEHICLE:

1. Raise hood on disabled vehicle and visually inspect engine compartment for:

- Generator drive belt condition and tension.
- Fuel fumes or leakage, correct if necessary.
- Frozen battery.
- Yellow or bright color test indicator, if equipped.
- Low battery fluid level.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

2. When using another vehicle as a booster source, turn off all accessories, place gear selector in park or neutral, set park brake or equivalent and operate engine at 1200 rpm.

3. On disabled vehicle, place gear selector in park or neutral and set park brake or equivalent. Turn OFF all accessories.

4. Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.

5. On disabled vehicle, connect RED jumper cable clamp to battery positive (+) terminal. Connect BLACK jumper cable clamp to the engine as close to the ground cable connection as possible.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

6. Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 min.), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.
- When using a Booster vehicle, disconnect BLACK cable clamp from battery negative terminal.
Disconnect RED cable clamp from battery positive terminal.
- Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

EMERGENCY TOW HOOKS

DESCRIPTION — EMERGENCY TOW HOOKS

WARNING: Remain at a safe distance from a vehicle that is being towed via its tow hooks. The tow straps/chains could break and cause serious injury.

Some Jeep vehicles are equipped with front emergency tow hooks. The tow hooks should be used for **EMERGENCY** purposes only.

CAUTION: DO NOT use emergency tow hooks for tow truck hook-up or highway towing.

2 - SUSPENSION

SUSPENSION - ELECTRICAL DIAGNOSTICS

ACTIVE CHASSIS - ELECTRICAL DIAGNOSTICS

ACTIVE CHASSIS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

ASBS INTERMITTENT CONDITION

For a complete wiring diagram **Refer to Section 8W.**

Diagnostic Test

1. PERFORM ASBS INTERMITTENT CONDITION TEST

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Wiggle the wires while checking for shorts and open circuits.

Perform a voltage drop test on the related circuits between the suspected faulty component and the Automatic Sway-Bar System.

Inspect and clean all PCM, ASBS, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits.

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

Use the scan tool to perform a System Test if one applies to failing component.

A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes

- Perform the necessary repairs.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Test Complete.

C2100–BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously.

◦ **Set Condition:**

The Automatic Sway-Bar System detects that system voltage is below 9.0 volts for 60 seconds.

Possible Causes
INTERMITTENT BATTERY VOLTAGE LOW
CHARGING SYSTEM DTCS PRESENT
(A959) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
AUTOMATIC SWAY-BAR SYSTEM (ASBS)

Diagnostic Test

1. CHARGING SYSTEM DTCS PRESENT

Ignition on.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCs present?

Yes

- Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No

- Go to [2](#)
-

2. DTC IS ACTIVE

With the scan tool, select View DTCs in the ASBS.

Is the status Active for this DTC?

Yes

- Go to [3](#)

No

- Go to [5](#)
-

3. (A959) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the ASBS harness connector.

Turn the ignition on.

With a 12-volt test light connected to ground, check the (A959) Fused B+ circuit in the ASBS harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go to [4](#)

No

- Repair the (A959) Fused B+ circuit for an open circuit or high resistance.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

4. AUTOMATIC SWAY-BAR SYSTEM (ASBS)

View repair.

Repair

- Replace the Automatic Sway-Bar System Module in accordance with the Service information.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors. Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Test complete.

C2101–BATTERY VOLTAGE HIGH

819ca795

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

Continuously.

◦ **Set Condition:**

The Automatic Sway-Bar System detects that system voltage is above 16.0 volts for 10 seconds with engine RPM greater than 350.

Possible Causes
INTERMITTENT BATTERY VOLTAGE HIGH
CHARGING SYSTEM DTCS PRESENT
AUTOMATIC SWAY-BAR SYSTEM POWER CIRCUITS OPEN OR HIGH RESISTANCE
AUTOMATIC SWAY-BAR SYSTEM (ASBS)

Diagnostic Test

1. CHARGING SYSTEM DTCS PRESENT

Ignition on.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCs present?

Yes

- Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No

- Go to [2](#)
-

2. DTC IS ACTIVE

With the scan tool, select View DTCs in the ASBS Module.

Is the status Active for this DTC?

Yes

- Go to [3](#)

No

- Go to [5](#)
-

3. AUTOMATIC SWAY-BAR SYSTEM (ASBS) MODULE GROUND CIRCUITS OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the ASBS harness connector.

With a 12-volt test light connected to B+, check the Ground circuits in the ASBS harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the Ground circuits?

Yes

- Go to [4](#)

No

- Repair the Ground circuit(s) for an open circuit or high resistance.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

4. AUTOMATIC SWAY-BAR SYSTEM (ASBS) MODULE

View repair.

Repair

- Replace the ASBS Module in accordance with the Service information.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Test complete.

C2207–OFF–ROAD ECU INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on. The Automatic Sway-Bar System Module monitors its internal microprocessors for correct operation.

- **Set Condition:**

If the Automatic Sway-Bar System Module detects an internal fault, the DTC is set.

Possible Causes
ASBS - INTERNAL FAULT

Diagnostic Test

1. ASBS INTERNAL FAILURE DTC PRESENT

Turn the ignition on.
With the scan tool, read DTCs.
With the scan tool, erase DTCs.
Cycle the ignition switch.
With the scan tool, read DTCs.

Does the scan tool display ASBS INTERNAL FAILURE?

Yes

- Replace the Automatic Sway-Bar System Module in accordance with the Service information.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Perform the ASBS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ASBS INTERMITTENT CONDITION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - DIAGNOSIS AND TESTING).

U0146–LOST COMMUNICATION WITH CENTRAL GATEWAY

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
- **Set Condition:**

If the Automatic Sway-Bar System Module either fails to receive bus messages from the Engine Control Module (ECM) for approximately 500 ms, or it receives invalid messages from the ECM, or it detects messages from the ECM are of improper data length.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM POWER AND GROUND
ECM
AUTOMATIC SWAY-BAR SYSTEM (ASBS) MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Turn the ignition on.

With the scan tool, read and record ASBS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ASBS DTCs.

Cycle the ignition switch.

With the scan tool, read ASBS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. VERIFY THAT THE ECM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ECM is active on the bus.

Is the ECM active on the bus?

Yes

- Go To [4](#)

No

- Perform the Stored Lost Communication test procedure.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the ECM?

Yes

- Replace/update the ECM in accordance with the service information.

No

- Replace and program the Final Drive Control Module in accordance with Service Information.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition run time is greater than 1 second. Battery voltage between 10 and 16 volts. Engine run time greater than 3 seconds.

- **Set Condition:**

The PCM doesn't receive an ABS message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
ABS MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With a scan tool, select View PCM DTCs.

Is the DTC Active at this time?

Yes

- Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0415–IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram **Refer to Section 8W**

◦ When Monitored:

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with ABS condition present, and no system undervoltage or overvoltage condition present.

◦ Set Condition:

The Automatic Sway-Bar System Module is receiving implausible data for vehicle speed, wheel speed.

Possible Causes
ANTILOCK BRAKE SYSTEM DTCS PRESENT
AUTOMATIC SWAY-BAR SYSTEM (ASBS)

Diagnostic Test

1. ABS DTCS PRESENT

Ignition on, engine not running.

With the scan tool, read DTCs in the Antilock Brake Controller.

Are there any DTCs present?

Yes

- Refer to the symptom list and perform the applicable diagnostic procedure.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Replace the ASBS Module in accordance with the Service Information.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

U0447–IMPLAUSIBLE DATA RECEIVED FROM CENTRAL GATEWAY

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

◦ **Set Condition:**

When the Automatic Sway-Bar System Module detects an incorrect CAN message from the Totally Integrated Power Module (TIPM).

Possible Causes
ASBS CAN BUS DTCS
ENGINE DTCS
AUTOMATIC SWAY-BAR SYSTEM (ASBS) MODULE

Diagnostic Test

1. CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM TIPM

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

Yes

- Go To [2](#)

No

- Perform the ASBS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ASBS-INTERMITTENT CONDITION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - DIAGNOSIS AND TESTING).

Diagnostic Test

2. CHECK IF TIPM CAN BUS DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes

- Refer to the appropriate diagnostic. (Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK IF ENGINE DTCs ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTCs present?

Yes

- Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Automatic Sway-Bar System Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Final Drive Control Module in accordance with Service Information.
- Perform ASBS VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

STANDARD PROCEDURE

ASBS VERIFICATION TEST

Diagnostic Test

1. PERFORM ASBS VERIFICATION TEST

CAUTION: Before removing the ASBS harness connector, clean the connector and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

NOTE: If the SKIM, PCM or FCM was replaced, refer to the service information for proper programming procedures.

- Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
- Ensure that all accessories are turned off.
- Ensure that the battery is fully charged.
- With the scan tool, record and erase all DTC(s) from the ASBS
- Start and run the engine for 2 minutes while operating all functions of the system that caused the original concern.
- **NOTE: When a Stabilizer System DTC diagnostic is complete and all repairs have been made, running the Stabilizer Motor System Test and/or LED System Test can also provide verification that the DTC has been repaired and the system is operating normally.**
- Turn the ignition off, wait 5 seconds, then turn the ignition on. Using the scan tool, read DTC(s) from the ASBS.

Are any ASBS DTC(s) present or is the original condition still present?

Yes

- The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No

- The repair is complete.

SUSPENSION - SERVICE INFORMATION**WHEEL ALIGNMENT****WHEEL ALIGNMENT****DESCRIPTION**

Wheel alignment involves the correct positioning of the wheels in relation to the vehicle. The positioning is accomplished through suspension and steering linkage adjustments. An alignment is considered essential for efficient steering, good directional stability and to minimize tire wear. The most important measurements of an alignment are caster, camber and toe position.

CAUTION: Never attempt to modify suspension or steering components by heating or bending.

NOTE: Periodic lubrication of the front suspension/steering system components may be required. Rubber

bushings must never be lubricated. Refer to Lubrication And Maintenance for the recommended maintenance schedule.

OPERATION

- **CASTER** is the forward or rearward tilt of the steering knuckle from vertical. Tilting the top of the knuckle rearward provides positive caster. Tilting the top of the knuckle forward provides negative caster. Caster is a directional stability angle. This angle enables the front wheels to return to a straight ahead position after turns
- **CAMBER** is the inward or outward tilt of the wheel relative to the center of the vehicle. Tilting the top of the wheel inward provides negative camber. Tilting the top of the wheel outward provides positive camber. Incorrect camber will cause wear on the inside or outside edge of the tire. The angle is not adjustable, damaged component(s) must be replaced to correct the camber angle
- **WHEEL TOE POSITION** is the difference between the leading inside edges and trailing inside edges of the front tires. Incorrect wheel toe position is the most common cause of unstable steering and uneven tire wear. The wheel toe position is the **final** front wheel alignment adjustment
- **STEERING AXIS INCLINATION ANGLE** is measured in degrees and is the angle that the steering knuckles are tilted. The inclination angle has a fixed relationship with the camber angle. It will not change except when a spindle or ball stud is damaged or bent. The angle is not adjustable, damaged component(s) must be replaced to correct the steering axis inclination angle
- **THRUST ANGLE** is the angle of the rear axle relative to the centerline of the vehicle. Incorrect thrust angle can cause off-center steering and excessive tire wear. This angle is not adjustable, damaged component(s) must be replaced to correct the thrust angle

DIAGNOSIS AND TESTING

SUSPENSION AND STEERING SYSTEM

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT END NOISE	1. Loose or worn wheel bearings.	1. Adjust or replace wheel bearings.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.
EXCESSIVE PLAY IN STEERING	1. Loose or worn wheel bearings.	1. Adjust or replace wheel bearings.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.
	3. Loose or worn steering gear.	3. Adjust or replace steering gear.
FRONT WHEELS SHIMMY	1. Loose or worn wheel bearings.	1. Adjust or replace wheel bearings.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.

	3. Tires worn or out of balance.	3. Replace or balance tires.
	4. Alignment.	4. Align vehicle to specifications.
	5. Leaking steering damper.	5. Replace steering damper.
	6. Tire pressure.	6. Adjust tire pressure.
VEHICLE INSTABILITY	1. Loose or worn wheel bearings.	1. Adjust or replace wheel bearings.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.
	3. Tire pressure.	3. Adjust tire pressure.
	4. Alignment.	4. Align vehicle to specifications.
EXCESSIVE STEERING EFFORT	1. Loose or worn steering gear.	1. Adjust or replace steering gear.
	2. Power steering fluid low.	2. Add fluid and repair leak.
	3. Column coupler binding.	3. Replace coupler.
	4. Tire pressure.	4. Adjust tire pressure.
	5. Alignment.	5. Align vehicle to specifications.
VEHICLE PULLS TO ONE SIDE DURING BRAKING	1. Uneven tire pressure.	1. Adjust tire pressure.
	2. Worn brake components.	2. Repair brakes as necessary.
	3. Air in brake line.	3. Repair as necessary.
VEHICLE LEADS OR DRIFTS FROM STRAIGHT AHEAD DIRECTION ON UNCROWNED ROAD	1. Radial tire lead.	1. Cross front tires.
	2. Brakes dragging.	2. Repair brake as necessary.
	3. Weak or broken spring.	3. Replace spring.
	4. Uneven tire pressure.	4. Adjust tire pressure.
	5. Wheel Alignment.	5. Align vehicle.
	6. Loose or worn steering or suspension components.	6. Repair as necessary.
	7. Cross caster out of spec.	7. Align vehicle.
KNOCKING, RATTLING OR SQUEAKING	1. Worn shock bushings.	1. Replace shock.

IMPROPER TRACKING	2. Loose, worn or bent steering/suspension components.	2. Inspect, tighten or replace components as necessary.
	3. Shock valve.	3. Replace shock.
	1. Loose, worn or bent track bar.	1. Inspect, tighten or replace component as necessary.
	2. Loose, worn or bent steering/suspension components.	2. Inspect, tighten or replace components as necessary.

STANDARD PROCEDURE

HEIGHT MEASUREMENT

CURB HEIGHT

NOTE: The suspension is non-adjustable.

The vehicle suspension height should be measured before performing wheel alignment procedure. Also when front suspension components have been replaced. This measure must be performed with the vehicle supporting it's own weight and taken on both sides of the vehicle.

Front and rear curb heights are not adjustable. The spring selections at assembly determine curb height for acceptable appearance of the vehicle. Curb height dimensions assume full fluids (including fuel) and zero passengers. Refer to the table below for front curb height dimensions.

Vehicle curb height audits should be performed utilizing the following procedure:

NOTE: Make sure the vehicle is in 2WD when checking curb height.

1. Bounce the front of the vehicle five times.
2. Measure and record the dimensions

Front – On each side of the vehicle, measure the distance from the bottom of the jounce bumper cup (1) to the top lip of the inner spring seat on axle (2).

REAR CURB HEIGHT

Rear – On each side of the vehicle, measure the distance from the bottom of the jounce bumper cup (1) to the top (2) of the rear axle (3).

CURB HEIGHT SPECIFICATIONS

MODEL	FRONT	REAR
4X2	63 mm / +25 mm to -12 mm	102 mm / +25 mm to -12 mm

+25 mm -12 mm	± 12 mm
(0.984 in. - 0.47 in)	(± 0.47 in)

CAMBER

Before each alignment reading the vehicle should be jounced (rear first, then front). Grasp each bumper at the center and jounce the vehicle up and down three times. Always release the bumper in the down position.

The wheel camber angle is preset. This angle is not adjustable and cannot be altered.

CASTER

Before each alignment reading the vehicle should be jounced (rear first, then front). Grasp each bumper at the center and jounce the vehicle up and down three times. Always release the bumper in the down position.

Check the caster of the front axle for correct angle. Be sure the axle is not bent or twisted. Road test the vehicle and observe the steering wheel return-to-center position. Low caster will cause poor steering wheel return ability.

During the road test, turn the vehicle to both the left and right. If the steering wheel returns to the center position unassisted, the caster angle is correct. However, if steering wheel does not return toward the center position unassisted, a low caster angle is probable.

Caster can be adjusted by installing a Mopar® cam adjustment kit located between the notches in the axle

bracket (3) and moving the lower suspension arm (1) at the axle forward or rearward.

The lower suspension arm will have to be removed at the axle bracket and then the knock-outs will have to be removed in order for the kit to be installed. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).

NOTE: Changing caster angle will also change the front propeller shaft angle. The propeller shaft angle has priority over caster. Refer to Group 3, Differential and Driveline for additional information.

TOE POSITION

Before each alignment reading the vehicle should be jounced (rear first, then front). Grasp each bumper at the center and jounce the vehicle up and down three times. Always release the bumper in the down position.

NOTE: The wheel toe position adjustment is the final adjustment. This adjustment must be performed with the engine running, if the vehicle is equipped with power steering.

1. Start the engine and turn wheels both ways before straightening the steering wheel. Center and secure the steering wheel.
2. Loosen the adjustment sleeve clamp bolts (2).
3. Adjust the total toe with the tie rod. Turn the knurled adjuster until the correct total toe is reached. Center both sockets at the knuckles and tighten the clamp bolts to 61 N·m (45 ft.lbs). **Make sure the toe setting does not change during clamp tightening.**

4. Adjust the drag link adjuster sleeve so that the left and right toe values are equal. Verify the steering wheel is still straight. Position the clamps as shown and tighten to 35 N·m (26 ft. lbs.).
5. Verify the toe specifications and turn off the engine.

FRONT

FRONT

DESCRIPTION

FRONT SUSPENSION

The front suspension is a link/coil design comprised of:

- Shock absorbers
- Jounce Bumper
- Coil springs
- Upper and lower suspension arms
- Stabilizer bar
- Track bar

CAUTION: Suspension components with rubber/urethane bushings (except stabilizer bar to frame and stabilizer bar to link attachments) should be tightened with the full weight of the vehicle at normal ride height. It is important to have the springs supporting the full weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

BUSHINGS

REMOVAL

STABILIZER BAR BUSHING

1. Raise and support the vehicle.
2. Remove the left upper stabilizer bar link nut from the stabilizer bar.
3. Remove the left lower stabilizer bar link bolt to the axle. **This will allow clearance to remove the stabilizer bar from the right side link without removing the whole link.**
4. Remove the right upper stabilizer bar link nut from the stabilizer bar.
5. Remove the splash shield.
6. Remove the right side stabilizer bar bracket bolts (3) to the frame.
7. Remove the left side stabilizer bar bracket bolts (3) to the frame.
8. Remove the stabilizer bar (1) to the bench.

9. Bend open the retaining tabs (1) on the bracket. **If these tabs (1) break that is okay, they are used for the factory installation only.**

10. Remove the retainer bracket (2).

11. Slide the bushings (3) off the stabilizer bar with a mixture of soapy water.

AXLE BUSHING

1. Remove the upper suspension arm from axle (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL).

2. Install the special tool 9948-3 Nut (1), 9948-1 Receiver (2) and 9948-2 Driver (4).

3. Press the bushing out of the axle housing.

AXLE BRACKET BUSHING

1. Remove the upper suspension arm from axle (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL).
2. Install the special tool 9948-3 Nut (1), 9948-1 Receiver (2), 9948-5 Spacer and 9948-2 Driver (4).
3. Press the bushing (5) out of the axle bracket (6).

INSTALLATION

STABILIZER BAR BUSHING

1. Slide the bushings (3) on the stabilizer bar with a mixture of soapy water.
2. Install the retainer bracket (2).

NOTE: Be sure to install the shear plate bracket (1) with the down turned part facing forward in vehicle.

3. Bend the retaining tabs (1) back into place on the bracket if they didn't break off. **If these tabs (1) break that is okay, they are used for the factory installation only and are not needed for proper operation.**

4. Install the stabilizer bar (1) to the vehicle.

NOTE: Stabilizer bar link to axle bolt should be tightened with vehicle sitting on its tires

5. Install the right side stabilizer bar bracket bolts (3) to the frame. Tighten to 61 N·m (45 ft.lbs).
6. Install the left side stabilizer bar bracket bolts (3) to the frame. Tighten to 61 N·m (45 ft.lbs).
7. Install the splash shield.
8. Install the right upper stabilizer bar link nut to the stabilizer bar. Tighten to 61 N·m (45 ft.lbs).
9. Install the left lower stabilizer bar link bolt to the axle. Tighten to 61 N·m (45 ft.lbs).
10. Install the left upper stabilizer bar link nut to the stabilizer bar. Tighten to 61 N·m (45 ft.lbs).

11. Remove the support and lower the vehicle.

AXLE BUSHING

1. Place special tool 9948-3 Nut (1), 9948-4 Driver (2), 9948-1 Receiver (5) and the press the bushing (3) in the axle housing (4).
2. Remove tools and install the upper suspension arm (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL).

AXLE BRACKET BUSHING

1. Place special tool 9948-3 Nut (1), 9948-1 Receiver (5), 9948-5 Spacer (3), 9948-4 Driver (2) and the press the bushing in the axle bracket (5).
2. Remove tools and install the upper suspension arm (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL).

HUB / BEARING

DESCRIPTION

The bearing used on the front hub of this vehicle is the combined hub and bearing unit type assembly. This unit assembly combines the front wheel mounting hub (flange) and the front wheel bearing into a one piece unit. The wheel mounting studs are the only replaceable component of the hub/bearing assembly.

OPERATION

The hub/bearing assembly is mounted to the steering knuckle and is retained by three mounting bolts accessible from the back of the steering knuckle. The hub/bearing unit is not serviceable and must be replaced as an assembly if the bearing or the hub is determined to be defective.

REMOVAL

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly. **Support the caliper, Do not let the caliper hang by the hose.**
3. Remove the disc brake caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the brake caliper adaptor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).

5. Remove the disc brake rotor (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

6. Remove the wheel speed sensor bolt (2).

7. Remove the wheel speed sensor (1) through the hole in the brake shield (2) (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - REMOVAL).

8. Remove the axle shaft nut if equipped.
9. Remove the 3 hub bearing mounting bolts (3) from the back of the steering knuckle. Remove hub bearing from the steering knuckle.

INSTALLATION

1. Install the hub bearing to the knuckle.
2. Install the hub bearing to knuckle and the 3 bolts (3) then tighten to 102 N·m (75 ft. lbs.).
3. Install the axle nut if equipped. Tighten to 136 N·m (100 ft. lbs.).

4. Install the wheel speed sensor (1) through the hole in the brake shield (2) (Refer to 5 - BRAKES/ELECTRICAL/Front WHEEL SPEED SENSOR - INSTALLATION).

5. Install the wheel speed sensor (1) into the hub & bearing and install the mounting bolt (2). Tighten to 4-6 N·m (34-50 in. lbs.).

6. Install the brake rotor (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

7. Install the brake caliper adaptor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).

8. Install the caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

9. Install the wheel and tire assembly (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE).

10. Remove the support and lower the vehicle.

JOUNCE BUMPER

DESCRIPTION

The jounce bumpers are mounted under the frame rails inside of the coil springs.

KNUCKLE

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.

3. Remove the outer tie rod end nut.

4. Separate the tie rod (3) from the knuckle (1) using special tool 9360 separator (2).

5. Remove the drag link nut. **Right side only.**

6. Separate the drag link (3) from the knuckle (1) using special tool 9360 separator (2) **Right side only.**

7. Remove the disc brake caliper adapter bolts (3). **support the disc brake caliper (4) do not let it hang by the brake hose.**

8. Remove the disc brake rotor (3).

9. Remove axle shaft nut (if equipped).

10. Remove the wheel speed sensor mounting bolt (2).

11. Remove the wheel speed sensor (1) through the hole in the brake shield (2).

12. Remove the lower ball joint cotter pin and nut (4).
13. Remove the upper ball joint cotter pin and nut.
14. Separate the lower ball joint from the knuckle (1) using special tool C-4150A puller (3).

15. Separate the upper ball joint from the knuckle (1) using special tool 9360 separator (2).
16. Remove the knuckle from the vehicle and transfer the hub/bearing with brake shield if needed.

INSTALLATION

1. Install the knuckle to the ball joint studs.
2. Install the upper ball joint nut and cotter pin. Tighten to
3. Install the lower ball joint nut and cotter pin. Tighten to

4. Install the wheel speed sensor (1) through the hole in the brake shield (2).

5. Install the axle shaft nut (if equipped). Tighten to 136 N·m (100 ft.lbs).
6. Install the wheel speed sensor (1) in the hub/bearing and tighten the bolt (2) to 4-6 N·m (34-50 in. lbs.).

7. Install the disc brake rotor (3).

8. Install the disc brake caliper (4) and tighten the caliper adaptor mounting bolts (3) to

9. Install the drag link to the knuckle and install the mounting nut. Tighten to 74 Nm (55 ft-lbs). **Right side only.**

10. Install the drag link to the knuckle and install the mounting nut. Tighten to 74Nm (55 ft-lbs).

11. Install the tire and wheel assembly.

12. Remove the support and lower the vehicle.

UPPER BALL JOINT

DIAGNOSIS AND TESTING

UPPER BALL JOINT

To properly diagnose the upper ball joint readings from the dial indicator are necessary.

1. Raise and support the vehicle.
2. Attach a dial indicator (3) with the indicator resting on either the front or back sides of the steering knuckle (4) as close to the upper ball joint (1) as possible.
3. Set the dial indicator(3) to zero.
4. Insert a prybar (5) between the knuckle (4) and axle tube (2).
5. Record the radial upper ball joint movement. If this reading is above 1.5 mm (0.060 in) then replacement of the upper ball joint is necessary (Refer to 2 - SUSPENSION/Front/UPPER BALL JOINT - REMOVAL).

REMOVAL

1. Remove the steering knuckle (Refer to 2 - SUSPENSION/Front/KNUCKLE - REMOVAL).
2. Remove the axle shaft from the axle (Refer to 3 - DIFFERENTIAL & DRIVELINE/Front AXLE - 216FBI/AXLE SHAFTS - REMOVAL). **4X4 only.**

3. Position special tool 6761 (RECEIVER) (2) and 6289-3 (DRIVER) (4) with C-4212-F (PRESS)(1) as shown to remove upper ball joint.

INSTALLATION

1. Position special tool 6752 (DRIVER) (2) and 6289-6 (RECEIVER) (5) with C-42121-F (PRESS) (1) as shown to install upper ball stud (3) .
2. Install the axle shaft into the axle (Refer to 3 - DIFFERENTIAL & DRIVELINE/Front AXLE - 216FBI/AXLE SHAFTS - INSTALLATION) **4X4 only**.
3. Install the steering knuckle (Refer to 2 - SUSPENSION/Front/KNUCKLE - INSTALLATION).

UPPER CONTROL ARM

DESCRIPTION

The upper suspension arms are steel and use rubber bushings at each end of the arm. The arms mount to the frame rail bracket and the axle brackets.

OPERATION

The arm and bushings provide location and react to loads from the axle. The bushings provide isolation from the axle.

REMOVAL

1. Raise and support the vehicle.
2. Remove electrical clip from the control arm clevis bracket
If equipped.
3. Remove the upper suspension arm nut and bolt (1) at the axle bracket.

4. Remove the nut and bolt (1) at the frame rail and remove the upper suspension arm (2).

INSTALLATION

1. Position the upper suspension arm (2) at the axle and frame rail.

NOTE: Axle bolt must be installed from the inboard to outboard.

2. Install the bolts and finger tighten the nuts (1).
3. Remove the supports and lower the vehicle.
4. Tighten the bolt at the axle and frame brackets to 102 N·m (75 ft. lbs.).

LOWER BALL JOINT

DIAGNOSIS AND TESTING

LOWER BALL JOINT

To properly diagnose the lower ball joint readings from the dial indicator are necessary.

1. Raise and support the vehicle.
2. Attach a dial indicator (4) with the indicator resting on the flat part of the steering knuckle (3) by the lower ball stud .
3. Set the dial indicator (4) to zero.
4. Pry between the knuckle (3) and the axle tube yoke (2) next to the upper ball joint using a pry bar (1), Record the reading on the dial indicator.
5. Axial measurement for a total lower ball joint movement, If

this reading is above 1.25 mm (0.050 in) then replacement of the lower ball joint is necessary (Refer to 2 - SUSPENSION/FRONT/LOWER BALL JOINT - REMOVAL).

REMOVAL

1. Remove the hub/bearing (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - REMOVAL).
2. Remove the axle shaft from the axle (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - 216FBI/AXLE SHAFTS - REMOVAL) **4X4 only**.
3. Remove the steering knuckle (1) (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL).

4. Position special tool 9949 (RECEIVER) (4) and 8975-4 (DRIVER) (2) with tool C4212-F (PRESS)(1) as shown to remove lower ball stud .

INSTALLATION

1. Position special tool 9950 (DRIVER) (5) and 6289-12 (RECEIVER) (2) with C4212-F (PRESS) (1) as shown to install lower ball stud (4).
2. Install the axle shaft into the axle (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - 216FBI/AXLE SHAFTS - INSTALLATION).
3. Install the hub/bearing (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - INSTALLATION).
4. Install the steering knuckle (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION).

LOWER CONTROL ARM

DESCRIPTION

The lower suspension arms are steel and use bushings at both ends of the arm. The arms mount to the frame rail bracket and the axle brackets.

OPERATION

The lower suspension arm bushings provide isolation from the axle. The arm and bushings provide location and react to loads from the axle. The lower suspension arms can be used to adjust caster and pinion angle by installing a cam bolt service package.

REMOVAL

1. Raise and support the vehicle.

NOTE: If the vehicle is equipped with a cam bolt service kit, paint or scribe marks on the cam adjuster and the suspension arm for installation reference.

2. Remove the lower suspension arm nut and cam/bolt (3) from the axle.
3. Remove the nut and bolt (3) from the frame rail bracket and remove the lower suspension arm (4).

INSTALLATION

1. Position the lower suspension arm (4) in the axle bracket and frame rail bracket.

NOTE: Position the paint dot located on the control arm toward the axle and facing outboard. If paint dot is not visible, the bend should point inboard, and the short end should attach to the axle side.

NOTE: Frame and axle bolts should be installed outboard to inboard.

2. Install the frame bolt and nut (3) finger tighten.
3. Install bolt and new nut (3) finger tighten in the axle.
4. Lower the vehicle.
5. Tighten axle bracket nut to 169 N·m (125 ft. lbs.).
6. Tighten frame bracket nut to 169 N·m (125 ft. lbs.).
7. Align vehicle to specifications. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

SHOCK

DESCRIPTION

The top of the shock absorbers are bolted to a frame bracket. The bottom of the shocks are bolted to the axle brackets.

OPERATION

The shock absorbers dampen jounce and rebound motion of the vehicle over various road conditions and limit suspension rebound travel.

DIAGNOSIS AND TESTING

SHOCK ABSORBER

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

REMOVAL

1. Raise and support the vehicle.
2. Remove the inner fender well.
3. Remove the nut, retainer and grommet (2) from the upper stud (1).

4. Remove the lower nut and bolt (2) from the axle bracket and remove the shock absorber (1).

INSTALLATION

1. Position the retainer and grommet (2) on the upper stud (1). Insert the shock absorber (3) through the shock bracket hole and tighten to 27 N·m (20 ft. lbs.).

2. Install the lower part of the shock (1) into the bracket.
 3. Install the lower bolt and nut (2). Tighten nuts to 76 N·m (56 ft. lbs.).
 4. remove the support and lower the vehicle.

SPRING

DESCRIPTION

The coil springs mount up in the wheelhouse which is part of the frame. A rubber doughnut isolator is located between the top of the spring and the bracket. The bottom of the spring seats on the axle pad.

OPERATION

The coil springs control ride quality and maintain proper ride height. The isolators provide road noise isolation.

REMOVAL

1. Raise and support the vehicle.
2. Remove the wheel and tire assemblies.
3. Position a hydraulic jack under the axle to support it.
4. Remove the front shocks at the lower mountings, (Refer to 2 - SUSPENSION/FRONT/SHOCK - REMOVAL).
5. Remove lower suspension arms mounting nuts and bolts from the frame, (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).
6. Remove the track bar from the axle bracket, (Refer to 2 - SUSPENSION/FRONT/TRACK BAR - REMOVAL).
7. Remove the right side of the drag link from the right side knuckle, (Refer to 19 - STEERING/LINKAGE/DAG LINK - REMOVAL).
8. Lower the axle until the spring is free from the upper mount.

NOTE: Rotation of the spring and prying down slightly on the axle will aid in removal.

9. Remove the upper spring isolator. (if needed)
10. Pull jounce bumper out of mount. (if needed)

INSTALLATION

1. Install jounce bumper into mount.
2. Install the spring isolator.

NOTE: Rotation of the spring and prying down slightly on the axle will aid in installation.

3. Position the coil spring on the axle pad. It may be necessary to rotate the spring while installing.
4. Raise the axle into position until the spring seats in the upper mount.
5. Install the shock at the axle, (Refer to 2 - SUSPENSION/FRONT/SHOCK - INSTALLATION).
6. Install the track bar to the axle bracket, (Refer to 2 - SUSPENSION/FRONT/TRACK BAR - INSTALLATION).
7. Install the lower suspension arms to the frame. Install mounting bolts and nuts finger tight, (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).
8. Install the drag link to the right side knuckle, (Refer to 19 - STEERING/LINKAGE/DAG LINK - INSTALLATION).
9. Remove the hydraulic jack from under the axle.
10. Install the wheel and tire assemblies, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
11. Remove the supports and lower the vehicle.
12. Tighten the lower suspension arms nuts to 169 N·m (125 ft. lbs.) at normal ride height with the vehicle weight.

STABILIZER BAR

DESCRIPTION

STABILIZER BAR

The stabilizer bar is on the bottom of the frame rails. Links are connected from the bar to the axle brackets. The stabilizer bar and links are isolated by rubber bushings.

DISCONNECTING STABILIZER BAR

This feature will provide feedback to the driver and be controlled by an electronic module which communicates via CAN C at 500 kbps. The disconnecting stabilizer bar module will read the ignition switch, vehicle speed, transfer case, and stabilizer bar switch messages on the CAN C bus and control the disconnecting stabilizer bar. The module will send a stabilizer bar status message and a lighting message on CAN C.

DISCONNECTING STABILIZER SWITCH

The instrument panel switch pod (1) is located just below the heater and air conditioner controls in the center stack area of the instrument panel. This switch is available in multiple configurations, which varies from two single push button switches to as many as five push button switches, or four switches and an indicator lamp, depending upon the optional equipment in the vehicle. The pod may include the following switches or indicators:

- **Front Sway Bar Disconnect Switch (2)**
- **Axle Locker Switch (6)**
- **Hazard Warning Switch (3)**
- **Headlamp Leveling Switch (Not Shown)**
- **Passenger Airbag On/Off Indicator (5)**
- **Electronic Stability Program (ESP) Switch (4)**

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active. Only the hazard warning switch push button latches, while the remaining switches feature momentary operation.

Four screws (3) secure the switch to the back of the instrument panel center bezel through integral mounting tabs that are molded into each corner of the switch housing. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out

and connector of the instrument panel wire harness.

Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches in the lower instrument panel switch pod cannot be repaired and are not serviced separately. If any component within the switch pod is ineffective or damaged, the entire switch pod unit must be replaced. For switch replacement (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - REMOVAL).

OPERATION

STABILIZER BAR

The stabilizer bar is used to control vehicle body roll during turns. The bar helps to control the vehicle body in relationship to the suspension.

DISCONNECTING STABILIZER BAR

STABILIZER BAR FAILSAFE

Stabilizer bar will ENGAGE with the loss of ignition switch, vehicle speed, or stabilizer bar switch signals

DISENGAGE

The bar will DISENGAGE when ALL the following conditions are met:

- vehicle speed under 18 MPH
- automatically at speeds over 14 MPH if the switch is in the ON position

transfer case in 4 HI or 4 LO

- stabilizer bar switch message received for DISENGAGE
- ignition switch in the RUN or START position
- no stabilizer bar faults detected

ENGAGE

The bar will ENGAGE when ANY of the following conditions are met:

- vehicle speed is greater or equal to 18 MPH
- stabilizer bar switch message received for ENGAGE
- transfer case in 2WD or neutral

DISCONNECTING STABILIZER BAR SWITCH

The disconnecting stabilizer bar system will latch the momentary switch (2) through software for an ignition switch OFF condition if the stabilizer bar was DISENGAGED and the transfer case was in 4LO at ignition switch OFF. Upon ignition switch RUN/START and the transfer case in 4LO, the system checks to verify all conditions to DISENGAGE the stabilizer bar are correct and then DISENGAGE the stabilizer bar without switch input.

The stabilizer switch LED will:

- Be ON SOLID when the stabilizer bar is DISENGAGED
- turn ON BLINKING when the stabilizer bar is transitioning from one state to another
- turn ON BLINKING when a request is received but conditions to DISENGAGE are not correct
- be turned OFF when the stabilizer bar is ENGAGED
- turn ON FAST BLINKING when there is a fault detected for the stabilizer bar
- turn OFF when the system is in diagnostic mode

REMOVAL

STABILIZER BAR

1. Raise and support the vehicle.
2. Remove the left upper stabilizer bar link nut (1) from the stabilizer bar.

3. Remove the right upper stabilizer bar link nut (2) from the stabilizer bar.

4. Remove the splash shield.

5. Remove the right side stabilizer bar bracket bolts (3) to the frame.

6. Remove the left side stabilizer bar bracket bolts (3) to the frame.

7. Remove the stabilizer bar (1) to the bench.

DISCONNECTING STABILIZER BAR

WARNING: The disconnecting stabilizer bar unit is not serviced separately from the bar. Do not disassemble this unit from the stabilizer bar.

NOTE: The stabilizer links, stabilizer bar retainers/bushings and the stabilizer bar as a complete unit only are serviceable. The new bar consists of the disconnecting unit and electronic actuator (1) attached as an assembly to the bar (2).

1. Raise and support the vehicle.
2. Hold the stabilizer link (1) shafts with a wrench and remove the link nuts (2) at the stabilizer bar.

NOTE: Before removing the connector (3) from the actuator clean the outside of the connector with a cleaner and compressed air, to remove any dirt or debris.

3. Disconnect the electronic actuator electrical connector (3) for the disconnecting stabilizer bar.

4. Remove the stabilizer bar retainers (4) from the frame rails and remove the stabilizer bar (1).

INSTALLATION

STABILIZER BAR

1. Install the stabilizer bar (1) to the vehicle.

NOTE: Stabilizer bar link to axle bolt should be tightened with vehicle sitting on its tires

2. Install the right side stabilizer bar bracket bolts (3) to the frame. Tighten to 102 N·m (75 ft. lbs.).

3. Install the left side stabilizer bar bracket bolts (3) to the frame. Tighten to 102 N·m (75 ft. lbs.).

4. Install the splash shield.

5. Install the right upper stabilizer bar link nut (2) to the stabilizer bar. Tighten to 102 N·m (75 ft. lbs.).

6. Install the left upper stabilizer bar link nut (1) to the stabilizer bar. Tighten to 102 N·m (75 ft. lbs.).
7. Remove the support and lower the vehicle.

DISCONNECTING STABILIZER BAR

WARNING: The disconnecting stabilizer bar unit (1) is not serviced separately from the bar (2). Do not disassemble this unit from the stabilizer bar.

NOTE: The stabilizer links, stabilizer bar retainers/bushings and the stabilizer bar as a complete unit only are serviceable. The new bar consists of the disconnecting unit and electronic actuator (1) attached as an assembly to the bar.

1. Position the stabilizer bar (1) on the frame rail and install the retainers (4) with bushings (2) and bolts (3). Ensure the bar is centered with equal spacing on both sides.
2. Tighten the retainer bolts (3) to 61 N·m (45 ft. lbs.).

NOTE: The seal must be clean and intact in the electrical connector (3) when reconnecting to the actuator (1).

3. Reconnect the electronic actuator electrical connector (3) for the disconnecting stabilizer bar.

NOTE: Stabilizer bar link to axle bolt should be tightened with vehicle sitting on its tires

4. Install links (1) and nuts (2) to the stabilizer bar. Hold the link shaft with a wrench and tighten the nuts (2) to 102 N·m (75 ft. lbs.).

5. Remove the supports and lower the vehicle.

6. Using a scan tool program the new stabilizer bar to the vehicle.

STABILIZER LINK

REMOVAL

1. Raise and support the vehicle.

2. Remove the left upper stabilizer bar link nut (1) from the stabilizer bar.

3. Remove the left lower stabilizer bar link bolt (4) to the axle.

4. Remove the right upper stabilizer bar link nut (2) from the stabilizer bar.
5. Remove the right lower stabilizer bar link bolt (4) to the axle.
6. Remove the stabilizer link (1).

INSTALLATION

NOTE: Stabilizer bar link to axle bolt should be tightened with vehicle sitting on its tires

1. Install the stabilizer link (1) to the vehicle.
2. Install the right lower stabilizer bar link bolt (4) to the axle. Tighten to 102 N·m (75 ft. lbs.).
3. Install the right upper stabilizer bar link nut (2) to the stabilizer bar. Tighten to 102 N·m (75 ft. lbs.).

4. Install the left lower stabilizer bar link bolt (4) to the axle. Tighten to 102 N·m (75 ft. lbs.).
5. Install the left upper stabilizer bar link nut (1) to the stabilizer bar. Tighten to 102 N·m (75 ft. lbs.).
6. Remove the support and lower the vehicle.

TRACK BAR

DESCRIPTION

The front track bar is a forged component with non-replaceable bushings on the frame and axle sides.

OPERATION

The track bar is used to control front axle lateral movement and provides cross car location of the axle assembly.

REMOVAL

1. Raise and support the vehicle.
2. Remove the nut and bolt (2) from the frame rail bracket.

3. Remove the bolt and flag nut (1) from the axle bracket.
4. Remove the track bar (2).

INSTALLATION

1. Install the track bar (2) at axle tube bracket. Loosely install the retaining bolt and flag nut (1).

NOTE: Frame bolt must be installed from front to rear.

2. It may be necessary to pry the axle assembly over to install the track bar (1) at the frame rail. Install track bar at the frame rail bracket. Install the nut and bolt (2) at the frame rail bracket.
3. Remove the supports and lower the vehicle.
4. Tighten the bolt at the frame and axle bracket to 169 N·m (125 ft. lbs.).
5. Check toe if a new track bar was installed. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

REAR

REAR

DESCRIPTION

REAR SUSPENSION

The rear suspension is link/coil design comprised of:

- Shock absorbers
- Coil springs
- Upper and lower suspension arms
- Stabilizer bar
- Track bar

CAUTION: Suspension components with rubber/urethane bushings (except stabilizer bar) should be tightened with the full weight of the vehicle at normal ride height. It is important to have the springs supporting the full weight of the vehicle when the fasteners are torqued. This will maintain vehicle ride comfort and prevent premature bushing wear.

SPECIFICATIONS

TORQUE

DESCRIPTION	N•m	Ft. Lbs.	In. Lbs.
Shock Absorber Upper Bolts	50	37	—
Shock Absorber Lower Nut	76	56	—
Suspension Arm Lower Axle Bracket Nut	169	125	—
Suspension Arm Lower Frame Bracket Bolt	169	125	—
Suspension Arm Upper Axle Bracket Bolt	169	125	—
Suspension Arm Upper Frame Bracket Bolt	169	125	—
Stabilizer Bar Retainer Bolts	61	45	—
Stabilizer Bar Link Nut/Bolt	102	75	—
Stabilizer Bar to Link Nut	90	66	—
Track Bar Frame Bracket Nut	169	125	—
Track Bar Axle Bracket Bolt	169	125	—

JOUNCE BUMPER

DESCRIPTION

The jounce bumpers are mounted outside the coil spring to the frame rail.

OPERATION

The jounce bumpers are used to limit suspension travel in compression.

REMOVAL

1. Raise and support the vehicle.
2. Pry the jounce bumper out of the cup.
3. Remove the jounce bumper.

INSTALLATION

1. Install the jounce bumper into the cup by pushing upwards until fully seated.
2. Remove the supports and lower the vehicle.

UPPER CONTROL ARM

DESCRIPTION

The Upper suspension arms are steel and use bushings at each end of the arm. The arms are mounted from the frame to the axle brackets.

OPERATION

The bushings isolate axle and road noise. The arm and bushings provide location and react to loads from the axle.

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the upper suspension arm flagnut and bolt at the axle bracket.
4. Remove the flagnut and bolt (1) at the frame rail mount and remove the upper suspension arm (2).

INSTALLATION

NOTE: Position the paint dot located on the control arm toward the axle and facing outboard. If paint dot is not visible, the bend should point inboard, and the short end should attach to the axle side.

1. Position the upper suspension arm (2) in the axle bracket and frame rail mount.
2. Install the mounting bolt (1) and finger tighten.
3. Remove the supports and lower the vehicle.

4. Tighten the upper suspension arm bolts to 169 N·m (125 ft. lbs.) with vehicle weight.

LOWER CONTROL ARM

DESCRIPTION

The lower suspension arms are steel and use bushings at each end of the arm. The arms are mounted from the frame to the axle brackets.

OPERATION

The bushings isolate axle and road noise. The arm and bushings provide location and react to loads from the axle.

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the lower suspension arm nut and bolt at the axle bracket (4).

4. Remove the flagnut and bolt (4) at the frame rail mount and remove the lower suspension arm (3).

INSTALLATION

1. Position the lower suspension arm (3) in the axle bracket and frame rail mount.
2. Install the frame mounting bolt (4) finger tight.

3. Install the axle mounting bolt (4) and nut at the axle bracket finger tight.
4. Remove the supports and lower the vehicle.
5. Tighten the lower suspension arm bolts to 169 N·m (125 ft. lbs.) with vehicle weight.

SHOCK

DESCRIPTION

The top of the shock absorbers are bolted to the frame. The bottom of the shocks are bolted to the axle brackets.

OPERATION

The shock absorbers dampen jounce and rebound motion of the vehicle over various road conditions and limit suspension rebound travel.

DIAGNOSIS AND TESTING

SHOCK ABSORBER

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

REMOVAL

1. Raise and support the vehicle and the axle.
2. Remove the upper mounting bolts (1).

3. Remove the lower nut and bolt (2) from the axle bracket.
- Remove the shock absorber (1).

INSTALLATION

818d167c

1. Install the shock absorber (2) on the upper frame rail and install mounting bolts (1).
2. Tighten the upper bolts (1) to 50 N·m (37 ft. lbs.).

818b1f37

3. Install lower bolt and nut (2) finger tight.
4. Remove the supports and lower the vehicle.
5. Tighten the lower nut to 76 N·m (56 ft. lbs.).

SPRING

DESCRIPTION

The coil springs mount between the bottom of the frame rail and the top of the axle. A rubber doughnut isolator is located between the top of the spring and the frame rail. A plastic isolator is located between the bottom of the spring and the axle.

818d167c

OPERATION

The coil springs control ride quality and maintain proper ride height. The isolators are used to isolate road noise.

REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support it.
2. Disconnect the stabilizer bar links (3) from the axle brackets. (Refer to 2 - SUSPENSION/REAR/STABILIZER BAR - REMOVAL)

3. Disconnect the shock absorbers from the axle brackets (2). (Refer to 2 - SUSPENSION/REAR/SHOCK - REMOVAL)

4. Disconnect the track bar from the axle bracket (3). (Refer to 2 - SUSPENSION/REAR/TRACK BAR - REMOVAL).
5. Lower the axle until the spring (1) is free from the upper mount seat and remove the spring (1).

INSTALLATION

1. Position the coil spring (1) on the axle pad isolator.
2. Raise the axle into position until the spring seats on the upper isolator.

3. Connect the stabilizer bar links to the axle bracket (3). (Refer to 2 - SUSPENSION/REAR/STABILIZER LINK - INSTALLATION).

4. Connect the shock absorbers to the axle bracket (2). (Refer to 2 - SUSPENSION/REAR/SHOCK - INSTALLATION).

5. Connect the track bar to the frame axle bracket (3). (Refer to 2 - SUSPENSION/REAR/TRACK BAR - INSTALLATION).

6. Remove the supports (2) and lower the vehicle.

STABILIZER BAR

DESCRIPTION

The spring steel bar extends across the frame and mounts to the frame rails. Links are connected from the bar to the axle. The stabilizer bar and links are isolated by rubber bushings at the axle bracket, and attach to the stabilizer bar with a ball joint..

OPERATION

The stabilizer bar is used to control vehicle body roll during turns. The bar helps to control the vehicle body in relationship to the suspension.

REMOVAL

1. Raise and support the vehicle.
2. Remove the stabilizer bar link nuts (1) from the stabilizer bar.
3. Remove the link (4) from the stabilizer bar.

4. Remove the stabilizer bar retainer bolts (2) and retainers (3) from the frame and remove the bar (1).

INSTALLATION

1. Install the stabilizer bar (1) to the frame and install the retainers (3) and bolts (2).

NOTE: Ensure the bar is centered with equal spacing on both sides.

2. Tighten the retainer bolts (2) to 61 N·m (45 ft. lbs.).

3. Install the links (4) onto the stabilizer bar. Install the nut (1) finger tight.
4. Support the axle and Tighten the link nut (1) to 90 N·m (66 ft. lbs.).

STABILIZER LINK

REMOVAL

1. Raise and support the vehicle.
2. Remove the rear tire.
3. Support the rear axle with a jack.
4. Remove the upper link nut at the stabilizer bar.
5. Remove the lower link nut & bolt (3) at the axle.
6. Remove stabilizer link (4).

INSTALLATION

NOTE: The stabilizer bar link to axle bracket fastener must be tightened with full vehicle weight.

1. Install the stabilizer link (4) to the vehicle.
2. Install the upper nut (1) for the stabilizer link to the stabilizer bar and tighten to 90 N·m (66 ft. lbs.).
3. Install the nut & bolt (3) to the axle and tighten to 102 N·m (75 ft. lbs.).
4. Remove the jack and lower the vehicle.

TRACK BAR

REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the track bar bolt at the axle bracket (1).

3. Remove the track bar bolt and nut (2) from the frame bracket.
4. Remove the track bar (1) from the vehicle.

INSTALLATION

1. Install the track bar (1) to the vehicle.

NOTE: Frame bolt must be installed from the front to the rear of the vehicle.

2. Install the track bar bolt and flagnut (2) in the frame bracket.

3. Install the track bar (2) into the axle bracket.
4. Install the track bar bolt and flagnut (1) in the axle bracket.
5. Remove the supports and lower the vehicle.
6. Tighten the frame and axle mounting bolt/nut to 169 N·m (125 ft. lbs.) **with full vehicle weight.**

3 - DIFFERENTIAL & DRIVELINE

DIFFERENTIAL & DRIVELINE - ELECTRICAL DIAGNOSTICS

DIFFERENTIAL & DRIVELINE - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

C1417–FRONT DIFFERENTIAL CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

▪ **When Monitored:**

Ignition on. Front Axle Lock engaged.

▪ **Set Condition:**

The TIPM detects the Front Locker Control circuit is shorted low.

Possible Causes
(A104) FUSED B+ CIRCUIT OPEN OR SHORTED TO GROUND
(G304) FRONT LOCKER RELAY CONTROL CIRCUIT SHORTED TO GROUND
(G304) FRONT LOCKER RELAY CONTROL CIRCUIT OPEN
FRONT LOCKER (OFF-ROAD) RELAY
FRONT LOCKER SOLENOID
TOTALLY INTEGRATED CONTROL MODULE (TIPM)

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To [2](#)

No

- Go To [8](#)

2. FRONT LOCKER SOLENOID OPERATION

NOTE: Before continuing with the below diagnostic test, ensure the TIPM harness connector seal is installed correctly. Inspect the terminals on both

harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

Turn the ignition off.

Disconnect the Front Locker Solenoid harness connector.

Ignition on, engine not running.

Using a 12-volt test light, jump across from the (T520)

Front Locker Relay Output circuit and the (Z905)

Ground circuit in the Front Locker harness connector.

With the scan tool, actuate the Front Locker Solenoid.

Does the test light illuminate and flash on and off?

Yes

- Inspect the Front Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. If OK, replace the Front Locker Solenoid in accordance with the Service Manual.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. FRONT LOCKER (OFF ROAD) RELAY

Turn the ignition off.

Verify the Front Locker (OFF-ROAD) Relay is installed properly and that the terminals are making a tight fit.

Remove the Front Locker (OFF-ROAD) Relay and substitute it with a known good Relay.

Ignition on, engine not running.

Using a 12-volt test light, jump across from the (T520)

Front Locker Relay Output circuit and the (Z905)

Ground circuit in the Front Locker harness connector.

With the scan tool, actuate the Front Locker Solenoid.

Does the test light illuminate and flash on and off?

Yes

- Replace the Front Locker (OFF-ROAD) Relay.

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. (A104) FUSED B+ FOR VOLTAGE

Turn the ignition off.

Remove the Front Locker (OFF-ROAD) Relay.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check the (A104) Fused B+ circuit in the Front Locker (OFF-ROAD) relay connection.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To [5](#)

No

- Repair (A104) Fused B+ circuit for an open or a

short to ground.

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. (G304) FRONT LOCKER RELAY CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the C2 TIPM harness connector.
Measure the resistance between ground and the (G304) Front Locker Relay Control circuit at the relay connection.

Is the resistance below 100 ohms?

Yes

- Repair the (G304) Front Locker Relay Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [6](#)

6. (G304) FRONT LOCKER RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (G304) Front Locker Relay Control circuit between the TIPM C1 harness connector and the Front Locker (OFF-ROAD) relay connection.

Is the resistance below 5.0 ohms?

Yes

- Repair (G304) Front Locker Relay Control circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. TOTALLY INTEGRATED POWER MODULE (TIPM)

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace and program the TIPM in accordance with Service Information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?**Yes**

- Repair as necessary.
- Perform TIPM VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Test Complete.

C1418–FRONT DIFFERENTIAL CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

▪ **When Monitored:**

Ignition on. Front Axle Lock engaged.

▪ **Set Condition:**

The TIPM detects the Front Locker Control circuit is shorted high.

Possible Causes
(G304) FRONT LOCKER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
FRONT LOCKER (OFF-ROAD) RELAY
FRONT LOCKER SOLENOID
TOTALLY INTEGRATED CONTROL MODULE (TIPM)

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

2. FRONT LOCKER SOLENOID OPERATION

NOTE: Before continuing with the below diagnostic test, ensure the TIPM harness connector seal is installed correctly. Inspect the terminals on both harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

Turn the ignition off.
 Disconnect the Front Locker Solenoid harness connector.
 Ignition on, engine not running.
 Using a 12-volt test light, jump across from the (T520) Front Locker Relay Output circuit and the (Z905) Ground circuit in the Front Locker harness connector.
 With a scan tool, actuate the Front Locker Solenoid.

Does the test light flash on and off?

Yes

- Inspect the Front Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. If OK, replace the Front Locker Solenoid in accordance with the Service Manual.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. FRONT LOCKER (OFF ROAD) RELAY

Turn the ignition off.
 Verify the Front Locker (OFF-ROAD) Relay is installed properly and that the terminals are making a tight fit.
 Remove the Front Locker (OFF-ROAD) Relay and substitute it with a known good Relay.
 Ignition on, engine not running.
 Using a 12-volt test light, jump across from the (T520) Front Locker Relay Output circuit and the (Z905) Ground circuit in the Front Locker harness connector.
 With the scan tool, actuate the Front Locker Solenoid.

Does the test light illuminate and flash on and off?

Yes

- Replace the Front Locker (OFF-ROAD) Relay.

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. (G304) FRONT LOCKER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the C2 TIPM harness connector.
 Remove the Front Locker (OFF-ROAD) Relay.
 Ignition on, engine not running.
 Measure the voltage on the (G304) Front Locker Relay Control circuit at the relay connection.

Is there any voltage present?

Yes

- Repair the (G304) Front Locker Relay Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. TOTALLY INTEGRATED POWER MODULE (TIPM)

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace and program the TIPM in accordance with Service Information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Test Complete.

C141D-REAR DIFFERENTIAL CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on. Rear Axle Lock engaged.

▪ **Set Condition:**

The TIPM detects the Rear Locker Control circuit is shorted low.

Possible Causes
(A104) FUSED B+ CIRCUIT OPEN OR SHORTED TO GROUND
(G305) REAR LOCKER RELAY CONTROL CIRCUIT SHORTED TO GROUND
(G305) REAR LOCKER RELAY CONTROL CIRCUIT OPEN
REAR LOCKER (OFF-ROAD) RELAY
REAR LOCKER SOLENOID
TOTALLY INTEGRATED CONTROL MODULE (TIPM)

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To [2](#)

No

- Go To [8](#)

2. REAR LOCKER SOLENOID OPERATION

NOTE: Before continuing with the below diagnostic test, ensure the TIPM harness connector seal is installed correctly. Inspect the terminals on both

harness connector and the module for damage. Failure to do so can result in misdiagnoses of the system.

Turn the ignition off.
 Disconnect the Rear Locker Solenoid harness connector.
 Ignition on, engine not running.
 Using a 12-volt test light, jump across from the (T526) Rear Locker Relay Output circuit and the (Z905) Ground circuit in the Rear Locker harness connector.
 With a scan tool, actuate the Rear Locker Solenoid.

Does the test light flash on and off?

Yes

- Inspect the Rear Locker Solenoid terminals and connectors for corrosion and/or dirt that may compromise the connection. If OK, replace the Rear Locker Solenoid.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. REAR LOCKER (OFF ROAD) RELAY

Turn the ignition off.
 Verify the Rear Locker (OFF-ROAD) Relay is installed properly and that the terminals are making a tight fit.
 Remove the Rear Locker (OFF-ROAD) Relay and substitute it with a known good Relay.
 Ignition on, engine not running.
 Using a 12-volt test light, jump across from the (T526) Rear Locker Relay Output circuit and the (Z905) Ground circuit in the Rear Locker harness connector.
 With the scan tool, actuate the Rear Locker Solenoid.

Does the test light illuminate and flash on and off?

Yes

- Replace the Rear Locker (OFF-ROAD) Relay.

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. (A104) FUSED B+ FOR VOLTAGE

Turn the ignition off.

Remove the Rear Locker (OFF-ROAD) Relay.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check the (A104) Fused B+ circuit in the Rear Locker (OFF-ROAD) relay connection.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To [5](#)

No

- Repair (A104) Fused B+ circuit for an open or a

short to ground.

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. (G305) REAR LOCKER RELAY CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the C2 TIPM harness connector.
Measure the resistance between ground and the (G305) Rear Locker Relay Control circuit at the relay connection.

Is the resistance below 100 ohms?

Yes

- Repair the (G305) Rear Locker Relay Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [6](#)

6. (G305) REAR LOCKER RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (G305) Rear Locker Relay Control circuit between the TIPM C1 harness connector and the Rear Locker (OFF-ROAD) relay connection.

Is the resistance below 5.0 ohms?

Yes

- Repair (G305) Rear Locker Relay Control circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. TOTALLY INTEGRATED POWER MODULE (TIPM)

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace and program the TIPM in accordance with Service Information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes

- Repair as necessary.
- Perform TIPM VERIFICATION TEST. (Refer to 2 - SUSPENSION/ACTIVE CHASSIS - STANDARD PROCEDURE)

No

- Test Complete.

- Replace the Rear Locker (OFF-ROAD) Relay.

5. TOTALLY INTEGRATED POWER MODULE (TIPM)

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace and program the TIPM in accordance with Service Information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Test Complete.

DIFFERENTIAL & DRIVELINE - SERVICE INFORMATION

PROPELLER SHAFT

PROPELLER SHAFT

DIAGNOSIS AND TESTING

PROPELLER SHAFT

VIBRATION

Tires that are out-of-round, or wheels that are unbalanced, will cause a low frequency vibration.

Brake drums/rotors that are unbalanced will cause a harsh, low frequency vibration.

Driveline vibration can also result from loose or damaged engine mounts.

Propeller shaft vibration increases as the vehicle speed is increased. A vibration that occurs within a specific speed range is not usually caused by a propeller shaft being unbalanced. Defective universal/CV joints, or an incorrect propeller shaft angle, are usually the cause of such a vibration.

DRIVELINE VIBRATION

Drive Condition	Possible Cause	Correction
Propeller Shaft Noise	1) Undercoating or other foreign material on shaft.	1) Clean exterior of shaft and wash with solvent.
	2) Loose flange bolts.	2) Install new bolts and tighten to proper torque.
	3) Loose or bent flange or excessive runout.	3) Install new flange.

	4) Incorrect driveline angularity.	4) Measure and correct driveline angles.
	5) Worn U-joint/CV bearings.	5) Install new propeller shaft.
	6) Propeller shaft damaged or out of balance.	6) Install new propeller shaft.
	7) Broken rear spring.	7) Install new rear spring.
	8) Excessive runout or unbalanced condition.	8) Re-index propeller shaft, test, and evaluate.
	9) Excessive drive pinion gear shaft runout.	9) Re-index propeller shaft and evaluate.
	10) Excessive axle flange deflection.	10) Inspect and replace flange if necessary.
	12) Excessive transfer case runout.	12) Inspect and repair as necessary.
Universal Joint /CV Noise	1) Loose clamping bolts.	1) Install new bolts and tighten to proper torque.

BALANCE

If propeller shaft is suspected of being out of balance, use the following procedure.

NOTE: Indexing propeller shaft 180 degrees relative to the yoke may eliminate some vibrations.

1. Raise and support vehicle.
2. Clean all foreign material from the propeller shaft.
3. Inspect propeller shaft for missing balance weights, broken welds and bent areas. **If propeller shaft is bent, it must be replaced.**
4. Inspect universal joints/CV joints for wear.
5. Check propeller shaft bolt torques.
6. Remove wheels and install lug nuts to retain brake rotors.
7. Mark and number the shaft six inches from the pinion flange end at four positions 90 degrees apart.
8. Run and accelerate vehicle until vibration occurs. Note at what speed the vibration occurred. Stop the engine.
9. Install a screw clamp at position (1).

10. Start engine and check vibration. If there is little or no change move the clamp to the next positions and

repeat vibration test.

NOTE: If there is no difference in vibration at this positions, the vibration may not be the propeller shaft.

11. If vibration decreased, install a second clamp (1) and repeat the test.

12. If additional clamp causes an additional vibration, separate the clamps 1/2 inch (1) above and below the mark. Repeat the vibration test .

13. Increase distance between the clamp screws (1) (2) and repeat test, until the least amount of vibration is noticed. Bend the slack end of the clamps so screws will not loosen.

14. If vibration remains unacceptable, repeat the procedure to the front end of the propeller shaft.

RUNOUT

1. Remove dirt, rust, paint, and undercoating from the propeller shaft surface where the dial indicator will contact the shaft.
2. The dial indicator must be installed perpendicular to the shaft surface.
3. Measure runout at the center and ends of the shaft sufficiently far away from weld areas to ensure that the effects of the weld process will not enter into the measurements.
4. Refer to Runout Specifications chart.
5. If the propeller shaft runout is out of specification, remove the propeller shaft, index the shaft 180°, and re-install the propeller shaft. Measure shaft runout again.
6. If the propeller shaft runout is now within specifications, mark the shaft and yokes for proper orientation.
7. If the propeller shaft runout is not within specifications, verify that the runout of the transmission/transfer case and axle are within specifications. Correct as necessary and re-measure propeller shaft runout.
8. Replace the propeller shaft if the runout still exceeds the limits.

RUNOUT SPECIFICATIONS

Front of Shaft	0.020 in. (0.50 mm)
Center of Shaft	0.025 in. (0.63 mm)
Rear of Shaft	0.020 in. (0.50 mm)
NOTE: Measure front/rear runout approximately 3 inches (76 mm) from the weld seam at each end of the shaft tube for tube lengths over 30 inches. For tube lengths under 30 inches, the maximum allowed runout is 0.020 in. (0.50 mm) for the full length of the tube.	

STANDARD PROCEDURE

PROPELLER SHAFT ANGLE

To obtain front (output) angle on a C/V propeller shaft, place Inclinometer 7663 on the machined ring of the pinion flange. To obtain propeller shaft angle measurement on the C/V front propeller shaft, place inclinometer on the propeller shaft tube. To obtain rear (output) angle on rear propeller shaft use transfer case/transmission flange.

1. Raise and support the vehicle at the axles as level as possible. Allow the wheels and propeller shaft to turn.
2. Remove universal joint snap rings if equipped, so inclinometer base sits flat.
3. Rotate shaft until transmission/transfer case output yoke bearing cap is facing downward.

NOTE: Always make measurements from front to rear and from the same side of the vehicle.

4. Place inclinometer (2) on yoke bearing cap (1) or pinion flange ring parallel to the shaft. Center bubble in sight glass and record measurement. This measurement will give you the transmission or Output Yoke Angle (A).

5. Rotate propeller shaft 90 degrees and place inclinometer (2) on yoke bearing cap (1) or propeller shaft tube on C/V propeller shaft, parallel to the shaft. Center bubble in sight glass and record measurement. This measurement can also be taken at the rear end of the shaft. This measurement will give you the propeller

shaft angle (C)

6. Subtract smaller figure from larger (C minus A) to obtain transmission output operating angle.

7. Rotate propeller shaft 90 degrees and place inclinometer (2) on pinion yoke bearing cap (1) parallel to the shaft. Center bubble in sight glass and record measurement. This measurement will give you the pinion shaft or input yoke angle (B).

8. Subtract smaller figure from larger (C minus B) to obtain axle Input Operating Angle.

RULES

Good cancellation of U-joint operating angles is within 1 degree.

Operating angles less than 3 degrees (U-joint system).

Operating angles less than 10 degrees for constant velocity joint.

At least 1/2 of one degree continuous operating (propeller shaft) angle. On one U-joint system less than 1 1/2 degree operating angle.

SPECIFICATIONS

PROPELLER SHAFT

TORQUE SPECIFICATIONS

DESCRIPTION	N•m	Ft. Lbs.	In. Lbs.
Front Shaft - Axle Flange Bolts	110	81	-
Front Shaft - Transfer Case Flange Bolts	20	15	-
Rear Shaft - Axle Flange Bolts	20	15	-
Rear Shaft - Transfer Case Flange Bolts	20	15	-

SPECIAL TOOLS

PROPELLER SHAFT

INCLINOMETER 7663

SHAFT-PROPELLER FRONT

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Mark an installation reference line across the front propeller shaft CV joint (1) and transfer case flange

(2).

3. Mark an installation reference line across the front propeller shaft flange (1) and the axle flange (2).

4. Remove the axle flange (1) bolts (2).

5. Remove the CV joint bolts (1) and retainers (2).
6. Compress the propeller shaft enough to remove the shaft from the flanges.

INSTALLATION

NOTE: Clean all propeller shaft bolts and apply Mopar® Lock & Seal Adhesive or equivalent to the threads before installation.

1. Compress the propeller shaft enough to install the shaft into the axle and transfer case flanges.
2. Align installation reference marks on the transfer case flange (1) front shaft CV joint (2).

3. Install CV joint retainers (2) and bolts (1). Tighten bolts to 20 N·m (15 ft. lbs.).

4. Align installation reference marks on the front propeller shaft flange (1) and axle flange (2).

5. Install the axle flange (1) bolts (2) and tighten to 110 N·m (81 ft. lbs.).

SHAFT-PROPELLER REAR REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Mark installation reference line across the rear propeller shaft CV joint (1) and the axle flange (2). Also mark to indicate propeller shaft axle end.

NOTE: Propeller shaft can be install either way.

3. Mark installation reference line across the front propeller shaft CV joint (1) and the transmission/transfer case flange (2). Also mark to indicate propeller shaft transmission/transfer case flange end.

4. Remove front propeller shaft CV joint bolts (1) and retainers (2).

5. Remove rear propeller shaft CV joint bolts (1) and retainers (2).
6. Compress the propeller shaft enough to remove it from the axle flange and transmission/transfer case flange.

INSTALLATION

NOTE: Clean all propeller shaft bolts and apply Mopar® Lock & Seal Adhesive or equivalent to the threads before installation.

1. Compress the propeller shaft enough to install it into the axle flange and transmission/transfer case flange.
2. Align installation reference marks on the transmission/transfer case flange (1) and propeller shaft transmission/transfer end CV joint (2).

3. Install propeller shaft CV joint retainers (2) and bolts (1). Tighten bolts to 20 N·m (15 ft. lbs.).

4. Align installation reference marks on the propeller shaft CV joint (1) and axle flange (2).

5. Install propeller shaft CV joint retainers (2) and bolts (1). Tighten bolts to 20 N·m (15 ft. lbs.).

FRONT AXLE - 186FBI

FRONT AXLE - 186FBI

DIAGNOSIS AND TESTING

FRONT AXLE - 186FBI

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.

- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint/CV or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joint or CV.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion flange run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV.
- Loose spring mounts.
- Loose pinion gear nut and flange.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
	3. End play in pinion bearings.	3. Refer to pinion pre-load information and correct as necessary.
	4. Excessive ring and pinion gear backlash.	4. Check and adjustment ring and pinion gear backlash.
	5. Improper pinion bearing adjustments.	5. Adjust the pinion bearings pre-load.
	6. Loose pinion flange nut.	6. Tighten pinion flange nut to specifications.
	7. Scuffed gear tooth contact surfaces.	7. Inspect and replace as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace broken shaft after correcting tube mis-alignment.
	2. Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.

	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper differential bearing adjustment.	1. Replace case, inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored flange.	5. Replace flange and seal.
	6. Differential cover not sealed.	6. Remove, clean, and seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.

	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring and pinion gear adjustment.	2. Check ring and pinion gear contact pattern.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring and pinion gears.	4. Replace ring and pinion gears.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Loose or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure bearing caps are torqued to the proper specification.
	9. Housing not machined properly.	9. Replace housing.

REMOVAL

NOTE: Procedure is the same for a 4x2 tube axle except for propeller shaft and axle vent removal.

1. With transmission in neutral, position vehicle on hoist.
2. Position and secure lift to axle.
3. Mark an installation reference line across the front propeller shaft flange (1) and the axle flange (2).

4. Remove vent hose (1) from axle housing (2).

- 5. Remove brake calipers and rotors.
- 6. Remove wheel speed sensors (1) from hub bearings.
- 7. Remove brake lines and sensor wiring from axle.

8. Remove stabilizer bar links (1) from axle brackets (2).

9. Remove shock absorbers (1) from axle brackets (2).

10. Remove track bar bolt (1) and track bar (2) from axle bracket.

11. Remove steering damper (1) from axle bracket (2).

12. Remove drag link (1) and tie rod ends (2) from steering knuckles.

13. Remove upper control arms (1) from axle brackets (2).

14. Mark lower control arm cams (1) for installation reference and loosen nuts (2).
15. Lower axle enough to remove coil springs from axle.
16. Remove lower control arm bolts remove axle from vehicle.

INSTALLATION

CAUTION: The weight of the vehicle must be supported by the springs before suspension arms and track bar fasteners are tightened. Failure to follow these instruction will result in damaging the bushings.

NOTE: Procedure is the same for a 4x2 tube axle except for propeller shaft and axle vent installation.

1. Position axle under vehicle.
2. Install lower control arms in axle brackets.
3. Install lower control arm bolts, cams (1) and loosely

install nuts (2).
4. Install coil springs on axle and raise axle into position.

5. Install upper control arms (1) on axle brackets (2) and loosely install bolts and nuts.

6. Install track bar (2) in axle bracket and loosely install bolt (1).

7. Install steering damper (1) on axle bracket (2) and tighten to specification.

8. Install drag link (1) and (2) tie rod ends on steering knuckles and tighten to specification.

9. Install shock absorbers (1) on axle brackets (2) and tighten to specification.

10. Install stabilizer bar links (1) on axle brackets (2) and tighten to specification.

11. Install wheel speed sensors harness on axle and install sensors (1) in hub bearings.
12. Install brake rotors, calipers and brakes lines.

13. Install vent hose (1) on axle housing (2).

NOTE: Clean all propeller shaft bolts and apply Mopar® Lock & Seal Adhesive or equivalent to the threads before installation.

14. Install propeller shaft with axle flange (2) and propeller shaft (1) marks aligned. Tighten bolts to specification.

- 15. Remove lift from the axle.
- 16. Install wheel and lower vehicle.
- 17. Align lower control arm (2) cams to reference marks and tighten control arm nuts to specification.
- 18. Tighten upper (1) control arm nuts to specification.

19.

Tighten track bar (2) bolt (1) at axle bracket to torque specification.

ADJUSTMENTS

PINION DEPTH-BEARING PRELOAD-GEAR BACKLASH

Compensation for pinion depth variance is achieved with a select shim (1). The shims are placed between the rear pinion bearing and the pinion gear head. A collapsible spacer on the pinion shaft is used to maintain pinion bearing preload. Differential bearing preload and ring gear (3) backlash is achieved, with select shims (2,4) located behind the bearing cups.

Ring and pinion gears are supplied as matched sets. The identifying numbers (3) for the ring and pinion gear are etched/marked onto each gear. A plus (+) number, minus (-) number or zero (0) is

etched/marked on the pinion gear (2). This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched/marked with a (0).

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion. Add or subtract this number from the thickness of the original depth shim to compensate for the difference in the depth variances. Refer to the Pinion Gear Depth Variance chart.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

Note the etched number on the face of the pinion gear head (-1, -2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim. If the number is 0 no change is necessary.

PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	?4	?3	?2	?1	0	+1	+2	+3	+4
+4	+0.008	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0

PINION DEPTH MEASUREMENT AND ADJUSTMENT

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set 6730 (2,3,4,5,6,7,8) and Dial Indicator C-3339A (1).

1. Assemble Pinion Height Block 6739 (2), Pinion Block 9946 (1) and rear pinion bearing onto Screw 6741.
2. Insert assembled height gauge components into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-nut 6740. Tighten nut until torque to rotate the screw is 2.25 N·m (20 in. lbs.).

4. Place Arbor Disc 6732 (1) on Arbor D-115-3 (2) and position in axle housing differential bearing cradles.

NOTE: Arbor Discs 6732 has different step diameters to fit other axles. Choose proper step for axle being serviced.

5. Install differential bearing caps (1) on arbor discs (2) and tighten cap bolts to 61 N·m (45 ft. lbs.).

6. Install Dial Indicator C-3339A (1) into Scooter Block D-115-2A (2) and secure set screw.
7. Position Scooter Block/Dial Indicator flush on the pinion height block and zero the dial indicator.
8. Slowly slide the scooter block across the pinion height block over to the arbor. Move the scooter block till the dial indicator probe crests the arbor and record the highest reading.
9. Select a shim equal to the dial indicator reading plus or minus the pinion depth variance number etched in the face of the pinion. **Example:** If depth variance is – 2 add 0.002 in. to the dial indicator reading. If depth

variance is +2 subtract 0.002 in. from the dial indicator reading. The total is the shim thickness needed for the pinion depth variance.

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

Before performing differential bearing preload and ring gear backlash measurements, pinion gear depth must be established and the pinion gear ready for installation. Establishing pinion gear depth is essential to ring gear backlash and tooth contact patterns.

Differential side bearing preload and gear backlash is accomplished with selective shims (2,4) positioned behind the differential side bearing cups. Shims are determined using Dummy Bearings D-348 in place of the differential side bearings and a Dial Indicator C-3339A.

SHIM FORMULA: Differential End Play + Preload Specification = Total Differential Shim. Total Differential Shim – Ring Gear Side Shim – Backlash Specification = Pinon Gear Side Shim.

PRELOAD SHIM SELECTION

1. Remove differential side bearings from differential case.
2. Remove factory installed shims from differential case.

3. Install ring gear on differential case and tighten bolts to specification.

4. Install dummy side bearings D-348 (1) on differential case (3) and install differential case (3) in the housing (2).

5. Install differential (3) bearing caps (1) in original location and snug bearing cap bolts.

6. Seat differential dummy bearings to pinion gear side of the housing (2), with a dead-blow hammer (1).

7. Seat differential dummy bearings to ring gear side of the housing (1), with a dead-blow hammer (2).

8. Thread Pin C-3288-B (2) into cover bolt hole.
9. Attach Dial Indicator C-3339A (1) to the pin and position indicator plunger on a flat surface between the ring gear bolts.

10. Push and hold differential case (1) to pinion gear side of the housing and zero dial indicator (2).

11. Push and hold differential case (2) to ring gear side of the housing. Record the dial indicator (1) reading. Add preload specification 0.2 mm (0.008 in.) to differential dial indicator reading. This is the total differential shim thickness needed to preload the differential bearings.

EXAMPLE: Differential Dial Indication Reading + Preload Specification 0.2 mm (0.008 in.) = Total Differential Shim

12. Rotate dial indicator out of the way on the pilot stud.
13. Remove differential case and dummy bearings from the housing.

14. Install pinion gear in the housing and establish pinion (1) torque to rotating (PTTR).

15. Install differential case (1) with dummy bearings D-348 in the housing, install bearing caps and snug bolts.
16. Seat ring gear side dummy bearing.
17. Position dial indicator (2) plunger on a flat surface between the ring gear bolts.
18. Push and hold differential case (1) against pinion gear and zero dial indicator (2).

19. Push and hold differential case (2) to ring gear side of the housing and record dial indicator (1) ring gear side reading.

20. Subtract backlash specification 0.05 mm (0.002 in.) from ring gear side reading for ring gear backlash. The remainder is the shim needed on the ring gear side of the differential.

EXAMPLE: Ring Gear Side Reading – Backlash Specification 0.05 mm (0.002 in.) = Ring Gear Side Shim

21. Subtract ring gear side shim from differential total preload shim. The remainder is the shim needed on the pinion gear side of the differential.

EXAMPLE: Total Differential Shim – Ring Gear Side Shim = Pinion Gear Side Shim

22. Rotate dial indicator out of the way on pilot stud.

23. Remove differential case with dummy bearings from the housing.

24. Install side bearings on differential case.

25. Install spreader W-129-B (1) and hold down adapters (2) from Adapter Set 6987B onto housing. Spread the housing 0.50 mm (0.020 in.).

CAUTION: Never spread housing over 0.50 mm (0.020 in.). Failure to follow these instruction could

result in distorting the housing.

- 26. Install differential case (2) with bearings cups (3) and shims into the housing (1).
- 27. Remove spreader from the housing.

- 28. Install bearing caps (1) and tighten bolts to 61 N·m (45 ft. lbs.).
- 29. Rotate differential case several times to seat the side bearings.

- 30. Position dial indicator plunger (1) against a ring gear tooth.

31. Push and hold ring gear upward while holding the pinion gear.
32. Zero dial indicator face to pointer.

33. Push and hold ring gear downward while holding the pinion gear. Dial indicator reading should be between 0.12 mm - 0.20 mm (0.005 in - 0.008 in). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the housing to the other.
34. Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern procedure.

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion gear depth and ring gear backlash has been adjusted correctly. Backlash can be adjusted within specifications to achieve desired tooth contact patterns.

The TOP LAND (1) of the gear tooth is the top surface of the tooth. The PROFILE (2) of the gear tooth is the depth of the tooth. The TOE (3) of the gear is the portion of the tooth surface at the end towards the center. The HEEL (4) of the gear is the portion of the tooth at the outer-end. The ROOT (5) of the gear tooth is the lowest portion of the tooth.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist and hold a shop towel around the pinion flange to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on the ring gear bolt, rotate the differential case one complete revolution in both directions while loading the pinion gear with shop towel.

The ring gear teeth with the greatest degree of contact with the pinion gear teeth will squeeze the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

NOTE: If the PROFILE across the tooth is the same it is a 3 Axis cut gear. If the PROFILE across the tooth is tapered it is a 2 Axis cut gear.

3 AXIS CUT GEAR

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		Desirable pattern. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None
	Top heel contact		Top toe contact	Backlash correct. Thicker pinion position shim required.
	Root toe contact		Root heel contact	Backlash correct. Thinner pinion position shim required.
	Top heel contact		Top heel contact	Pinion position shim correct. Decrease backlash.
	Root toe contact		Root toe contact	Pinion position shim correct. Increase backlash.

DIFFERENTIAL BEARING PRELOAD CHECK

With an inch pound torque wrench (2) measure Total Torque To Rotate (TTTR). This is the final check on the differential assembly before installing the axle shafts. This will verify the correct differential bearing preload.

Total Torque To Rotate is: Pinion Torque To Rotate (PTTR) plus 0.79 - 1.24 N·m (7 - 11 in. lbs.).

NOTE: If TTTR is high, decrease the shim thickness equally on both sides of the differential and check TTTR again. If TTTR is low, increase the shims thickness equally on both sides of the differential and check TTTR again.

SPECIFICATIONS

FRONT AXLE - 186FBI

816b7b17

AXLE

DESCRIPTION	SPECIFICATION
Axle Ratio	3.21, 4.10
Ring Gear Diameter	186 mm (7.33 in.)
Ring Gear Runout	0.12 mm (0.005 in.)
Ring Gear Backlash	0.12 - 0.20 mm (0.005 - 0.008 in.)
Pinion Torque To Rotate - Original Bearings	1.2 - 2.2 N·m (10 - 20 in. lbs.)
Pinion Torque To Rotate - New Bearings	2 - 3.4 N·m (15 - 30 in. lbs.)
Differential Total Torque To Rotate: Pinion Torque To Rotate Plus	0.79 - 1.24 N·m (7 - 11 in. lbs.)

COVER-DIFFERENTIAL REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove fill plug (1) and cover (2) bolts.
3. Remove cover and drain lubricant.

INSTALLATION

1. Apply a 6.35mm (1/4 in.) bead of Mopar Silicone Rubber Sealant (2) or equivalent to the housing cover (1).

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to follow these instructions will result in a leak.

2. Install differential cover (2) and identification tag. Tighten cover bolts in a criss-cross pattern to 41 N·m (30 ft. lbs.).
3. Fill differential to specifications.
4. Install fill plug (1) and tighten to 34 N·m (25 ft. lbs.).

SHAFTS-AXLE

REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove brake components.
3. Remove wheel speed sensor from hub bearing.
4. Remove hub nut (1) from axle shaft (2).

5. Remove three hub bearing bolts (1) from steering knuckle (2).

6. Remove hub bearing (1) with axle shaft (2) through steering knuckle (3).

7. Remove brake shield and hub bearing from axle.

INSTALLATION

1. Clean axle shaft and apply a thin film of Mopar Wheel Bearing Grease or equivalent to the shaft splines and seal contact surface.
2. Install hub bearing and brake shield on axle shaft.
3. Install axle shaft (2) with hub bearing (1) through steering knuckle and into differential side gears.

4. Install three hub bearing bolts (1) through steering knuckle (2) and tighten to 102 N·m (75 ft. lbs.).

5. Install hub nut (1) on axle shaft (2) and tighten to 136 N·m (100 ft. lbs.).
6. Install wheel speed sensor.
7. Install brake components.

SEALS-AXLE SHAFT

REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove hub bearings (1) and axle shafts (2) from axle.

3. Remove differential case (2) with bearing cups (3) and shims from differential housing (1).
4. Remove inner axle shaft seals with a seal puller.

INSTALLATION

1. Clean axle oil seal bores.
2. Install oil seals in axle tube, then with Turnbuckle 6797 (1) and Discs 8110 (2) tighten tool until disc bottoms (2) in housing.

3. Install differential (1) into housing (1) with bearing cups (3) and shims. Install bearing caps.

- 4. Install hub bearings (1) with axle shafts (2).
- 5. Install wheel speed sensor.
- 6. Install brake components.

UNIVERSAL JOINT-SINGLE CARDAN

REMOVAL

NOTE: Saturate bearing caps with penetrating oil prior to removal.

1. Remove axle shaft.
2. Remove bearing cap snap rings (1) from stub shaft yoke (2) bearing caps.

3. Position receiver/socket (2) and driver/socket (1) on stub shaft yoke (3) in press. Press bearing cup into receiver/socket (2).

4. Remove bearing cap (1) from stub shaft yoke (2).

5. Position receiver/socket (2) under stub shaft yoke (3) remaining bearing cup and driver/socket (1) on U-joint cross in press. Press bearing cup into receiver/socket (2)

6. Remove bearing cap (1) from stub shaft yoke (2). Then remove stub shaft from U-joint cross.

7. Remove snap rings (1) from shaft yoke (2) bearing caps.

8. Position receiver/socket (2) and driver/socket (1) on shaft yoke (3) in press. Press bearing cup into receiver/socket (2).

9. Remove bearing cap (1) from shaft yoke (2).

10. Position receiver/socket (2) under shaft yoke (3) remaining bearing cup and driver/socket (1) on U-joint cross in press. Press bearing cup into receiver/socket (2)

11. Remove bearing cap (1) from shaft yoke (2). Then remove U-joint cross from shaft yoke.

INSTALLATION

CAUTION: Keep cross and bearing cap straight during installation. Failure to follow these instruction will result in damage.

1. Pack bearing caps 1/3 full of wheel bearing lubricant. Apply extreme pressure (EP), lithium-base lubricant to aid in installation.
2. Position cross (1) in the shaft yoke (2).

3. Tap bearing cap into the yoke bores far enough to position cross.
4. Position receiver/socket (1) on shaft yoke and driver/socket (2) on bearing cap in press.

5. Press bearing cap into shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).

6. Position receiver/socket (1) on shaft yoke and driver/socket (2) on bearing cap in press.

7. Press bearing cap into shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).

8. Install stub shaft yoke (1) on U-joint cross (2).

9. Tap fist bearing cap into the stub shaft yoke bore far enough to position cross.

10. Position receiver/socket (1) on shaft yoke and driver/socket (2) on bearing cap in press.

11. Press bearing cap into stub shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).

12. Position receiver/socket (1) on stub shaft yoke and driver/socket (2) on bearing cap in press.

13. Press bearing cap into stub shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).

14. Install axle shaft.

SEAL-PINION

REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove brake rotors and calipers.
3. Remove propeller shaft.
4. Rotate pinion gear three or four times.
5. Record pinion torque to rotate (1) with an inch pound torque wrench (2), for installation reference.

6. Hold pinion flange (1) with Flange Wrench C-3281 (2) and remove pinion nut.
7. Mark a reference line across the pinion shaft and flange for installation reference.

8. Remove pinion flange (1) with Puller C-452 (2).
9. Remove seal with a seal puller.

INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer 8681 (1) and Handle C-4171 (2).

2. Install flange on the pinion shaft with the reference marks aligned.
3. Install flange (1) with Installer 8112 (2) and Cup 8109.

4. Install **new** pinion nut.
5. Hold pinion flange (1) with Flange Wrench C-3281 (2) and tighten pinion nut to 217 N·m (160 ft. lbs.).

6. Measure pinion torque to rotating (1) with an inch pound torque wrench (2). With a torque wrench set at 542 N·m (400 ft. lbs.) tighten nut in 6.8 N·m (5 ft. lbs.) increments until pinion torque to rotating is achieved. Pinion torque to rotating is, the recorded reading plus an additional 0.56 N·m (5 in. lbs.).

CAUTION: If maximum tightening torque of 542 N·m (400 ft. lbs.) is reached before torque to rotate is achieved, the collapsible spacer may have been damaged. Never loosen pinion gear nut to decrease pinion gear bearing rotating torque and never exceed specified preload torque. Failure to follow

these instruction may result in damage.

7. Install propeller shaft.
8. Install brake components.

DIFFERENTIAL REMOVAL

1. Remove differential fill plug (2).
2. Remove differential cover (1) and drain fluid.
3. Remove axle shafts.

4. Note reference letters stamped (1,2) on the bearing caps and housing machined sealing surface.

5. Loosen differential bearing cap (1) bolts.

6. Position Spreader W-129-B (4) with Adapter Kit 6987B (2) on differential locating holes. Install hold-down clamps (3) and tighten the turnbuckle (5) finger-tight.

7. Install a Pin C-3288-B (5) at the left side of the differential housing. Attach Dial Indicator C-3339A (2) to pin. Load indicator plunger against the opposite side of the housing and zero the indicator.

8. Spread housing while measuring the distance with the dial indicator (1).

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

9. Remove dial indicator.
10. Holding differential case (2) in position, remove differential bearing caps.
11. Remove differential case (2) from housing (1) and tag differential bearing cups (3) and shims location.
12. Remove spreader from housing.
13. Clean the housing cavity with flushing oil, light engine oil or lint free cloth.

NOTE: Do not use water, steam, kerosene or gasoline for cleaning.

DISASSEMBLY

1. Remove ring gear bolts (1) and ring gear (2) from differential.

2. Remove pinion mate shaft (1) roll pin with a punch (2) and hammer.

3. Remove pinion mate shaft (1) from differential and pinion gears (2).

4. Rotate pinion gears (1) with thrust washers (2) to differential windows (3).

5. Remove pinion gears (1) with thrust washers (2) through differential windows (3).

6. Remove first side gear (1) with thrust washer (2) through differential window.

7. Remove second side gear (1) with thrust washer (2) through differential window.

ASSEMBLY

NOTE: If same gears and thrust washers are being used, install them into their original locations.

1. Lubricate all differential components with axle lubricant.
2. Install first side gear (1) with thrust washer (2) through differential window.

3. Install second side gear (1) with thrust washer (2) through differential window.

4. Install pinion gears (1) with thrust washers (2) through differential windows (3).
5. Rotate pinion gears (1) with thrust washers (2) and align gears to pinion mate shaft hole.

6. Install pinion mate shaft (1) in differential and pinion gears (2).

7. Install pinion mate shaft (2) roll pin (1).

8. Install ring gear (2) and bolts (1) on differential.

INSTALLATION

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer **Adjustments (Differential Bearing Preload and Gear Backlash)** to determine the proper shim selection.

1. Position Spreader W-129-B (1) and with dowel pins from Adapter Kit 6987B seated in housing locating holes. Install hold-down clamps (2) and tighten turnbuckle finger-tight.

2. Install Pin C-3288-B at the left side of the differential housing. Attach Dial Indicator C-3339A (1) to pin. Load the indicator plunger (2) against the opposite side of the housing and zero the indicator.
3. Spread the housing while measuring the distance with the dial indicator.

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

4. Remove the dial indicator.

5. Install differential case (2) into the housing (1) with bearing cups (3) and preload shims. Tap the differential case to ensure the bearings cups (3) are seated in the housing.

6. Install bearing caps with reference marks (1,2) in their original locations.
7. Loosely install differential bearing cap bolts.
8. Remove axle housing spreader.

9. Tighten bearing cap (1) bolts to 61 N·m (45 ft. lbs.).

- 10.

Install axle shafts.

11. Install differential cover (1).

BEARINGS-DIFFERENTIAL CASE

REMOVAL

1. Remove bearings (2) from the differential case (3) with Puller C-293-PA (5) Adapter C-293-39 (1) and Plug SP-3289 (4).

INSTALLATION

1. Install differential side bearings with Installer C-3716-A (1) and Handle C-4171 (2).

GEAR-PINION/RING

REMOVAL

NOTE: The ring and pinion gears are serviced as a matched set. Never replace one gear without replacing the other matched gear.

1. Remove differential from axle housing.
2. Remove ring gear bolts (1) and remove ring gear (2) from differential case.

3. Hold pinion flange (1) with Flange Wrench C-3281 (2) and remove the pinion nut.

4. Remove pinion flange (1) with Puller C-452 (2).

5. Drive pinion out of the housing with a dead blow hammer (1).

6. Remove pinion seal with seal puller.
7. Remove oil slinger (1).

8. Remove front bearing (1).

9. Remove front pinion bearing cup with Remover D-149 (1) and Handle C-4171 (2).
10. Remove rear pinion bearing cup and oil baffle with a hammer and brass drift.

11. Remove collapsible spacer (1) from pinion shaft (2).

12. Remove rear pinion bearing from pinion shaft (1) with Puller C-293-PA (2) and Adapters C-293-48 (3).

13. Remove pinion depth shim (1) from the pinion shaft (2) and record thickness.

INSTALLATION

1. Install oil baffle in rear bearing cup bore then install rear bearing cup with Installer C-4308 (1) and Handle C-4171 (2).

2. Install front bearing cup with Installer D-146 (1) and Handle C-4171 (2).

3. Install front pinion bearing (1) into the housing.

4. Install front pinion bearing oil slinger (1) into the housing.

5. Apply a light coating of gear lubricant on pinion seal lip and install seal with Installer 8681 (1) and Handle C-4171 (2).

6. Install pinion depth shim (1) on pinion shaft (2).

7. Install rear pinion bearing (4) on pinion gear (3) with Installer C-4040 (2) and a press (1).

8. Install **new** collapsible spacer (1) on pinion shaft (2) and install pinion into the housing.

9. Install pinion flange (1) with Installer 8112 (2) and Cup 8109.

10. Install **new** pinion nut.
11. With Flange Wrench C-3281 (2) and torque wrench tighten pinion nut to 217 N·m (160 ft. lbs.).

12. Using Flange Wrench C-3281 and torque wrench set at 542 N·m (400 ft. lbs.). Slowly tighten the nut in 6.8 N·m (5 ft. lb.) increments until the pinion torque to rotate is achieved. Measure pinion (1) torque to rotate with an inch pound torque wrench (2) frequently to avoid over crushing the collapsible spacer.

Pinion Torque To Rotate (PTTR) is:

- **Original Bearings:** 1.13 - 2.26 N·m (10 - 20 in. lbs.).
- **New Bearings:** 1.7 - 3.4 N·m (15 - 30 in. lbs.).

CAUTION: If more than 542 N·m (400 ft. lbs.) torque is required to crush the collapsible spacer,

the spacer is defective and must be replaced. Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. Failure to follow these instructions may result in damage.

13. Install ring gear with **new** ring gear bolts (1) and alternately tighten to 108 N·m (80 ft. lbs.).

CAUTION: Never reuse ring gear bolts. Failure to follow these instructions may result in damage.

14. Install differential case in to axle housing.

15. Measure differential Total Torque To Rotate (TTTR) with an inch pound torque wrench (2) before installing the axle shafts. This will verify differential bearing preload.

Total Torque To Rotate is: Pinion Torque To Rotate (PTTR) plus 0.79 - 1.24 N·m (7 - 11 in lbs.).

NOTE: If TTTR is too high, decrease shim

thickness equally from both sides of the differential and check TTTR again. If TTTR is too low, increase shim thickness equally to both sides of the differential and check TTTR again.

FRONT AXLE - 216FBI

FRONT AXLE - 216FBI

DIAGNOSIS AND TESTING

FRONT AXLE - 216FBI

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint/CV or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joint or CV.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion flange run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV.
- Loose spring mounts.

- Loose pinion gear nut and flange.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
	3. End play in pinion bearings.	3. Refer to pinion pre-load information and correct as necessary.
	4. Excessive ring and pinion gear backlash.	4. Check and adjustment ring and pinion gear backlash.
	5. Improper pinion bearing adjustments.	5. Adjust the pinion bearings pre-load.
	6. Loose pinion flange nut.	6. Tighten pinion flange nut to specifications.
	7. Scuffed gear tooth contact surfaces.	7. Inspect and replace as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace broken shaft after correcting tube mis-alignment.
	2. Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper differential bearing adjustment.	1. Replace case, inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.

	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored flange.	5. Replace flange and seal.
	6. Differential cover not sealed.	6. Remove, clean, and seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring and pinion gear adjustment.	2. Check ring and pinion gear contact pattern.
	3. Unmatched ring gear and	3. Replace gears with a matched ring gear and pinion.

pinion.	
4. Worn teeth on ring and pinion gears.	4. Replace ring and pinion gears.
5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
6. Loose differential bearings.	6. Adjust differential bearing pre-load.
7. Loose or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure bearing caps are torqued to the proper specification.
9. Housing not machined properly.	9. Replace housing.

REMOVAL

NOTE: Procedure is the same for a 4x2 tube axle except for propeller shaft and axle vent removal.

1. With transmission in neutral, position vehicle on hoist.
2. Position and secure a lift under the axle.
3. Mark an installation reference line across the front propeller shaft flange (1) and the axle flange (2).

4. Disconnect Tru-Lok wiring connectors (1,2) and axle vent hose.

5. Remove brake calipers and rotors.
6. Remove wheel speed sensors (1) from hub bearings.
7. Remove brake lines and sensor wiring from axle.

8. Remove stabilizer bar links (1) from axle brackets (2).

9. Remove shock absorbers (1) from axle brackets (2).

10. Remove track bar bolt (1) and track bar (2) from axle bracket.

11. Remove steering damper (1) from axle bracket (2).

12. Remove drag link (1) and tie rod ends (2) from steering knuckles.

13. Remove upper control arms (1) from axle brackets (2).

14. Mark lower control arm cams (1) for installation reference and loosen nuts (2).

15. Lower axle enough to remove coil springs from axle.

16. Remove lower control arm bolts remove axle from vehicle.

INSTALLATION

CAUTION: The weight of the vehicle must be supported by the springs before suspension arms and track bar fasteners can be tightened. Failure to follow these instruction will result in damaging the bushings.

NOTE: Procedure is the same for a 4x2 tube axle except for propeller shaft and axle vent installation.

1. Position axle under vehicle.
2. Install lower control arms in axle brackets.
3. Install lower control arm bolts, cams (1) and loosely install nuts (2).
4. Install coil springs on axle and raise axle into position.

5. Install upper control arms (1) on axle brackets (2) and loosely install bolts and nuts.

6. Install track bar (2) in axle bracket and loosely install bolt (1).

7. Install steering damper (1) on axle bracket (2) and tighten to specification.

8. Install drag link (1) and (2) tie rod ends on steering knuckles and tighten to specification.

9. Install shock absorbers (1) on axle brackets (2) and tighten to specification.

10. Install stabilizer bar links (1) on axle brackets (2) and tighten to specification.

11. Install wheel speed sensors harness on axle and install sensors (1) in hub bearings.
12. Install brake rotors, calipers and brakes lines.

13. Connect Tru-Lok wiring connectors (1,2) and axle vent hose.

NOTE: Clean all propeller shaft bolts and apply Mopar® Lock & Seal Adhesive or equivalent to the threads before installation.

14. Install propeller shaft with axle flange (2) and propeller shaft (1) marks aligned.

15. Remove lift from the axle.
16. Install wheel and lower vehicle.
17. Align lower control arm (2) cams to reference marks and tighten control arm nuts to specification.
18. Tighten upper (1) control arm nuts to specification.

19. Tighten track bar (2) bolt (1) at axle bracket to torque specification.

ADJUSTMENTS

PINION DEPTH-BEARING PRELOAD-GEAR BACKLASH

Ring and pinion gears are supplied as matched sets. The identifying numbers (3) for the ring and pinion gear are etched into the each gear. A plus (+) number, minus (–) number or zero (0) is etched into the face of the pinion gear (2). This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard depth provides the best gear tooth contact pattern. Refer to Backlash and Contact Pattern in this section for additional information.

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion. Add or subtract this number from the thickness of the original depth shim/oil slinger to compensate for the difference in the depth variances. Refer to the Depth Variance chart.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

Note the etched number on the face of the pinion gear head (–1, –2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim. If the number is 0 no change is necessary.

PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	?4	?3	?2	?1	0	+1	+2	+3	+4
+4	+0.008	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0

PINION DEPTH MEASUREMENT

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set 6730 (2,3,4,5,6,7,8) and Dial Indicator C-3339A (1).

1. Assemble Pinion Height Block 6739 (2), Pinion Block 9990 (1) and rear pinion bearing onto Screw 6741 .
2. Insert assembled height gauge components, rear bearing and screw into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-nut 6740. Tighten nut until a Torque To Rotate the screw is 2.25 N·m (20 in. lbs.).

4. Place Arbor Disc 8541 (1) on Arbor D-115-3 (2) in position in the housing side bearing cradles .

NOTE: Arbor Discs 8541 has different step diameters to fit other axles. Choose proper step for axle being serviced.

5. Install differential bearing caps (1) on arbor discs (2) and install bearing cap bolts. Tighten bearing cap bolts to 108 N·m (80 ft. lbs.).

6. Assemble Scooter Block D-115-2A (1) and Dial Indicator C-3339A (2) secure set screw.
7. Position Scooter Block/Dial Indicator flush on the pinion height block. Hold scooter block and zero the dial indicator.
8. Slowly slide the scooter block (1) across the pinion height block over to the arbor. Move the scooter block till dial indicator (2) crests the arbor, then record the highest reading.
9. Select a shim equal to the dial indicator reading plus or minus the pinion depth variance number etched in the face of the pinion. **Example:** If the depth variance

is -2, add 0.002 in. to the dial indicator reading. If the depth variance is +2, subtract 0.002 in. from the dial indicator reading.

The total is the shim thickness needed for the pinion depth variance.

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

Before performing differential bearing preload and ring gear backlash measurements, pinion gear depth must be established and the pinion gear ready for installation. Establishing pinion gear depth is essential to gear backlash and tooth contact patterns.

Differential bearing preload and gear backlash is accomplished with selective shims (2,4) positioned behind the differential side bearing cups. Shim thickness is determined using Dummy Bearings 9992 in place of the differential side bearings and a Dial Indicator C-3339A.

SHIM FORMULA: Differential End Play + Preload Specification = Total Differential Shim. Total Differential Shim – Ring Gear Side Shim – Backlash Specification = Pinon Gear Side Shim.

1. Remove differential side bearings from differential case.
2. Remove factory installed shims from differential case.
3. Install ring gear on differential case and tighten bolts to specification.

4. Install dummy side bearings 9992 on differential case.
5. Install differential case (3) in the housing (2).
6. Install bearing caps (1) in original location and snug the bolts.

7. Seat differential (3) dummy bearings to pinion side (2) of the housing with a dead-blow hammer (1).

8. Seat differential (3) dummy bearings to ring gear side (1) of the housing with a dead-blow hammer (2).

9. Thread Pin C-3288-B (3) into cover bolt hole below ring gear.
10. Attach the Dial Indicator C-3339A (4) to the pin. Position the dial indicator plunger on a flat surface between the ring gear bolt heads.

11. Push and hold differential case (1) to pinion gear side of the housing and zero dial indicator (2).

12. Push and hold differential case (2) to ring gear side of the housing. Record dial indicator (1) differential reading. Add preload specification 0.25 mm (0.010 in) to differential dial indicator reading. This is the total shims needed to preload the differential bearings.

EXAMPLE: Differential Dial Indicator Reading + Preload Specification 0.25 mm (0.010 in) = Total Differential Shim

13. Rotate dial indicator out of the way on the pilot

stud.

14. Remove differential case and dummy bearings from the housing.

15. Install pinion gear in the housing and establish pinion torque to rotating (PTTR).

16. Install differential case and dummy bearings 9992 in the housing, install bearing caps and snug bolts.

17. Seat ring gear side dummy bearing.

18. Position dial indicator (2) plunger on a flat surface between the ring gear bolts.

19. Push and hold differential case (1) against pinion gear and zero dial indicator (2).

20. Push and hold differential case (2) to ring gear side of the housing and record dial indicator (1) ring gear side reading.

21. Subtract backlash specification 0.05 mm (0.002 in.) from ring gear side reading for ring gear backlash. The remainder is the shim needed for the ring gear side of the differential.

EXAMPLE: Ring Gear Side Dial Indicator Reading – Backlash Specification 0.05 mm (0.002 in.) = Ring Gear Side Shim

22. Subtract ring gear side shim from the total preload shim. This is the shim needed on the pinion side of the differential.

EXAMPLE: Total Differential Shim – Ring Gear Side Shim = Pinion Gear Side Shim

- 23. Rotate dial indicator out of the way on pilot stud.
- 24. Remove differential case and dummy bearings from the housing.
- 25. Install side bearings on differential case.

26. Install Spreader W-129-B (1) with hold downs (2) from Adapter Set 6987B on the housing and spread open enough to receive differential case.

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

27. Install differential case (2) into the housing with bearing cups (3) and shims.

28. Install bearing caps and tighten bolts finger tight. Remove spreader from the housing.
29. Install bearing cap (1) and tighten bolts to 108 N·m (80 ft. lbs.).
30. Rotate the differential case several times to seat the side bearings.

31. Position dial indicator plunger against a ring gear tooth.
32. Push and hold ring gear upward while not allowing the pinion gear to rotate.
33. Zero dial indicator (1) face to pointer.
34. Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm - 0.20 mm (0.005 in - 0.008 in). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the housing to the other.

35. Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

The TOP LAND (1) of the gear tooth is the top surface of the tooth. The PROFILE (2) of the gear tooth is the depth of the tooth. The TOE (3) of the gear is the portion of the tooth surface at the end towards the center. The HEEL (4) of the gear is the portion of the tooth at the outer-end. The ROOT (5) of the gear tooth is the lowest portion of the tooth.

NOTE: If the PROFILE across the tooth is the same it is a 3 Axis cut gear. If the PROFILE across the tooth is tapered it is a 2Axis cut gear.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on the ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart adjust pinion depth and gear backlash as necessary.

THREE AXIS CUT GEAR

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		Desirable pattern. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None
	Top heel contact		Top toe contact	Backlash correct. Thicker pinion position shim required.
	Root toe contact		Root heel contact	Backlash correct. Thinner pinion position shim required.
	Top heel contact		Top heel contact	Pinion position shim correct. Decrease backlash.
	Root toe contact		Root toe contact	Pinion position shim correct. Increase backlash.

8106312d

TWO AXIS CUT GEAR

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		Desirable pattern. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None
	Top toe contact		Top heel contact	Backlash correct. Thicker pinion position shim required.
	Root heel contact		Root toe contact	Backlash correct. Thinner pinion position shim required.
	Top heel contact		Top toe contact	Pinion position shim correct. Decrease backlash.
	Root toe contact		Root heel contact	Pinion position shim correct. Increase backlash.

8106361d

DIFFERENTIAL BEARING PRELOAD CHECK

The final check on the differential assembly before installing the axle shafts is torque to rotate pinion and differential combined. This will verify the correct differential bearing preload.

Total Torque To Rotate (TTTR) is: Pinion Torque To Rotate plus 0.79 - 1.24 N·m (7 - 11 in lbs).

NOTE: If TTTR is high, decrease the shim thickness equally on both sides of the differential and check TTTR again. If TTTR is low, increase the shims thickness equally on both sides of the differential and check TTTR again.

SPECIFICATIONS

COVER-DIFFERENTIAL REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove fill plug (1).
3. Remove cover (2) bolts.
4. Remove cover and drain lubricant.

INSTALLATION

1. Apply a 6.35mm (1/4 in.) bead of Mopar Silicone Rubber Sealant (3) or equivalent to the housing cover .

CAUTION: If housing cover is not installed within

3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to heed caution may result in damage.

2. Install differential cover (2), and tighten cover bolts in a criss-cross pattern to 41 N·m (30 ft. lbs.).
3. Fill differential to specifications.
4. Install fill plug and tighten to 34 N·m (25 ft. lbs.).

SHAFT-AXLE

REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove brake components.
3. Remove wheel speed sensor from hub bearing.
4. Remove hub nut (1) from axle shaft (2).

5. Remove three hub bearing bolts (1) from steering knuckle (2).

6. Remove hub bearing (1) with axle shaft (2) through steering knuckle (3).
7. Remove brake shield and hub bearing from axle.

INSTALLATION

1. Clean axle shaft and apply a thin film of Mopar Wheel Bearing Grease or equivalent to the shaft splines and seal contact surface.
2. Install hub bearing and brake shield on axle shaft.
3. Install axle shaft (2) with hub bearing (1) through steering knuckle and into differential side gears.

4. Install three hub bearing bolts (1) through steering knuckle (2) and tighten to 102 N·m (75 ft. lbs.).

5. Install hub nut (1) on axle shaft (2) and tighten to 136 N·m (100 ft. lbs.).
6. Install wheel speed sensor.
7. Install brake components.

SEAL-AXLE SHAFT

REMOVAL

1. With trasmission in neutral, position vehicle on hoist.
2. Remove brake components.
3. Remove wheel speed sensor from hub bearing.
4. Remove hub bearings (1) with axle shafts (2) from axle.

5. Remove differential cover.
6. Remove differential assembly (2) from axle housing (1).
7. Remove inner axle shaft seals with a seal puller.

INSTALLATION

1. Remove any sealer remaining from original seals.
2. Install oil seals with Discs 8110 (2) and Turnbuckle 6797 (1). Tighten tool until disc bottoms in housing.

3. Install differential (2) into housing (1).

4. Install hub bearings (1) and axles (2).

8187cab9

5. Install hub bearing bolts (1) through steering knuckle (2) and tighten to 102 N·m (75 ft. lbs.).
6. Install wheel speed sensor.
7. Install brake components.

UNIVERSAL JOINT-SINGLE CARDAN

REMOVAL

8187c83c

NOTE: Saturate bearing caps with penetrating oil prior to removal.

1. Remove axle shaft.
2. Remove bearing cap snap rings (1) from stub shaft yoke (2) bearing caps.

3. Position receiver/socket (2) and driver/socket (1) on stub shaft yoke (3) in press. Press bearing cup into receiver/socket (2).

4. Remove bearing cap (1) from stub shaft yoke (2).

5. Position receiver/socket (2) under stub shaft yoke (3) remaining bearing cup and driver/socket (1) on U-joint cross in press. Press bearing cup into receiver/socket (2)

6. Remove bearing cap (1) from stub shaft yoke (2). Then remove stub shaft from U-joint cross.

7. Remove snap rings (1) from shaft yoke (2) bearing caps.

8. Position receiver/socket (2) and driver/socket (1) on shaft yoke (3) in press. Press bearing cup into receiver/socket (2).

9. Remove bearing cap (1) from shaft yoke (2).

10. Position receiver/socket (2) under shaft yoke (3) remaining bearing cup and driver/socket (1) on U-joint cross in press. Press bearing cup into receiver/socket (2)

11. Remove bearing cap (1) from shaft yoke (2). Then remove U-joint cross from shaft yoke.

INSTALLATION

CAUTION: Keep cross and bearing cap straight during installation. Failure to follow these instruction will result in damage.

1. Pack bearing caps 1/3 full of wheel bearing lubricant. Apply extreme pressure (EP), lithium-base lubricant to aid in installation.
2. Position cross (1) in the shaft yoke (2).

3. Tap bearing cap into the yoke bores far enough to position cross.

4. Position receiver/socket (1) on shaft yoke and driver/socket (2) on bearing cap in press.

5. Press bearing cap into shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).

6. Position receiver/socket (1) on shaft yoke and driver/socket (2) on bearing cap in press.

7. Press bearing cap into shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).

8. Install stub shaft yoke (1) on U-joint cross (2).

9. Tap fist bearing cap into the stub shaft yoke bore far enough to position cross.

10. Position receiver/socket (1) on shaft yoke and driver/socket (2) on bearing cap in press.

11. Press bearing cap into stub shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).

12. Position receiver/socket (1) on stub shaft yoke and driver/socket (2) on bearing cap in press.

8187da37

13. Press bearing cap into stub shaft yoke (1) until bearing cap snap ring groove is visible and install snap ring (2).
14. Install axle shaft.

SEAL-PINION

REMOVAL

8187da3b

1. With transmission in neutral, position vehicle on hoist.
2. Mark propeller shaft, pinion flange and pinion shaft for installation reference.
3. Remove propeller shaft.
4. Remove brake calipers to prevent drag.
5. Rotate pinion gear three or four times and verify it rotates smoothly.
6. Record pinion torque to rotate (1) with an inch pound torque wrench (2) for installation reference.

7. Hold pinion flange (1) with Flange Wrench C-3281 (2) and remove pinion nut.
8. Mark a reference line across the pinion shaft and flange for installation reference.

9. Remove pinion flange (1) with Puller C-452 (2).
10. Remove seal with a seal puller.

INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Handle C-4171 (1) and Installer 8681 (2).

2. Place pinion flange on the pinion shaft with reference marks aligned.
3. Install flange (1) with Installer 8112 (2) and Cup 8109.

4. Install **new** pinion nut.
5. Hold pinion flange (1) with Flange Wrench C-3281 (2) and tighten pinion nut to 217 N·m (160 ft. lbs.).

6. Measure pinion torque to rotate (1) with an inch

pound torque wrench (2). Pinion torque to rotate is recorded reading plus 0.56 N·m (5 in. lbs.). If torque to rotate is low, tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until torque to rotate is achieved.

CAUTION: If maximum tightening torque of 271 N·m (200 ft. lbs.) is reached before torque to rotate is achieved, the collapsible spacer may have been damaged. Never loosen pinion gear nut to decrease pinion gear bearing rotating torque and never exceed specified preload torque. Failure to follow these instruction may result in damage.

7. Install propeller shaft with reference marks aligned.
8. Install brake calipers.
9. Check and add gear lubricant to axle if necessary.

DIFFERENTIAL-TRU-LOK

DESCRIPTION

Tru-Lok is an electronically locking differential (1). The differential has four pinion gears, three pinion shafts and two side gears. On the back side of one side gear (2) is half of the dog clutch.

NOTE: The electric locking differential is serviced as an assembly.

A 12 volt electromagnetic coil (3) on the differential is controlled by the Totally Integrated Power Module (TIPM). When the coil (3) is energized the dog clutch is engaged which locks the one side gear to the differential case. This action locks the axles and triggers a switch (4) in the differential housing which activates the Tru-Lok indicator light on the dash.

OPERATION

Pressing a two-way momentary rocker switch on the switch bank request axle lock. The first press DOWN requests rear axle to be locked, every other press DOWN toggles between "front and rear axle lock" and "rear axle lock" request states. Press rocker switch UP requests both axles to be unlocked. The switch is on the IP in the switch bank. The switch bank sends a message to the Cabin Cluster Node (CCN). The CCN handles the switch debounce and switch diagnostics. Any one message sent by the CCN on the network is a valid switch change. The CCN passes the information to the Totally Integrated Power Module (TIPM) via a CAN B message. The TIPM will process the switch info received from CAN B, control the outputs

as required by the Axle Lock Electrical Requirements, and send a lighting request to the CCN via CAN B. There are three telltales on the cluster, "Rear", "Front", and "Lock". The telltales will be off if the axles are unlocked, flashing if there is a pending request to lock but the axles are not yet locked (transition to lock, torque-locked, or conditions not correct), and flashing rapidly if there is a fault. The "Front" and "Rear" telltales will match the front and rear differential states. The "Lock" telltale will be on solid if either the "Front" or "Rear" telltale is on or blinking. The TIPM will send the axle lock status message to the ESP module via CAN C.

AXLE LOCK ELECTRICAL REQUIREMENTS

DIFFERENTIAL LOCK

- Vehicle speed of 16 KPH (10 MPH) or below
- Transfer case in 4 LO position
- Switch request message for the corresponding axle/s has been received
- Ignition switch in the RUN or START position
- No system, module, or switch faults have been detected

DIFFERENTIAL UNLOCK

- Transfer case in 4 HI, 2 WD, or Neutral
- Loss of ignition switch signal, vehicle speed signal, transfer case signal
- Vehicle speed of 50 KPH (30 MPH) or higher
- Valid switch message received

AXLE FAIL-SAFE

- Axles will UNLOCK with ignition switch in either the OFF or ACC position.
- Axles will not LOCK if there is no ignition switch, vehicle speed, or transfer case position signal. Axles will UNLOCK with the loss of any of these signals.
- Axles will not LOCK if the ignition switch is OFF.
- Axles will UNLOCK if a switch failure is detected.

Software Latch Feature: The Totally Integrated Power Module (TIPM) will have a software latch of the axle switch during an ignition switch OFF when the vehicle is in 4 LO transfer case position. Upon ignition key RUN or START the TIPM shall check to verify conditions are correct for an axle lock and automatically lock the axles that were locked before the ignition was turned OFF.

NOTE: The electric locking differential is serviced as an assembly.

DIAGNOSIS AND TESTING

DIFFERENTIAL - TRU-LOK

The control module for the electronically locking differentials detects faults from input signal/messages, sensors, solenoids, and drivers/relays and report the corresponding Diagnostic Trouble Code (DTC).

The lighting strategy for the axle lock switch.

1. The FRONT LED will

- a. turn ON SOLID when the front axle is locked
- b. turn ON BLINKING when the front axle is attempting to lock
- c. turn ON BLINKING when a lock front axle request is received but conditions to lock are not correct
- d. turn OFF when the axle is UNLOCKED
- e. turn ON FAST BLINKING when there is a fault detected for the front axle

2. The REAR LED will

- a. turn ON SOLID when the rear axle is locked
- b. turn ON BLINKING when the rear axle is attempting to lock
- c. turn ON BLINKING when a lock rear axle request is received but conditions to lock are not correct
- d. turn OFF when the axle is UNLOCKED
- e. turn ON FAST BLINKING when there is a fault detected for the rear axle

INDICATOR SWITCH

Ohm meter set on continuity: One lead on each connector terminal

- Switch Plunger IN Locker Not Engaged - No Continuity
- Switch Plunger OUT Locker Engaged - Continuity

REMOVAL

1. Remove differential fill plug (2).
2. Remove differential cover (1) and drain fluid.
3. Remove axle shafts.

4. Remove Tru-Lok harness from the coil connector (1) and indicator switch (2).
5. Remove Tru-Lok coil connector (1) bolt.

6. Remove Tru-Lok coil connector (1) from the axle housing and remove coil harness (2) from the connector (1).

7. Loosen differential bearing cap (1) bolts.

8. Position Spreader W-129-B (2) with Adapter Kit 6987B on differential locating holes. Install hold-down clamps and tighten the turnbuckle finger-tight.
9. Install a Pin C-3288-B (1) at the left side of the differential housing. Attach Dial Indicator C-3339A to pin. Load indicator plunger against the opposite side of the housing and zero the indicator.
10. Spread housing while measuring the distance with the dial indicator (1).

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

11. Remove dial indicator.
12. Holding differential case in position, remove differential bearing cap bolts.
13. Remove coil anti-rotation bracket (1) from the bearing cap (2), then remove both bearing caps.
14. Remove differential case from housing and tag differential bearing cups and shims location.
15. Remove spreader from housing.

16. Remove Tru-Lok indicator switch (1) from differential housing (2).
17. Clean the housing cavity with flushing oil, light engine oil or lint free cloth.

NOTE: Do not use water, steam, kerosene or gasoline for cleaning.

DISASSEMBLY

1. Remove bearing from coil side of the differential case with Puller C-293-PA (1), Plug C-293-3 (2), and Adapters C-293-47 (3).

2. Remove washer (1) from coil (2).

3. Remove coil (1) from differential case.

4. Remove ring gear bolts (1) and remove ring gear (2).

5. Remove differential case (1) screws (2).

6. Pry up dog clutch actuator plate (1) and remove from differential case (2).

7. Turn differential case over and remove case half.
8. Remove thrust washer (1) from side gear (2).

9. Remove side gear (1) from differential case (2).

10. Push pinion shaft (2) pin (1) up.

11. Pull pinion shaft pin (1) out of the pinion shaft (2) and case.

12. Remove pinion shaft (1) from the case and remove pinion gear (2) with thrust washer.

13. Pull opposite pinion shaft pin (1) out of the pinion shaft (2) and case.

14. Remove the pinion shaft (1) from the case and remove pinion gear (2) with thrust washer.

15. Slid remaining pinion shaft (1) out of the case and remove the remaining two pinion gears (2) with thrust washers.

16. Remove dog clutch side gear (1) from differential case (2).

17. Turn dog clutch side gear (2) over and remove thrust washers (1).

18. Remove wave spring stop ring (1) from differential case (2).

19. Remove wave spring (1) from differential case (2).

20. Remove dog clutch (1) from differential case (2).

ASSEMBLY

1. Install dog clutch (1) in differential case (2).

2. Install wave spring (1) in differential case (2).

3. Install wave spring stop ring (1) in differential case (2) and align tabs with dog clutch notches.

4. Install both thrust washers (1) on dog clutch side of the side gear (2).

5. Install side gear dog clutch (1) with thrust washers in differential case (2).

6. Install two pinion gears (2) with thrust washers then slid pinion shaft (1) into the case.

7. Install third pinion gear (2) with thrust washer then slid pinion shaft (1) into the case.

8. Install pinion shaft pin (1) into the pinion shaft (2) and case.

9. Install fourth pinion gear (2) with thrust washer then slid pinion shaft (1) into the case.

10. Install pinion shaft pin (1) into the pinion shaft (2) and case.

11. Install side gear (1) into differential case (2).

12. Install thrust washer (1) on side gear (2).
13. Install case half and align screw holes.

14. Install dog clutch actuator plate (1) on dog clutch and case (2).

15. Install differential case (1) screws (2).

16. Install ring gear with **new** ring gear (2) bolts (1) and alternately tighten to 136 N·m (100 ft. lbs.).

17. Install coil (1) on differential case.

18. Install washer (1) on coil (2).

19. Install differential bearing with Installer C-4213 (1) and Handle C-4171 (2).

INSTALLATION

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer Adjustments (Differential Bearing Preload and Gear Backlash) to determine the proper shim selection.

1. Install Tru-Lok indicator switch (1) into differential housing (2).

2. Position Spreader W-129-B (1) and with dowel pins from Adapter Kit 6987B seated in housing locating holes. Install hold-down clamps (2) and tighten turnbuckle finger-tight.

3. Install Pin C-3288-B at the left side of the differential housing. Attach Dial Indicator C-3339A (1) to pin. Load the indicator plunger (2) against the opposite side of the housing and zero the indicator.
4. Spread the housing while measuring the distance with the dial indicator.

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

5. Remove the dial indicator.

6. Install differential case into the housing with differential bearing cups and shims in their original locations.
7. Install bearing caps (2) in their original locations and coil anti-rotation bracket (1).

8. Loosely install differential bearing cap bolts.
9. Remove spreader.
10. Tighten bearing cap (1) bolts in a criss-cross pattern to 108 N·m (80 ft. lbs.).

11. Install Tru-Lok coil connector (2) to the coil harness (1).

12. Install Tru-Lok coil connector (1) and install bolt.
13. Install Tru-Lok harness to the coil connector (1) and indicator switch (2).

14. Install axle shafts.
15. Install differential cover (1).

SWITCH-LOCKER

REMOVAL

1. Remove Tru-Lok harness from the coil connector (1) and indicator switch (2).
2. Remove Tru-Lok coil connector (1) bolt.

3. Remove Tru-Lok coil connector (1) from the axle housing and remove coil harness (2) from the connector (1).
4. Remove differential.

5. Remove Tru-Lok indicator switch (1) from differential housing (2).

INSTALLATION

1. Install Tru-Lok indicator switch (1) into differential housing (2).
2. Install differential.

3. Install Tru-Lok coil connector (2) to the coil harness (1).

4. Install Tru-Lok coil connector (1) and install bolt.
 5. Install Tru-Lok harness to the coil connector (1) and indicator switch (2).

BEARINGS-DIFFERENTIAL CASE

REMOVAL

81a118e4

1. Remove differential case from axle housing.
2. Remove bearings from the differential case with Puller C-293-PA (1), Plug C-293-3 (2), and Adapters C-293-47 (3).

INSTALLATION

81abdd14

1. Install differential side bearings with Installer C-4213 (1) and Handle C-4171 (2).
2. Install differential into the housing.

COIL-DIFFERENTIAL

REMOVAL

1. Remove differential case from axle housing.
2. Remove bearing from the coil side of the differential case with Puller C-293-PA (1), Plug C-293-3 (2), and Adapters C-293-47 (3).

3. Remove thrust washer (1) from differential case and coil (2).

4. Remove coil (1) from differential case.

INSTALLATION

1. Install coil (1) on differential case.

2. Install thrust washer (1) on top of the coil (2).

3. Install differential side bearing with Installer C-4213 (1) and Handle C-4171 (2).
4. Install differential into the housing.

GEAR-PINION/RING

REMOVAL

NOTE: The ring and pinion gears are serviced as a matched set. Never replace one gear without replacing the other gear.

1. Remove differential assembly from axle housing.
2. Remove ring gear bolts (1) and remove ring gear (2) from differential case.

3. Remove Tru-Lok indicator switch (1) from differential housing (2).

4. Hold pinion flange (1) with Flange Wrench C-3281 (2) and remove pinion nut.

5. Remove pinion flange (1) with Puller C-452 (2).

6. Remove pinion gear from housing with dead blow hammer (1).

7. Remove collapsible spacer (1) from pinion gear (3).

8. Remove rear pinion bearing from pinion shaft (1) with Puller C-293-PA (2) and Adapters C-293-47 (3).

9. Remove pinion depth shim (1) from pinion shaft (2) and record thickness.

- 10. Remove pinion seal with seal puller.
- 11. Remove front bearing oil slinger (1).

12. Remove front pinion bearing (1).

13. Remove front pinion bearing cup with Remover D-158 (1) and Handle C-4171 (2).

14. Remove rear bearing cup (1) and oil baffle with a hammer and punch (2).

INSTALLATION

1. Install oil baffle in rear pinion cup bore.
2. Install rear pinion bearing cup with Installer C-4308 (1) and Handle C-4171 (2).

3. Install front pinion bearing cup with Installer D-146 (1) and Handle C-4171 (2).

4. Install pinion front bearing (1).

5. Install pinion front bearing oil slinger (1).

6. Apply a light coating of gear lubricant on pinion seal lip. Install seal with Installer 8681 (1) and Handle C-4171 (2).

7. Install pinion depth shim (1) on pinion gear shaft (2).

8. Install rear pinion bearing (4) on the pinion gear (3) with Installer C-4040 (2) and a press (1).

9. Install collapsible spacer (1) on pinion gear (3).

- 10. Install pinion gear in housing.
- 11. Install pinion flange (1) with Installer 8112 (2) and Cup 8109.

12. Install **new** nut on the pinion gear. Hold pinion flange (1) with Flange Wrench C-3281 (2) and tighten nut to 217 N·m (160 ft. lbs.).

13. Set torque wrench to 271 N·m (200 ft. lbs.) and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until Pinion Torque To Rotate (PTTR) specification is achieved.

14. Measure Pinion Torque To Rotate (1) after each 6.8 N·m (5 ft. lbs.) increment with an inch pound torque wrench (2).

Pinion Torque To Rotate is:

- **Original Bearings:** 1 - 2 N·m (10 - 20 in. lbs.)
- **New Bearings:** 2 - 4.5 N·m (20 - 40 in. lbs.)

15. Install ring gear with **new** ring gear (2) bolts (1) and alternately tighten to 136 N·m (100 ft. lbs.).

CAUTION: Never reuse the ring gear bolts. Failure to follow these instruction may result in damage.

16. Install Tru-Lok indicator switch (1) into differential housing (2).
17. Install differential case into axle housing.

18. Measure differential Total Torque To Rotate (TTTR) with an inch pound torque wrench (2) before installing the axle shaft. This will verify differential bearing preload.

Total Torque To Rotate is: Pinion Torque To Rotate plus 0.79 - 1.24 N·m (7 - 11 in lbs.).

NOTE: If TTTR is too high, decrease shim thickness equally from both sides of the differential and check TTTR again. If TTTR is too low, increase shim thickness equally to both sides of the differential and check TTTR again.

REAR AXLE - 226RBI

REAR AXLE - 226RBI

DIAGNOSIS AND TESTING

REAR AXLE - 226RBI

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of

driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint/CV or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joint or CV.
- Loose/broken springs.
- Damaged axle shaft bearing(s).

- Loose pinion gear nut.
- Excessive pinion flange run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV.
- Loose spring mounts.
- Loose pinion gear nut and flange.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brindled wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
	3. End play in pinion bearings.	3. Refer to pinion pre-load information and correct as necessary.
	4. Excessive ring and pinion gear backlash.	4. Check and adjustment ring and pinion gear backlash.
	5. Improper pinion bearing adjustments.	5. Adjust the pinion bearings pre-load.

	6. Loose pinion flange nut.	6. Tighten pinion flange nut to specifications.
	7. Scuffed gear tooth contact surfaces.	7. Inspect and replace as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace broken shaft after correcting tube mis-alignment.
	2. Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper differential bearing adjustment.	1. Replace case, inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored flange.	5. Replace flange and seal.
	6. Differential cover not sealed.	6. Remove, clean, and seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Adjust bearing pre-loads.

	4. Insufficient ring gear backlash.	4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring and pinion gear adjustment.	2. Check ring and pinion gear contact pattern.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring and pinion gears.	4. Replace ring and pinion gears.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Loose or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure bearing caps are torqued to the proper specification.
	9. Housing not machined properly.	9. Replace housing.

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Position and secure a lift under the axle.
3. Mark propeller shaft flange (1) and axle pinion flange (2) for installation reference.
4. Remove propeller shaft and suspend under the vehicle.

5. Remove vent hose (1) from the axle tube (2).

6. Disconnect Tru-Lok wiring connectors (1,2).

7. Remove brake calipers (2) and rotors (1) from axle.

8. Remove park brake cables (1) from axle (2).

NOTE: Park brake cables are self adjusting and must be locked out before removal.

9. Remove brake sensors connector (1) from sensors (2).

10. Remove track bar (1) from axle bracket (2)

11. Remove stabilizer bar links (1) from axle brackets (2).

12. Remove shock absorbers (1) from axle brackets (2).

13. Remove upper control arms (1) from axle brackets (2).

14. Loosen lower control arm (1) bolts and lower axle enough to remove coil springs and spring insulators.
15. Remove lower control arm (1) from axle brackets (2).
16. Lower and remove the axle.

INSTALLATION

CAUTION: The weight of the vehicle must be supported by the springs before the control arms and track bar are tightened. Failure to follow these instructions will cause premature bushing failure.

1. Raise the axle under the vehicle.
2. Install lower control arms (1) onto axle brackets (2) and loosely install mounting bolts and nuts.
3. Install coil spring isolators and springs.
4. Raise axle up until springs are seated.

5. Install upper control arms (1) onto axle brackets (2) and loosely install mounting bolts and nuts.

6. Install shock absorbers (1) onto axle brackets (2) and tighten nuts to specification.

7. Install stabilizer links (1) onto axle brackets (2) and tighten nuts to specification.

8. Install track bar (1) onto axle bracket (2). and loosely install track bar bolt.

9. Install brake sensors connector (1) on sensors (2).

10. Install park brake cables (1) on axle (2).

11. Install brake rotors (1) and calipers (2) on axle.

12. Install vent hose (1) on axle tube (2).

13. Connect Tru-Lok wiring connectors (1,2).

14. Install propeller shaft with propeller shaft flange (1) and pinion flange (2) reference marks aligned.

NOTE: Clean all propeller shaft bolts and apply Mopar Lock & Seal Adhesive or equivalent to the threads before installation.

15. Install propeller shaft bolts and tighten to specifications.

16. Install wheels and tires.

17. Remove lift from axle and lower vehicle.

18. Tighten lower control arms, upper control arms and track bar nuts to specification.

ADJUSTMENTS

PINION DEPTH-BEARING PRELOAD-GEAR BACKLASH

Ring and pinion gears are supplied as matched set. The identifying match numbers (3) for the ring and pinion gear are etched into the face of each gear. A plus (+) number, minus (–) number or zero (0) is etched into the face of the pinion gear (2). This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard depth provides the best teeth

contact pattern. Refer to Backlash and Contact Pattern Analysis Paragraph in this section for additional information.

Compensation for pinion depth variance is achieved with select shims. The shims are placed under the inner pinion bearing on the pinion shaft.

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion gear. Add or subtract the thickness of the original depth shims to compensate for the difference in the depth variances. Refer to the Depth Variance charts.

Note where Old and New Pinion Marking columns intersect. The intersecting figure represents plus or minus the amount needed.

Note the etched number on the face of the drive pinion gear (-1, -2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shim(s). If the number is positive, subtract that value from the thickness of the depth shim(s). If the number is 0 no change is necessary. Refer to the Pinion Gear Depth Variance Chart.

PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	?4	?3	?2	?1	0	+1	+2	+3	+4
+4	+0.008	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0

PINION DEPTH MEASUREMENT

Measurements are taken with pinion cups and pinion bearings installed in housing. Take measurements with Pinion Gauge Set 6730 (2,3,4,5,6,7,8) and Dial Indicator C-3339A (1).

1. Assemble Pinion Height Block 6739 (2), Pinion Block 9990 (1) and rear pinion bearing onto Screw 6741.
2. Insert assembled height gauge components, rear bearing and screw into axle housing through pinion bearing cups.
3. Install front pinion bearing and Cone Nut 6740. Tighten nut until torque to rotate the screw is 2.25 N·m (20 in. lbs.). Measure torque to rotate with an inch pound torque wrench.

4. Place Arbor Disc 8541 (1) on Arbor D-115-3 (2) and position in the housing side bearing cradles.

NOTE: Arbor Discs 8541 have different step diameters to fit other axle sizes. Pick correct size step for axle being serviced.

5. Install differential bearing caps (1) on arbor discs (2) and tighten cap bolts to 108 N·m (80 ft. lbs.).

6. Assemble Dial Indicator C-3339A (1) into Scooter Block D-115-2 (2) and secure set screw.
7. Place Scooter Block/Dial Indicator in position in axle housing so dial probe and scooter block are flush against the rearward surface of the pinion height block. Hold scooter block in place and zero the dial indicator face to the pointer. Tighten dial indicator face lock screw.
8. Slowly slide the Scooter Block/Dial Indicator across the pinion height block over to the arbor bar (1). Move the Scooter Block/Dial Indicator to the crest of the arbor bar and record the highest reading.

9. Select a shim equal to the dial indicator reading plus or minus the pinion gear depth variance number etched in the face of the pinion gear. **Example:** If the depth variance is – 2 add 0.002 in. to the dial indicator reading. If the depth variance is + 2 subtract 0.002 in. to the dial indicator reading.

The total is the shim thickness needed for the pinion depth variance.

PRELOAD SHIM SELECTION

Before performing differential bearing preload and ring gear backlash measurements, pinion gear depth must be established and the pinion gear ready for installation. Establishing pinion gear depth is essential to gear backlash and tooth contact patterns.

Differential side bearing preload and gear backlash is accomplished with selective shims (2,4) positioned behind the differential side bearing cups. Shim thickness is determined using Dummy Bearings 9992 in place of the differential side bearings and a Dial Indicator C-3339A.

SHIM FORMULA : Differential End Play + Preload Specification = Total Differential Shim. Total Differential Shim – Ring Gear Side Shim – Backlash Specification = Pinon Gear Side Shim.

1. Remove differential side bearings from differential case.
2. Remove factory installed shims from differential case.

3. Install ring gear on differential case and tighten bolts to specification.
4. Install dummy side bearings 9992 (1) on differential case.
5. Install differential case (3) with dummy bearings (1) into the differential housing (2).

6. Install the differential (3) bearing caps (1) in their correct positions. Install and snug the bolts.

7. Seat pinion gear side (2) differential dummy bearing in the housing with a dead blow hammer (1).

8. Seat ring gear side (1) differential dummy bearing in the housing with a dead blow hammer (2).

9. Install Pin C-3288-B (3) into rear cover bolt hole below ring gear.

10. Attach a dial indicator C-3339A (4) to Pilot Stud C-3288-B (3). Position the dial indicator plunger on a flat surface between the ring gear bolt heads.

11. Push and hold differential case (1) to pinion gear side of the housing and zero dial indicator (2).

12. Push and hold differential case (2) to ring gear side of the housing. Record dial indicator (1) differential reading. Add preload specification 0.25 mm (0.010 in.) to differential dial indicator reading. This is the total shim needed to preload the differential bearings.

EXAMPLE: Differential Dial Indicator Reading + Preload Specification 0.25 mm (0.010 in.) = Total Differential Shim

13. Rotate dial indicator out of the way on pilot stud.
 14. Remove differential case and dummy bearings from the housing.
 15. Install pinion gear in the housing and establish pinion torque to rotating (PTTR) .

16. Install differential case and dummy bearings 9992 in the housing, install bearing caps and tighten bolts snug.
 17. Seat ring gear side (3) dummy bearing in the housing (1) with dead blow hammer (2)

18. Position the dial indicator plunger (4) on a flat surface between the ring gear bolt heads.

19. Push and hold differential case (1) toward the pinion gear and zero dial indicator (2).

20. Push and hold differential case (2) to ring gear side of the housing and record dial indicator (1) ring gear side reading.

21. Subtract backlash specification 0.05 mm (0.002 in.) from ring gear side reading for ring gear backlash. The remainder is the shim needed on the ring gear side of the differential.

EXAMPLE: Ring Gear Side Dial Indicator Reading – Backlash Specification 0.05 mm (0.002 in.) = Ring Gear Side Shim

22. Subtract ring gear side shim from differential total preload shim. This remainder is the shim needed on the pinion side of the differential.

EXAMPLE: Total Differential Shim – Ring Gear Side Shim = Pinion Gear Side Shim

- 23. Rotate dial indicator out of the way on pilot stud.
- 24. Remove differential case and dummy bearings from the housing.
- 25. Install new side bearings on differential case.

26. Install Spreader W-129-B (1) with hold downs (2) from Adapter Set 6987B on the housing and spread open enough to receive differential case.

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

27. Install differential case (2) into the housing with bearing cups (3) and shims.

28. Install bearing caps and tighten bolts finger tight. Remove spreader from the housing.
29. Install bearing cap (1) and tighten bolts to 108 N·m (80 ft. lbs.).
30. Rotate the differential case several times to seat the side bearings.

31. Position dial indicator (1) plunger against a ring gear tooth.
32. Push and hold ring gear upward while not allowing the pinion gear to rotate and zero dial indicator.
33. Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm - 0.20 mm (0.005 in. - 0.008 in.).

If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the housing to the other

Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary

more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

The TOP LAND (1) of the gear tooth is the top surface of the tooth. The PROFILE (2) of the gear tooth is the depth of the tooth. The TOE (3) of the gear is the portion of the tooth surface at the end towards the center. The HEEL (4) of the gear is the portion of the tooth at the outer-end. The ROOT (5) of the gear tooth is the lowest portion of the tooth.

NOTE: If the PROFILE across the tooth is the same it is a 3 Axis cut gear. If the PROFILE across the tooth is tapered it is a 2 Axis cut gear.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. Using a boxed end wrench on a ring gear bolt, Rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

THREE AXIS CUT GEARS

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		Desirable pattern. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None
	Top heel contact		Top toe contact	Backlash correct. Thicker pinion position shim required.
	Root toe contact		Root heel contact	Backlash correct. Thinner pinion position shim required.
	Top heel contact		Top heel contact	Pinion position shim correct. Decrease backlash.
	Root toe contact		Root toe contact	Pinion position shim correct. Increase backlash.

TWO AXIS CUT GEARS

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		Desirable pattern. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None
	Top toe contact		Top heel contact	Backlash correct. Thicker pinion position shim required.
	Root heel contact		Root toe contact	Backlash correct. Thinner pinion position shim required.
	Top heel contact		Top toe contact	Pinion position shim correct. Decrease backlash.
	Root toe contact		Root heel contact	Pinion position shim correct. Increase backlash.

8106361d

DIFFERENTIAL BEARING PRELOAD CHECK

With an inch pound torque wrench (2) measure Total Torque To Rotate (TTTR). This is the final check on the differential assembly before installing the axle shafts. This will verify the correct differential bearing preload.

Total Torque To Rotate the differential is: Pinion Torque To Rotate plus 0.79 - 1.24 N·m (7 - 11 in. lbs.).

NOTE: If TTTR is high, decrease the shim thickness equally on both sides of the differential and check TTTR again. If TTTR is low, increase the shims thickness equally on both sides of the differential and check TTTR again.

SPECIFICATIONS

REAR AXLE - 226RBI

AXLE

DESCRIPTION	SPECIFICATION
Axle Ratio	3.21, 4.10
Ring Gear Diameter	226 mm (8.89 in.)
Ring Gear Runout	0.12 mm (0.005 in.)
Ring Gear Backlash	0.12 - 0.20 mm (0.005 - 0.008 in.)
Pinion Torque To Rotate - Original Bearings	1 - 2.2 N·m (10 - 20 in. lbs.)
Pinion Torque To Rotate - New Bearings	2.2 - 4.5 N·m (20 - 40 in. lbs.)

COVER-DIFFERENTIAL REMOVAL

1. With transmission in neutral, position vehicle on hoist.

2. Remove fill plug (1).
3. Remove cover (2) bolts.
4. Remove cover and drain lubricant.

INSTALLATION

1. Apply a 6.35 mm (1/4 in.) bead of Mopar Silicone Rubber Sealant (2) or equivalent to the housing cover (1).

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to heed caution may result in damage.

2. Install cover (1), identification tag (3) and tighten cover bolts in a criss-cross pattern to 41 N·m (30 ft. lbs.).
3. Fill differential to specifications.
4. Install fill plug (2) and tighten to 34 N·m (25 ft. lbs.).

SHAFT-AXLE

REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove brake caliper with adapter and rotor.
3. Remove park brake cable (1) from support plate (2).

NOTE: Park brake cables are self adjusting and must be locked out before removal.

4. Remove brake sensor harness (1) and remove sensor (2) from support plate.

5. Remove axle retainer plate nuts.
6. Pull axle shaft (1) with support plate, bearing and seal from axle tube (2).

INSTALLATION

1. Install axle assembly (1) into the axle tube (2).

WARNING: Never reuse axle retainer nuts. Used torque nuts can loosen up. Failure to follow these instruction may result in personal injury.

2. Install **new** axle retainer nuts and tighten to 61 N·m (45 ft. lbs.).
3. Install brake (2) and harness (1).

4. Install park brake cables (1).

BEARINGS-AXLE REMOVAL

1. Remove axle shaft from vehicle.

NOTE: Axle bearing race is a slip fit in the axle tube. No tool are required.

2. Remove brake dust shield (1) and support plate (2) from the axle.

3. Bearing retainer (1), axle bearing (2), axle shaft seal (3) and axle shaft retainer (4) are removed as an assembly.

4. Remove bearing retainer (1) and bearing (2) with seal from axle with Splitter 1130 (3) and press. Position splitter between axle shaft retainer and tone ring and press assembly off shaft.

INSTALLATION

NOTE: Inspect axle shaft retaining plate (1), if plate is bent or warped replace plate.

1. Install retaining plate (1) on axle shaft (2).

2. Apply a coat of multi-purpose grease on sealing surface of axle seal.
3. Install seal (1) on axle shaft (2) with cavity away from axle shaft retaining.

4. Press bearing and bearing retaining ring (1) onto axle shaft (2) with press and press blocks.

5. Install dust shield (1) and support plate (2) on axle shaft retainer.

6. Lubricate bearing with Mopar Wheel Bearing Grease, or equivalent. Wipe excess grease from outside of bearing.

7. Install axle in vehicle.

SEAL-PINION

REMOVAL

1. With transmission in neutral, position vehicle on hoist.

2. Remove brake component to eliminate drag.

3. Remove propeller shaft at pinion flange.

4. Rotate pinion gear three or four times.

5. Record pinion torque to rotate (1) with an inch pound torque wrench (2).

819f0e23

6. Hold pinion flange (1) with Spanner Wrench 6958 (2) and remove pinion nut and washer.
7. Mark a line across the pinion shaft and flange for installation reference.

819a74b5

8. Remove pinion flange (1) with Puller C-452 (2).
9. Remove pinion seal with a seal puller.

INSTALLATION

819a74be

1. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer 8681 (1) and Handle C-4171 (2).

819a7136

2. Install flange on the pinion shaft with the reference marks aligned.
3. Install flange (1) Installer C-3718 (2) on pinion shaft.

4. Hold pinion flange with Spanner Wrench 6958 (1) and tighten Installer C-3718 nut (2). Tighten nut to remove all end play.

5. Install pinion washer and a **new** nut on the pinion gear.
6. Hold pinion flange (1) with Spanner Wrench 6958 (2) and tighten pinion nut to 217 N·m (160 ft. lbs.).

7. Measure pinion torque to rotate (1) inch pound torque wrench (2). Pinion torque to rotate is recorded reading plus 0.56 N·m (5 in. lbs.).

8. If pinion rotating torque is low. Hold pinion flange with Spanner Wrench 6958 and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until pinion torque to rotating is achieved.

CAUTION: If maximum tightening torque of 271 N·m (200 ft. lbs.) is reached before torque to rotate is achieved, the collapsible spacer may have been damaged. Never loosen pinion gear nut to decrease pinion gear bearing rotating torque and never exceed specified preload torque. Failure to follow these instruction may result in damage.

9. Install propeller shaft.

10. Install brake components.

DIFFERENTIAL

REMOVAL

1. Remove differential fill plug (2).
2. Remove differential cover (1) and drain fluid.
3. Remove axle shafts.

4. Note reference letters stamped (1,2) on the bearing caps and housing machined sealing surface.

5. Loosen differential bearing cap (1) bolts.

6. Position Spreader W-129-B (4) with Adapter Kit 6987B (2) on differential locating holes. Install hold-

down clamps (3) and tighten the turnbuckle (5) finger-tight.

7. Install a Pin C-3288-B (5) at the left side of the differential housing. Attach Dial Indicator C-3339A (2) to pin. Load indicator plunger against the opposite side of the housing and zero the indicator.

8. Spread housing while measuring the distance with the dial indicator (1).

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

9. Remove dial indicator.
10. Holding differential case (2) in position, remove differential bearing caps.
11. Remove differential case (2) from housing (1) and tag differential bearing cups (3) and shims location.
12. Remove spreader from housing.
13. Clean the housing cavity with flushing oil, light engine oil or lint free cloth.

NOTE: Do not use water, steam, kerosene or gasoline for cleaning.

DISASSEMBLY

1. Remove ring gear bolts (1) and ring gear (2) from differential.

2. Remove pinion mate shaft (1) roll pin with a punch (2) and hammer.

3. Remove pinion mate shaft (1) from differential and pinion gears (2).

4. Rotate pinion gears (1) with thrust washers (2) to differential windows (3).

5. Remove pinion gears (1) with thrust washers (2) through differential windows (3).

6. Remove first side gear (1) with thrust washer (2) through differential window (3).

7. Remove second side gear (1) with thrust washer (2) through differential window.

ASSEMBLY

NOTE: If same gears and thrust washers are being used, install them into their original locations.

1. Lubricate all differential components with axle lubricant.
2. Install first side gear (1) with thrust washer (2) through differential window.

3. Install second side gear (1) with thrust washer (2) through differential window.

4. Install pinion gears (1) with thrust washers (2) through differential windows (3).
5. Rotate pinion gears (1) with thrust washers (2) and align gears to pinion mate shaft hole.

6. Install pinion mate shaft (1) in differential and pinion gears (2).

7. Install pinion mate shaft (2) roll pin (1).

8. Install ring gear (2) and bolts (1) on differential.

INSTALLATION

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer **Adjustments (Differential Bearing Preload and Gear Backlash)** to determine the proper shim selection.

1. Position Spreader W-129-B (1) and with dowel pins from Adapter Kit 6987B seated in housing locating holes. Install hold-down clamps (2) and tighten turnbuckle finger-tight.

2. Install Pin C-3288-B at the left side of the differential housing. Attach Dial Indicator C-3339A (1) to pin. Load the indicator plunger (2) against the opposite side of the housing and zero the indicator.
3. Spread the housing while measuring the distance with the dial indicator.

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

4. Remove the dial indicator.

5. Install differential case (2) in the housing (1). Ensure that the differential bearing cups remain in position on the bearing cones. Tap the differential case to ensure the bearings cups (3) are seated in the housing.

6. Install bearing caps with reference marks (1,2) in their original locations.
 7. Loosely install differential bearing cap bolts.
 8. Remove axle housing spreader.

9. Tighten bearing cap (1) bolts in a criss-cross pattern to 108 N·m (80 ft. lbs.).

- 10. Install axle shafts.
- 11. Install differential cover (1).

DIFFERENTIAL-TRAC-LOK

OPERATION-TRAC-LOK®

This differential clutches are engaged by two concurrent forces. The first being the preload force exerted through Belleville spring washers within the clutch packs (6) (8). The second is the separating forces generated by the side gears (7) as torque is applied through the ring gear (2).

This design provides the differential action needed for turning corners and for driving straight ahead during periods of unequal traction. When one wheel loses traction, the clutch packs transfer additional torque to the wheel having the most traction. This differential resist wheel spin on bumpy roads and provide more pulling power when one wheel loses traction. Pulling power is provided continuously until both wheels loose traction. If both wheels slip due to unequal traction, Trac-lok® operation is normal. In extreme cases of differences of traction, the wheel with the least traction may spin.

DIAGNOSIS AND TESTING

DIFFERENTIAL-TRAC-LOK®

A common problem of the Trac-Lok® differential is a chatter noise when turning corners. Before removing the unit for repair, drain, flush and refill the axle with the specified lubricant. Add a container of Mopar Limited Slip Additive after repair service or during a lubricant change.

After changing the lubricant, drive the vehicle and make 10 to 12 slow, figure-eight turns. This maneuver will pump lubricant through the clutches. This will correct the condition in most instances. If the chatter persists, clutch damage could have occurred.

The differential can be tested without removing the differential case by measuring rotating torque. Make sure brakes are not dragging during this measurement.

1. Place blocks in front and rear of both front wheels.
2. Raise one rear wheel until it is completely off the ground.
3. Engine off, transmission in neutral, and parking brake off.
4. Remove wheel and bolt Torque Check Tool 6790 (1) or equivalent tool to studs.
5. Use torque wrench (2) on Torque Check Tool (1) to rotate wheel and read rotating torque.
6. If rotating torque is less than 41 N·m (30 ft. lbs.) or more than 271 N·m (200 ft. lbs.) on either wheel the unit must be replaced.

DISASSEMBLY

1. Remove ring gear.
2. Clamp side gear Fixture 6963A (1) in a vise and set differential case (2) on the fixture.

3. Remove pinion gear mate shaft roll pin from differential case (1) with a hammer and punch (2).

4. Rotate differential case (1) on the fixture (2) and remove pinion mate shaft (3).

5. Lubricate and install disc (1) without threaded hole from Trac-lok® Tool C-4487 into lower side gear (2).

6. Lubricate and install disc (1) with threaded hole from Trac-lok® Tool C-4487 into upper side gear (2). Thread forcing screw (3) from Trac-lok® Tool C-4487 into upper disc until it contacts the lower disc (4).

NOTE: Slot in threaded upper disc (1) can be used to prevent it from turning using a screw driver.

7. Tighten forcing screw to compress belleville springs in clutch packs. Then Insert turning bar (1) from Trac-lok® Tool C-4487 into the pinion mate shaft hole in the case (2).

8. Rotate differential case (1) with turning bar until the pinion gears (1) and washers can be removed.

NOTE: Loosen forcing screw in small increments to relieve clutch pack tension if differential case can not be rotated.

9. Remove Forcing Screw, Step Plate and Threaded Adapter.

10. Remove upper clutch pack (1), clutch pack retainers (2) and upper side gear (3) from case.

11. Remove lower clutch pack, clutch pack retainers and lower side gear (1) from case (2).

12. Remove clutch pack retainers (1), clutch pack (3) belleville spring (2) from side gear (4). Keep plates in order during removal.

ASSEMBLY

NOTE: New Plates and discs with fiber coating (no grooves or lines) must be presoaked in Friction Modifier before assembly. Soak plates and discs for a minimum of 20 minutes.

1. Lubricate components with gear lubricant.
2. Assemble clutch discs (1), plates (6) and belleville spring (2) into packs and secure disc packs with retainers (5).

NOTE: Belleville spring (2) is position with the convex side against the side gear.

3. Position assembled clutch disc packs on the side gear (4) hubs.

4. Install lower clutch pack and side gear (1) in the differential case (2), with retaining clips seated in the case pocket.

5. Install upper clutch disc pack (1) retaining clips (2) and side gear (3) with seated in the case pocket.

6. Lubricated and install discs into side gears from Trac-lok® Tool C-4487. Install forcing screw from Trac-lok® Tool C-4487 and thread screw to compress belleville springs in clutch packs.

7. Install pinion gears (2) in side gears opposite each other.

8. Rotate differential case (2) with turning bar (1) from Trac-lok® Tool C-4487 until pinion gears align with mate shaft holes in the case.

NOTE: Loosen forcing screw in small increments to relieve clutch pack tension if differential case can not be rotated.

9. Install pinion gear thrust washers (1) between the gear and case (2). Align washers with mate shaft hole in the case.

10. Remove forcing screw upper disc from side gear.
11. Remove lower disc (1) from side gear (2).

12. Install pinion mate shaft (3) in case (1).

13. Install pinion mate shaft (1) roll pin (2).
14. Install ring gear.
15. Lubricate all differential components with gear lubricant.

DIFFERENTIAL-TRU-LOK

DESCRIPTION

Tru-Lok is an electronically locking differential (1). The differential has four pinion gears, three pinion shafts and two side gears. On the back side of one side gear (2) is half of the dog clutch.

NOTE: The electric locking differential is serviced as an assembly.

A 12 volt electromagnetic coil (3) on the differential is controlled by the Totally Integrated Power Module (TIPM). When the coil (3) is energized the dog clutch is engaged which locks the one side gear to the differential case. This action locks the axles and

triggers a switch (4) in the differential housing which activates the Tru-Lok indicator light on the dash.

OPERATION

Pressing a two-way momentary rocker switch on the switch bank request axle lock. The first press DOWN requests rear axle to be locked, every other press DOWN toggles between "front and rear axle lock" and "rear axle lock" request states. Press rocker switch UP requests both axles to be unlocked. The switch is on the IP in the switch bank. The switch bank sends a message to the Cabin Cluster Node (CCN). The CCN handles the switch debounce and switch diagnostics. Any one message sent by the CCN on the network is a valid switch change. The CCN passes the information to the Totally Integrated Power Module (TIPM) via a CAN B message. The TIPM will process the switch info received from CAN B, control the outputs as required by the Axle Lock Electrical Requirements, and send a lighting request to the CCN via CAN B. There are three telltales on the cluster, "Rear", "Front", and "Lock". The telltales will be off if the axles are unlocked, flashing if there is a pending request to lock but the axles are not yet locked (transition to lock, torque-locked, or conditions not correct), and flashing rapidly if there is a fault. The "Front" and "Rear" telltales will match the front and rear differential states. The "Lock" telltale will be on solid if either the "Front" or "Rear" telltale is on or blinking. The TIPM will send the axle lock status message to the ESP module via CAN C.

AXLE LOCK ELECTRICAL REQUIREMENTS

DIFFERENTIAL LOCK

- Vehicle speed of 16 KPH (10 MPH) or below
- Transfer case in 4 LO position
- Switch request message for the corresponding axle/s has been received
- Ignition switch in the RUN or START position
- No system, module, or switch faults have been detected

DIFFERENTIAL UNLOCK

- Transfer case in 4 HI, 2 WD, or Neutral
- Loss of ignition switch signal, vehicle speed signal, transfer case signal

- Vehicle speed of 50 KPH (30 MPH) or higher
- Valid switch message received

AXLE FAIL-SAFE

- Axles will UNLOCK with ignition switch in either the OFF or ACC position.
- Axles will not LOCK if there is no ignition switch, vehicle speed, or transfer case position signal. Axles will UNLOCK with the loss of any of these signals.
- Axles will not LOCK if the ignition switch is OFF.
- Axles will UNLOCK if a switch failure is detected.

Software Latch Feature: The Totally Integrated Power Module (TIPM) will have a software latch of the axle switch during an ignition switch OFF when the vehicle is in 4 LO transfer case position. Upon ignition key RUN or START the TIPM shall check to verify conditions are correct for an axle lock and automatically lock the axles that were locked before the ignition was turned OFF.

NOTE: The electric locking differential is serviced as an assembly.

DIAGNOSIS AND TESTING

DIFFERENTIAL - TRU-LOK

The control module for the electronically locking differentials detects faults from input signal/messages, sensors, solenoids, and drivers/relays and report the corresponding Diagnostic Trouble Code (DTC).

The lighting strategy for the axle lock switch.

1. The FRONT LED will

- a. turn ON SOLID when the front axle is locked
- b. turn ON BLINKING when the front axle is attempting to lock
- c. turn ON BLINKING when a lock front axle request is received but conditions to lock are not correct
- d. turn OFF when the axle is UNLOCKED
- e. turn ON FAST BLINKING when there is a fault detected for the front axle

2. The REAR LED will

- a. turn ON SOLID when the rear axle is locked
- b. turn ON BLINKING when the rear axle is attempting to lock
- c. turn ON BLINKING when a lock rear axle request is received but conditions to lock are not correct
- d. turn OFF when the axle is UNLOCKED
- e. turn ON FAST BLINKING when there is a fault detected for the rear axle

INDICATOR SWITCH

Ohm meter set on continuity: One lead on each connector terminal

- Switch Plunger IN Locker Not Engaged - No Continuity
- Switch Plunger OUT Locker Engaged - Continuity

REMOVAL

1. Remove differential fill plug (2).
2. Remove differential cover (1) and drain fluid.
3. Remove axle shafts.

4. Remove Tru-Lok harness from the coil (1) and indicator switch (2).

5. Remove Tru-Lok coil connector (1) bolt (2).

6. Remove Tru-Lok coil connector from the axle housing and remove coil harness (1) from the connector (2).

7. Loosen differential bearing cap (1) bolts.
8. Position Spreader W-129-B with Adapter Kit 6987B on differential locating holes. Install hold-down clamps and tighten the turnbuckle finger-tight.
9. Install a Pin C-3288-B at the left side of the differential housing. Attach Dial Indicator C-3339A to pin. Load indicator plunger against the opposite side of the housing and zero the indicator.
10. Spread housing while measuring the distance with the dial indicator.

CAUTION: Never spread housing over 0.50 mm

(0.020 in). Failure to follow these instructions will damage the housing.

11. Remove dial indicator.
12. Holding differential case in position, remove differential bearing cap bolts.
13. Remove coil anti-rotation bracket (1) from the bearing cap (2), then remove both bearing caps.
14. Remove differential case from housing and tag differential bearing cups and shims location.
15. Remove spreader from housing.
16. Clean the housing cavity with flushing oil, light engine oil or lint free cloth.

NOTE: Do not use water, steam, kerosene or gasoline for cleaning.

DISASSEMBLY

1. Remove bearing from coil side of the differential case with Puller C-293-PA (1), Plug C-293-3 (2), and Adapters C-293-47 (3).

2. Remove washer (1) from coil (2).

3. Remove coil (1) from differential case.

4. Remove ring gear bolts (1) and remove ring gear (2).

5. Remove differential case (1) screws (2).

6. Pry up dog clutch actuator plate (1) and remove from differential case (2).

7. Turn differential case over and remove case half.
8. Remove thrust washer (1) from side gear (2).

9. Remove side gear (1) from differential case (2).

10. Push pinion shaft (2) pin (1) up.

11. Pull pinion shaft pin (1) out of the pinion shaft (2) and case.

12. Remove pinion shaft (1) from the case and remove pinion gear (2) with thrust washer.

13. Pull opposite pinion shaft pin (1) out of the pinion shaft (2) and case.

14. Remove the pinion shaft (1) from the case and remove pinion gear (2) with thrust washer.

15. Slid remaining pinion shaft (1) out of the case and remove the remaining two pinion gears (2) with thrust washers.

16. Remove dog clutch side gear (1) from differential case (2).

17. Turn dog clutch side gear (2) over and remove thrust washers (1).

18. Remove wave spring stop ring (1) from differential case (2).

19. Remove wave spring (1) from differential case (2).

20. Remove dog clutch (1) from differential case (2).

ASSEMBLY

1. Install dog clutch (1) in differential case (2).

2. Install wave spring (1) in differential case (2).

3. Install wave spring stop ring (1) in differential case (2) and align tabs with dog clutch notches.

4. Install both thrust washers (1) on dog clutch side of the side gear (2).

5. Install side gear dog clutch (1) with thrust washers in differential case (2).

6. Install two pinion gears (2) with thrust washers then slid pinion shaft (1) into the case.

7. Install third pinion gear (2) with thrust washer then slid pinion shaft (1) into the case.

8. Install pinion shaft pin (1) into the pinion shaft (2) and case.

9. Install fourth pinion gear (2) with thrust washer then slid pinion shaft (1) into the case.

10. Install pinion shaft pin (1) into the pinion shaft (2) and case.

11. Install side gear (1) into differential case (2).

12. Install thrust washer (1) on side gear (2).
13. Install case half and align screw holes.

14. Install dog clutch actuator plate (1) on dog clutch and case (2).

15. Install differential case (1) screws (2).

16. Install ring gear with **new** ring gear (2) bolts (1) and alternately tighten to 136 N·m (100 ft. lbs.).

17. Install coil (1) on differential case.

18. Install washer (1) on coil (2).

19. Install differential bearing with Installer C-4213 (1) and Handle C-4171 (2).

INSTALLATION

81aB25f3

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer **Adjustments (Differential Bearing Preload and Gear Backlash)** to determine the proper shim selection.

1. Position Spreader W-129-B (1) and with dowel pins from Adapter Kit 6987B seated in housing locating holes. Install hold-down clamps (2) and tighten turnbuckle finger-tight.

816f13e4

2. Install Pin C-3288-B at the left side of the differential housing. Attach Dial Indicator C-3339A (1) to pin. Load the indicator plunger (2) against the opposite side of the housing and zero the indicator.
3. Spread the housing while measuring the distance with the dial indicator.

CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

4. Remove the dial indicator.

5. Install differential case into the housing with differential bearing cups and shims in their original locations.

6. Install bearing caps (2) in their original locations and coil anti-rotation bracket (1).

7. Loosely install differential bearing cap bolts.

8. Remove spreader.

9. Tighten bearing cap (1) bolts in a criss-cross pattern to 108 N·m (80 ft. lbs.).

10. Install Tru-Lok coil connector (2) to the coil harness (1).

11. Install Tru-Lok coil connector (1) bolt (2).

12. Install Tru-Lok harness to the coil (1) and indicator switch (2).

- 13. Install axle shafts.
- 14. Install differential cover (1).

SWITCH-LOCKER

REMOVAL

1. Remove Tru-Lok harness from the coil (1) and indicator switch (2).

2. Remove Tru-Lok coil connector (1) bolt (2).

3. Remove Tru-Lok coil connector from the axle housing and remove coil harness (1) from the connector (2).

4. Remove differential.
5. Remove Tru-Lok inductor switch (1) from differential housing (2).

INSTALLATION

1. Install indicator switch (1) into differential housing (2).

2. Install differential.
3. Install Tru-Lok coil connector (2) to the coil harness (1).

4. Install Tru-Lok coil connector (1) bolt (2).

5. Install Tru-Lok harness to the coil (1) and indicator switch (2).

BEARINGS-DIFFERENTIAL CASE

REMOVAL

1. Remove differential case from axle housing.
2. Remove bearings (2) from the differential case with Puller C-293-PA (5), Adapters C-293-47 (1) and Plug C-293-3 (4).

NOTE: Use the same tools for the Tru-Lok differential.

INSTALLATION

1. Install differential side bearings on Tru-Lok differentials with Installer C-4213 (1) and Handle C-4171 (2).

2. Install differential side bearings on open or Trac-Lok® differentials with Installer D-156 (1) and Handle C-4171 (2).
3. Install differential into the housing.

COIL-DIFFERENTIAL REMOVAL

1. Remove differential case from axle housing.
2. Remove bearing from the coil side of the differential case with Puller C-293-PA (1), Plug C-293-3 (2), and Adapters C-293-47 (3).

3. Remove thrust washer (1) from differential case and coil (2).

4. Remove coil (1) from differential case.

INSTALLATION

1. Install coil (1) on differential case.

2. Install thrust washer (1) on top of the coil (2).

3. Install differential side bearing with Installer C-4213 (1) and Handle C-4171 (2).
4. Install differential into the housing.

GEAR-PINION/RING REMOVAL

NOTE: The ring gear and pinion are serviced as a matched set. Never replace one gear without replacing the other matched gear.

1. Remove differential assembly from axle housing.
2. Remove ring gear bolt (1) and ring gear (2) from differential case.

3. Hold pinion flange (1) with Spanner Wrench 6958 (2) and remove the pinion nut and washer.

4. Remove pinion flange (1) with Puller C-452 (2).

5. Remove pinion gear (1) from the housing with Driver 8976 (2).

6. Remove collapsible spacer (1) from pinion (3).

7. Remove rear pinion bearing from pinion shaft (1) with Puller C-293-PA (2) and Adapters C-293-47 (3).

8. Remove and record pinion depth shims (1) from the pinion gear shaft (2).

9. Remove pinion seal with seal puller and remove oil slinger (1).

10. Remove front pinion bearing (1).

11. Remove front pinion bearing cup from differential housing with Remover D-103 (1) and Handle C-4171 (2).

12. Remove rear pinion bearing cup from differential housing with Remover C-4307 (1) and Handle C-4171 (2).

INSTALLATION

1. Install rear bearing cup with Installer C-4308 (1) and Handle C-4171 (2).

2. Install front bearing cup with Installer D-129 (1) and Handle C-4171 (2).

3. Install front pinion bearing (1).

4. Install front pinion bearing oil slinger (1).

5. Apply a light coating of gear lubricant on the lip of pinion seal. Install pinion seal with Installer 8681 (1) and Handle C-4171 (2).

6. Install pinion depth shims (1) on the pinion shaft (2).

7.

Install rear pinion bearing (4) on the pinion gear (3) with Installer C-4040 (2) and a press (1).

8. Install collapsible spacer (1) on pinion shaft (3).

9. Install pinion gear into the housing.

10. Install pinion flange (1) with Installer C-3718 (2).

819a74cc

11. Install pinion washer and a new nut. Hold pinion flange with Spanner Wrench 6958 and tighten pinion nut to 217 N·m (160 ft. lbs.).

12. Set torque wrench to 271 N·m (200 ft. lbs.) and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until Pinion Torque To Rotate specification is achieved.

819a74b5

13. Measure Pinion Torque To Rotate (1) (PTTR) after each 6.8 N·m (5 ft. lbs.) increment with an inch pound torque wrench (2).

Pinion Torque To Rotate is:

- **Original Bearings** - 1 to 2 N·m (10 to 20 in. lbs.)
- **New Bearings** - 2 to 4.5 N·m (20 to 40 in. lbs.)

14. Install **new** ring gear bolts (1) and alternately tighten to 183 N·m (135 ft. lbs.).

CAUTION: Never reuse ring gear bolts, the bolts can fracture causing extensive damage. Failure to these instruction may result in damage.

15. Install differential in axle housing and verify gear backlash, mesh and contact pattern.

16. Measure Total Torque To Rotate (TTTR) with an inch pound torque wrench (2) before installing the axle shafts.

Total Torque To Rotate is: Pinion Torque To Rotate plus 0.79 - 1.24 N·m (7 - 11 in lbs.).

NOTE: If TTTR is too high, decrease shim thickness equally from both sides of the differential and check TTTR again. If TTTR is too low, increase shim thickness equally to both sides of the differential and check TTTR again.

4 - VEHICLE QUICK REFERENCE

FLUID - CAPACITIES & RECOMMENDED

SPECIFICATIONS

RECOMMENDED FLUIDS, LUBRICANTS AND GENUINE PARTS

ENGINE

Component	Fluid, Lubricant, or Genuine Part
Engine Coolant	Mopar ® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology)
Engine Oil	API Certified SAE 5W-20 Engine Oil is recommended. Meets the requirements of DaimlerChrysler Material Standard MS-6395. Refer to your engine oil filler cap for correct SAE grade.
Spark Plugs (3.8L Engine)	RE14PLP5 (Gap 0.050 in [1.27 mm])
Oil Filter (3.8L Engine)	Mopar ® Oil Filter (P/N 04105409AC)
Fuel Selection	87 Octane

ENGINE - EXPORT

Component	Fluid, Lubricant, or Genuine Part
Engine Coolant	Mopar ® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology)
Engine Oil - Gasoline (Non ACEA Categories)	Use API Certified SAE 5W-20 engine oil, meeting the requirements of DaimlerChrysler Material Standard MS-6395. Refer to your engine oil filler cap for correct SAE grade. SAE 5W-30 engine oil approved to MB 229.31 or MB 229.51 may be used when SAE 5W-20 engine oil is not available.
Engine Oil - Gasoline (ACEA Categories)	For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3, and approved to MB 229.31 or MB 229.51. SAE 5W-30 engine oil approved to MB 229.31 or MB 229.51 may be used when SAE 5W-20 engine oil is not available.
Engine Oil - Diesel (without Particulate Filter)	Use SAE 0W-40 diesel engine oils confirming to API Quality CI-4 or CJ-4. For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3 and approved to MB 229.31 or MB 229.51.

Engine Oil - Diesel (with Particulate Filter)	Use SAE 5W-30 diesel engine oils conforming to API Quality CI-4 or CJ-4. For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3 (LOW ASH) and approved to MB 229.31 or MB 229.51.
Spark Plugs (3.8L Engine)	RE14PLP5 (Gap 0.050" [1.27 mm])
Oil Filter (2.8L Diesel Engine)	Mopar ® Oil Filter (P/N 5003558AA)
Oil Filter (3.8L Engine)	Mopar ® Oil Filter (P/N 04105409AC)
Fuel Selection (Gasoline Engines)	91 Octane
Fuel Selection (Diesel Engines)	50 Cetane or higher (Less than 15 ppm Sulfur)

CHASSIS

Component	Fluid, Lubricant, or Genuine Part
Automatic Transmission	Mopar ® ATF+4 Automatic Transmission Fluid
Manual Transmission	Mopar ® Manual Transmission Lubricant or equivalent (meeting the requirements of DaimlerChrysler Material Standard MS-9224)
Transfer Case	Mopar ® ATF+4 Automatic Transmission Fluid or equivalent.
Brake Master Cylinder	Mopar ® DOT 3 Brake Fluid, SAE J1703 should be used. If DOT 3, SAE J1703 brake fluid is not available, then DOT 4 is acceptable. Use only recommended brake fluids.
Power Steering Reservoir	Mopar ® ATF+4 Automatic Transmission Fluid Mopar ® Power Steering Fluid + 4, Mopar ® ATF+4 Automatic Transmission Fluid

CHASSIS - EXPORT

FUSE LOCATIONS & TYPES

SPECIFICATIONS

FUSES (TOTALLY INTEGRATED POWER MODULE)

The Totally Integrated Power Module (TIPM) is located in the engine compartment near the battery. This center contains cartridge fuses, mini fuses and relays. A label that identifies each component is printed on the inside of the cover.

Cavity	Cartridge Fuse	Mini Fuse	Description
J1	—		—
J2	30 Amp Pink		Transfer Case Module
J3	—		—
J4	25 Amp Natural		Driver Door Node
J5	25 Amp Natural		Passenger Door Node
J6	40 Amp Green		Anti-Lock Brake System (ABS) Pump Feed/ESP
J7	30 Amp Pink		Anti-Lock Brake System (ABS) Valve Feed/ESP
J8	—		—
J9	40 Amp Green		PZEV Sec Motor Feed/Flex Fuel
J10	30 Amp Pink		Headlamp Wash Relay/Manifold Tuning Valve
J11	30 Amp Pink		Sway Bar
J13	60 Amp Yellow		Ignition Off Draw (IOD) — Main
J14	40 Amp Green		EBL (Rear Window Defogger)
J15	30 Amp Pink		Rear Blower
J17	40 Amp Green		Starter Solenoid
J18	20 Amp Yellow		Powertrain Control Module (PCM) Trans Range
J19	60 Amp Yellow		Radiator Fan
J20	30 Amp		Front Wiper LO/HI

	Pink		
J21	20 Amp Yellow		Front/Rear Washer
J22	—		Spare
M1		15 Amp Blue	Center High-Mounted Stop Light (CHMSL)/Switch Stop Lamp Feed
M2		20 Amp Yellow	Relay Trailer Lighting (Stop)
M3		20 Amp Yellow	Frt/Rear Axle Locker Relay
M4		—	—
M5		—	—
M6		20 Amp Yellow	Power Outlet #1/Rain Sensor
M7		20 Amp Yellow	Power Outlet #2 (BATT/ACC SELECT)
M8		20 Amp Yellow	Front Heated Seat
M9		20 Amp Yellow	Rear Heated Seat (If Equipped)
M10		20 Amp Yellow	Ignition Off Draw — Vehicle Entertainment System (IOD-VES), Satellite Digital Audio Receiver (SDARS), DVD, Hands-Free Module (HFM), RADIO, Antenna (ANT), Universal Garage Door Opener (UGDO), Vanity Lamp (VANITY LP)
M11		10 Amp Red	(Ignition Off Draw) IOD-HVAC/ATC, MW SENSR, Underhood Lamp (UH LMP)
M12		30 Amp Green	Amplifier (AMP)
M13		20 Amp Yellow	Ignition Off Draw— Cabin Compartment Node (IOD-CCN), Wireless Control Module (WCM), SIREN, Multifunction Control Switch (MULTIFCTN SW)

M14		20 Amp Yellow	Trailer Tow (Export Only)
M15		20 Amp Yellow	COL MOD, IR SNS, Heater Ventilation, Air Conditioning/Automatic Temperature Control (HVAC/ATC), Rear View Mirror (RR VW MIR), Cabin Compartment Node (CCN), Transfer Case Switch (T-CASE SW), RUN/ST, Multi-Function Control Switch (MULTIFTCN SW), Tire Pressure Monitor (TPM), Glow Plug Module (GLW PLG MOD) — Export Diesel Only
M16		10 Amp Red	Occupant Restraint Controller (ORC)
M17		15 Amp Blue	Left Tail/License/Park Lamp (LT-TAIL/LIC/PRK LMP)
M18		15 Amp Blue	Right Tail/Park/Run Lamp (RT-TAIL/PRK/RUN LMP)
M19		25 Amp Natural	Auto Shut Down (ASD #1 and #2)
M20		15 Amp Blue	Cabin Compartment Node Interior Light (CCN INT LIGHT), Switch Bank (SW BANK)
M21		20 Amp Yellow	Auto Shut Down (ASD #3)
M22		10 Amp Red	Right Horn (RT HORN (HI/LOW)
M23		10 Amp Red	Left Horn (LT HORN (HI/LOW)
M24		25 Amp Natural	Rear Wiper (REAR WIPER)
M25		20 Amp Yellow	Fuel Pump (FUEL PUMP), Diesel Lift Pump (DSL LIFT PUMP) — Export Only
M26		—	—
M27		10 Amp Red	Ignition Switch Feed, Wireless Module

M28		10 Amp Red	PCM Feed/TCM
M29		—	—
M30		15 Amp Blue	Wiper Motor Frt, J1962 Diagnostic Feed
M31		20 Amp Yellow	Backup Lamps (B/U LAMPS)
M32		10 Amp Red	Occupant Restraint Controller (ORC), TT EUROPE
M33		10 Amp Red	Next Generation Controller (NGC), Global Powertrain Engine Controller (GPEC)
M34		10 Amp Red	Park Assist (PRK ASST), Heater Ventilation, Air Conditioning Module (HVAC MOD), Headlamp Wash (HDLP WASH), Compass (COMPAS)
M35		10 Amp Red	Heated Mirrors
M36		20 Amp Yellow	Power Outlet
M37		10 Amp Red	Anti-Lock Brake System (ABS) , Electronic Stability Program (ESP), Stop Lamp Switch (STP LP SW), Fuel Pump Rly Hi Control
M38		25 Amp Natural	Lock/Unlock Motors (LOCK/UNLOCK MTRS)

12	Spare

CAUTION:

- **When installing the Integrated Power Module cover, it is important to ensure the cover is properly positioned and fully latched. Failure to do so may allow water to get into the Integrated Power Module, and possibly result in an electrical system failure.**
- **When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.**

MAINTENANCE SCHEDULES**DESCRIPTION****MAINTENANCE SCHEDULES - NAFTA**

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Non-EVIC equipped vehicles “CHANGE OIL” will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions the oil change indicator message will illuminate, this means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change your vehicles oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 6,000 miles (10,000 km) or 6 months, whichever comes first.**

Your dealer will reset the oil change indicator message after completing the scheduled oil change. If this

scheduled oil change is performed by someone other than your dealer the message can be reset by referring to the steps described under “Odometer/Trip Odometer” in the “Instrument Cluster Description” section of this manual.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Check the manual transmission fluid level.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

Required Maintenance Intervals

Maintenance Items	Perform Maintenance Every		
	Miles	Kilometers	or Months
Change the engine oil and engine oil filter.	6,000	10 000	6
Rotate tires.	6,000	10 000	6
If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter, replace if necessary.	12,000	20 000	12
Inspect the brake linings, replace if necessary.	12,000	20 000	12

Replace the air conditioning filter.	12,000	20 000	12
Inspect the front & rear axle fluid, change if using your vehicle for police, taxi, fleet, off-road or frequent trailer towing.	18,000	30 000	18
Inspect the CV Joints. Perform the first inspection at 12,000 miles (20 000 km) or 12 months.	24,000	40 000	24
Inspect exhaust system. Perform the first inspection at 12,000 miles (20 000 km) or 12 months.	24,000	40 000	24
Inspect the front suspension, tie rod ends and boot seals, replace if necessary.	24,000	40 000	24
Replace the engine air cleaner filter.	30,000	50 000	30
Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, snow plowing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more then 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).	30,000	50 000	30
Inspect the transfer case fluid.	30,000	50 000	30
Change the automatic transmission fluid and main sump filter if using your vehicle for any of the following: police, taxi, fleet or frequent trailer towing.	60,000	100 000	60
Change the transfer case fluid if using your vehicle for any of the following: police, taxi, fleet, off-road or frequent trailer towing.	60,000	100 000	60
Inspect and replace PCV valve if necessary.	90,000	150 000	90
Flush and replace the engine coolant.	102,000	170 000	60
Replace the ignition cables.	102,000	170 000	102
Replace the spark plugs.	102,000	170 000	102
Change the automatic transmission fluid, main sump filter, and spin-on cooler return filter (if equipped).	120,000	200 000	120
Replace accessory drive belt(s).	120,000	200 000	120

WARNING:

You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE SCHEDULES - EXPORT - GAS

To help you have the best driving experience possible, the manufacturer has identified the specific vehicle maintenance service intervals that are required to keep your vehicle operating properly and safely.

DaimlerChrysler Corporation recommends that these maintenance intervals be performed at your selling dealer. The technicians at your dealership know your vehicle best, and have access to factory trained information,

genuine Mopar parts, and specially designed electronic and mechanical tools that can help prevent future costly repairs.

The maintenance intervals shown should be performed as indicated in this section.

NOTE: Under no circumstances should oil change intervals exceed 7,500 miles (12 000 km) or 6 months, whichever comes first.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Check the manual transmission fluid level.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

Severe Duty

If your vehicle is operated under the Severe Duty conditions listed below change your engine oil and filter every 3,000 miles (5 000 km) or 3 months as indicated in the Maintenance Schedule.

- Stop and go driving.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

Required Maintenance Intervals

	Perform Maintenance Every
--	--------------------------------------

	(Where time and mileage are
--	-----------------------------

	listed, follow the interval that occurs first.)		
Maintenance Items	Miles	Kilometers	or Months
Change the engine oil and engine oil filter if using your vehicle under any of the severe duty conditions: Short trips, stop and go driving, dusty or off-road conditions, police, taxi, fleet, or frequent trailer towing.	3,000	5 000	3
	or	or	or
Change the engine oil and engine oil filter if your vehicle is NOT operated under any of the conditions listed under Severe Duty .	7,500	12 000	6
Rotate tires.	7,500	12 000	6
If using your vehicle for any of the following: Dusty or off-road conditions. Inspect the engine air cleaner filter, replace if necessary.	15,000	24 000	12
Inspect the brake linings, replace if necessary.	15,000	24 000	12
Inspect the front & rear axle fluid, change if using your vehicle for police, taxi, fleet, off-road or frequent trailer towing.	15,000	24 000	12
Inspect the CV Joints. Perform the first inspection at 15,000 miles (24 000 km) or 12 months.	22,500	36 000	18
Inspect Exhaust System. Perform the first inspection at 15,000 miles (24 000 km) or 12 months.	22,500	36 000	18
Inspect the front suspension, tie rod ends and boot seals, replace if necessary.	22,500	36 000	18
Replace the engine air cleaner filter.	30,000	50 000	30
Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, snow plowing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more then 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).	30,000	50 000	30
Inspect the transfer case fluid.	30,000	50 000	30
Change the automatic transmission fluid & filter if using your vehicle for any of the following: police, taxi, fleet or frequent trailer towing.	60,000	100 000	60
Change the transfer case fluid if using your vehicle for any of the following: police, taxi, fleet, off-road or frequent trailer towing.	60,000	100 000	60
Inspect and replace PCV valve if necessary.	90,000	150 000	90
Flush and replace the engine coolant.	102,000	170 000	60
Replace the ignition cables.	102,000	170 000	102

Replace the spark plugs.	102,000	170 000	102
Change the automatic transmission fluid, main sump filter, and spin-on cooler return filter (if equipped).	120,000	200 000	120
Replace Accessory Drive Belt(s).	120,000	200 000	120

WARNING:

You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE SCHEDULES - EXPORT - DIESEL**Change Oil Message (Diesel Models with DPF (Diesel Particulate Filter) Only)**

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Non-EVIC equipped vehicles “CHANG E OIL” will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions, the oil change indicator message will illuminate, this means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

Your dealer will reset the oil change indicator message after completing the scheduled oil change. If this scheduled oil change is performed by someone other than your dealer the message can be reset by referring to the steps described under “Odometer/Trip Odometer” in the “Instrument Cluster Description” section of this manual.

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule “**A**”. It is for vehicles that are not operated under any of the conditions listed under Schedule “**B**.”

Second is Schedule “**B**”. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

Once a Month

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, clean and tighten the terminals as required.
- Check the fluid levels of engine coolant/antifreeze deaeration bottle, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/antifreeze level, hoses, and clamps.
- Inspect engine accessory drive belts. Replace as necessary.
- Inspect for the presence of water in the fuel filter/water separator unit.

Schedule “A”

Kilometers	20 000	40 000	60 000	80 000	100 000
(Miles)	(12,500)	(25,000)	(37,500)	(50,000)	(62,500)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X		X		X
Replace the engine air filter element.		X		X	
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.		X		X	
Replace the engine accessory drive belt.					X
Inspect the brake linings.		X		X	
Inspect the manual transmission fluid, add if necessary.		X		X	
Inspect the transfer case fluid, add if necessary.				X	

Kilometers	120 000	140 000	160 000	180 000	200 000
------------	---------	---------	---------	---------	---------

(Miles)	(75,000)	(87,500)	(100,000)	(112,500)	(125,000)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.		X		X	X
Replace the engine air filter element.	X		X		X
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.	X		X		X
Flush and replace the engine coolant.			X		X
Replace the engine accessory drive belt.					X
Replace the engine timing belt, and timing belt tensioner.					X
Inspect the brake linings.	X		X		X
Inspect the manual transmission fluid, add if necessary.	X		X		X
Inspect the transfer case fluid, add if necessary.			X		

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Kilometers	10 000	20 000	30 000	40 000	50 000
(Miles)	(6,250)	(12,500)	(18,750)	(25,000)	(31,250)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X		X		X
Replace the engine air filter element.		X		X	

Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.				X	
Drain and refill the front and rear axle fluid.		X		X	
Inspect the brake linings.		X		X	
Inspect the manual transmission fluid, add if necessary.					X
Inspect the transfer case fluid, add if necessary.		X		X	
Drain and refill the front and rear axle fluid.		X		X	

Kilometers	60 000	70 000	80 000	90 000	100 000
(Miles)	(37,500)	(43,750)	(50,000)	(56,250)	(62,500)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.		X		X	
Replace the engine air filter element.	X		X		X
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.			X		
Replace the engine accessory drive belt.	X				
Inspect the brake linings.	X		X		X
Drain and refill the front and rear axle fluid.	X		X		X
Inspect the transfer case fluid, add if necessary.	X		X		X
Inspect the manual transmission fluid, add if necessary.					X
Drain and refill the automatic transmission fluid. Replace main sump filter and spin-on cooler return filter (if equipped).					X

Kilometers	110 000	120 000	130 000	140 000	150 000
(Miles)	(68,750)	(75,000)	(81,250)	(87,500)	(93,750)

Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X	X	X	X	X
Replace the engine air filter element.		X		X	
Replace the engine accessory drive belt.		X			
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.		X			
Inspect the brake linings.		X		X	
Inspect the manual transmission fluid, add if necessary.					X
Inspect the transfer case fluid, add if necessary.		X		X	
Drain and refill the front and rear axle fluid.		X		X	

Kilometers	160 000	170 000	180 000	190 000	200 000
(Miles)	(100,000)	(106,250)	(112,500)	(118,750)	(125,000)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.		X		X	
Replace the engine air filter element.	X		X		X
Replace the engine accessory drive belt.			X		
Replace the engine timing belt, and timing belt tensioner.					X
Drain the fuel filter/water separator unit.	X	X	X	X	X
Replace the fuel filter/water separator unit.	X				X
Flush and replace the engine coolant/anti-freeze.	X				
Inspect the brake linings.	X		X		X
Inspect the manual transmission fluid, add if necessary.					X
Drain and refill the automatic transmission fluid. Replace main sump filter and spin-on cooler return filter (if equipped).					X

Inspect the transfer case fluid, add if necessary.	X		X		X
Drain and refill the front and rear axle fluid.	X		X		X

‡ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

REPLACEMENT BULBS

SPECIFICATIONS

REPLACEMENT BULBS - INTERIOR

LIGHT BULBS - INTERIOR	BULB NUMBER
Auto. Trans. Indicator Light	658
Courtesy Lights, Under Dash (1)	906
Heater Control Lights (2)	194
Rocker Switch Indicator Light (Rear Window Defogger, and Rear Wash/Wipe)	**
Soundbar Dome Light	912
** Bulbs only available from authorized dealer.	

REPLACEMENT BULBS - EXTERIOR

LIGHT BULBS - EXTERIOR	BULB NUMBER

TRAILER TOWING

SPECIFICATIONS

TRAILER TOWING - NAFTA

In this section you will find safety tips and information on limits to the type of towing you can reasonably do with your vehicle. Before towing a trailer carefully review this information to tow your load as efficiently and safely as possible.

To maintain warranty coverage, follow the requirements and recommendations in this manual concerning vehicles used for trailer towing.

Common Towing Definitions

The following trailer towing related definitions will assist you in understanding the following information:

Gross Vehicle Weight Rating (GVWR)

The GVWR is the total allowable weight of your vehicle. This includes driver, passengers, cargo and tongue weight. The total load must be limited so that you do not exceed the GVWR.

Gross Trailer Weight (GTW)

The Gross Trailer Weight (GTW) is the weight of the trailer plus the weight of all cargo, consumables and equipment (permanent or temporary) loaded in or on the trailer in its "loaded and ready for operation" condition. The recommended way to measure GTW is to put your fully-loaded trailer on a vehicle scale. The entire weight of the trailer must be supported by the scale.

Gross Combination Weight Rating (GCWR)

The Gross Combination Weight Rating (GCWR) is the total permissible weight of your vehicle and trailer when weighed in combination. (Note that GCWR ratings include a 150 lbs (68 kg) allowance for the presence of a driver).

Gross Axle Weight Rating (GAWR)

The GAWR is the maximum capacity of the front and rear axles. Distribute the load over the front and rear axles evenly. Make sure that you do not exceed either front or rear GAWR.

WARNING:

It is important that you do not exceed the maximum front or rear GAWR. A dangerous driving condition can result if either rating is exceeded. You could lose control of the vehicle and have an accident.

Tongue Weight (TW)

Trailer tongue weight is the downward force exerted on the hitch ball by the trailer. In most cases it should not be less than 10% or more than 15% of the trailer load. You must consider this as part of the load on your vehicle.

Frontal Area

Frontal area is the maximum height and maximum width of the front of a trailer.

Trailer Sway Control

The trailer sway control is a telescoping link that can be installed between the hitch receiver and the trailer tongue. It typically provides adjustable friction associated with the telescoping motion to dampen any unwanted trailer swaying motions while traveling.

Weight-Carrying Hitch

A weight-carrying hitch supports the trailer tongue weight, just as if it were luggage located at a hitch ball or some other connecting point of the vehicle. This kind of hitch is the most popular on the market today and is commonly used to tow small and medium-sized trailers.

Weight-Distributing Hitch

A weight-distributing hitch system works by applying leverage through spring (load) bars. It is typically used for

heavier loads, to distribute trailer tongue weight to the tow vehicle's front axle and the trailer axle(s). When used in accordance with the manufacturers' directions, it provides for a more level ride, offering more consistent steering and brake control thereby enhancing towing safety. The addition of a friction/hydraulic sway control also dampens sway caused by traffic and crosswinds, and contributes positively to tow vehicle and trailer stability. Trailer sway control and a weight-distributing (load-equalizing) hitch are recommended for heavier tongue weights (TW) and may be required depending on vehicle and trailer configuration/loading to comply with Gross Axle Weight Rating (GAWR) requirements.

WARNING:

An improperly adjusted weight-distributing hitch system may reduce handling, stability, braking performance, and could result in an accident.

Weight-Distributing Hitch Systems may not be compatible with Surge Brake Couplers. Consult with your hitch and trailer manufacturer or a reputable Recreational Vehicle dealer for additional information.

Trailer Hitch Classification

The following chart provides the industry standard for the maximum trailer weight a given trailer hitch class can tow and should be used to assist you in selecting the correct trailer hitch for your intended towing condition. Refer to the Trailer Towing Weights (Maximum Trailer Weight Ratings) chart for the Max. GTW towable for your given drivetrain.

Trailer Hitch Classification	
Class	Max. GTW (Gross Trailer Wt.)

Class I - Light Duty	2,000 lbs (907 kg)
Class II - Medium Duty	3,500 lbs (1 587 kg)

All trailer hitches should be professionally installed on your vehicle.

Trailer Towing Weights (Maximum Trailer Weight Ratings)

The following chart provides the maximum trailer weight ratings towable for your given drivetrain.

Engine/Transmission	Axle	Model	GCWR (Gross Combined Wt. Rating)	Frontal Area	Max. GTW (Gross Trailer Wt.)	Max. Tongue Wt. (See Note 1)
3.8L/Manual	3.21	2-Door X Model (4WD)	4,987 lbs (2 262 kg)	25 sq ft (2.32 sq m)	1,000 lbs (453 kg)	100 lbs (45 kg)
3.8L/Manual	3.73	2-Door X Model (4WD)	5,987 lbs (2 716 kg)	25 sq ft (2.32 sq m)	2,000 lbs (907 kg)	200 lbs (91 kg)
3.8L/Automatic	3.73	2-Door X Model (4WD)	6,032 lbs (2 736 kg)	25 sq ft (2.32 sq m)	2,000 lbs (907 kg)	200 lbs (91 kg)
3.8L/Manual	3.21	2-Door Sahara Model (4WD)	5,163 lbs (2 342 kg)	25 sq ft (2.32 sq m)	1,000 lbs (453 kg)	100 lbs (45 kg)
3.8L/Manual	3.73	2-Door Sahara Model (4WD)	6,163 lbs (2 795 kg)	25 sq ft (2.32 sq m)	2,000 lbs (907 kg)	200 lbs (91 kg)
3.8L/Automatic	3.73	2-Door Sahara Model (4WD)	6,163 lbs (2 795 kg)	25 sq ft (2.32 sq m)	2,000 lbs (907 kg)	200 lbs (91 kg)
3.8L/Manual	4.10	2-Door Rubicon Model (4WD)	6,236 lbs (2 829 kg)	25 sq ft (2.32 sq m)	2,000 lbs (907 kg)	200 lbs (91 kg)
3.8L/Automatic	4.10	2-Door Rubicon Model (4WD)	6,281 lbs (2 849 kg)	25 sq ft (2.32 sq m)	2,000 lbs (907 kg)	200 lbs (91 kg)
3.8L/Manual	3.21	4-Door X Model (2WD)	5,121 lbs (2 323 kg)	32 sq ft (2.97 sq m)	1,000 lbs (453 kg)	100 lbs (45 kg)
3.8L/Manual	3.73	4-Door X Model (2WD)	7,621 lbs (3 457 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Automatic	3.73	4-Door X Model (2WD)	7,647 lbs (3 469 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Manual	3.21	4-Door Sahara	5,277 lbs (2 394 kg)	32 sq ft	1,000 lbs (453 kg)	100 lbs (45 kg)

		Model (2WD)		(2.97 sq m)		
3.8L/Manual	3.73	4-Door Sahara Model (2WD)	7,777 lbs (3 527 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Automatic	3.73	4-Door Sahara Model (2WD)	7,803 lbs (3 539 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Manual	3.21	4-Door X Model (4WD)	5,325 lbs (2 415 kg)	32 sq ft (2.97 sq m)	1,000 lbs (453 kg)	100 lbs (45 kg)
3.8L/Manual	3.73	4-Door X Model (4WD)	7,825 lbs (3 549 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Automatic	3.73	4-Door X Model (4WD)	7,825 lbs (3 549 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Manual	3.21	4-Door Sahara Model (4WD)	5,481 lbs (2 486 kg)	32 sq ft (2.97 sq m)	1,000 lbs (453 kg)	100 lbs (45 kg)
3.8L/Manual	3.73	4-Door Sahara Model (4WD)	7,981 lbs (3 620 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Automatic	3.73	4-Door Sahara Model (4WD)	8,027 lbs (3 641 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Manual	4.10	4-Door Rubicon Model (4WD)	8,059 lbs (3 655 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
3.8L/Automatic	4.10	4-Door Rubicon Model (4WD)	8,104 lbs (3 676 kg)	32 sq ft (2.97 sq m)	3,500 lbs (1 587 kg)	350 lbs (159 kg)
Refer to local laws for maximum trailer towing speeds.						

NOTE: The trailer tongue weight must be considered as part of the combined weight of occupants and cargo, and should never exceed the weight referenced on the Tire and Loading Information placard. Refer to the “Tire-Safety Information” section in this manual.

Trailer and Tongue Weight

Always load a trailer with 60% to 65% of the weight in the front of the trailer. This places 10% to 15% of the Gross Trailer Weight (GTW) on the tow hitch of your vehicle. Loads balanced over the wheels or heavier in the rear can cause the trailer to sway **severely** side-to-side which will cause loss of control of vehicle and trailer. Failure to load trailers heavier in front is the cause of many trailer accidents.

Consider the following items when computing the weight on the rear axle of the vehicle:

- The trailer tongue weight.
- The weight of any other type of cargo or equipment put in or on your vehicle.
- The weight of the driver and all passengers.

NOTE: Remember that everything put into or on the trailer adds to the load on your vehicle. Also, additional factory-installed options, or authorized dealer-installed options, must be considered as part of the total load on your vehicle. Refer to the Tire and Loading Information placard in the “Tire— Safety Information” section of this manual for the maximum combined weight of occupants and cargo for your vehicle.

Towing Requirements

To promote proper break-in of your new vehicle drivetrain components, the following guidelines are recommended:

NOTE: Trailer towing requires special rear axle lubricant. Refer to “Fluids, Lubricants, and Genuine Parts” in Section 7 for more information.

CAUTION: Avoid towing a trailer for the first 500 miles (805 km) of vehicle operation. Doing so may damage your vehicle.

Perform the maintenance listed in the “Maintenance Schedule.” Refer to Section 8 of this manual. When towing a trailer, never exceed the GAWR, or GCWR, ratings.

WARNING:

Improper towing can lead to an injury accident. Follow these guidelines to make your trailer towing as safe as possible:

Make certain that the load is secured in the trailer and will not shift during travel. When trailering cargo that is not fully secured, dynamic load shifts can occur that may be difficult for the driver to control. You could lose control of your vehicle and have an accident.

- When hauling cargo or towing a trailer, do not overload your vehicle or trailer. Overloading can cause a loss of control, poor performance or damage to brakes, axle, engine, transmission, steering, suspension, chassis structure or tires.
- Safety chains must always be used between your vehicle and trailer. Always connect the chains to the frame or hook retainers of the vehicle hitch. Cross the chains under the trailer tongue and allow enough slack for turning corners.
- Vehicles with trailers should not be parked on a grade. When parking, apply the parking brake on the tow vehicle. Put the tow vehicle automatic transmission in PARK (P). With a manual transmission, shift the transmission into 1st gear. And with four-wheel-drive vehicles, make sure the transfer case is not in N (Neutral). Always, block or "chock" the trailer wheels.
- GCWR must not be exceeded.
- **Total weight must be distributed between the tow vehicle and the trailer such that the following four ratings are not exceeded:**
 - GVWR

- GTW
- GAWR
- Tongue weight rating for the trailer hitch utilized (This requirement may limit the ability to always achieve the 10% to 15% range of tongue weight as a percentage of total trailer weight).

Towing Requirements - Tires

- Do not attempt to tow a trailer while using a compact spare tire.
- Proper tire inflation pressures are essential to the safe and satisfactory operation of your vehicle. Refer to the “Tires–General Information” section of this manual for proper tire inflation procedures.
- Also, check the trailer tires for proper tire inflation pressures before trailer usage.
- Check for signs of tire wear or visible tire damage before towing a trailer. Refer to the (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION) section of this manual on Tread Wear Indicators for the proper inspection procedure.
- When replacing tires refer to (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION) section of this manual on Replacement Tires for proper tire replacement procedures. Replacing tires with a higher load carrying capacity will not increase the vehicle's GVWR and GAWR limits.

Towing Requirements — Trailer Brakes

- Do **not** interconnect the hydraulic brake system or vacuum system of your vehicle with that of the trailer. This could cause inadequate braking and possible personal injury.
- An electronically-actuated trailer brake controller is required when towing a trailer with electronically actuated brakes. When towing a trailer equipped with a hydraulic surge-actuated brake system, an electronic brake controller is not required.
- Trailer brakes are recommended for trailers over 1,000 lbs (454 kg) and required for trailers in excess of 2,000 lbs (907 kg).

CAUTION:

If the trailer weighs more than 1,000 lbs (454 kg) loaded, it should have its own brakes and they should be of adequate capacity. Failure to do this could lead to accelerated brake lining wear, higher brake pedal effort, and longer stopping distances.

WARNING:

Do not connect trailer brakes to your vehicle's hydraulic brake lines. It can overload your brake system and cause it to fail. You might not have brakes when you need them and could have an accident.

Towing any trailer will increase your stopping distance. When towing you should allow for additional space between your vehicle and the vehicle in front of you. Failure to do so could result in an accident.

Towing Requirements — Trailer Lights & Wiring

Whenever you pull a trailer, regardless of the trailer size, stop lights and turn signals on the trailer are required for motoring safety.

The Trailer Tow Package will include a 4-pin wiring harness. Use a factory-approved trailer harness and connector.

NOTE: Do not cut or splice wiring into the vehicles wiring harness.

The electrical connections are all complete to the vehicle but you must mate the harness to a trailer connector. Refer to the following illustration.

Towing Tips

Before setting out on a trip, practice turning, stopping and backing the trailer in an area away from heavy traffic.

If using a manual transmission vehicle for trailer towing, all starts must be in 1st gear to avoid excessive clutch slippage.

Towing Tips - Automatic Transmission

The DRIVE (D) range can be selected when towing. However, if frequent shifting occurs while in this range, the OVERDRIVE (O/D) range should be selected.

NOTE: Using “O/D OFF” while operating the vehicle under heavy operating conditions will improve performance and extend transmission life by reducing excessive shifting and heat build up. This action will also provide better engine braking.

The automatic transmission fluid and filter should be changed if you REGULARLY tow a trailer for more than 45 minutes of continuous operation. Refer to the “Maintenance Schedule” in Section 8 of this manual for transmission fluid change intervals.

NOTE: Check the automatic transmission fluid level before towing.

Towing Tips - O/D Off (If Equipped)

To reduce potential for automatic transmission overheating, select the “O/D OFF” feature when driving in hilly areas or shift the transmission to DRIVE (D) position 2 on more severe grades. Refer to “Transmission Shifting” in this section.

Towing Tips - Electronic Speed Control (If Equipped)

- Don't use in hilly terrain or with heavy loads.
- When using the speed control, if you experience speed drops greater than 10 mph (16 km/h), disengage until you can get back to cruising speed.
- Use speed control in flat terrain and with light loads to maximize fuel efficiency.

Towing Tips - Cooling System

To reduce potential for engine and transmission overheating, take the following actions:

- Highway Driving - Reduce speed.
- Air Conditioning - Turn off temporarily.
- Refer to Cooling System Operating information in the Maintenance section of this manual for more information.

5 - BRAKES

BRAKES - BASE - SERVICE INFORMATION

BRAKES - BASE - SERVICE INFORMATION

DESCRIPTION

BRAKE SYSTEM

Power assist front disc and rear drum brakes are standard equipment. Disc brake components consist of single piston calipers and ventilated rotors. Rear drum brakes are dual shoe units with cast brake drums.

The parking brake mechanism is lever and cable operated. The cables are attached to levers on the rear drum brake secondary shoes. The parking brakes are operated by a hand lever.

A dual diaphragm vacuum power brake booster is used for all applications. All models have an aluminum master cylinder with plastic reservoir.

Factory brake lining on all models consists of an organic base material combined with metallic particles. The original equipment linings do not contain asbestos.

NOTE: LHD shown in graphics. The removal and installation procedures and torques specs are the same for the RHD.

SERVICE WARNINGS & CAUTIONS

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. USE A VACUUM CLEANER SPECIFICALLY DESIGNED FOR THE REMOVAL OF ASBESTOS FIBERS FROM BRAKE COMPONENTS. IF A SUITABLE VACUUM CLEANER IS NOT AVAILABLE, CLEANING SHOULD BE DONE WITH A WATER DAMPENED CLOTH. DO NOT SAND, OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DISPOSE OF ALL RESIDUE CONTAINING ASBESTOS FIBERS IN SEALED BAGS OR CONTAINERS TO MINIMIZE EXPOSURE TO YOURSELF AND OTHERS. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION AND THE ENVIRONMENTAL PROTECTION AGENCY FOR THE HANDLING, PROCESSING, AND DISPOSITION OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean the system components. These fluids damage rubber cups and seals. Use only fresh brake fluid or Mopar brake cleaner to clean or flush brake system components. These are the only cleaning materials recommended. If system contamination is suspected, check the fluid for dirt, discoloration, or separation into distinct layers. Also check the reservoir cap seal for distortion. Drain and flush the system with new brake fluid if contamination is suspected.

CAUTION: Use Mopar brake fluid, or an equivalent quality fluid meeting SAE/DOT standards J1703 and DOT 3. Brake fluid must be clean and free of contaminants. Use fresh fluid from sealed containers only to ensure proper brake component operation.

CAUTION: Use Mopar multi-mileage or high temperature grease to lubricate caliper slide surfaces, drum brake pivot pins, and shoe contact points on the backing plates. Use multi-mileage grease or GE 661 or Dow 111 silicone grease on caliper slide pins to ensure proper operation.

WARNING

WARNING: DaimlerChrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean the system components. These fluids damage rubber cups and seals. Use only fresh brake fluid or Mopar brake cleaner to clean or flush brake system components. These are the only cleaning materials recommended. If system contamination is suspected, check the fluid for dirt, discoloration, or separation into distinct layers. Also check the reservoir cap seal for distortion. Drain and flush the system with new brake fluid if contamination is suspected.

CAUTION: Use Mopar brake fluid, or an equivalent quality fluid meeting SAE/DOT standards J1703 and DOT 3. Brake fluid must be clean and free of contaminants. Use fresh fluid from sealed containers only to ensure proper antilock component operation.

CAUTION: Use Mopar multi-mileage or high temperature grease to lubricate caliper slide surfaces, drum brake pivot pins, and shoe contact points on the backing plates. Use multi-mileage grease or GE 661 or Dow 111 silicone grease on caliper slide pins to ensure proper operation.

DIAGNOSIS AND TESTING

BASE BRAKE SYSTEM

Base brake components consist of the brake shoes, calipers, wheel cylinders, brake drums, rotors, brake lines, master cylinder, booster, and parking brake components.

Brake diagnosis involves determining if the problem is related to a mechanical, hydraulic, or vacuum operated component.

The first diagnosis step is the preliminary check.

PRELIMINARY BRAKE CHECK

1. Check condition of tires and wheels. Damaged wheels and worn, damaged, or underinflated tires can cause pull, shudder, vibration, and a condition similar to grab.
2. If complaint was based on noise when braking, check suspension components. Jounce front and rear of vehicle and listen for noise that might be caused by loose, worn or damaged suspension or steering components.

3. Inspect brake fluid level and condition. Note that the front disc brake reservoir fluid level will decrease in proportion to normal lining wear. **Also note that brake fluid tends to darken over time. This is normal and should not be mistaken for contamination.**

a. If fluid level is abnormally low, look for evidence of leaks at calipers, wheel cylinders, brake lines, and master cylinder.

b. If fluid appears contaminated, drain out a sample. System will have to be flushed if fluid is separated into layers, or contains a substance other than brake fluid. The system seals and cups will also have to be replaced after flushing. Use clean brake fluid to flush the system.

4. Check parking brake operation. Verify free movement and full release of cables and pedal. Also note if vehicle was being operated with parking brake partially applied.

5. Check brake pedal operation. Verify that pedal does not bind and has adequate free play. If pedal lacks free play, check pedal and power booster for being loose or for bind condition. Do not road test until condition is corrected.

6. If components checked appear OK, road test the vehicle.

ROAD TESTING

1. If complaint involved low brake pedal, pump pedal and note if it comes back up to normal height.

2. Check brake pedal response with transmission in Neutral and engine running. Pedal should remain firm under constant foot pressure.

3. During road test, make normal and firm brake stops in 25-40 mph range. Note faulty brake operation such as low pedal, hard pedal, fade, pedal pulsation, pull, grab, drag, noise, etc.

PEDAL FALLS AWAY

A brake pedal that falls away under steady foot pressure is generally the result of a system leak. The leak point could be at a brake line, fitting, hose, or caliper/wheel cylinder. Internal leakage in the master cylinder caused by worn or damaged piston cups, may also be the problem cause.

If leakage is severe, fluid will be evident at or around the leaking component. However, internal leakage in the master cylinder may not be physically evident.

LOW PEDAL

If a low pedal is experienced, pump the pedal several times. If the pedal comes back up, worn lining, rotors, or drums are the most likely causes.

SPONGY PEDAL

A spongy pedal is most often caused by air in the system. However, thin brake drums or substandard brake lines and hoses can also cause a spongy pedal. The proper course of action is to bleed the system, or replace thin drums and suspect quality brake lines and hoses.

HARD PEDAL OR HIGH PEDAL EFFORT

A hard pedal or high pedal effort may be due to lining that is water soaked, contaminated, glazed, or badly worn.

The power booster or check valve could also be faulty.

PEDAL PULSATION

Pedal pulsation is caused by components that are loose, or beyond tolerance limits.

The primary cause of pulsation are disc brake rotors with excessive lateral runout or thickness variation, or out of round brake drums. Other causes are loose wheel bearings or calipers and worn, damaged tires.

NOTE: Some pedal pulsation may be felt during ABS activation.

BRAKE DRAG

Brake drag occurs when the lining is in constant contact with the rotor or drum. Drag can occur at one wheel, all wheels, fronts only, or rears only.

Drag is a product of incomplete brake shoe release. Drag can be minor or severe enough to overheat the linings, rotors and drums.

Minor drag will usually cause slight surface charring of the lining. It can also generate hard spots in rotors and drums from the overheat-cool down process. In most cases, the rotors, drums, wheels and tires are quite warm to the touch after the vehicle is stopped.

Severe drag can char the brake lining all the way through. It can also distort and score rotors and drums to the point of replacement. The wheels, tires and brake components will be extremely hot. In severe cases, the lining may generate smoke as it chars from overheating.

Possible causes for brake drag condition are:

- Seized or improperly adjusted parking brake cables.
- Loose/worn wheel bearing.
- Seized caliper or wheel cylinder piston.
- Caliper binding on corroded bushings or rusted slide surfaces.
- Loose caliper mounting bracket.
- Drum brake shoes binding on worn/damaged support plates.
- Mis-assembled components.

If brake drag occurs at all wheels, the problem may be related to a blocked master cylinder return port, or faulty power booster (binds-does not release).

BRAKE FADE

Brake fade is usually a product of overheating caused by brake drag. However, brake overheating and resulting fade can also be caused by riding the brake pedal, making repeated high deceleration stops in a short time span, or constant braking on steep mountain roads. Refer to the Brake Drag information in this section for causes.

BRAKE PULL

Possible causes for front brake pull condition are:

- Contaminated lining in one caliper.
- Seized caliper piston.
- Binding caliper.
- Loose caliper.
- Rusty adapter/caliper slide surfaces.
- Improper brake shoes.
- Damaged rotor.

A worn, damaged wheel bearing or suspension component are further causes of pull. A damaged front tire (bruised, ply separation) can also cause pull.

A common and frequently misdiagnosed pull condition is where direction of pull changes after a few stops. The cause is a combination of brake drag followed by fade at one of the brake units.

As the dragging brake overheats, efficiency is so reduced that fade occurs. Since the opposite brake unit is still functioning normally, its braking effect is magnified. This causes pull to switch direction in favor of the normally functioning brake unit.

An additional point when diagnosing a change in pull condition concerns brake cool down. Remember that pull will return to the original direction, if the dragging brake unit is allowed to cool down (and is not seriously damaged).

REAR BRAKE GRAB OR PULL

Rear grab or pull is usually caused by improperly adjusted or seized parking brake cables, contaminated lining, bent or binding shoes and support plates, or improperly assembled components. This is particularly true when only one rear wheel is involved. However, when both rear wheels are affected, the master cylinder or proportioning valve could be at fault.

BRAKES DO NOT HOLD AFTER DRIVING THROUGH DEEP WATER PUDDLES

This condition is generally caused by water soaked lining. If the lining is only wet, it can be dried by driving with the brakes very lightly applied for a mile or two. However, if the lining is both soaked and dirt contaminated, cleaning and/or replacement will be necessary.

BRAKE SQUEAK/SQUEAL

Brake squeak or squeal may be due to linings that are wet or contaminated with brake fluid, grease, or oil. Glazed linings and rotors with hard spots can also contribute to squeak. Dirt and foreign material embedded in the brake lining will also cause squeak/squeal.

A very loud squeak or squeal is frequently a sign of severely worn brake lining. If the lining has worn through to the brake shoes in spots, metal-to-metal contact occurs. If the condition is allowed to continue, rotors and drums can become so scored that replacement is necessary.

BRAKE CHATTER

Brake chatter is usually caused by loose or worn components, or glazed/burnt lining. Rotors with hard spots can also contribute to chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

THUMP/CLUNK NOISE

Thumping or clunk noises during braking are frequently **not** caused by brake components. In many cases, such noises are caused by loose or damaged steering, suspension, or engine components. However, calipers that bind on the slide surfaces can generate a thump or clunk noise. In addition, worn out, improperly adjusted, or improperly assembled rear brake shoes can also produce a thump noise.

BRAKE LINING CONTAMINATION

Brake lining contamination is mostly a product of leaking calipers or wheel cylinders, worn seals, driving through deep water puddles, or lining that has become covered with grease and grit during repair. Contaminated lining should be replaced to avoid further brake problems.

WHEEL AND TIRE PROBLEMS

Some conditions attributed to brake components may actually be caused by a wheel or tire problem.

A damaged wheel can cause shudder, vibration and pull. A worn or damaged tire can also cause pull.

Severely worn tires with very little tread left can produce a grab-like condition as the tire loses and recovers traction. Flat-spotted tires can cause vibration and generate shudder during brake operation. A tire with internal damage such as a severe bruise, cut, or ply separation can cause pull and vibration.

STANDARD PROCEDURE

MANUAL BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

1. Remove reservoir filler caps and fill reservoir.
2. If calipers were overhauled, open all caliper bleed screws.

Then close each bleed screw as fluid starts to drip from it. Top off master cylinder reservoir once more before proceeding.

3. Attach one end of bleed hose (1) to bleed screw and insert opposite end in glass container (2) partially filled with brake fluid. Be sure end of bleed hose is immersed in fluid.

NOTE: Bleed procedure should be in this order (1) Right rear (2) Left rear (3) Right front (4) Left front.

4. Open up bleeder, then have a helper press down the brake pedal. Once the pedal is down close the bleeder. Repeat bleeding until fluid stream is clear and free of bubbles. Then move to the next wheel.

5. Before moving the vehicle verify the pedal is firm and not mushy.

6. Top off the brake fluid and install the reservoir cap.

PRESSURE BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Follow the manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 15-20 psi is sufficient for bleeding.

Fill the bleeder tank with recommended fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system.

SPECIFICATIONS

SPECIAL TOOLS

BASE BRAKES

Handle C-4171

BRAKE LINES

DESCRIPTION

Flexible rubber hose is used at both front brakes and at the rear axle junction block. Double walled steel tubing is used to connect the master cylinder to the major hydraulic braking components and then to the flexible rubber hoses. Double inverted style and ISO style flares are used on the brake lines.

OPERATION

The hoses and lines transmit the brake fluid hydraulic pressure to the calipers and or wheel cylinders.

DIAGNOSIS AND TESTING

BRAKE LINE AND HOSES

Flexible rubber hose is used at both front brakes and at the rear axle junction block. Inspect the hoses whenever the brake system is serviced, at every engine oil change, or whenever the vehicle is in for service.

Inspect the hoses for surface cracking, scuffing, or worn spots. Replace any brake hose immediately if the fabric casing of the hose is exposed due to cracks or abrasions.

Also check brake hose installation. Faulty installation can result in kinked, twisted hoses, or contact with the wheels and tires or other chassis components. All of these conditions can lead to scuffing, cracking and eventual failure.

The steel brake lines should be inspected periodically for evidence of corrosion, twists, kinks, leaks, or other damage. Heavily corroded lines will eventually rust through causing leaks. In any case, corroded or damaged brake lines should be replaced.

Factory replacement brake lines and hoses are recommended to ensure quality, correct length and superior fatigue life. Care should be taken to make sure that brake line and hose mating surfaces are clean and free from nicks and burrs. Also remember that right and left brake hoses are not interchangeable.

Use new copper seal washers at all caliper connections. Be sure brake line connections are properly made (not

cross threaded) and tightened to recommended torque.

STANDARD PROCEDURE

DOUBLE INVERTED FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

1. Cut off damaged tube with Tubing Cutter.
2. Ream cut edges of tubing to ensure proper flare.
3. Install replacement tube nut on the tube.
4. Insert tube in flaring tool.
5. Place gauge form over the end of the tube.
6. Push tubing through flaring tool jaws until tube contacts recessed notch in gauge that matches tube diameter.
7. Tighten the tool bar on the tube
8. Insert plug on gauge in the tube. Then swing compression disc over gauge and center tapered flaring screw in recess of compression disc.
9. Tighten tool handle until plug gauge is squarely seated on jaws of flaring tool. This will start the inverted flare.
10. Remove the plug gauge and complete the inverted flare.

ISO FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

To make a ISO flare use an ISO flaring tool kit.

1. Cut off damaged tube with Tubing Cutter.
2. Remove any burrs from the inside of the tube.
3. Install tube nut on the tube.
4. Position the tube in the flaring tool flush with the top of the tool bar (6). Then tighten the tool bar on the tube.
5. Install the correct size adaptor (1) on the flaring tool yoke screw.
6. Lubricate the adaptor (2).
7. Align the adaptor and yoke screw over the tube.
8. Turn the yoke screw in until the adaptor is squarely seated on the tool bar.

REMOVAL

FRONT BRAKE HOSE

1. Raise and support vehicle.
2. Remove the tire and wheel assembly.
3. Remove the wheel speed sensor wire (2) from the brake hose (1).
4. Remove the brake hose banjo bolt (5) at the caliper (6).

- Remove the brake line (1) at the frame.
5. Remove the brake hose mounting bolt (2) at the frame.
6. Remove the hose (3).

REAR BRAKE HOSE

1. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
2. Raise and support vehicle.
3. Remove the banjo bolt (2) from the rear caliper for the brake hose (1).

4. Remove the rear brake line (1) from the brake hose (3) at the frame.
5. Remove the mounting bolt (2) for the brake hose (3) at the frame.
6. Remove the brake hose (3).

INSTALLATION

INSTALLATION

1. Install the hose (3).
2. Install the mounting bolt (2) for the brake hose at the frame.
3. Install the brake line (1) to the brake hose (3).

4. Reinstall the wheel speed sensor wire (2) to the brake hose (1).
5. Install the brake hose banjo bolt (5) at the caliper (6). Tighten to 28 N·m (250 in. lbs.)
6. Remove the support and lower the vehicle.
7. Bleed the brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).

INSTALLATION

1. Install the brake hose (3) to the mounting hole at the frame and install the mounting bolt (2).
2. Install the brake line tube nut (1) to the brake hose (3) and tighten to 23 N·m (200 in. lbs.) torque.

3. Install banjo bolt (2) attaching brake hose (1) to caliper. Install NEW washers on each side of hose fitting as banjo bolt is placed through banjo fitting. Thread banjo bolt into caliper and tighten to 31 N·m (23 ft. lbs.) torque.
4. Lower vehicle.
5. Remove brake pedal holding tool.
6. Bleed base brake hydraulic system as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

DISC BRAKE CALIPERS

DESCRIPTION

The calipers are a single piston type. The calipers are free to slide laterally, this allows continuous compensation for lining wear.

OPERATION

When the brakes are applied fluid pressure is exerted against the caliper piston. The fluid pressure is exerted equally and in all directions. This means pressure exerted against the caliper piston and within the caliper bore will be equal .

Fluid pressure applied to the piston is transmitted directly to the inboard brake shoe. This forces the shoe lining against the inner surface of the disc brake rotor. At the same time, fluid pressure within the piston bore forces the caliper to slide inward on the mounting bolts. This action brings the outboard brake shoe lining into contact with the outer surface of the disc brake rotor.

In summary, fluid pressure acting simultaneously on both piston and caliper, produces a strong clamping action. When sufficient force is applied, friction will attempt to stop the rotors from turning and bring the vehicle to a stop.

Application and release of the brake pedal generates only a very slight movement of the caliper and piston. Upon release of the pedal, the caliper and piston return to a rest position. The brake shoes do not retract an appreciable distance from the rotor. In fact, clearance is usually at, or close to zero. The reasons for this are to keep road debris from getting between the rotor and lining and in wiping the rotor surface clear each revolution.

The caliper piston seal controls the amount of piston extension needed to compensate for normal lining wear.

During brake application, the seal is deflected outward by fluid pressure and piston movement . When the brakes (and fluid pressure) are released, the seal relaxes and retracts the piston.

The amount of piston retraction is determined by the amount of seal deflection. Generally the amount is just enough to maintain contact between the piston and inboard brake shoe.

REMOVAL

FRONT

1. Raise and support vehicle.
2. Remove front wheel and tire assembly.
3. Drain small amount of fluid from master cylinder brake reservoir with **clean** suction gun.
4. Bottom caliper pistons into the caliper (4) by prying the caliper over.
5. Remove brake hose banjo bolt and gasket washers (1). Discard gasket washers.
6. Remove the caliper slide bolts (3).
7. Remove the caliper (4) from the adapter.

REAR

1. Raise and support vehicle.
2. Remove rear wheel and tire assembly.
3. Drain small amount of fluid from master cylinder brake reservoir with a **clean** suction gun.
4. Bottom caliper pistons into the caliper by prying the caliper over.
5. Remove brake hose banjo bolt (3) and discard gasket washers.
6. Remove the caliper slide pins (2).
7. Remove caliper from the adapter.
8. Remove the brake pads.

DISASSEMBLY

1. Remove brake shoes from caliper.
2. Drain brake fluid out of caliper.
3. Take a piece of wood and pad it with one-inch thickness of shop towels. Place this piece in the outboard shoe side of the caliper in front of the piston. This will cushion and protect caliper piston during removal .

4. Remove caliper piston with **short bursts** of low pressure compressed air. Direct air through fluid inlet port and ease piston out of bore .

CAUTION: Do not blow the piston out of the bore with sustained air pressure. This could result in a cracked piston. Use only enough air pressure to ease the piston out.

WARNING: NEVER ATTEMPT TO CATCH THE PISTON AS IT LEAVES THE BORE. THIS MAY RESULT IN PERSONAL INJURY.

5. Remove caliper piston dust boot with suitable pry tool .

6. Remove caliper piston seal with wood or plastic tool . Do not use metal tools as they will scratch piston bore.

7. Remove caliper mounting bolt bushings and boots .

CLEANING

Clean the caliper components with clean brake fluid or brake clean only. Wipe the caliper and piston dry with lint free towels or use low pressure compressed air.

CAUTION: Do not use gasoline, kerosene, paint thinner, or similar solvents. These products may leave a residue that could damage the piston and seal.

INSPECTION

The piston is made from a phenolic resin (plastic material) and should be smooth and clean.

The piston must be replaced if cracked or scored. Do not attempt to restore a scored piston surface by sanding or polishing.

CAUTION: If the caliper piston is replaced, install the same type of piston in the caliper. Never interchange phenolic resin and steel caliper pistons. The pistons, seals, seal grooves, caliper bore and piston tolerances are different.

The bore can be **lightly** polished with a brake hone to remove very minor surface imperfections. The caliper should be replaced if the bore is severely corroded, rusted, scored, or if polishing would increase bore diameter more than 0.025 mm (0.001 inch).

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Insure assembly area is clean and dry.

1. Lubricate caliper piston bore, new piston seal and piston with clean brake fluid.
2. Lubricate caliper bushings and interior of bushing boots with silicone grease.
3. Install bushing boots in caliper, then insert bushing into boot and push bushing into place.

4. Install new piston seal into seal groove with finger.

5. Install new dust boot on caliper piston and seat boot in piston groove .

6. Press piston into caliper bore by hand, use a turn and push motion to work piston into seal .

7. Press caliper piston to bottom of bore.
 8. Seat dust boot in caliper with Installer Tool C-4842 and Tool Handle C-4171 .

9. Replace caliper bleed screw if removed.

INSTALLATION

FRONT

1. Install the caliper (4) on the adapter.
2. Caliper slide pins should be free from debris and lightly lubricated..
3. Install the caliper slide pin bolts (3) and tighten to 35 N·m (26 ft. lbs.).
4. Gently lift one end of the slide pin boot to equalize air pressure, then release the boot and verify that the boot is fully covering the slide pin.

CAUTION: Verify brake hose is not twisted or kinked before tightening banjo bolt.

5. Install brake hose (1) to caliper (4) with **new copper washers (6)** and tighten banjo bolt (6) to 31 N·m (23 ft.

- lbs.).
- 6. Fill and bleed brake system.
- 7. Install wheel and tire assemblies.
- 8. Remove supports and lower vehicle.
- 9. Verify brake fluid level.

REAR

- 1. Install the brake pads if removed.
- 2. Install caliper to the caliper adapter.
- 3. Coat the caliper mounting slide pin bolts (1) with silicone grease. Then install and tighten the bolts to 35 N·m (26 in. lbs.).
- 4. Install the brake hose banjo bolt if removed.
- 5. Install the brake hose to the caliper with **new seal washers** and tighten fitting bolt to 31 N·m (23 ft. lbs.).

CAUTION: Verify brake hose is not twisted or kinked before tightening fitting bolt.

- 6. Remove the prop rod from the vehicle.
- 7. Bleed the base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
- 8. Install the wheel and tire assemblies (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
- 9. Remove the supports and lower the vehicle.
- 10. Verify a firm pedal before moving the vehicle.

BRAKE PADS/SHOES

REMOVAL

FRONT PADS

- 1. Raise and support vehicle.
- 2. Remove wheel and tire assembly.
- 3. Drain small amount of fluid from master cylinder brake reservoir with **clean** suction gun.
- 4. Remove the 2 caliper mounting bolts (3).
- 5. Compress the caliper (4) and remove from the adaptor.
- 6. Secure caliper (4) to nearby suspension part with wire. **Do not allow brake hose to support caliper weight.**

7. Remove the inboard (2) and outboard brake pads (3) from the caliper adapter (4).
8. Remove the anti-rattle clips from the brake caliper adapter (4).

REAR DISC BRAKE PADS

1. Raise and support vehicle.
2. Remove the wheel and tire assemblies.
3. Compress the caliper.
4. Remove the caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

NOTE: Do not allow brake hose to support caliper assembly.

5. Support and hang the caliper.
6. Remove the inboard brake pad (3) from the caliper adapter (1).
7. Remove the outboard brake pad (4) from the caliper adapter (1).

INSTALLATION

FRONT PADS

1. Remove and clean all rust and debris from the anti-rattle clip mounting surfaces (3) on the brake caliper adapter (2).
2. Install new anti-rattle clips into the caliper adapter (4).
3. Install the inboard (2) and outboard brake pads (3) onto the caliper adapter (4).

4. Install caliper (4) on the caliper adapter.
5. Install the caliper slide pin bolts (3) and tighten to 44 N·m (32 ft. lbs.).
6. Install wheel and tire assembly.
7. Remove support and lower vehicle.
8. Pump brake pedal until caliper pistons and brake pads are seated and a firm brake pedal is obtained.
9. Fill brake fluid.

REAR DISC BRAKE PADS

1. Bottom pistons in caliper bore with C-clamp. Place an old brake shoe between a C-clamp and caliper piston.
2. Clean caliper mounting adapter and anti-rattle springs.
3. Install anti-rattle springs.

NOTE: Anti-rattle springs are not interchangeable.

4. Install inboard brake pad (3) in adapter (1).

5. Install outboard brake pad (4) in adapter (1).
6. Install caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
7. Install wheel and tire assemblies and lower vehicle, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
8. Apply brakes several times to seat caliper pistons and brake pads to obtain firm pedal.
9. Top off master cylinder fluid level.

DISC BRAKE CALIPER ADAPTER

REMOVAL

FRONT

1. Raise and support the vehicle.
2. Remove the front wheel and tire assembly.
3. Remove the caliper (4) from the adaptor (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the disc brake caliper (1) from the adapter (4).

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

5. Remove the inboard (2) and outboard brake pads (3). (Refer to 5 -

BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL).

6. Remove the caliper adapter mounting bolts (1).
7. Remove the caliper adapter (4).

REAR

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the disc brake caliper from the adapter.

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

5. Remove the inboard (3) and outboard brake pads (4). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL).
6. Remove the caliper adapter mounting bolts (2).

INSTALLATION

FRONT

1. Install the caliper adapter mounting bolts (1). Tighten the mounting bolts to 163 N·m (120 ft.lbs).
2. Install the inboard (2) and outboard pads (3). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).

3. Install the caliper (4) to the adapter (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
4. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

REAR

1. Install the caliper adapter mounting bolts (2). Tighten the mounting bolts to 75 N·m (55 ft.lbs).
2. Install the inboard (3) and outboard pads (3). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).

3. Install the caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
4. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

FLUID

DIAGNOSIS AND TESTING

BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, caliper seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

STANDARD PROCEDURE

BRAKE FLUID LEVEL

Always clean the master cylinder reservoir and caps before checking fluid level. If not cleaned, dirt could enter the fluid.

The fluid fill level is indicated on the side of the master cylinder reservoir (1).

The correct fluid level is to the MAX indicator on the side of the reservoir. If necessary, add fluid to the proper level.

SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open

container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

FLUID RESERVOIR

REMOVAL

1. Install prop rod on brake pedal to keep pressure on the brake system.
2. Remove reservoir cap and siphon fluid into drain container.
3. Remove the electrical connector (3) from the fluid level switch in the reservoir (2).

4. Remove the reservoir (1) from the master cylinder by pulling the four tabs (3) outward to release.

5. Remove the reservoir (1) from the master cylinder by pulling upwards.

6. If replacing the reservoir (1) remove the fluid level sensor (2) by squeezing the tabs together while pulling on the sensor (2).

7. Remove old grommets (2) from cylinder body (1).

INSTALLATION

CAUTION: Do not use any type of tool to install the grommets (2). Tools may cut, or tear the grommets creating a leak problem after installation. Install the grommets using finger pressure only and insure that the grommets are properly seated and checked for leaks after installation.

1. Lubricate new grommets (2) with clean brake fluid and Install new grommets (2) onto reservoir outlets (1). Use finger pressure to install and seat grommets.

2. Start reservoir (1) and grommets into holes on master cylinder.

3. Then rock reservoir (1) back and forth while pressing downward to seat it in the holes on the master cylinder. **Make sure the four tabs are securely seated over the nubs (3).**

4. Install the fluid level sensor (2) if removed by just inserting the sensor in the reservoir until the tabs click.

5. Reconnect the electrical connector (3) to the fluid reservoir level switch.
6. Remove the prop rod from the vehicle.
7. Fill and bleed base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).

MASTER CYLINDER

DESCRIPTION

The master cylinder has a removable plastic reservoir. The cylinder body is made of aluminum and contains a primary and secondary piston assembly. The cylinder body including the piston assemblies are not serviceable. If diagnosis indicates an internal problem with the cylinder body, it must be replaced as an assembly. The reservoir and grommets are the only replaceable parts on the master cylinder.

OPERATION

The master cylinder bore contains a primary and secondary piston. The primary piston supplies hydraulic pressure to the front brakes. The secondary piston supplies hydraulic pressure to the rear brakes. The master cylinder reservoir stores reserve brake fluid for the hydraulic brake circuits.

DIAGNOSIS AND TESTING

MASTER CYLINDER/POWER BOOSTER

1. Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding, also ensure booster mounting nuts are torqued correctly.
2. Stop engine and shift transmission into Neutral.
3. Pump brake pedal until all vacuum reserve in booster is depleted.
4. Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage). This could also indicate an external leak, such as at fittings, hoses, HCU, etc, or a symptom of an internal leak in the HCU
5. Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.
6. If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 rpm, close the throttle and immediately turn off ignition to stop engine.
7. Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect vacuum gauge to booster check valve with short length of hose and T-fitting .
2. Start and run engine at curb idle speed for one minute.
3. Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.

4. Clamp hose shut between vacuum source and check valve.
5. Stop engine and observe vacuum gauge.
6. If vacuum drops more than one inch Hg (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Disconnect vacuum hose from check valve.
2. Remove check valve and valve seal from booster.
3. Use a hand operated vacuum pump for test.
4. Apply 15-20 inches vacuum at large end of check valve .
5. Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.

STANDARD PROCEDURE

MASTER CYLINDER BLEEDING

A new master cylinder should be bled before installation on the vehicle. Required bleeding tools include bleed tubes and a wood dowel to stroke the pistons. Bleed tubes can be fabricated from brake line.

1. Mount master cylinder in vise.
2. Attach bleed tubes to cylinder outlet ports. Then position each tube end into reservoir .
3. Fill reservoir with fresh brake fluid.
4. Press cylinder pistons inward with wood dowel. Then release pistons and allow them to return under spring

pressure. Continue bleeding operations until air bubbles are no longer visible in fluid.

REMOVAL

NOTE: LHD shown in graphics. The removal and installation procedures and torques specs are the same for the RHD.

1. Siphon and drain the fluid from the reservoir (2).
2. Disconnect the fluid level electrical connector (3) from the reservoir (2).
3. Remove the brake lines (4) at the master cylinder.
4. Remove mounting nuts (5) from the master cylinder.

5. Remove master cylinder.
6. Remove cylinder cover and drain the rest of the fluid.
7. If master cylinder reservoir requires service, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID RESERVOIR - REMOVAL).

INSTALLATION

NOTE: LHD shown in graphics. The removal and installation procedures and torques specs are the same for the RHD.

NOTE: If master cylinder is replaced, bleed cylinder before installation.

1. Clean cylinder mounting surface of brake booster (3).

NOTE: Insure the O-ring is on the master cylinder at the booster interface.

2. Install master cylinder onto brake booster studs (4).

3. Install mounting nuts (5) and tighten to 17 N·m (151 in. lbs.).
4. Connect the brake lines (4) to the master cylinder and tighten to 19 N·m (168 in. lbs.).
5. Connect fluid level electrical connector (3) to the reservoir (2).
6. Fill and bleed base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).

PEDAL

DESCRIPTION

A suspended-type brake pedal is used, the pedal pivots on a shaft mounted in the pedal support bracket. The bracket is attached to the dash panel.

The brake pedal assembly and pedal pad are the only serviceable component.

OPERATION

The brake pedal is attached to the booster push rod. When the pedal is depressed, the primary booster push rod is depressed which moves the booster secondary rod. The booster secondary rod depresses the master cylinder piston.

REMOVAL

1. Remove negative battery cable.
2. Remove the steering column opening cover.
3. Remove brake lamp switch **and discard**.
4. Remove retainer clip securing booster push rod (6) to brake pedal (2).
5. Disconnect the master cylinder/clutch push rod (7) from the pedal (1).
6. Remove the mounting bolts (3) securing the shaft.

NOTE: Clutch pedal is spring loaded (4), Care should be taken when shaft is being removed.

7. Slide the pedal shaft inboard until pedals fall free.
8. Remove pedal bushings (5) if they are to be replaced.

INSTALLATION

1. Install new bushings (5) in pedal and IP structure lubricate all bushings and shaft with multi-purpose grease.
2. Position the shaft in IP structure and install the shaft mounting bolts (3).
3. Install new retaining clip.
4. Install the booster push rod over the brake pedal (2) push pin (6).

NOTE: Clutch pedal is spring loaded (4), Care should be taken when shaft is being installed.

5. Reconnect the clutch M/C push rod (7) to clutch pedal (1) **if equipped**.
6. Install and connect a **new** brake lamp switch.
7. Install the steering column opening cover.

8. Install negative battery cable.

POWER BRAKE BOOSTER

DESCRIPTION

The booster assembly consists of a housing divided into separate chambers by two internal diaphragms. The outer edge of each diaphragm is attached to the booster housing.

Two push rods are used in the booster. The primary push rod connects the booster to the brake pedal. The secondary push rod connects the booster to the master cylinder to stroke the cylinder pistons.

OPERATION

The atmospheric inlet valve is opened and closed by the primary push rod. Booster vacuum supply is through a hose attached to an intake manifold fitting at one end and to the booster check valve at the other. The vacuum check valve in the booster housing is a one-way device that prevents vacuum leak back.

Power assist is generated by utilizing the pressure differential between normal atmospheric pressure and a vacuum. The vacuum needed for booster operation is taken directly from the engine intake manifold. The entry point for atmospheric pressure is through a filter and inlet valve at the rear of the housing .

The chamber areas forward of the booster diaphragms are exposed to vacuum from the intake manifold. The chamber areas to the rear of the diaphragms, are exposed to normal atmospheric pressure of 101.3 kilopascals (14.7 pounds/square in.).

Brake pedal application causes the primary push rod to open the atmospheric inlet valve. This exposes the area behind the diaphragms to atmospheric pressure. The resulting pressure differential provides the extra apply force for power assist.

The booster check valve, check valve grommet and booster seals are serviceable.

J9505-58

REMOVAL

NOTE: LHD shown in graphics. The removal and installation procedures and torques specs are the same for the RHD.

1. Remove the master cylinder.
2. Disconnect vacuum hose from booster check valve.
3. Remove retaining clip that secures booster push rod to brake pedal and slide the rod off the pin.
4. Remove the nuts (1) attaching booster mounting plate to the front cowl panel.
5. In engine compartment, slide booster and mounting plate out of the cowl panel, and remove the booster assembly from engine compartment.

6. Remove booster mounting nuts (2) from the mounting plate (1).
7. Disconnect the clutch pedal from the clutch M/C **if equipped.**
8. Remove the booster from the mounting plate (1).

INSTALLATION

NOTE: LHD shown in graphics. The removal and installation procedures and torques specs are the same for the RHD.

1. Clean the booster mounting surface.
2. Install the booster on the mounting plate (1).
3. Install the booster mounting nuts (2) that attach booster to mounting plate. Tighten booster mounting nuts to 25 N·m (18 ft. lbs.).

4. Install the booster assembly (2) with the mounting plate to the front cowl.
5. Install the booster mounting plate nuts (1) that attach the mounting plate to the front cowl. Tighten booster mounting plate nuts **in an X pattern** to 18 N·m (159 in. lbs.).
6. Connect vacuum hose to booster check valve.
7. Install master cylinder.
8. Lubricate the pedal pin and bushing with Mopar multi-mileage grease. Then slide the booster push rod onto brake pedal pin and secure with retaining clip.
9. Reconnect the clutch M/C to pedal **if equipped**.
10. Top off master cylinder fluid level and bleed base brakes.

ROTORS

DIAGNOSIS AND TESTING

DISC BRAKE ROTOR

The rotor braking surfaces should not be refinished unless necessary.

Light surface rust and scale can be removed with a lathe equipped with dual sanding discs. The rotor surfaces can be restored by machining in a disc brake lathe if surface scoring and wear are light.

Replace the rotor under the following conditions:

- Severely Scored
- Tapered
- Hard Spots
- Cracked
- Below Minimum Thickness

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if worn below minimum thickness, or if machining would reduce thickness below the allowable minimum.

Rotor minimum thickness is usually specified on the rotor hub. The specification is either stamped or cast into the hub surface.

ROTOR RUNOUT

Check rotor lateral runout with dial indicator C-3339. Excessive lateral runout will cause brake pedal pulsation and rapid, uneven wear of the brake shoes. Position the dial

indicator (1) plunger approximately 6.35 mm (1/4 in.) inward from the rotor edge.

NOTE: Be sure wheel bearing has zero end play before checking rotor runout.

Maximum allowable rotor runout is 0.102 mm (0.004 in.).

ROTOR THICKNESS VARIATION

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness at 6-to-12 points around the rotor face .

Position the micrometer (1) approximately 25.4 mm (1 in.) from the rotor outer circumference for each measurement.

Thickness should not **vary** by more than 0.013 mm (0.0005 in.) from point-to-point on the rotor. Machine or replace the rotor if necessary.

BRAKE DRUM IN HAT ROTOR

The maximum allowable diameter of the drum braking surface is indicated on the drum outer edge. Always replace the drum if machining would cause drum diameter to exceed the size limit indicated on the drum in hat.

BRAKE DRUM RUNOUT

Measure drum diameter and runout with an accurate gauge. The most accurate method of measurement involves mounting the drum in a brake lathe and checking variation and runout with a dial indicator.

Machine the drum if runout or variation exceed values. Replace the drum in hat rotor if machining causes the drum in hat rotor to exceed the maximum allowable diameter.

STANDARD PROCEDURE

DISC BRAKE ROTORS

NOTE: A hub mounted on-vehicle lathe is highly recommended. This type of lathe trues the rotor to the vehicles hub/bearing.

The disc brake rotor can be machined if scored or worn. The on-vehicle lathe must machine both sides of the rotor simultaneously with dual cutter heads. The rotor mounting surface must be clean before placing on the on-vehicle lathe. Equipment capable of machining only one side at a time may produce a tapered rotor **This type of rotor machining is not recommended.**

NOTE: Proper wheel torque is also critical to help prevent any warping of the disc brake rotor.

CAUTION: Brake rotors that do not meet minimum thickness specifications before or after machining must be replaced.

BRAKE DRUM IN HAT ROTOR MACHINING

The brake drum in hat rotor can be machined on a drum lathe when necessary. Initial machining cuts should be limited to 0.12 - 0.20 mm (0.005 - 0.008 in.) at a time as heavier feed rates can produce taper and surface variation. Final finish cuts of 0.025 to 0.038 mm (0.001 to 0.0015 in.) are recommended and will generally provide the best surface finish.

Be sure the drum in hat rotor is securely mounted in the lathe before machining operations. A damper strap should always be used around the drum to reduce vibration and avoid chatter marks.

The maximum allowable diameter of the drum braking surface is stamped or cast into the drum in hat rotor.

CAUTION: Replace the drum in hat rotor if machining will cause the drum to exceed the maximum allowable diameter.

REMOVAL

FRONT

1. Remove wheel and tire assemble.
2. Remove caliper (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
3. Remove retainers securing rotor to hub studs .
4. Remove rotor (3) from hub.
5. If rotor shield requires service, remove front hub and bearing assembly.

REAR

1. Raise and support the vehicle
2. Remove the tire and wheel assembly.

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

3. Remove the disc brake caliper adapter (2) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).
4. Remove the retaining clips and rotor assembly.

INSTALLATION

FRONT

1. Clean the hub from any rust before installing the rotor.
2. Install rotor on hub.
3. Install caliper. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
4. Install wheel and tire assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

REAR

1. Install the rotor to the axle shaft.
2. Install the disc brake caliper adapter (2) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).

3. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
4. Lower the vehicle.

SUPPORT PLATE

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).
4. Remove the disc brake rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
5. Remove the wheel speed sensor (Refer to 5 - BRAKES/ELECTRICAL/REAR WHEEL SPEED SENSOR - REMOVAL).
6. Lock out the front brake cable at the equalizer.
7. Remove the rear parking brake cable from the equalizer.
8. Remove the parking brake cable from the brake shoe lever at the axle.
9. Remove the axle shaft.
10. Tap the support plate from the axle shaft.
11. Disassemble the rear park brake shoes.
12. Remove the support plate from the axle seal plate.

INSTALLATION

NOTE: After parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake lever.

1. Install the support plate on the axle seal plate. Tighten the bolts to
2. Reassemble the rear park brake shoes.
3. Install the support plate on the axle shaft.
4. Install the axle shaft to the axle.
5. Reconnect the brake cable to the park brake shoe lever behind the support plate.
6. Install the rear park brake cable at the equalizer.
7. Remove the lockout on the front park brake cable.
8. Install the rear wheel speed sensor. (Refer to 5 - BRAKES/ELECTRICAL/REAR WHEEL SPEED SENSOR - INSTALLATION).
9. Adjust the rear brake shoes (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).
10. Install the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
11. Install the disc brake caliper adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
12. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
13. Check and fill the rear axle fluid.
14. Lower the vehicle.
15. Check the operation of the park brake system.

PARKING BRAKE

DESCRIPTION

The parking brake is a hand lever (1) and cable (2) operated system used to apply the rear brakes.

OPERATION

A hand operated lever in the passenger compartment is the main application device. The front cable is connected between the hand lever and the tensioner.

The rear cables are connected to the actuating lever on each secondary brake shoe.

To apply the parking brakes, the hand lever is pulled upward. This pulls the rear brake shoe actuating levers forward, by means tensioner and cables.

A parking brake switch is mounted on the parking brake lever and is actuated by movement of the lever. The switch, which is in circuit with the red warning light in the dash, will illuminate the warning light whenever the parking brakes are applied.

Parking brake adjustment is controlled by a cable tensioner mechanism. The cable tensioner, once adjusted at the factory, should not need further adjustment under normal circumstances. Adjustment may be required if a new tensioner, or cables are installed, or disconnected.

STANDARD PROCEDURE

PARK BRAKE SYSTEM LOCKOUT

1. Remove the center floor console (3) (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

2. Pull up on the equalizer cable (3) and then install a suitable tool (1) to lockout the park brake lever.

3. Remove the rear park brake cables (2) from the equalizer.

When repairs are completed install the rear park brake cables to the equalizer, remove the lockout tool, check the operation of the system and then install the center floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

SHOES

DESCRIPTION

Drum in hat park brakes are dual shoe (2&4), internal expanding units with an automatic self adjusting mechanism.

OPERATION

When the parking brake lever is pulled the brake cable pulls the brake shoes outward against the brake drum. When the brake lever is released the return springs attached to the brake shoes pull the shoes back to their original position.

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).
4. Remove the disc brake rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

5. Remove the wheel speed sensor (3) (Refer to 5 - BRAKES/ELECTRICAL/REAR WHEEL SPEED SENSOR - REMOVAL).

6. Remove the center floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).
7. Lock out the park brake system at the lever using a suitable tool (1) and pulling upward on the brake cable (3) (Refer to 5 - BRAKES/PARKING BRAKE - STANDARD PROCEDURE).

8. Remove the rear parking brake cables (2) from the equalizer.

9. Remove the parking brake cable (1) from the brake shoe lever (2) at the axle.

10. Remove the axle shaft (1).

11. Tap the seal plate from the brake support (1) on the axle shaft (2).

12. Remove the support plate with the brake shoes (1) from the axle shaft (1).

13. Disassemble the rear park brake shoes.

CLEANING - REAR DRUM IN HAT BRAKE

Clean the individual brake components, including the support plate exterior, with a water dampened cloth or with brake cleaner. Do not use any other cleaning agents. Remove light rust and scale from the brake shoe contact pads on the support plate with fine sandpaper.

INSPECTION - REAR DRUM IN HAT BRAKE

As a general rule, riveted brake shoes should be replaced when worn to within 0.78 mm (1/32 in.) of the rivet heads. Bonded lining should be replaced when worn to a thickness of 1.6 mm (1/16 in.).

Examine the lining contact pattern to determine if the shoes are bent or the drum is tapered. The lining should exhibit contact across its entire width. Shoes exhibiting contact only on one side should be replaced and the drum checked for runout or taper.

Inspect the adjuster screw assembly (8). Replace the assembly if the star wheel or threads are damaged, or the components are severely rusted or corroded.

Discard the brake springs (5&7) and retainer components (6) if worn, distorted or collapsed. Also replace the springs if a brake drag condition had occurred. Overheating will distort and weaken the springs.

Inspect the brake shoe contact pads on the support plate (1), replace the support plate if any of the pads are worn or rusted through. Also replace the plate if it is bent or distorted.

INSTALLATION

NOTE: After parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake lever.

1. Reassemble the rear park brake shoes.

2. Install the support plate (1) on the axle shaft (2).

3. Install the axle shaft (1) to the axle housing.

4. Reconnect the brake cable (1) to the park brake shoe lever (2) behind the support plate.

5. Install the rear wheel speed sensor (3). (Refer to 5 - BRAKES/ELECTRICAL/REAR WHEEL SPEED SENSOR - INSTALLATION).

6. Adjust the rear brake shoes (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).

7. Install the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

8. Install the disc brake caliper adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).

9. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

10. Lower the vehicle.

11. Install the rear park brake cables (2) at the equalizer.

12. Remove the lockout (1) on the front park brake lever.

13. Check the operation of the park brake system.

14. Install the center floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT - REAR DRUM IN HAT PARK BRAKE (ROTOR REMOVED)

Under normal circumstances, the only time adjustment is required is when the shoes are replaced, removed for access to other parts, or when one or both rotors are replaced.

Adjustment can be made with a standard brake gauge or with adjusting tool . Adjustment is performed with the

complete brake assembly installed on the backing plate.

CAUTION: Before adjusting the park brake shoes be sure that the park brake pedal is in the fully released position. If park brake pedal is not in the fully released position, the park brake shoes can not be accurately adjusted.

1. Raise vehicle.
2. Remove tire and wheel.
3. Remove disc brake caliper from caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove rotor from the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.

5. Using Brake Shoe Gauge, Special Tool C-3919, or equivalent, **accurately** measure the inside diameter of the park brake drum portion of the rotor .

6. Using a ruler that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool .

7. Reduce the inside diameter measurement of the brake drum that was taken using Special Tool C-3919 by 1/64 of an inch. Reset Gauge, Brake Shoe, Special Tool C-3919 or the equivalent used, so that the outside measurement jaws are set to the reduced measurement .

8. Place Gauge, Brake Shoe, Special Tool C-3919, or

equivalent over the park brake shoes. The special tool must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.

9. Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on the special tool.

10. Repeat step 8 above and measure shoes in both directions.

11. Install brake rotor on the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION) .

12. Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.

13. Install disc brake caliper on caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

14. Install wheel and tire.

15. Tighten the wheel mounting nuts in the proper sequence until all nuts are torqued to half the specified torque. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).

16. Lower vehicle.

CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.

NOTE: After parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake hand lever.

17. Road test the vehicle to ensure proper function of the vehicle's brake system.

WITH ADJUSTING TOOL (ROTOR INSTALLED)

Adjustment can be made with a standard brake gauge or with adjusting tool . Adjustment is performed with the complete brake assembly installed on the backing plate.

1. Be sure parking brake lever is fully released.
2. Raise vehicle so rear wheels can be rotated freely.
3. Remove plug from each access hole in brake support plates.
4. Loosen parking brake cable adjustment nut until there is slack in front cable.
5. Insert adjusting tool through support plate access hole and engage tool in teeth of adjusting screw star wheel .
6. Rotate adjuster screw star wheel (move tool handle upward) until slight drag can be felt when wheel is rotated.
7. Push and hold adjuster lever away from star wheel with thin screwdriver.
8. Back off adjuster screw star wheel until brake drag is

eliminated.

9. Repeat adjustment at opposite wheel. Be sure adjustment is equal at both wheels.

10. Install support plate access hole plugs.

11. Adjust parking brake cable and lower vehicle.

12. Depress park brake lever and make sure park brakes hold the vehicle stationary.

13. Release park brake lever.

LEVER

REMOVAL

1. Remove the center console (3) (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

2. Lockout the parking brake lever by inserting a punch (1) in the hole on the lever and by pulling up on the cable (3) to loosen and provide some slack (Refer to 5 - BRAKES/PARKING BRAKE - STANDARD PROCEDURE).

3. Disconnect the rear park cables (2) from the equalizer.

- 4. Disconnect the electrical connector (4).
- 5. Disconnect the electrical wiring harness clip (5) on the side of the lever.
- 6. Remove the four mounting nuts (2) for the park brake lever.
- 7. Remove the lever from the vehicle.

INSTALLATION

- 1. Install the lever to the vehicle.
- 2. Install the four mounting nuts (2) and tighten the nuts to
- 3. Reconnect the electrical wiring clip (5) to the side of the lever.
- 4. Reconnect the electrical connector (4) to the lever.

5. Reconnect the equalizer (2) to the rear park brake cables.

6. Remove the lockout (1) for the park brake lever.
7. Check park brake system operation.

8. Install the center console (3) (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

CABLES

REMOVAL

NOTE: Park brake system must be locked out for servicing (Refer to 5 - BRAKES/PARKING BRAKE - STANDARD PROCEDURE).

1. Remove the center console (3). (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

2. Lockout the parking brake cable by pulling up on the brake cables at the equalizer (3) then installing or a suitable tool (1).

3. Remove the cables from the equalizer (2).
4. Remove the cables from the body bracket (1) using a wrench to fit the end of the cable snug to depress the tangs.

5. Raise and support the vehicle.
6. Remove the cables and grommets (2) from the floor (1) of the vehicle.

7. Remove the cable (1) from the axle bracket (2).

8. Remove the brake cable (1) from the brake lever (2) at the support plate.

INSTALLATION

REAR CABLE

1. Install the cable (1) to the axle bracket (2).

2. Install the cable (1) into the brake lever (2) at the support plate.

3. Install the cables and grommets (2) into the floor (1) of the vehicle.

4. Lower the vehicle.

5. Install the brake cables (2) to the body bracket (1).
6. Install the cables (2) to the equalizer.

7. Remove the lockout (1) for the park brake cable.
8. Check the park brake system operation.

9. Install the center floor console (3) (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

BRAKES - ABS ELECTRICAL DIAGNOSTICS

BRAKES - ABS ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

C1008-BRAKE FLUID LEVEL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

◦ **Set Condition:**

When the Totally Integrated Power Module indicates that the Brake Fluid Level Circuit is greater than 4.9 volts for more than 5 seconds.

Possible Causes
(B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT OPEN
(B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE
(K91) SENSOR GROUND CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. BRAKE FLUID LEVEL SWITCH SIGNAL VOLTAGE ABOVE 4.9 VOLTS

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read Brake Fluid Level Switch Signal voltage.

Is the voltage above 4.9 volts?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. (B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT FOR SHORT TO BATTERY VOLTAGE

Turn the ignition off.
 Disconnect the Brake Fluid Level Switch harness connector.
 Turn the ignition on.
 Measure the voltage of the (B20) Brake Fluid Level signal circuit in the Brake Fluid Level Switch harness connector to ground.

Is the voltage above 5.2 volts?

Yes

- Repair the (B20) Brake Fluid Level signal circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE

Turn the ignition off.
 Connect a jumper wire between the (B20) Brake Fluid Level signal circuit and the (K91) Brake Fluid Level ground circuit in the Brake Fluid Level Switch harness connector.
 Turn the ignition on.
 With the scan tool, read the Brake Fluid Level Switch voltage

Is the voltage below 1.0 volt?

Yes

- Replace the Brake Fluid Level Switch in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

(B20) BRAKE FLUID LEVEL SWITCH CIRCUIT OPEN

4.

Turn the ignition off.
 Disconnect the Brake Fluid Level Switch.
 Disconnect the TIPM harness connector.
 Measure the resistance of the (B20) Brake Fluid Level signal circuit between the Brake Fluid Level Switch harness connector and the TIPM harness connector.

Is the resistance below 5 ohms?

Yes

- Go To [5](#)

No

- Repair the open in the (B20) Brake Fluid Level Switch signal circuit.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. (K91) SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Brake Fluid Level Switch harness connector.
 Reconnect the TIPM harness connector.
 Measure the resistance of the (K91) Brake Fluid Level Switch ground circuit between the Brake Fluid Level Switch harness connector and ground.

Is the resistance below 5.0 ohms?

Yes

- Replace and program the Totally Integrated Power Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the open in the (K91) Sensor ground circuit .

Perform POWERTRAIN VERIFICATION TEST.
(Refer to 9 - ENGINE - STANDARD PROCEDURE)

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

When the Left Front Wheel Speed Sensor (WSS) circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B9) LEFT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO (B9) LEFT FRONT WSS 12 VOLT SUPPLY CIRCUIT
LEFT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

Is the Left Front WSS or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK (B9) LEFT FRONT WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

Does the test light illuminate brightly?**Yes**

- Repair the (B9) Left Front WSS Supply circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

**5. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN**

Connect a jumper wire between ground and the (B9) Left Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

Does the test light illuminate brightly?**Yes**

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the (B9) Left Front WSS Supply circuit for an open.
- Perform ABS VERIFICATION TEST - VER 1. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**6. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector. Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B8) Left Front WSS Signal circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN

Connect a jumper wire between ground and the (B8) Left Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Go To [8](#)

No

- Repair the (B8) Left Front WSS Signal circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B8) Left Front WSS

Signal circuit and ground.

Is the voltage above one volt?

Yes

- Repair the (B8) Left Front WSS Signal circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER

Turn the ignition off.

Measure the resistance between the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit.

Is the resistance above 120 ohms?

Yes

Go To [10](#)

No

- Repair the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit for a short together.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

When the Left Front Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT FRONT WSS LOOSE — B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT FRONT TONE WHEEL DAMAGE
LEFT FRONT WHEEL/ BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If DTC C100A Left Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

- Go To [3](#)
-

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Front Wheel Speed Sensor
Inspect the Left Front Wheel Speed Sensor face for damage.

Is the Left Front Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Left Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel/Bearing damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK LEFT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Left Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Front Wheel Bearing Damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [8](#)

8. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
 Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
 Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Left Front Wheel Speed Sensor (WSS) Signal reading is different from the readings received from the other WSS's at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT FRONT WSS LOOSE — B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT TONE WHEEL/BEARING DAMAGE
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Front Wheel Speed Sensor
Inspect the Left Front Wheel Speed Sensor face for damage.

Is the Left Front Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Left Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel/Bearing damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

If the Right Front Wheel Speed Sensor (WSS) circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT
RIGHT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

Is the Right Front WSS or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
 Disconnect the Right Front WSS harness connector.
 Disconnect the Anti-Lock Brake Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B7) Right Front WSS Supply circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B7) Right Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

Does the test light illuminate brightly?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the (B7) Right Front WSS Supply circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off.
 Disconnect the Anti-Lock Brake Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B6) Right Front WSS Signal circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN

Connect a jumper wire between ground and the (B6) Right Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Go To [8](#)

No

- Repair the (B6) Right Front WSS Signal circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.
 Remove all jumper wires.
 Measure the voltage between the (B6) Right Front WSS

Signal circuit and ground.

Is the voltage above one volt?

Yes

- Repair the (B6) Right Front WSS Signal circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER

Turn the ignition off.

Measure the resistance between the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit.

Is the resistance above 120 ohms?

Yes

Go To [10](#)

No

- Repair the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit for a short together.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Right Front Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
RIGHT FRONT WSS LOOSE — B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT FRONT TONE WHEEL DAMAGE
RIGHT FRONT WHEEL/BEARING DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If DTC C1015–Right Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Front Wheel Speed Sensor
Inspect the Right Front Wheel Speed Sensor face for damage.

Is the Right Front Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Right Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Front Tone Wheel/Bearing damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK RIGHT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Right Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Front Wheel Bearing Damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [8](#)

8. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Right Front Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT FRONT WSS LOOSE — B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT TONE WHEEL/BEARING DAMAGE
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Front Wheel Speed Sensor
Inspect the Right Front Wheel Speed Sensor face for damage.

Is the Right Front Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Right Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Front Tone Wheel/Bearing damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

If the Left Rear Wheel Speed Sensor (WSS) circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT
LEFT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

Is the Left Rear WSS or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.
 Disconnect the Anti-Lock Brake Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B4) Left Rear WSS Supply circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B4) Left Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the (B4) Left Rear WSS Supply circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
 Disconnect the Anti-Lock Brake Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B3) Left Rear WSS Signal circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B3) Left Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Go To [8](#)

No

- Repair the (B3) Left Rear WSS Signal circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.
 Remove all jumper wires.
 Measure the voltage between the (B3) Left Rear WSS Signal

circuit and ground.

Is the voltage above one volt?

Yes

- Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER

Turn the ignition off.

Measure the resistance between the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit.

Is the resistance above 120 ohms?

Yes

Go To [10](#)

No

- Repair the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit for a short together.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Left Rear Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT REAR WSS LOOSE — B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT REAR TONE WHEEL DAMAGE
LEFT REAR WHEEL BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.
With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

- Repair as necessary.

No

- Go To [5](#)

5. CHECK LEFT REAR WSS LOOSENESS, INSPECT B4, B5 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector

Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and

Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Rear Wheel Speed Sensor
Inspect the Left Rear Wheel Speed Sensor face for damage.

Is the Left Rear Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK LEFT REAR WHEEL BEARING FOR DAMAGE

Inspect the Left Rear wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Rear Wheel Bearing Damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [9](#)

9. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

When the Left Rear Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS

readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT REAR WSS LOOSE — B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR TONE WHEEL DAMAGE
AXLE SHAFT FASTENER HARDWARE
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?**Yes**

- Repair as necessary.

No

- Go To [5](#)

5. CHECK LEFT REAR WSS LOOSENESS, INSPECT B3, B4 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector. Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?**Yes**

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Rear Wheel Speed Sensor
Inspect the Left Rear Wheel Speed Sensor face for damage.

Is the Left Rear Wheel Speed Sensor damaged?**Yes**

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [8](#)

8. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

If the Right Rear Wheel Speed Sensor (WSS) circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT
RIGHT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

Is the Right Rear WSS or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
 Disconnect the Right Rear WSS harness connector.
 Disconnect the Anti-Lock Brake Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B2) Right Rear WSS Supply circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the (B2) Right Rear WSS Supply circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
 Disconnect the Anti-Lock Brake Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B1) Right Rear WSS Signal circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Go To [8](#)

No

- Repair the (B1) Right Rear WSS Signal circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.
 Remove all jumper wires.
 Measure the voltage between the (B1) Right Rear WSS

Signal circuit and ground.

Is the voltage above one volt?

Yes

- Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.

Is the resistance above 120 ohms?

Yes

Go To [10](#)

No

- Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Right Rear Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
RIGHT REAR WSS LOOSE — B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT REAR TONE WHEEL DAMAGE
RIGHT REAR WHEEL BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.
With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

- Repair as necessary.

No

- Go To [5](#)

5. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Rear Wheel Speed Sensor.
Inspect the Right Rear Wheel Speed Sensor face for damage.

Is the Right Rear Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Tone Wheel damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK RIGHT REAR WHEEL BEARING FOR DAMAGE

Inspect the Right Rear wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Rear Wheel Bearing Damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [9](#)

9. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

When the Right Rear Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT REAR WSS LOOSE — B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR TONE WHEEL/BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
RIGHT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification

as required.

Was the Axle Shaft fastener loose?

Yes

- Repair as necessary.

No

- Go To [5](#)

5. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Rear Wheel Speed Sensor.

Inspect the Right Rear Wheel Speed Sensor face for damage.

Is the Right Rear Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK RIGHT REAR TONE WHEEL/BEARING FOR DAMAGE

Inspect the Right Rear Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Tone Wheel/Bearing damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [8](#)

8. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test Complete.

C1041-LEFT FRONT TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT FRONT TONE WHEEL/BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
DIRT, METAL, DAMAGED TONE WHEEL/SENSOR

Diagnostic Test

1. CHECK FOR A DTC C1041-LEFT FRONT TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
 With the scan tool, read DTCs.
 Record DTC and Freeze Frame information.
 With the scan tool, erase DTCs.
 Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1041-LEFT FRONT TONE WHEEL PERFORMANCE active?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Left Front Tone Wheel/Bearing for damage.

Check the Left Front Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Replace the Left Front Tone Wheel/Bearing in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

Possible Causes
DIRTY TONE WHEEL/SENSOR
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT TONE WHEEL/BEARING DAMAGE

Diagnostic Test

1. CHECK FOR A DTC C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, read DTCs.
Record DTC and Freeze Frame information.
With the scan tool, erase DTCs.
Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1042-RIGHT FRONT TONE WHEEL PERFORMANCE?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK THE RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Right Front Tone Wheel/Bearing for damage.
Check the Right Front Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Right Front Tone Wheel/Bearing in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1043-LEFT REAR TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

Possible Causes
DIRTY TONE WHEEL/SENSOR
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
AXLE SHAFT FASTENER HARDWARE
LEFT REAR TONE WHEEL/BEARING DAMAGE

Diagnostic Test

1. CHECK FOR A DTC C1043-LEFT REAR TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1043-LEFT REAR TONE WHEEL PERFORMANCE?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic

behavior?

Yes

- Go To [3](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

- Repair as necessary.

No

- Go To [5](#)

5. CHECK THE LEFT REAR TONE WHEEL/BEARING FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Left Rear Tone Wheel/Bearing for damage.
Check the Left Rear Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Replace the Left Rear Tone Wheel/Bearing in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

C1044-RIGHT REAR TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

Possible Causes
DIRTY TONE WHEEL/SENSOR
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
AXLE SHAFT FASTENER HARDWARE
RIGHT REAR TONE WHEEL/BEARING DAMAGE

Diagnostic Test

1. CHECK FOR A DTC C1044-RIGHT REAR TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, read DTCs.
Record DTC and Freeze Frame information.
With the scan tool, erase DTCs.
Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1044-RIGHT REAR TONE WHEEL PERFORMANCE?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.
With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To [3](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.
Check and adjust the Right Rear Tire pressure.
Check and adjust all other tire pressures.
Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

- Repair as necessary.

No

- Go To [5](#)

5. CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Right Rear Tone Wheel for damage.
Check the Right Rear Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Replace the Right Rear Tone Wheel in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

C1046–LEFT FRONT WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During active ABS control.

- **Set Condition:**

If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
LEFT FRONT TONE WHEEL/BEARING DAMAGED
WHEEL SPEED SIGNALS SWAPPED
LEFT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: Ensure brake capability is available before road testing.

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Does the Left Front WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECKING INSIDE WHEEL SPEED

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

Was the inside wheel slower than outside?

Yes

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

No

- Go To [3](#)

3. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1046–LEFT FRONT WHEEL PRESSURE PHASE MONITORING reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C1047–RIGHT FRONT WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During active ABS control.

- **Set Condition:**

If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
RIGHT FRONT TONE WHEEL DAMAGED
WHEEL SPEED SIGNALS SWAPPED

RIGHT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: Ensure brake capability is available before road testing.

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Does the Right Front WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECKING INSIDE WHEEL SPEED

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

Was the inside wheel slower than outside?

Yes

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

No

- Go To [3](#)

3. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1047–RIGHT FRONT WHEEL PRESSURE PHASE MONITORING reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C1048–LEFT REAR WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During active ABS control.

- **Set Condition:**

If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
LEFT REAR TONE WHEEL/WHEEL BEARING
WHEEL SPEED SIGNALS SWAPPED
LEFT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: Ensure brake capability is available before road testing.

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Does the Left Rear WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECKING INSIDE WHEEL SPEED

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

Was the inside wheel slower than outside?

Yes

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

No

- Go To [3](#)

3. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired

connectors.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1048–LEFT REAR WHEEL PRESSURE PHASE MONITORING reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C1049–RIGHT REAR WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During active ABS control.

- **Set Condition:**

When the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
RIGHT REAR TONE WHEEL DAMAGED
WHEEL SPEED SIGNALS SWAPPED
RIGHT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: Ensure brake capability is available before road testing.

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Does the Right Rear WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. CHECKING INSIDE WHEEL SPEED

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

Was the inside wheel slower than outside?

Yes

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND

TESTING)

No

- Go To [3](#)

3. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1049–RIGHT REAR WHEEL PRESSURE PHASE MONITORING reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

C1073–ABS PUMP MOTOR CONTROL CIRCUIT

01550012

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

When the ABS Pump Motor is activated.

- **Set Condition:**

The ABM detects low pump motor feedback voltage with actuation of the pump motor relay.

Possible Causes
BLOWN PUMP FUSE
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
INTEGRATED CONTROL UNIT

Diagnostic Test

1. CHECK FOR A DTC C1073-ABS PUMP MOTOR CONTROL CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid. If present, diagnose and repair DTC C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE before diagnosing this DTC.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1073-ABS PUMP MOTOR CONTROL CIRCUIT?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK THE ABS PUMP MOTOR FUSED B+ FOR AN OPEN

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor B+ fuse.

Is the ABS Pump Motor B+ fuse open?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (A107) Fused B+ circuit.

Does the test light illuminate brightly?

Yes

- Repair the (A107) Fused B(+) circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK THE (A107) FUSED B(+) CIRCUIT

Turn the ignition off.

Visually inspect the (A107) Fused B(+) circuit in the wiring harness.

Look for any signs of intermittent short to ground.

Is the wiring harness OK?

Yes

- Go To [6](#)

No

- Repair the (A107) Fused B(+) circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

Is the voltage above 10 volts?

Yes

- Go To [7](#)

No

- Repair the (A107) Fused B(+) circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

7. CHECK THE (Z907) AND (Z917) GROUND CIRCUITS FOR AN OPEN

Measure the resistance of the (Z907) and (Z917) Ground circuits between the Anti-Lock Brake Module harness connector and ground

Is the resistance below 5.0 ohms?

Yes

- Replace the ICU per service information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the high resistance in the affected circuit.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1078–TIRE REVOLUTIONS RANGE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

When Monitored:

Continuously.

- **Set Condition:**

A comparison between the tire circumference value contained in the EEPROM and the tire circumference value received on the CAN bus. Programmed value for tire size is not within acceptable range.

Possible Causes
INCORRECT VALUE PROGRAMMED INTO TIPM

Diagnostic Test

1. INCORRECT VALUE PROGRAMMED INTO TIPM

TIRE SIZE	BODY STYLE	ENGINE SIZE	SALES CODE	TIRE DIAMETER (MM)
P225/75R 17 BSW ALL TERRAIN	JK	ALL	TNA	2480
P225/70R 18 BSW ON/OFF ROAD	JK	ALL	TNB, TT6	2480
P225/75R 16 BSW ON/OFF ROAD	JK	ALL	TRM	2253
LT225/75R 17 BSW OFF ROAD	JK	ALL	TT7	2495
P225/75R 17 OWL ON/OFF ROAD	JK	ALL	TUF	2480
P245/75R 16 BSW ON/OFF ROAD	JK	ALL	TYX, TYZ	2357

Verify the correct Tire/wheel information is programmed in the TIPM.

Is the correct value programmed in the TIPM according to the chart?

Yes

- Test complete.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Program the correct Tire/Wheel information in the TIPM.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C107C–BRAKE PEDAL SWITCH 1/2 STUCK

For a complete wiring diagram **Refer to Section 8W.**

1. ENGINE DTCS PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTCs present?

Yes

- Refer to Section 9 – Engine Electrical Diagnostics and perform the appropriate diagnostic procedure.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
- Perform POWERTRAIN VERIFICATION TEST - VER 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

C107D–BRAKE PEDAL SWITCH 1/2 CORRELATION

For a complete wiring diagram **Refer to Section 8W.**

1. ENGINE DTCS PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTCs present?

Yes

- Refer to Section 9 – Engine Electrical Diagnostics and perform the appropriate diagnostic procedure.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
- Perform POWERTRAIN VERIFICATION TEST - VER 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

C1090–ABS BRAKE LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When monitoring the Brake Lamp Activation Relay Control circuit the module detects a short to ground.

Possible Causes
(B45) BRAKE LAMP ACTIVATION RELAY CONTROL OPEN OR SHORTED TO GROUND
BLOWN FUSE
BRAKE LAMP ACTIVATION RELAY
ANTI-LOCK BRAKE MODULE (ABM)

Diagnostic Test

1. CHECK FOR DTC C1090–ABS BRAKE LAMP CONTROL CIRCUIT LOW

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Start Engine.

Apply brake pedal firmly with at least 80 bar (1160 psi.) .

With the scan tool, read DTCs.

Does the scan tool display: C1090–ABS BRAKE LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector and the Brake Lamp Activation Relay harness connector.

Is the Anti-Lock Brake Module or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST.

No

- Go To [3](#)

3. CHECK (B45) BRAKE LAMP ACTIVATION RELAY CONTROL SHORTED TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module

Start the engine.

Using a 12-volt test light connected to ground, probe the (B45) Brake Lamp Activation Relay Control Circuit at the Anti-Lock Brake Module harness connector.

Does the test light illuminate brightly?

Yes

- Replace the Anti-Lock Brake Module in accordance with the service information.
- Perform ABS VERIFICATION TEST.

No

- Go To [4](#)

4. CHECK (F500) FUSED IGNITION SWITCH OUTPUT

Turn the ignition off.

Disconnect the Brake Lamp Activation Relay.

Start the engine.

Using a 12-volt test light connected to ground, probe the (F500) Fused Ignition Switch Output Circuit at the Brake Lamp Activation Relay harness connector.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Check for open Fuse, if ok repair open or short to ground in the (F500) Fused Ignition Switch Output Circuit.
- Perform ABS VERIFICATION TEST.

5. BRAKE LAMP ACTIVATION RELAY

Turn the ignition off.

Measure the resistance of the (B45) Brake Lamp Activation Relay Control Circuit between the Brake Lamp Activation relay and the Anti-Lock Brake Module.

Is the resistance 5 ohms ?

Yes

- Replace the Brake Lamp Activation Relay in accordance with the Service Information.
- Perform ABS VERIFICATION TEST.

No

- Repair open in the (B45) Brake Lamp Inhibit Relay Control circuit.
- Perform ABS VERIFICATION TEST.

C1091–ABS BRAKE LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

When Set:

When monitoring the Brake Lamp Activation Relay Control circuit the module detects a short to B+.

Possible Causes
(B45) BRAKE LAMP ACTIVATION RELAY CONTROL SHORTED TO VOLTAGE
BRAKE LAMP ACTIVATION RELAY
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1091–ABS BRAKE LAMP CONTROL CIRCUIT HIGH

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Start Engine.

Apply brake pedal firmly with at least 80 bar (1160 psi.) .

With the scan tool, read DTCs.

Does the scan tool display: C1091–ABS BRAKE LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector and the Brake Lamp Activation Relay harness connector.

Is the Anti-Lock Brake Module or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST.

No

- Go To [3](#)

3. CHECK (B45) BRAKE LAMP ACTIVATION RELAY CONTROL SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module

Disconnect the Brake Lamp Activation Relay.

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (B45) Brake Lamp Activation Relay Control Circuit at the Brake Lamp Activation Relay harness connector.

Does the test light illuminate brightly?

Yes

- Repair the short to voltage in the (B45) Brake Lamp Inhibit Relay Control circuit.
- Perform ABS VERIFICATION TEST.

No

- Go To [4](#)

4. BRAKE LAMP ACTIVATION RELAY

Turn the ignition off.

Measure the resistance across the relay between the (B45) Brake Lamp Activation Relay Control Circuit and the (F500) Fused Ignition switch Output.

Is the resistance 75 ohms $\pm$ 5 ohms?

Yes

- Replace the Anti-Lock Brake Module in accordance with the service information.
- Perform ABS VERIFICATION TEST.

No

- Replace the Brake Lamp Activation Relay in accordance with the Service Information.
- Perform ABS VERIFICATION TEST.

C1210–G SENSOR INPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ When Monitored:

Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 m.p.h.) for the first time, but not if the sensor voltage is out of range.

Or, during diagnostic mode.

Or, if the monitoring was inhibited by a corresponding diagnostics command.

◦ Set Condition:

If the measured acceleration signal is higher than 0.8 g for longer than the specified detection time.

DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

Diagnostic Test

1. CHECK FOR A DTC C1210–G SENSOR INPUT CIRCUIT PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C1210–G SENSOR INPUT CIRCUIT PERFORMANCE?

Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1219–STEERING ANGLE SENSOR ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Continuous monitoring.

◦ **Set Condition:**

If the Anti-Lock Brake Module detects that the calculated steering wheel angle and the actual steering angle disagree.

Possible Causes

VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING ANGLE SENSOR LOOSE
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

NOTE: If present, diagnose and repair DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE before diagnosing this DTC.

Turn the ignition on.
 With the scan tool, erase ABS DTCs.
 Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by driving straight at a velocity between 10 and 25 km/hr (6 and 15 mph.) for 1 minute.
 Park the vehicle.
 Turn the steering wheel from stop to stop.
 With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.
 Center the steering wheel.
 With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage. ABS module must be reinitialized after repair.

Turn the ignition off.
 Inspect the vehicle for damage causing tracking problems.
 Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor is properly installed.

Is the Steering Angle Sensor properly installed?

Yes

- Go To [5](#)

No

- Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL

With the scan tool, read the Steering Angle Sensor Position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor Position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

Did the steering angle change accordingly?**Yes**

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C121A-STEERING ANGLE SENSOR NOT INITIALIZED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuous monitoring.

◦ **Set Condition:**

When the Anti-Lock Brake Module detects a low voltage at the Steering Angle Sensor or Steering Angle Sensor failure.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE
(F943) FUSED B(+) CIRCUIT OPEN
(Z910) GROUND CIRCUIT OPEN
STEERING CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C121A-STEERING ANGLE SENSOR NOT INITIALIZED

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Road test the vehicle over 30 km/h (19 mph) for at least 30 seconds.

With the scan tool, read and record DTCs.

Does the scan tool display: C121A-STEERING ANGLE SENSOR NOT INITIALIZED?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Check the Steering Angle Sensor installation.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK THE VOLTAGE ON THE (F943) FUSED B(+) CIRCUIT

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Measure the voltage of the (F943) Fused B(+) circuit.

Is the voltage above 10 volts?

Yes

- Go To [4](#)

No

- Repair the (F943) Fused B(+) circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

4. CHECK THE RESISTANCE OF THE (Z910) GROUND CIRCUIT

Turn the ignition off.
Disconnect the Steering Control Module harness connector.
Measure the resistance between the (Z910) Ground circuit and ground.

Is the resistance below 5.0 ohms?

Yes

- Replace the Steering Control Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the (Z910) Ground circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C121C–TORQUE REQUEST SIGNAL DENIED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module indicates if engine management relevant for Automatic Yaw Control/Traction Control System control can be accomplished.

Possible Causes
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED

NOTE: This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

Start Engine.

With the scan tool, read and record DTCs and monitor ESP Torque Request status.

Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

2. ESP TORQUE REQUEST SIGNAL

Engine started.

With the scan tool, read the Allow ESP Torque Request status bit.

Was the Allow ESP Torque Request showing NOT set?

Yes

- Replace the Powertrain Module in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C121D-BRAKE PRESSURE SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS
ECU INTERNAL FAILURE
HCU INTERNAL FAILURE

Diagnostic Test

1. CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Slowly depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. HCU/ECU ISOLATION

Turn the ignition off.

Separate the ECU from the HCU.

With the scan tool, monitor brake pressure.

Does the scan tool display brake pressure above 218 bar (3162 psi)?

Yes

- Replace the HCU in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the ECU in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C121E–BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS
ECU INTERNAL FAILURE
ICU INTERNAL FAILURE

Diagnostic Test

1. CHECK FOR A DTC C121E–BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, read and record DTCs.
With the scan tool, read and record Freeze Frame information.
With the scan tool, erase DTCs.
Start the engine.
Depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121E–BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. RECHECK FOR A DTC C121E–BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121E–BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

Yes

- Go To [3](#)
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test complete

3. HCU/ECU ISOLATION

Turn the ignition off.

Separate the ECU from the HCU.

With the scan tool, monitor brake pressure.

Does the scan tool display brake pressure above 218 psi?

Yes

- Replace the HCU in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the ECU in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1231-DRIVE TEST: STEERING ANGLE SENSOR

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During the Drive Test.

- **Set Condition:**

If the Anti-Lock Brakes Module detects implausible Steering Angle Sensor data.

Possible Causes
STEERING ANGLE SENSOR INSTALLATION
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR A DTC C1231-DRIVE TEST: STEERING ANGLE SENSOR

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If any of the following DTCs are present they must be repaired before continuing.

DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE
DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE
DTC C1240-STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C1231-DRIVE TEST: STEERING ANGLE SENSOR?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

With the scan tool, select Steering Control Module.
Verify that the Steering Angle Sensor is active on the bus.

Is the Steering Angle Sensor active on the bus?**Yes**

- Go To [3](#)

No

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

3. CHECK STEERING ANGLE

Turn steering wheel so wheels point in a straight ahead position.
With scan tool check steering angle.

Is the Steering Angle reading within ± 15 degrees?**Yes**

- Go To [4](#)

No

- Go To [5](#)

4. CHECK STEERING ANGLE CHANGE

Turn steering wheel so wheels point in a straight ahead position.
With scan tool check steering angle.
Slowly rotate steering wheel while looking for a smooth change. The degrees will decrease to the right and increase when rotating steering wheel to the left.

Did the steering angle change accordingly?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Turn the ignition off.

Verify that the Steering Angle Sensor is properly installed. Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION.

Is the Steering Angle Sensor properly installed?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1232–DRIVE TEST: PRESSURE SENSOR

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During the Drive Test.

- **Set Condition:**

If the Pressure Sensor fails to activate.

Possible Causes
HYDRAULIC / BRAKE SYSTEM COMPONENT INSTALLATION
INTEGRATED CONTROL UNIT
PRESSURE SENSOR (HYDRAULIC CONTROL UNIT)

Diagnostic Test

1. CHECK FOR A DTC C1232–DRIVE TEST: PRESSURE SENSOR

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine and apply the brake firmly.

With the scan tool, read and record DTCs.

Does the scan tool display: C1232–DRIVE TEST: PRESSURE SENSOR?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

Verify that the brake system components are installed and functioning properly.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Clean contacts in HCU first if problem reoccurs replace the Integrated Control Unit in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During the Drive Test.

- **Set Condition:**

If the Anti-Lock Brakes Module detects implausible Dynamics Sensor data.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR A DTC C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, read and record DTCs.
With the scan tool, read and record Freeze Frame information.
Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).
Start the engine.
With the scan tool, read and record DTCs.

Does the scan tool display: C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.
Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1238-DRIVE TEST: UNSUCCESSFUL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

During the Drive Test.

- **Set Condition:**

If the Anti-Lock Brakes Module detects a fault with the Steering Angle Sensor, the Pressure Sensor, or the Dynamics Sensor.

Possible Causes
STEERING ANGLE SENSOR

PRESSURE SENSOR
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. DIAGNOSE & REPAIR ALL DTCs

Repair

- Diagnose and repair all DTCs.

C1239–EMISSIONS ROLLS TEST ACTIVE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The functional effects are that the output signal for all wheel speeds mimic the wheel with the highest wheel speed.

This DTC sets when the Emissions Rolls Test is active.

Close out the Emissions Rolls Test through the Gateway Module.

C123A–ESP SYSTEM SENSORS CALIBRATION

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Once per ignition cycle.

- **Set Condition:**

If the calculated checksum does not match the stored checksum.

Possible Causes
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. INITIALIZE ANTI-LOCK BRAKES MODULE

Initialize ECU refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Does this DTC reset?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test complete.

C123B-ESP SYSTEM CONTROL TOO LONG

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

When the Anti-Lock Brake Module indicates ESP control lasting longer the 10 seconds.

Possible Causes
HYDRAULIC/BRAKE ISSUE
DYNAMICS SENSOR
INTEGRATED CONTROL MODULE
STEERING ANGLE SENSOR

Diagnostic Test

1. CHECK FOR A DTC C123B-ESP SYSTEM CONTROL TOO LONG

NOTE: If other DTCs are set they must be repaired before continuing. To help in the service of the ESP System, it is recommend speaking to the customer to find out what type of environment they were driving in when the ESP concern took place, heavy rain, snow or ice. This should be considered normal operation and no repair is necessary. This DTC may set while driving under excessive driving conditions.

Turn the ignition on.

Perform ECU initialization with drive test. Refer to Perform ABS VERIFICATION TEST.

NOTE: Drive test must be performed correctly for ECU to initialize.

Cycle the ignition switch from off to on.

Did the ECU initialization/drive test pass?

Yes

- Go To [2](#)

No

- Refer to associated drive test diagnostic procedure.
- Refer to the DTC list. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK STEERING ANGLE SIGNAL

Turn steering wheel so wheels point in a straight ahead position.

With scan tool read Steering Angle Sensor Signal.

Is the Steering Angle reading within ± 6 degrees?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. CHECK STEERING ANGLE INSTALLATION AND WHEEL ALIGNMENT

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Verify that the Steering Angle Sensor is properly installed.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Replace the Steering Angle Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

4. CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

Verify that the brake system components are installed and functioning properly.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. REPLACE THE INTEGRATED CONTROL MODULE & VERIFY IF THE DTC IS STILL ACTIVE

Replace the Integrated Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

Connect all previously disconnected components and connectors.

Turn the ignition on.
With the scan tool, erase ABS DTCs.
Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No

- Test complete.

C123C–DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE

01a00006

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With vehicle speed above 11 km/h (7 mph), but not if the sensor signal is invalid.

Or, during skidding.

Or, when driving in reverse.

- **Set Condition:**

If the Anti-Lock Brakes Module detects implausible Dynamics Sensor values.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: If present, diagnose and repair DTC C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C123F–STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With ignition on, but not if a checksum failure of the stored offset values is detected.

Or, a CAN time-out failure is detected.

Or, a failure is detected by the Steering Angle Sensor.

- **Set Condition:**

If the Anti-Lock Brakes Module detects that either the calculated steering wheel angle offset or the steering wheel angle signal measured output is out of range.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING WHEEL ALIGNMENT
STEERING ANGLE SENSOR LOOSE
STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
STEERING ANGLE SENSOR
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

NOTE: If present, diagnose and repair DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE, C121A-STEERING ANGLE SENSOR NOT INITIALIZED, or C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE before diagnosing this DTC.

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Turn the steering wheel so wheels point in a straight ahead position.

With the scan tool, read the Steering Angle Sensor position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$ degrees?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor is properly installed.

Is the Steering Angle Sensor properly installed?

Yes

- Go To [5](#)

No

- Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. RE-INITIALIZE THE ESP MODULE

Perform ECU initialization with drive test to clear offsets. Refer to Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Is DTC C123F–STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE still active?

Yes

- Go To [6](#)

No

- Sensor was probably loose or calibrated with wheels not centered to vehicle. Test complete.
- Perform the ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL

With the scan tool, read the Steering Angle Sensor position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

Did the steering angle change accordingly?**Yes**

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform the ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1240–STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With ignition on, but not if a CAN time out failure is detected.

Or, if a fault is detected by the Steering Angle Sensor.

- **Set Condition:**

If the Anti-Lock Brakes Module detects that the absolute value of the measured steering wheel angle is greater than 720 degrees.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING WHEEL ALIGNMENT
STEERING ANGLE SENSOR LOOSE
STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
STEERING ANGLE SENSOR

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

Turn steering wheel from lock to lock.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Center the steering wheel.

With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Center the steering wheel.

With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK STEERING ANGLE CHANGE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle if reading travels to 720 degrees while rotating wheel from lock to lock.

NOTE: Sensor damage can occur if wheel is turned over 720 degrees.

Rotate steering wheel to the right and the degrees will decrease and rotate steering wheel to the left and the degrees will increase.

Did the steering angle change accordingly and display less than 720 degrees from lock to lock?

Yes

- Go To [5](#)

No

- Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor is properly installed. Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION.

Is the Steering Angle Sensor properly installed?

Yes

Replace the Steering Angle Sensor and clear offsets by initializing ECU with wheels pointing straight ahead, in accordance with the Service Information.

- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1242–G SENSOR INPUT SIGNAL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

◦ When Monitored:

Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 m.p.h.) for the first time, but not if the sensor voltage is out of range,

Or, during diagnostic mode.

Or, if the monitoring was inhibited by a corresponding diagnostics command.

Or, if the vehicle speed has exceeded 20 km/h (12.4 m.p.h.) during the actual ignition cycle.

Or, if at least one over spinning wheel is detected.

Or, if one of the control functions is active.

◦ Set Condition:

If the measured acceleration signal is higher than 0.8 g and longer than the specified detection time.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR OR ANTI-LOCK BRAKE MODULE
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- **NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.**

Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.

- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1243–G SENSOR NOT INITIALIZED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Once after ignition on.

- **Set Condition:**

If the stored zero point calibration value of the longitudinal acceleration sensor is invalid.

Possible Causes
DYNAMICS SENSOR NOT CALIBRATED
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. PERFORM ECU INITIALIZATION

Turn the ignition on.
With the scan tool, erase ABS DTCs.
Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Perform ECU initialization with drive test refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

NOTE: The ECU Initialization process must include driving the vehicle into a 90° turn.

Park the vehicle.

- Go To [2](#)

2. VERIFY IF DTC IS STILL ACTIVE

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- **NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.**

Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.

- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2100–BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Anti-Lock Brakes Module detects system voltage is below 9.5 volts.

Possible Causes
ECM OR PCM DTCs PRESENT
VEHICLE BATTERY / CHARGING SYSTEM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. DTCS IN THE PCM

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs from the PCM.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, read and record DTCs.

With the scan tool read DTCs from the PCM.

Are any charging system codes present?

Yes

- Repair the charging system DTC in the PCM.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [2](#)

2. CHARGING SYSTEM FAILURE

Start the engine.

Connect voltmeter to vehicle battery.

Is the vehicle battery voltage under 8.2 volts?

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

Yes

- Repair the charging system per service information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2101–BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

◦ **Set Condition:**

If the Anti-Lock Brakes Module detects system voltage is above 17 volts.

Possible Causes
ECM/PCM DTCs PRESENT
VEHICLE BATTERY / CHARGING SYSTEM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs from the ECM/PCM.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, read and record DTCs.

With the scan tool read DTCs from the PCM.

Are any charging system codes present?

Yes

- Repair the charging system DTC in the ECM/PCM.
- Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

No

- Go To [2](#)

2. CHARGING SYSTEM FAILURE

Start the engine.

Connect voltmeter to vehicle battery.

Is the vehicle battery voltage over 16.8 volts?

No

- Go To [3](#)

Yes

- Repair the charging system per service information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

3. CHARGING POWER SUPPLY VOLTAGE

With a scan tool read Power Supply Voltage.

Is Power Supply Voltage over 16.8 volts?**No**

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW

01a00036

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Dynamics Sensor status changes from initialized to not initialized due to low voltage on the (G4) Dynamics Sensor Supply circuit.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT HIGH RESISTANCE
(G94) DYNAMICS SENSOR GROUND CIRCUIT HIGH RESISTANCE
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?**Yes**

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT & (G94) DYNAMICS SENSOR GROUND CIRCUIT FUNCTION

Disconnect the Dynamics Sensor harness connector.
 Turn the ignition on.
 Measure the voltage between the (G4) Dynamics Sensor Supply Circuit and the (G94) Dynamics Sensor Ground Circuit.

Is the voltage above 10.5 volts?**Yes**

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off.
 Disconnect the Anti-Lock Brakes Module harness connector.

Measure the resistance of the (G4) Dynamics Sensor Supply circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?**Yes**

- Go To [5](#)

No

- Repair the (G4) Dynamics Sensor Supply circuit for high resistance.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

Measure the resistance of the (G94) Dynamics Sensor Ground circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the (G94) Dynamics Sensor Ground circuit for high resistance.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH

01a00036

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Upon ignition on, prior to switching the (G4) Dynamics Sensor Supply circuit power on.

◦ **Set Condition:**

If the Anti-Lock Brakes Module detects voltage on the (G4) Dynamics Sensor Supply circuit when the circuit's power is turned off.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
ANTI-LOCK BRAKES MODULE

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

- Repair as necessary.

- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.

Turn the ignition on.

Measure the voltage of the (G4) Dynamics Sensor Supply Circuit.

Is the voltage above 0.2 volts?

Yes

- Repair the (G4) Dynamics Sensor Supply Circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE

01550012

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on and the ABS Pump Motor deactivated, but not if supply voltage faults are detected.

Or, if the control is switched off.

◦ **Set Condition:**

If the Anti-Lock Brakes Module detects either a low voltage condition when the ABS Pump Motor is activated or deactivated or a high voltage condition when the ABS Pump Motor is deactivated.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
ABS PUMP MOTOR FUSE OPEN
(A917) FUSED B(+) CIRCUIT SHORTED TO GROUND, OPEN, OR HIGH RESISTANCE
(Z907) OR (Z917) GROUND CIRCUIT OPEN, OR HIGH RESISTANCE
ANTI-LOCK BRAKES MODULE
PUMP MOTOR (HYDRAULIC CONTROL UNIT)

Diagnostic Test

1. CHECK FOR A DTC C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

Diagnostic Test**2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS**

Turn the ignition off.

Visually inspect the Anti-Lock Brakes Module harness connector and wiring harness for damage.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?**Yes**

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK ABS PUMP MOTOR FUSE

Remove and visually inspect the ABS Pump Motor fuse.

Is the fuse open?**Yes**

- Go To [4](#)

No

- Go To [5](#)

4. CHECK (A917) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Anti-Lock Brakes Module harness connector.

Measure the resistance of the (A917) Fused B(+) circuit

between ground and the Anti-Lock Brakes Module harness connector.

Is the resistance below 10k ohms?

Yes

- Repair the (A917) Fused B(+) circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK (A917) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Replace the ABS Pump Motor fuse.

Using a 12-volt test light connected to ground, probe the (A917) Fused B(+) circuit.

NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To [6](#)

No

- Repair the (A917) Fused B(+) circuit for an open or high resistance.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (Z907) OR (Z917) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Using a 12-volt test light connected to 12 volts, probe the (Z907) and (Z917) Ground circuit.

NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly on both circuits?

Yes

- Go To [7](#)

No

- Repair (Z907) or (Z917) circuit for an open or high resistance.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

7. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Replace the Anti-Lock Brakes Module in accordance with the Service Information.
 Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).
 Turn the ignition on.
 With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Replace the Hydraulic Control Unit in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2200–ANTI-LOCK BRAKE MODULE INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on. The Anti-Lock Brake Module monitors its internal microprocessors for correct operation.

- **Set Condition:**

If the Anti-lock brake module detects an internal fault, the DTC is set.

Possible Causes
ABM - INTERNAL FAULT

Diagnostic Test

1. ABM INTERNAL FAILURE DTC PRESENT

Turn the ignition on.
 With the scan tool, read DTCs.
 With the scan tool, erase DTCs.
 Turn the ignition off.
 Turn the ignition on.
 With the scan tool, read DTCs.

Does the scan tool display ANTI-LOCK BRAKE MODULE INTERNAL FAILURE?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2202-ORIGINAL VIN MISMATCH/MISSING

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

At power up, VIN is read off the CAN bus.

◦ **Set Condition:**

The VIN stored in the ABM does not match the VIN read off of the CAN bus.

Possible Causes

ABM MOVED FROM DIFFERENT VEHICLE
ANTI-LOCK BRAKE MODULE (ABM)
WRONG VIN PROGRAMMED INTO VEHICLE

Diagnostic Test

1. CHECK FOR A DTC C2202-ORIGINAL VIN MISMATCH/MISSING

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C2202-ORIGINAL VIN MISMATCH/MISSING?

Yes

- Go To [2](#)

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

2. WRONG VIN PROGRAMMED INTO VEHICLE

Is the correct VIN programmed into the vehicle?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Reprogram the VIN per service information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2204–DYNAMICS SENSOR INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 mph) for the first time, but not if the sensor voltage is out of range.

Or, during diagnostic mode.

Or, if the monitoring was inhibited by a corresponding diagnostics command.

Or, if the vehicle speed has exceeded 20 km/h (12.4 mph) during the actual ignition cycle.

Or, if at least one over spinning wheel is detected.

Or, if one of the control functions is active.

- **Set Condition:**

If the Anti-Lock Brakes Module detects that the Lateral Sensor signal is out of range.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

Diagnostic Test

1. VERIFY DTC IS ACTIVE

- Turn the ignition on.
- With the scan tool, read and record ABS DTCs.
- With the scan tool, read and record Environmental Data (EV Data).
- With the scan tool, erase ABS DTCs.
- Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2205–STEERING ANGLE SENSOR INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With ignition on, but not if supply voltage faults are detected.

◦ **Set Condition:**

If the Anti-Lock Brakes Module detects that the Steering Angle Sensor sends an internal failure message.

Possible Causes
STEERING ANGLE SENSOR

Diagnostic Test

1. CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTCs.
- With the scan tool, read and record Freeze Frame information.
- With the scan tool, erase DTCs.

WARNING: Ensure brake capability is available before road testing.

- Start the vehicle and turn the wheel from lock to lock.
- Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).
- Park the vehicle.
- With the scan tool, read and record DTCs.

Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?

Yes

- Replace the Steering Angle Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Refer to the INTERMITTENT CONDITION diagnostic procedure.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2206–VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module detects the signal from the gateway module relevant for vehicle characteristic is missing or does not match for a period greater than the specified fault duration.

Possible Causes
TIPM / PCM NOT CONFIGURED CORRECTLY
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: This DTC will be active when a new module is installed until initialization is performed.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Perform ECU initialization with drive test on ABM. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. VERIFY THAT THE TIPM/PCM IS CONFIGURED CORRECTLY

Turn the ignition on.

Check the following data to verify the TIPM/PCM is configured correctly. Engine Displacement (PCM), XWD 4x2, 4x4, all Wheel Drive, (TIPM), Axle ratio (TIPM), Vehicle Line (TIPM), Brake type 0= ABS 1=ESP (TIPM).

NOTE: The DTC will be active when a new controller is installed until initialization is performed.

Was the TIPM/PCM configured correctly?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Reprogram the appropriate module.
- Perform ABS or PCM VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0002–CAN C BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Anti-Lock Brake Module detects a corrupt CAN C Bus message.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE

ENGINE CONTROL MODULE (DIESEL ONLY)
TRANSMISSION CONTROL MODULE
STEERING ANGLE SENSOR
AUTOMATIC SWAY BAR SYSTEM MODULE
WIRELESS CONTROL MODULE
OCCUPANT RESTRAINT CONTROLLER MODULE
OCCUPANT CLASSIFICATION MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [2](#)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANTILOCK BRAKE MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [3](#)

No

- Inspect the wiring and connectors for damage or shorted circuits in accordance with the service information. If ok, replace and program the Anti—Lock Brake Module in accordance with the service information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.
 Disconnect the Powertrain Control Module C1 harness connector.
 Turn the ignition on.
 With the scan tool, record and erase TIPM DTCs.
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [4](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.
- Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

4. ENGINE CONTROL MODULE (DIESEL ONLY) — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Engine Control Module harness connectors.
 Turn the ignition on.
 With the scan tool, record and erase TIPM DTCs.
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [5](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Engine Control Module in accordance with the service information.
- Perform the ECM VERIFICATION TEST.

5. TRANSMISSION CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Transmission Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [6](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.
- Perform the TCM VERIFICATION TEST.

6. STEERING ANGLE SENSOR — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [7](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Steering Angle Sensor in accordance with the service information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

7. AUTOMATIC SWAY BAR SYSTEM MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Automatic Sway Bar System Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [8](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Automatic Sway Bar System Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. WIRELESS CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Wireless Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [9](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Wireless Control Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

9. OCCUPANT RESTRAINT CONTROLLER MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Occupant Restraint Controller Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [10](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Restraint Controller Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

10. OCCUPANT CLASSIFICATION MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Occupant Classification Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002–CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [11](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Classification Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the Totally Integrated Power Module C1 harness connector.
 Turn the ignition on.
 Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is there any voltage present?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [12](#)

12. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?**Yes**

- Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [13](#)

**13. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?**Yes**

- Repair the (D65) CAN C Bus (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [14](#)

**14. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?**Yes**

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [15](#)

**15. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT**

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?**Yes**

- Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**U0100–LOST COMMUNICATION WITH ECM/PCM**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- **Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the ECM or PCM for approximately 500 ms.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM POWER AND GROUND
ECM OR PCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No

- Go To [3](#)

3. VERIFY THAT THE ECM OR PCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ECM or PCM is active on the bus.

Is the ECM or PCM active on the bus?

Yes

- Go To [4](#)

No

- Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the ECM or PCM?

Yes

- Replace/update the ECM or PCM in accordance with the service information.
- Perform POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)..

No

- Replace the Anti-Lock Brakes Module in accordance with the service information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0101–LOST COMMUNICATION WITH TCM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
- **Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the TCM for approximately 500 ms.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
TCM POWER AND GROUND
PCM DTCs PRESENT
TCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

NOTE: If present, diagnose and repair DTC U0002–CAN C BUS OFF PERFORMANCE, DTC or DTC U1502–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TIPM before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- Perform the Stored Lost Communication test procedure. Refer to the table of contents in this section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No

- Go To [3](#)

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the Table of Contents located in this section for a no response test procedure.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the TCM?

Yes

- Replace/update the TCM in accordance with the service information.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace the Anti-Lock Brakes Module in accordance with the service information.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0114-LOST COMMUNICATION WITH FINAL DRIVE MODULE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - TIPM is configured correctly
- **Set Condition:**

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED CONTROL MODULE
MODULE THAT SET THIS DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
- Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
- Perform BODY VERIFICATION TEST – VER 1.

No

- Go To [3](#)

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the Table of Contents located in this section for a no response test procedure.
- Perform BODY VERIFICATION TEST – VER 1.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the TIPM?

Yes

- Replace/update the Totally Integrated Power Module in accordance with the service information.
- Perform BODY VERIFICATION TEST – VER 1.

No

- Replace/update the module that set this DTC in accordance with the service information
- Perform BODY VERIFICATION TEST – VER 1.

U0125–LOST COMMUNICATION WITH DYNAMICS SENSOR

01a00036

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

◦ **Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the Dynamics Sensor.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: If present, diagnose and repair DTC C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before proceeding.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

Is there any voltage present?

Yes

- Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (D465) Dynamics Sensor High Data Link circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

Is there any voltage present?

Yes

- Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [8](#)

8. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness

connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0126—LOST COMMUNICATION WITH STEERING ANGLE SENSOR

- Battery voltage between 10 and 16 volts
- IOD fuse installed
- **Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the Steering Angle Sensor for approximately 500 ms.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
STEERING ANGLE SENSOR POWER AND GROUND
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the Steering Angle Sensor is active on the bus.

Is the Steering Angle Sensor active on the bus?

Yes

- Go To [4](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the STEERING ANGLE SENSOR?

Yes

- Replace/update the Steering Angle Sensor in accordance with the service information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

Replace the Anti-Lock Brakes Module in accordance with the service information.

- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - TIPM is configured correctly
- **Set Condition:**

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately 2 to 5 seconds.

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED CONTROL MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes

- Go To [4](#)

No

- (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the TIPM?

Yes

- Replace/update the Front Control Module in accordance with the service information.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0401–IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram **Refer to Section 8W**

◦ **When Monitored:**

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

◦ **Set Condition:**

When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Module.

Possible Causes
ABM CAN BUS DTCS
ENGINE DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTCs.
Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

Yes

- Go To [2](#)

No

- Perform the ABS Intermittent Condition diagnostic procedure in this Section.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) .

Diagnostic Test

2. CHECK IF TIPM CAN BUS DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes

- Refer to the appropriate diagnostic. (Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK IF ENGINE DTCs ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTCs present?

Yes

- Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0429–IMPLAUSIBLE DATA RECEIVED FROM SCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

With ignition on, but not if low voltage is detected.

Or, if a CAN Bus off event is detected.

- **Set Condition:**

If the Anti-Lock Brakes Module detects either the sequence or integrity of the Steering Angle Sensor messages is invalid.

Possible Causes
CAN C BUS CIRCUIT(S) SHORTED
LOAD TOO HIGH ON CAN C BUS
STEERING ANGLE SENSOR DTCs PRESENT
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK IF COMMUNICATION RELATED DTCs ARE PRESENT

Turn the ignition on.
With the scan tool, read ABS DTCs.

Are any Communication related DTCs present?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of symptoms.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [2](#)

2. CHECK IF OTHER STEERING ANGLE SENSOR RELATED DTCs ARE PRESENT

With the scan tool, read ABS DTCs.

Are any other STEERING ANGLE SENSOR DTCs present?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of symptoms.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Steering Angle Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1003–ESP CAN C BUS PERFORMANCE

#10e61cf

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

◦ **Set Condition:**

If the Anti-Lock Brakes Module detects too many CAN Bus off events on the Dynamics Sensor Data Link circuits.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
(D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D52) Dynamics Sensor High Data Link circuit.

Is there any voltage present?

Yes

- Repair the (D52) Dynamics Sensor High Data Link circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor

harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the (D52) Dynamics Sensor High Data Link circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (D52) Dynamics Sensor High Data Link circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.
Measure the voltage of the (D51) Dynamics Sensor Low Data Link circuit.

Is there any voltage present?

Yes

- Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [7](#)

7. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to ground.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [8](#)

8. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness

connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [9](#)

No

- Repair the (D51) Dynamics Sensor Low Data Link circuit for an open.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

9. REPLACE DYNAMICS SENSOR & VERIFY IF DTC IS STILL ACTIVE

Replace the Dynamics Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1104-CAN C BUS CRC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Anti-Lock Brakes Module detects an invalid CAN message from the Dynamics Sensor.

Possible Causes
DYNAMICS SENSOR

Diagnostic Test

1. VERIFY DTC IS ACTIVE

- Turn the ignition on.
With the scan tool, read and record ABS DTCs.
With the scan tool, read and record Environmental Data (EV Data).
With the scan tool, erase ABS DTCs.
Cycle the ignition switch.
With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

U140E–IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Once per ignition cycle, but not during cranking.

Or, if low supply voltage faults are detected.

- **Set Condition:**

If the Anti-Lock Brakes Module either fails to receive vehicle configuration data from the Engine Control Module (ECM) or Powertrain Control Module (PCM) or Totally Integrated Power Module (TIPM) or the configuration data it receives from the ECM or PCM or TIPM is invalid

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM DTCs PRESENT
ECM OR PCM NOT PROGRAMMED OR PROGRAMMED WITH INCORRECT VIN
TIPM NOT PROGRAMMED OR PROGRAMMED WITH INCORRECT INFORMATION
ECM, PCM OR TIPM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: This DTC must be active for the results of this test to be valid. If DTC C2206-VEHICLE CONFIGURATION MISMATCH is present it must be repaired before continuing.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?**Yes**

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?**Yes**

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No

- Go To [3](#)

3. CHECK IF TIPM DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are any DTCs present?**Yes**

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. VERIFY TIPM IS CONFIGURED CORRECTLY

With the scan tool, verify that the TIPM part number and configuration is correct for the vehicle.

Is the correct TIPM installed in the vehicle?**No**

- Replace and program the TIPM in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Yes

- Go To [5](#)

5. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

Are any DTCs present?**Yes**

- Diagnose and repair the DTC(s). Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [6](#)

6. VERIFY CORRECT ECM OR PCM IS INSTALLED IN THE VEHICLE

With the scan tool, verify that the ECM or PCM part number is correct for the vehicle.

Is the correct ECM or PCM installed in the vehicle?**No**

- Replace and program the ECM or PCM in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Yes

- Go To [7](#)

7. VERIFY ECM OR PCM IS PROGRAMMED WITH CORRECT VIN

With the scan tool, verify that the ECM or PCM is programmed with the correct VIN.

Is the ECM or PCM programmed with the correct VIN?**No**

- Using the scan tool, perform PCM Replaced to update the VIN in the PCM.

- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Yes

- Go To [8](#)

8. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the ECM or PCM?

Yes

- Replace/update the ECM or PCM in accordance with the service information.
- Perform POWERTRAIN VERIFICATION TEST. Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1501–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM ECM/PCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously, with ignition on.

- **Set Condition:**

If the Anti-Lock Brakes Module detects bus messages from the Engine Control Module (ECM) or Powertrain Control Module (PCM) are of improper data length.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM DTCs PRESENT

ECM OR PCM

ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No

- Go To [3](#)

3. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

Are any DTCs present?

Yes

- Diagnose and repair the DTC(s). Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the ECM or PCM?

Yes

- Replace/update the ECM or PCM in accordance with the service information.
- Perform POWERTRAIN VERIFICATION TEST. Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1502–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously, with ignition on.

- **Set Condition:**

If the Anti-Lock Brakes Module detects bus messages from the Transmission Control Module (TCM) are of improper data length.

WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
TCM DTCs PRESENT
TCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go To [2](#)

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

- Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No

- Go To [3](#)

3. CHECK IF TCM DTCs ARE PRESENT

With the scan tool, read TCM DTCs.

Are any TCM DTCs present?

Yes

- Diagnose and repair the DTC(s).
- Perform TRANSMISSION VERIFICATION TEST - VER 1.

No

- Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1503–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TIPM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously with the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module detects an incorrect CAN message from the Totally Integrated Power Module (TIPM).

Possible Causes
TIPM CAN BUS DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK IF TIPM CAN BUS DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes

- Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

ABS INTERMITTENT CONDITION

For a complete wiring diagram **Refer to Section 8W.**

Diagnostic Test

1. PERFORM ABS INTERMITTENT CONDITION TEST

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Wiggle the wires while checking for shorts and open circuits.

Perform a voltage drop test on the related circuits between the suspected inoperative component and the Anti-Lock Brake Module.

Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC. If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits. For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation. Use the scan tool to perform a System Test if one applies to failing component. A co-pilot, data recorder, or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes

- Perform the necessary repairs.
- Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No

- Test Complete.

STANDARD PROCEDURE

ABS VERIFICATION TEST

1. ABS VERIFICATION TEST

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

NOTE: If the ABM (Anti-Lock Brake Module), SAS (Steering Angle Sensor), Dynamics Sensor was replaced, it must be initialized using the scan tool. If not initialized, the ABS indicator will flash continuously with no DTCs. To initialize the ABM and clear offsets have wheels pointing straight ahead and follow the directions on the scan tool. The drive test requires a 90° turn. If the Dynamics Sensor was replaced, test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Verify all accessories are turned off and the battery is fully charged.
4. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was indicating the failure.
5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
6. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.

NOTE: For Sensor Signal and Pump Motor faults, the ABM must sense all 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicator.

7. If there are no DTCs present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several anti-lock braking stops.
8. Again, with the scan tool read DTCs . If any DTCs are present, refer to the Table of Contents in the applicable Section for the diagnostic test procedure and troubleshoot the new or recurring symptom.
9. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

Are any DTCs present or is the original concern still present?

Yes

- Repair is not complete, refer to appropriate symptom.

No

- Repair is complete.

BRAKES - ABS - SERVICE INFORMATION

BRAKES - ABS - SERVICE INFORMATION

DESCRIPTION

The ESP system enhances directional control and stability of the vehicle under various driving conditions. ESP corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESP uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESP applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition.

OPERATION

To determine whether the car is responding properly to cornering commands, ESP uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESP operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESP system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

DIAGNOSIS AND TESTING

ANTILOCK BRAKES

The ABS brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The CAB monitors the systems input and output circuits to verify the system is operating correctly. If the on board diagnostic system senses that a circuit is malfunctioning the system will set a trouble code in its memory.

NOTE: An audible noise may be heard during the self-test. This noise should be considered normal.

NOTE: The MDS or DRB III scan tool is used to diagnose the ABS system. For additional information refer to the Antilock Brake section in Group 8W. For test procedures refer to the Chassis Diagnostic Manual.

STANDARD PROCEDURE

BLEEDING ABS BRAKE SYSTEM

ABS system bleeding requires conventional bleeding methods plus use of the DRB scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids. A second base brake bleeding procedure is then required to remove any air remaining in the system.

1. Perform base brake bleeding. Refer to base brake section for procedure.
2. Connect scan tool to the Data Link Connector.
3. Select ANTILOCK BRAKES, followed by MISCELLANEOUS, then ABS BRAKES. Follow the instructions displayed. When scan tool displays TEST COMPLETE, disconnect scan tool and proceed.
4. Perform base brake bleeding a second time. Refer to base brake section for procedure.
5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.

SPECIFICATIONS

TORQUE CHART

TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Hydraulic Control Unit Bracket to HCU Bolts	6.5	—	57
Hydraulic Control Unit Body Bracket Bolts	16-24	—	142-212
HCU to Body Bracket Bolts	9-13	—	80-115
Hydraulic Control Unit Brake Lines	15-18	—	130-160
Antilock Brake Module (ABM) Mounting Bolt	7-9	—	60-80
Front Wheel Speed Sensors Mounting Bolt	4-6	—	34-50
Rear Wheel Speed Sensors Mounting Bolt	12-14	—	106-124

ELECTRICAL

DESCRIPTION

A wheel speed sensor is used at each wheel. The front sensors are mounted to the steering knuckles. The rear

sensors are mounted at the outboard end of the axle. Tone wheels are mounted to the outboard ends of the front and rear axle shafts. The gear type tone wheel serves as the trigger mechanism for each sensor.

OPERATION

The sensors convert wheel speed into a small digital signal. The ABM sends 12 volts to the sensors. The sensor has an internal magneto resistance bridge that alters the voltage and amperage of the signal circuit. This voltage and amperage is changed by magnetic induction when the toothed tone wheel passes the wheel speed sensor. This digital signal is sent to the ABM. The ABM measures the voltage and amperage of the digital signal for each wheel.

SENSOR - FRONT WHEEL SPEED

REMOVAL

1. Raise vehicle and support the vehicle.
2. Remove the disc brake caliper (1) and adapter (2).
3. Remove the disc brake rotor (3).

4. Clean sensor (1) and surrounding area with shop towel before removal.
5. Remove bolt (2) attaching sensor (1) to hub/bearing.

6. Remove the sensor (1) through the hole in the brake shield (2).

7. Remove sensor wire (2) from brake hose (1).
8. Disconnect sensor wire connector at harness plug.

INSTALLATION

1. Install the sensor (1) through the hole in the brake shield (2).

2. Install the sensor (1) in the hub & bearing and tighten sensor attaching bolt (2) to 4-6 N·m (34-50 in. lbs.).

3. Install the disc brake rotor (3).
4. Install the disc brake caliper (1) and adaptor (2).

5. Route the sensor wire (2) and secure to the brake hose (1).
6. Connect sensor wire to harness.
7. Install the tire & wheel assembly.
8. Remove the support and lower the vehicle.

SENSOR - REAR WHEEL SPEED

REMOVAL

1. Raise and support the vehicle.
2. Disconnect the wheel speed sensor electrical connector (1).
3. Remove the wheel speed sensor mounting bolt (2) from the rear support plate.
4. Remove the wheel speed sensor (3).

INSTALLATION

1. Insert the wheel speed sensor (3).
2. Tighten the wheel speed sensor bolt (2) to 12-14 N·m (106-124 in. lbs.).
3. Reconnect the wheel speed sensor electrical connector (1).
4. Lower the vehicle.

SENSOR - DYNAMICS

DESCRIPTION

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (1). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor (1) must be replaced when necessary.

REMOVAL

1. Remove the center console.
2. Disconnect the electrical connector (2) for the sensor (1).
3. Remove the two nuts (3) securing the sensor (1).
4. Remove the sensor (1).

INSTALLATION

1. Install the sensor (1) to the vehicle.
2. Install the two mounting nuts (3).
3. Reconnect the electrical connector (2) to the sensor (1).
4. Install the center console.

SENSOR-STEERING ANGLE

DESCRIPTION

NOTE: Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clockspring.

Under transient cornering conditions the lateral acceleration sensor does not measure the true side to side force on the car. In order to compensate for this the system uses the driver's steering command (Steering angle sensor) and vehicle speed to estimate the true sway force. This signal is matched with the lateral acceleration sensor signal to ensure a significantly-reduced transient side to side force of the vehicle body.

REMOVAL

NOTE: Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clockspring.

1. For removal of the steering angle sensor (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

INSTALLATION

1. For installation of the steering angle sensor (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

SWITCH - ESP

DESCRIPTION

The instrument panel switch pod (1) is located just below the heater and air conditioner controls in the center stack area of the instrument panel. This switch is available in multiple configurations, which varies from two single push button switches to as many as five push button switches, depending upon the optional equipment in the vehicle. The pod may include the following switches:

- **Axle Locker Switch (5)**
- **Electronic Stability Program (ESP) Switch (4)**
- **Front Sway Bar Disconnect Switch (2)**
- **Hazard Warning Switch (3)**
- **Headlamp Leveling Switch (Not Shown)**

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active. Only the hazard warning switch push button latches, while the remaining switches feature momentary operation.

Four screws secure the switch to the back of the instrument panel center bezel through integral mounting tabs that are molded into each corner of the switch housing. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches in the lower instrument panel switch pod cannot be repaired and are not serviced separately. If any component within the switch pod is ineffective or damaged, the entire switch pod unit must be replaced.

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.

2. Remove the center bezel (1) from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Disconnect the wire harness connector from the back of the instrument panel switch pod (2).
4. Remove the four screws (3) that secure the switch pod to the back of the center bezel.
5. Remove the switch pod from the center bezel.

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: There are several different instrument panel switch pods available, depending upon the optional equipment content of the vehicle. Be certain that a replacement switch pod matches the optional equipment of the vehicle into which it is being installed.

1. Position the instrument panel switch pod (2) to the back of the center bezel (1).
2. Install and tighten the four screws (3) that secure the switch pod to the center bezel. Tighten the screws to 2 N·m (17 in. lbs.).
3. Reconnect the wire harness connector to the back of the switch pod.
4. Reinstall the center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
5. Reconnect the battery negative cable.

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

The HCU consists of a valve body, pump motor, low pressure accumulators, inlet valves, outlet valves and noise attenuators.

OPERATION

Accumulators in the valve body store extra fluid released from the calipers during ABS mode operation. The pump is used to clear the accumulator of brake fluid and is operated by a DC type motor. The motor is controlled by the ABM. The valves modulate brake pressure during antilock braking and are controlled by the ABM. The HCU provides individual pressure control to each front and rear brake.

During antilock braking, the solenoid valves are opened and closed as needed. They are cycled rapidly and continuously to modulate pressure and control wheel slip and deceleration. Brake Traction Control and Electronic Stability Program modulate pressure on each wheel individually without any driver brake input.

During normal braking, the HCU solenoid valves and pump are not activated. The master cylinder and power booster operate the same as a vehicle without an ABS brake system. During antilock braking, solenoid valve pressure modulation occurs in three stages; pressure increase, pressure hold, and pressure decrease. The valves are all contained in the valve body portion of the HCU.

PRESSURE DECREASE

The outlet valve is opened and the inlet valve is closed during the pressure decrease cycle.

A pressure decrease cycle is initiated when speed sensor signals indicate high wheel slip at one or more wheels. At this point, the ABM closes the inlet then opens the outlet valve, which also opens the return circuit to the accumulators. Fluid pressure is allowed to bleed off (decrease) as needed to prevent wheel lock.

Once the period of high wheel slip has ended, the ABM closes the outlet valve and begins a pressure increase or hold cycle as needed.

PRESSURE HOLD

Both solenoid valves are closed in the pressure hold cycle but only the inlet valve is energized. Fluid apply pressure in the control channel is maintained at a constant rate. The ABM maintains the hold cycle until sensor inputs indicate a pressure change is necessary.

PRESSURE INCREASE

The inlet valve is open and the outlet valve is closed during the pressure increase cycle. The pressure increase cycle is used to reapply the brakes. This cycle controls re-application of fluid apply pressure.

REMOVAL

1. Remove the master cylinder (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL).
2. Install prop rod on the brake pedal to keep pressure on the

brake system.

3. Remove negative battery cable from the battery.

4. Pull up on the ABM harness connector release (1) and remove connector (2).

5. Remove brake lines (2) from the HCU (4).

6. Remove HCU/ABM mounting nuts and bolt (4) and remove HCU (2) / ABM (3) as an assembly.

INSTALLATION

NOTE: If the ABM is being replaced with a new ABM is

must be reprogrammed with the use of a scan tool.

1. Install HCU/ABM (2&3) on the mounting studs (4).
2. Install mounting nuts and bolt (4). Tighten to 11.5 N·m (102 in. lbs.).

3. Install brake lines (2) to the HCU (4) and tighten to 19 N·m (170 in. lbs.).

4. Install wiring harness connector (2) to the ABM and push down on the release (1) to secure the connector.
5. Install the master cylinder (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION).
6. Install negative battery cable to the battery.
7. Bleed ABS brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6 - CLUTCH

CLUTCH

WARNING

WARNING: DaimlerChrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on manual clutch parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

DIAGNOSIS AND TESTING

CLUTCH

Drive the vehicle at normal speeds. Shift the transmission through all gear ranges and observe clutch action. If the clutch chatters, grabs, slips or does not release properly, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed as the transmission or another driveline component may be at fault.

NOTE: Vehicles equipped with a Dual Mass Flywheel may produce a rattle when the engine is shut off. This noise is considered normal.

CLUTCH CONTAMINATION

Fluid contamination is a frequent cause of clutch malfunctions. Oil, water or clutch fluid on the clutch disc and pressure plate surfaces will cause chatter, slip and grab. Inspect components for oil, hydraulic fluid or water/road splash contamination.

Oil contamination indicates a leak at either the rear main seal or transmission input shaft. Clutch fluid leaks are usually from damaged slave cylinder push rod seals. Heat buildup caused by slippage between the pressure plate, disc and flywheel can bake the oil residue onto the components. The glaze-like residue ranges in color from amber to black.

Road splash contamination is dirt/water entering the clutch housing due to loose bolts, housing cracks. Driving through deep water puddles can force water/road splash into the housing through such openings.

IMPROPER RELEASE OR CLUTCH ENGAGEMENT

Clutch release or engagement problems are caused by wear or damage clutch components. A visual inspection of the release components will usually reveal the problem part.

Release problems can result in hard shifting and noise. Look for leaks at the clutch cylinders and interconnecting line and loose slave cylinder bolts. Also worn/loose release fork, pivot stud, clutch disc, pressure plate or release bearing.

Engagement problems can result in slip, chatter/shudder and noisy operation. The causes may be clutch disc contamination, wear, distortion or flywheel damage. Visually inspect to determine the actual cause of the problem.

CLUTCH MISALIGNMENT

Clutch components must be in proper alignment with the crankshaft and transmission input shaft. Misalignment caused by excessive runout or warpage of any clutch component will cause grab, chatter and improper clutch release.

PRESSURE PLATE AND DISC RUNOUT

Check the clutch disc before installation. Axial (face) runout of a **new** disc should not exceed 0.50 mm (0.020 in.). Measure runout about 6 mm (1/4 in.) from the outer edge of the disc facing. Obtain another disc if runout is excessive.

Check condition of the clutch before installation. A warped cover or diaphragm spring will cause grab and incomplete release or engagement. Be careful when handling the cover and disc. Impact can distort the cover, diaphragm spring, release fingers and the hub of the clutch disc.

Use an alignment tool when positioning the disc on the flywheel. The tool prevents accidental misalignment which could result in cover distortion and disc damage.

A frequent cause of clutch cover distortion (and consequent misalignment) is improper bolt tightening.

FLYWHEEL RUNOUT

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended**. Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the

flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Overtightening can distort the flywheel hub causing runout.

DIAGNOSIS CHART

The diagnosis charts [Diagnosis Chart](#) describe common clutch problems, causes and correction. Conditions, causes and corrective action are outlined in the indicated columns.

Diagnosis Chart

CONDITION	POSSIBLE CAUSES	CORRECTION
Disc facing worn out	1. Normal wear.	1. Replace cover and disc.
	2. Driver frequently rides (slips) the clutch. Results in rapid overheating and wear.	2. Replace cover and disc.
	3. Insufficient clutch cover diaphragm spring tension.	3. Replace cover and disc.
Clutch disc facing contaminated with oil, grease, or clutch fluid.	1. Leak at rear main engine seal or transmission input shaft seal.	1. Replace appropriate seal.
	2. Excessive amount of grease applied to the input shaft splines.	2. Remove grease and apply the correct amount of grease.
	3. Road splash, water entering housing.	3. Replace clutch disc. Clean clutch cover and reuse if in good condition.
	4. Slave cylinder leaking.	4. Replace hydraulic clutch linkage.
Clutch is running partially disengaged.	1. Release bearing sticking or binding and does not return to the normal running position.	1. Verify failure. Replace the release bearing and transmission front bearing retainer as necessary.
Flywheel below minimum thickness specification.	1. Improper flywheel machining. Flywheel has excessive taper or excessive material removal.	1. Replace flywheel.
Clutch disc, cover and/or diaphragm spring warped or distorted.	1. Rough handling. Impact bent cover, spring, or disc.	1. Replace disc or cover as necessary.
	2. Improper bolt tightening procedure.	2. Tighten clutch cover using proper procedure.
Facing on flywheel side of disc torn, gouged, or worn.	1. Flywheel surface scored or nicked.	1. Correct surface condition if possible. Replace flywheel and disc as necessary.

	2. Clutch disc sticking or binding on transmission input shaft.	2. Lubricate splines with high temperature grease.
Clutch disc facing burnt. Flywheel and cover pressure plate surfaces heavily glazed.	1. Frequent operation under high loads or hard acceleration conditions.	1. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause.
	2. Driver frequently rides (slips) clutch. Results in rapid wear and overheating of disc and cover.	2. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause.
	3. Contamination of clutch.	3. Correct fluid leak. Replace clutch cover and disc.
Clutch disc binds on input shaft splines.	1. Clutch disc hub splines damaged during installation.	1. Clean, smooth, and lubricate hub splines if possible. Replace disc if necessary.
	2. Input shaft splines rough, damaged, or corroded.	2. Clean, smooth, and lubricate shaft splines if possible. Replace input shaft if necessary.
Clutch disc rusted to flywheel and/or pressure plate.	1. Clutch not used for and extended period of time (e.g. long term vehicle storage).	1. Sand rusted surfaces with 180 grit sanding paper. Replace clutch cover and flywheel if necessary.
Pilot bearing seized, loose, or rollers are worn.	1. Bearing cocked during installation.	1. Install and lubricate a new bearing.
	2. Bearing defective.	2. Install and lubricate a new bearing.
	3. Bearing not lubricated.	3. Install and lubricate a new bearing.
	4. Clutch misalignment.	4. Inspect clutch and correct as necessary. Install and lubricate a new bearing.
Clutch will not disengage properly.	1. Low clutch fluid level.	1. Replace hydraulic linkage assembly.
	2. Clutch cover loose.	2. Follow proper bolt tightening procedure.
	3. Clutch disc bent or distorted.	3. Replace clutch disc.
	4. Clutch cover diaphragm spring bent or warped.	4. Replace clutch cover.
	5. Clutch disc installed backwards.	5. Remove and install clutch disc correctly.
	6. Release fork bent or fork pivot loose or damaged.	6. Replace fork or pivot as necessary.
	7. Clutch master or slave cylinder failure.	7. Replace hydraulic linkage assembly.
Clutch pedal squeak.	1. Pivot pin loose.	1. Tighten pivot pin if possible. Replace clutch pedal if necessary.
	2. Master cylinder bushing not	2. Lubricate master cylinder bushing.

	lubricated.	
	3. Pedal bushings worn out or cracked.	3. Replace and lubricate bushings.
Clutch master or slave cylinder plunger dragging and/or binding	1. Master or slave cylinder components worn or corroded.	1. Replace clutch hydraulic linkage assembly.
Release bearing is noisy.	1. Release bearing defective or damaged.	1. Replace release bearing.
Contact surface of release bearing damaged.	1. Clutch cover incorrect or release fingers bent or distorted.	1. Replace clutch cover and release bearing.
	2. Release bearing defective or damaged.	2. Replace the release bearing.
	3. Release bearing misaligned.	3. Check and correct runout of clutch components. Check front bearing sleeve for damage/alignment. Repair as necessary.
Partial engagement of clutch disc. One side of disc is worn and the other side is glazed and lightly worn.	1. Clutch pressure plate position incorrect.	1. Replace clutch disc and cover.
	2. Clutch cover, spring, or release fingers bent or distorted.	2. Replace clutch disc and cover.
	3. Clutch disc damaged or distorted.	2. Replace clutch disc.
	4. Clutch misalignment.	4. Check alignment and runout of flywheel, disc, pressure plate, and/or clutch housing. Correct as necessary.

STANDARD PROCEDURE

BLEED CLUTCH HYDRAULIC CIRCUIT

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

BLEED CLUTCH HYDRAULIC CIRCUIT

1. Verify fluid level in brake master cylinder, top off brake fluid as necessary.
2. Open bleeder (1) on slave cylinder (2) and install a length of clear hose to divert fluid into suitable container. Push and hold clutch pedal down then close bleeder. Repeat this step several times.
3. Remove slave cylinder from transmission.
4. Hold slave cylinder with actuator rod pointing down and open bleeder. Push cylinder actuator rod in completely then close bleeder. Repeat this step several times.
5. Remove drain hose and replace dust cap on bleeder and install slave cylinder on transmission.
6. Actuate clutch pedal 25 times, then start engine and verify clutch operation and pedal feel.

If pedal feels spongy or clutch does not fully disengage, air is still trapped in the hydraulic circuit and must be bleed again.

PRESSURE BLEED CLUTCH HYDRAULIC CIRCUIT

Follow manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 15-20 psi is sufficient for bleeding.

Fill bleeder tank with recommended DOT 3 fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system. Use adapter provided with the equipment or Adapter 6921.

NOTE: When pressure bleeding system slave cylinder must be removed and actuator rod pointing downward to remove trapped air.

DISC-CLUTCH

REMOVAL

1. Remove transmission.
2. Mark position of pressure plate (1) on flywheel with paint or a scribe for assembly reference, if clutch is not being replaced.
3. Loosen pressure plate bolts evenly and in rotation to relieve spring tension and avoid warping the plate.
4. Remove pressure plate bolts and pressure plate and disc.

INSTALLATION

GAS ENGINES

1. Lightly scuff sand flywheel face with 180 grit emery cloth, then clean with a wax and grease remover.
2. Lubricate pilot bearing with Mopar high temperature bearing grease or equivalent.
3. Check runout and operation of **new** clutch disc.

NOTE: Disc must slide freely on transmission input shaft splines.

4. With the disc on the input shaft, check face runout with dial indicator. Check runout at disc hub 6 mm (1/4 in.) from outer edge of facing. Obtain another clutch disc if runout exceed 0.5 mm (0.020 in.).
5. Position clutch disc on flywheel with side marked flywheel against the flywheel.

NOTE: If not marked, the flat side of disc hub goes towards the flywheel.

6. Insert clutch alignment tool (3) through the clutch disc and into the pilot bearing.
7. Position clutch pressure plate (2) over disc and on the flywheel (1).
8. Install pressure plate bolts finger tight.

CAUTION: Use only the factory bolts to mount the pressure plate. The bolts must be the correct size. If bolts are too short, there isn't enough thread engagement, if too long bolts interfere with the Dual Mass Flywheel.

9. Tighten pressure plate bolts evenly and in rotation a few threads at a time.

CAUTION: The bolts must be tightened evenly and to specified torque. Failure to follow these instructions will distort the pressure plate.

10. Tighten pressure plate bolts 50 N·m (37 ft. lbs.).
11. Apply light coat of Mopar high temperature bearing grease or equivalent to clutch disc hub and splines of transmission input shaft.

CAUTION: Do not over lubricate shaft splines. This will result in grease contamination of disc.

12. Install transmission.

DIESEL ENGINE

1. Lightly scuff sand flywheel face with 180 grit emery cloth, then clean with a wax and grease remover.
2. Lubricate pilot bearing with Mopar high temperature bearing grease or equivalent.
3. Check runout and operation of **new** clutch disc.

NOTE: Disc must slide freely on transmission input shaft splines.

4. With the disc on the input shaft, check face runout with dial indicator. Check runout at disc hub 6 mm (1/4 in.) from outer edge of facing. Obtain another clutch disc if runout exceed 0.5 mm (0.020 in.).
5. Position clutch disc on flywheel with side marked flywheel side (1) against the flywheel. If not marked, the flat side of disc hub goes towards the flywheel.

6. Insert clutch alignment tool (3) through the clutch disc and into the pilot bearing.

7. Position clutch pressure plate (2) over disc and on the flywheel (1).

8. Install pressure plate bolts (1) finger tight.

9. Tighten pressure plate bolts evenly and in rotation a few threads at a time.

CAUTION: The bolts must be tightened evenly and to specified torque. Failure to follow these instruction will distort the pressure plate.

10. Tighten pressure plate bolts to 54 N·m (40 ft. lbs.).

11. Apply light coat of Mopar® high temperature bearing grease or equivalent to clutch disc hub and splines of transmission input shaft.

CAUTION: Do not over lubricate shaft splines. Failure to follow these instruction will contamination of disc.

12. Install transmission.

BEARING-CLUTCH RELEASE

REMOVAL

1. Remove transmission.

2. Disconnect release bearing (1) from release fork (2) and remove the bearing.

3. Inspect bearing slide surface of transmission front bearing retainer. Replace retainer if slide surface is scored, worn, or cracked.

4. Inspect release fork and fork pivot. Be sure pivot is secure and in good condition. Be sure fork is not distorted or worn.

Replace release fork retainer spring if bent or damaged.

INSTALLATION

1. Lubricate crankshaft pilot bearing with Mopar™ high temperature bearing grease or equivalent. Apply grease to end of long shank, small diameter flat blade screwdriver. Then insert tool through clutch disc hub to reach bearing.
2. Lubricate input shaft splines, bearing retainer slide surface, fork pivot and release fork pivot surface.
3. Install new release bearing (1) and secured to release fork (2).
4. Install transmission.

FLYWHEEL

DESCRIPTION

STANDARD FLYWHEEL

The standard flywheel (3) is a heavy plate bolted to the rear of the crankshaft (1). The flywheel incorporates the ring gear (2) to mesh with the starter. The rear face of the flywheel serves as the driving member to the clutch disc.

DUAL MASS FLYWHEEL

The Dual Mass Flywheel incorporates the ring gear to mesh with the starter. The primary flywheel (6) side is bolted to the crankshaft. The secondary flywheel (3) face serves as the driving member to the clutch disc. Internal springs (4) between the flywheels are used to dampen energy.

OPERATION

The flywheel serves to dampen the engine firing pulses. The heavy weight of the flywheel relative to the rotating mass of the engine components serves to stabilize the flow of power to the remainder of the drivetrain. The crankshaft has the tendency to attempt to speed up and slow down in response to the cylinder firing pulses. The flywheel dampens these impulses by absorbing energy when the crankshaft speeds and releasing the energy back into the system when the crankshaft slows down.

On a Dual Mass Flywheel the additional secondary mass coupled to the transmission lowers the natural frequency of the transmission rotating elements. This decreases the transmission gear rattle. The damper springs between the two flywheel masses replace the clutch disc damper springs and assist in a smooth transfer of torque to the transmission.

CAUTION: The Dual Mass Flywheel is serviced as an assembly only and should never be taken apart. Failure to heed caution may result in damage.

DIAGNOSIS AND TESTING

FLYWHEEL

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended**. Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also

weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Overtightening can distort the flywheel hub causing runout.

REMOVAL

1. Remove transmission.
2. Remove clutch pressure plate and disc.
3. Remove flywheel-to-crankshaft bolts and remove flywheel assembly.

INSTALLATION

1. Clean the surfaces of the flywheel and pressure plate.
2. Install flywheel with **new** bolts and tighten in a criss-cross pattern. On 3.8L engine tighten bolts to 81 N·m (60 ft. lbs.). On 2.8L engine tighten bolts to 95 N·m (70 ft. lbs.).
3. Install clutch disc and pressure plate.
4. Install transmission.

BEARING-PILOT

REMOVAL

1. Remove transmission.
2. Remove pressure plate and clutch disc.
3. Remove pilot bearing with an internal (blind hole) puller.

INSTALLATION

1. Lubricate new bearing with Mopar high temperature bearing grease or equivalent.
2. Start new pilot bearing (1) into crankshaft by hand. Then seat bearing with clutch alignment tool (2).
3. Install clutch disc and pressure plate.
4. Install transmission.

CYLINDER-MASTER

REMOVAL

1. Pry actuator rod off clutch pedal pin.
2. Remove hose (1) from clutch master cylinder and plug hose to prevent fluid loss.
3. Pull hydraulic line (2) clip and remove line from bottom of clutch master cylinder.
4. Disconnect wiring harness (3) from pedal position switch.
5. Turn clutch master cylinder assembly clockwise a quarter turn and remove from brake booster mounting plate.

INSTALLATION

1. Install clutch master cylinder through brake booster mounting plate and turn counter clockwise a quarter turn.
2. Install hose (1) to clutch master cylinder from brake master cylinder reservoir.
3. Install hydraulic line to the bottom of clutch master cylinder.

NOTE: Verify O-ring is on hydraulic line.

4. Connect wiring harness (3) to pedal position switch.
5. Install actuator rod on clutch pedal pin.
6. Bleed clutch hydraulic circuit.

CYLINDER-SLAVE

REMOVAL

1. With transmission in neutral, position vehicle on hoist.
2. Remove mounting nuts (1) from slave cylinder (3).
3. Pull hydraulic line (2) clip and the line with bracket from slave cylinder (3).
4. Remove slave cylinder.

INSTALLATION

1. Install slave cylinder (3) in transmission.
2. Install hydraulic line (2) and with bracket to slave cylinder.

NOTE: Verify O-ring is on hydraulic line.

3. Install slave cylinder nuts (1) and tighten to 23 N·m (17 ft. lbs.).
4. Bleed hydraulic system.

PEDAL-CLUTCH

REMOVAL

1. Remove steering column lower cover and knee blocker for access.
2. Disengage clutch master cylinder actuator to pedal pivot.
3. Remove nuts attaching pedal and bracket to dash panel and upper cowl support.
4. Separate pedal assemble from vehicle.

INSTALLATION

1. Place clutch pedal and bracket over studs on dash panel and cowl support. Install nuts and tighten to 39 N·m (29 ft. lbs.).
2. Engage clutch master cylinder actuator on brake pedal pivot.

SWITCH-CLUTCH PEDAL POSITION

DESCRIPTION

The clutch pedal position switch is attached to the side of the clutch master cylinder.

The clutch pedal position switch override relay is located in the Power Distribution Center (PDC). Refer to PDC cover label for location within PDC.

OPERATION

The clutch pedal position switch is used to prevent starter motor engagement unless the clutch pedal is depressed. An input from this switch is also used to either shut down/prevent operation of the speed control system when the clutch pedal is depressed.

Four Wheel Drive Feature: The clutch pedal position switch override relay, inhibits operation of the position switch when the vehicle transfer case is in the four wheel drive low-range position. This enables the starter motor to operate without depressing the clutch pedal, for off-road applications. If Diagnostic Trouble Codes (DTC's) for the override relay or transfer case switch are stored, override relay will be inhibited.

DIAGNOSIS AND TESTING

CLUTCH PEDAL POSITION SWITCH

START INTERLOCK TEST - DIESEL AND GAS

Ohm meter set on continuity: One lead on switch START INTERLOCK post 2 and second lead on COMMON post 3.

- Pedal Released - No Continuity
- Pedal Depressed End Of Stroke - Continuity

81a1387a

CRUISE TEST - DIESEL ONLY

Ohm meter set on continuity: One lead on switch CRUISE post 1 and second lead on COMMON post 3.

- Pedal Released - Continuity
- Pedal Depressed Beginning Of Stroke - No Continuity

REMOVAL

1. Disconnect wiring harness (1) from pedal position switch (2).

2. Pry pedal position switch (1) off clutch master cylinder.

INSTALLATION

1. Snap pedal position switch (1) on clutch master cylinder.

2. Connect harness (1) to clutch pedal position switch (2).

7 - COOLING

COOLING

DESCRIPTION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment and cooling the automatic transmission fluid. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Charge Air Cooler (Diesel engine)
- 2 Speed Electric Cooling Fan
- Mechanical fan drive (Diesel engine)
- Aluminum-core radiator with plastic side tanks
- Pressurized coolant recovery container (Diesel engine)
- Ambient coolant recovery container (Gas engine)
- Water pump
- Combination A/C condenser/transmission oil cooler (automatic transmission)
- Thermostat
- Hoses and hose clamps

OPERATION

- When engine is cold the thermostat is closed. The cooling system has no flow through the radiator. The coolant flows through the engine, water pump, and heater.
- When engine is warm, the thermostat is full open. The coolant flows through the engine, radiator, heater, and water pump.
- On the diesel engine coolant flows through the engine, radiator, heater, and water pump.
- As coolant expands, some coolant will move to the coolant recovery container. Once the coolant cools, the coolant from the coolant recovery container will move back to the radiator. (Gas engine only)

DIAGNOSIS AND TESTING

ON-BOARD DIAGNOSTICS - OBD

COOLING SYSTEM RELATED DIAGNOSTICS

The Powertrain Control Module (PCM) has been programmed to monitor the following cooling system

components:

- If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.
- If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicate an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician.

ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data, (Refer to 25 - EMISSIONS CONTROL/ON-BOARD DIAGNOSTICS - OPERATION).

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature
- Slight tail wind at idle
- Slow traffic
- Traffic jams
- High speed or steep grades

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed for more air flow is recommended. (Diesel engine only)

TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed

- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to [COOLING SYSTEM DIAGNOSIS CHART](#).

COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat?	1. (Refer to 25 - EMISSIONS CONTROL/ON-BOARD DIAGNOSTICS - OPERATION). Replace thermostat if necessary.
	2. Is the temperature sending unit connected?	2. Check the temperature sensor connector. Repair connector if necessary.
	3. Is the temperature gauge operating OK?	3. Check gauge operation (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Repair as necessary.
	4. Coolant level low in cold ambient temperatures, accompanied with poor heater performance.	4. Check coolant level in the coolant reserve/overflow tank or degas bottle and the radiator. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section of the manual text for WARNINGS and CAUTIONS associated with removing the radiator cap.
	5. Improper operation of internal heater doors or heater controls.	5. Inspect heater and repair as necessary. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING) for procedures.
TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. Refer to Possible Causes (2-18).
	2. Is the temperature gauge reading correctly?	2. Check gauge. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Repair as necessary.
	3. Is the temperature warning illuminating unnecessarily?	3. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING)
	4. Coolant low in coolant reserve/overflow tank and radiator?	4. Check for coolant leaks and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).

5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.	5. Tighten cap
6. Poor seals at the radiator cap.	6. (a) Check condition of cap and cap seals. Refer to Radiator Cap. Replace cap if necessary.
	(b) Check condition of radiator filler neck or degas bottle. If neck is bent or damaged, replace radiator or degas bottle.
7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools	7. (a) Check condition of radiator cap and cap seals. Refer to Radiator Cap in this Group. Replace cap if necessary.
	(b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.
	(c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary.
	(d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.
8. Incorrect coolant concentration	8. Check coolant. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
9. Coolant not flowing through system	9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.
10. Radiator or A/C condenser fins are dirty or clogged.	10. Remove insects and debris. (Refer to 7 - COOLING - STANDARD PROCEDURE).
11. Radiator core is corroded or plugged.	11. Have radiator re-cored or replaced.
12. Dragging brakes	12. Check and correct as necessary. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)
13. Fuel or ignition system problems.	13. Refer to 14 - Fuel System or 8 - Electrical for diagnosis and testing procedures.
14. Bug screen or cardboard is being, reducing airflow.	14. Remove bug screen or cardboard.
15. Thermostat partially or completely shut.	15. Check thermostat operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL) .

	16. Viscous fan drive not operating properly.	16. Check fan drive operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL) .
	17. Cylinder head gasket leaking.	17. Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	18. Heater core leaking.	18. Check heater core for leaks. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING). Repair as necessary.
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES, OR IS ERRATIC	1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.	1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.
	2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.	2. Check operation of gauge and repair if necessary. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).
	3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running)	3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven.
	4. Gauge reading high after re-starting a warmed up (hot) engine.	4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.
	5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).	5. Check and correct coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late.	6. (a) Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
		(b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary.
	7. Water pump impeller loose on shaft.	7. Check water pump and replace as necessary. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).
	8. Loose accessory drive belt. (water pump slipping)	8. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). Check and correct as necessary.
	9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT	1. Pressure relief valve in radiator cap is defective.	1. Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR

TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK		PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap as necessary.	
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).	
DETONATION OR PRE- IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	1. Engine overheating.	1. Check reason for overheating and repair as necessary.	
	2. Freeze point of coolant not correct. Mixture is too rich or too lean.	2. Check coolant concentration. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).	
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	1. (a) Radiator cap relief valve stuck. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace if necessary	
		(b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary.	
		(c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary.	
		(d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.	
NOISY VISCOUS FAN/DRIVE	1. Fan blades loose.	1. Replace fan blade assembly. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).	
	2. Fan blades striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.	
	3. Air obstructions at radiator or air conditioning condenser.	3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser.	
	4. Thermal viscous fan drive has defective bearing.	4. Replace fan drive. Bearing is not serviceable. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).	
	5. A certain amount of fan noise may be evident on models equipped with a thermal viscous fan drive. Some of this noise is normal.	5. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DESCRIPTION) for an explanation of normal fan noise.	
INADEQUATE HEATER PERFORMANCE. THERMOSTAT	1. Has a Diagnostic trouble Code (DTC) been set?	1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).	

FAILED IN OPEN POSITION		
	2. Coolant level low	2. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	3. Obstructions in heater hose/fittings	3. Remove heater hoses at both ends and check for obstructions
	4. Heater hose kinked	4. Locate kinked area and repair as necessary
	5. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation.	5. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL). If a slipping belt is detected, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). If heater core obstruction is detected, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/HEATER CORE - REMOVAL)
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.

LEAK TESTING

ULTRAVIOLET LIGHT METHOD

All Jeep models have a leak detection additive added to the cooling system before they leave the factory. The additive is highly visible under ultraviolet light (black light). If the

factory original coolant has been drained, pour one ounce of additive into the cooling system. The additive is available through the parts department. Place the heater control unit in HEAT position. Start and operate the engine until the radiator upper hose is warm to the touch. Aim the commercially available black light tool at the components to be checked. If leaks are present, the black light will cause the additive to glow a bright green color.

The black light can be used along with a pressure tester to determine if any external leaks exist.

PRESSURE TESTER METHOD

The engine should be at the normal operating temperature. Recheck the system cold if the cause of coolant loss is not located during warm engine examination.

WARNING: Hot, pressurized coolant can cause injury by scalding.

Carefully remove the radiator pressure cap from the filler neck and check the coolant level. Push down on the cap to disengage it from the stop tabs. Wipe the inner part of the filler neck and examine the lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect the reserve/overflow tank tube for internal obstructions. Insert a wire through the tube to be sure it is not obstructed.

Inspect the cams on the outside part of the filler neck. If the cams are bent, seating of pressure cap valve and tester seal will be affected. Replace cap if cams are bent.

Attach pressure tester 7700 (or an equivalent) to the radiator filler neck.

Operate the tester pump to apply 124 kPa (18 psi) pressure to the system. If the hoses enlarge excessively or bulge while testing, replace as necessary. Observe the gauge pointer and determine the condition of the cooling system according to the following criteria:

- **Holds Steady:** If the pointer remains steady for two minutes, there are no serious coolant leaks in the system. However, there could be an internal leak that does not appear with normal system test pressure. Inspect for interior leakage or do the Internal Leakage Test. Do this if it is certain that coolant is being lost and no leaks can be detected.
- **Drops Slowly:** Shows a small leak or seepage is occurring. Examine all connections for seepage or slight

leakage with a flashlight. Inspect the radiator, hoses, gasket edges and heater. Seal any small leak holes with a Sealer Lubricant or equivalent. Repair leak holes and reinspect the system with pressure applied.

- Drops Quickly: Shows that a serious leakage is occurring. Examine the system for serious external leakage. If no leaks are visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

INTERNAL LEAKAGE INSPECTION

Remove the engine oil pan drain plug and drain a small amount of engine oil. Coolant, being heavier than engine oil, will drain first. Another way of testing is to operate the engine and check for water globules on the engine oil dipstick. Also inspect the automatic transmission oil dipstick for water globules. Inspect the automatic transmission fluid cooler for leakage. Operate the engine without the pressure cap on the radiator until thermostat opens.

Attach a pressure tester to the filler neck. If pressure builds up quickly, a leak exists as a result of a faulty cylinder head gasket or crack in the engine. Repair as necessary.

WARNING: Do not allow pressure to exceed 124 kPa (18 psi). Turn the engine off. To release the pressure, rock the tester from side to side. When removing the tester, do not turn the tester more than 1/2 turn if the system is under pressure.

If there is no immediate pressure increase, pump the pressure tester until the indicated pressure is within the system range. Vibration of the gauge pointer indicates compression or combustion leakage into the cooling system.

WARNING: Do not disconnect the spark plug wires while the engine is operating.

CAUTION: Do not operate the engine with a spark plug shorted for more than a minute. The catalytic converter may be damaged.

Isolate the compression leak by shorting each spark plug to the cylinder block. The gauge pointer should stop or decrease vibration when spark plug for leaking cylinder is shorted. This happens because of the absence of combustion pressure.

COMBUSTION LEAKAGE TEST (WITHOUT PRESSURE TESTER)

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

WARNING: Do not remove the cylinder block drain plugs or loosen the radiator draincock with the system hot and under pressure. Serious burns from coolant can occur.

Remove thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).

Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

Add coolant to the radiator to bring the level to within 6.3 mm (1/4 in) of the top of the thermostat housing.

CAUTION: Avoid overheating. Do not operate the engine for an excessive period of time. Open the draincock immediately after the test to eliminate boil over of coolant.

Start the engine and accelerate rapidly three times (to approximately 3000 rpm) while observing the coolant. If internal engine combustion gases are leaking into the cooling system, bubbles will appear in the coolant. If

bubbles do not appear, there is no internal combustion gas leakage.

STANDARD PROCEDURE

CLEANING/REVERSE FLUSHING

CAUTION: The cooling system normally operates at 97 - 110 kPa (14 -16 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

CHEMICAL CLEANING

If visual inspection indicates the formation of sludge or scaly deposits, use a radiator cleaner, Mopar® Radiator Kleen or equivalent, before flushing. This will soften scale and other deposits and aid the flushing operation.

CAUTION: Be sure instructions on the container are followed.

REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator fittings. Attach a section of radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

CAUTION: The cooling system normally operates at 97 - 110 kPa (14 - 16 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Allow the radiator to fill with water. When radiator is filled, apply air in short blasts allowing radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. For more information, refer to operating instructions supplied with flushing equipment. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE). Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump. Attach a lead away hose to the water pump inlet fitting.

CAUTION: Be sure that the heater control valve is closed (heat off). This is done to prevent coolant flow with scale and other deposits from entering the heater core.

Connect the water supply hose and air supply hose to the flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose. For more information, refer to operating instructions supplied

with flushing equipment.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL). Install the thermostat and housing with a replacement gasket (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION). Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture (Refer to 7 - COOLING - STANDARD PROCEDURE).

DRAINING COOLING SYSTEM

WARNING: Do not remove the cylinder block drain plugs or loosen the radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

NOTE: Radiator draincock is located on the right/lower side of radiator facing to front of vehicle.

1. Remove radiator pressure cap from radiator or coolant recovery container as necessary.
2. Raise and support vehicle.
3. Attach one end of a hose to the draincock. Put the other end into a clean container. Open draincock and drain coolant from radiator.
4. If necessary, siphon coolant from coolant recovery container. (Diesel engine)

COOLING - REFILLING

1. Tighten the radiator draincock and the cylinder block drain plug(s).
2. Fill system with an antifreeze mixture (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). Fill the radiator to the top and install the radiator cap. Add sufficient coolant to the reserve/overflow tank to raise the level to the FULL mark.
3. Operate the engine with both the radiator cap and reserve/overflow tank cap in place. After the engine has reached the normal operating temperature, shut the engine off and allow it to cool.
4. Add coolant to the reserve/overflow tank as necessary. **Only add coolant when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.**

COOLANT LEVEL CHECK

NOTE: Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant reserve/overflow tank.

The coolant reserve/overflow system provides a quick visual method for determining coolant level without removing radiator pressure cap. With engine idling and at normal operating temperature, observe coolant level in reserve/overflow tank. The coolant level should be between ADD and FULL marks.

DRAINING - 2.8L DIESEL

WARNING: Do not remove the cylinder block drain plugs or loosen the radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

DO NOT remove the radiator cap when draining the coolant from the reserve/overflow tank. Open the radiator draincock and when the tank is empty, remove the radiator cap. The coolant does not have to be removed from the tank unless the system is being refilled with a fresh mixture.

1. Drain the coolant from the radiator by loosening the draincock.
2. Drain coolant from engine block by removing the block heater plug.

ACCESSORY DRIVE

BELTS-ACCESSORY DRIVE

DIAGNOSIS AND TESTING

VISUAL DIAGNOSIS

When diagnosing serpentine accessory drive belts, small cracks that run across the ribbed surface of the belt from rib to rib (1), are considered normal. These are not a reason to replace the belt. However, cracks running along a rib (not across) (2) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords or severe glazing.

Refer to the [ACCESSORY DRIVE BELT DIAGNOSIS CHART](#) for further belt diagnosis.

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves.	1. Remove foreign objects from pulley grooves. Replace belt.
	2. Installation damage	2. Replace belt
RIB OR BELT WEAR	1. Pulley misaligned	1. Align pulley(s)
	2. Abrasive environment	2. Clean pulley(s). Replace belt if necessary

	3. Rusted pulley(s)	3. Clean rust from pulley(s)
	4. Sharp or jagged pulley groove tips	4. Replace pulley. Inspect belt.
	5. Belt rubber deteriorated	5. Replace belt
BELT SLIPS	1. Belt slipping because of insufficient tension	1. Adjust tension (2.5L)
	2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol)	2. Replace belt and clean pulleys
	3. Driven component bearing failure (seizure)	3. Replace faulty component or bearing
	4. Belt glazed or hardened from heat and excessive slippage	4. Replace belt.
LONGITUDAL BELT CRACKING	1. Belt has mistracked from pulley groove	1. Replace belt
	2. Pulley groove tip has worn away rubber to tensile member	2. Replace belt
"GROOVE JUMPING" (Belt does not maintain correct position on pulley)	1. Belt tension either too low or too high	1. Replace accessory drive belt tensioner (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL)
	2. Pulley(s) not within design tolerance	2. Replace pulley(s)
	3. Foreign object(s) in grooves	3. Remove foreign objects from grooves
	4. Pulley misalignment	4. Align component
	5. Belt cordline is broken	5. Replace belt
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	1. Excessive tension	1. Replace belt and adjust tension to specification
	2. Tensile member damaged during belt installation	2. Replace belt
	3. Severe misalignment	3. Align pulley(s)
	4. Bracket, pulley, or bearing failure	4. Replace defective component and belt
NOISE (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation)	1. Belt slippage	1. Replace accessory drive belt tensioner (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL)
	2. Bearing noise	2. Locate and repair
	3. Belt misalignment	3. Align belt/pulley(s)

	4. Belt to pulley mismatch	4. Install correct belt
	5. Driven component induced vibration	5. Locate defective driven component and repair
	6. System resonant frequency induced vibration	6. Vary belt tension within specifications.
TENSION SHEETING FABRIC FAILURE (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object	1. Correct rubbing condition
	2. Excessive heat causing woven fabric to age	2. Replace belt
	3. Tension sheeting splice has fractured	3. Replace belt
CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body)	1. Excessive tension	1. Replace accessory drive belt tensioner (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL)
	2. Belt contacting stationary object	2. Replace belt
	3. Pulley(s) out of tolerance	3. Replace pulley
	4. Insufficient adhesion between tensile member and rubber matrix	4. Replace belt and adjust tension to specifications

REMOVAL

3.8L

CAUTION: Do not let tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner **clockwise** until it contacts its stop. Remove belt, then slowly rotate the tensioner into the freearm position .

2.8L DIESEL

CAUTION: Do not let tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

1. Disconnect negative battery cable.
2. Using a suitable tool, rotate accessory drive belt tensioner until holes on arm and base are aligned.
3. Insert pin into hole to lock tensioner in place.
4. Remove accessory drive belt.

INSTALLATION

3.8L

1. Check condition of all pulleys.

CAUTION: When installing the accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Route belt around all pulleys except the idler pulley (1). Rotate the tensioner arm **clockwise** until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.

2.8L DIESEL

BELT ROUTING

1 - WITH A/C
2 - WITHOUT A/C

1. Check condition of all pulleys.

CAUTION: When installing the accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install accessory drive belt. Route the belt around all pulleys (1 or 2).

3. Using a suitable tool, hold accessory drive belt tensioner and remove pin.
4. Make sure the belt is seated onto all pulleys.
5. Slowly release tensioner into accessory drive belt.

TENSIONER-ACCESSORY DRIVE BELT

DESCRIPTION

The automatic belt tensioner is a spring loaded arm and pulley assembly. The tensioner assembly is designed to apply constant pressure on the accessory drive belt to maintain proper belt tension.

OPERATION

WARNING: The automatic belt tensioner assembly is spring loaded. Do not attempt to disassemble the tensioner assembly.

The automatic belt tensioner maintains correct belt tension using a coiled spring within the tensioner housing. The spring applies pressure to the tensioner arm pressing the arm into the belt, tensioning the belt.

If a new belt is being installed, the arrow must be within approximately 3 mm (1/8 in.) of indexing mark. Belt is considered new if it has been used 15 minutes or less. If this specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

REMOVAL

3.8L

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove accessory drive belt tensioner mounting bolt (1).
3. Remove accessory drive belt tensioner (2) from engine front cover .

WARNING: Because of high spring tension, do not attempt to disassemble automatic tensioner. Unit is serviced as an assembly.

2.8L DIESEL

1. Disconnect negative battery cable.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Using a suitable tool, hold accessory drive belt tension and remove pin.
4. Slowly release accessory drive belt tensioner to the freearm position.
5. Remove belt tensioner retaining bolt and remove accessory drive belt tensioner.

INSTALLATION

3.8L

81b4a1fe

1. An indexing slot is located on back of tensioner (2). Align this slot to the head of the bolt on the front cover. Install the mounting bolt (1) . Tighten bolt to 41 N·m (30 ft. lbs.).
2. Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

2.8L DIESEL ENGINE

81cddf6c

1. Install belt tensioner and retaining bolt. Torque bolt to 55 N·m (40 ft. lbs.).
2. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

PULLEY-IDLER

REMOVAL

3.8L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
2. Remove bolt (1) and idler pulley (2).

2.8L DIESEL

CAUTION: The retaining bolts on the idler pulleys are left hand thread.

1. Disconnect negative battery cable.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Remove idler pulley retaining bolts and pulley.

INSTALLATION

3.8L ENGINE

81aba736

1. Install idler pulley (1) and pulley bolt (2). Tighten bolt to 61 N·m (45 ft. lbs.) torque.
2. install accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

2.8L DIESEL

81cdeb42

1. Install idler pulley and retaining bolt. Tighten bolts to 53 N·m (39 ft. lbs.)
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Connect negative battery cable.

ENGINE

COOLANT

DESCRIPTION

DESCRIPTION - ENGINE COOLANT

WARNING: Antifreeze is an ethylene glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

ETHYLENE-GLYCOL MIXTURES

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (ethylene-glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain a freeze point of -37°C (-35°F).

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68% antifreeze concentration, which prevents freezing down to -67.7° C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22°C (-8°F).

PROPYLENE-GLYCOL MIXTURES

Its overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32°C (-26°F). 5°C (41°F) higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125°C (257°F) at 96.5 kPa (14 psi), compared to 128°C (263°F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up on a cooling system designed for ethylene-glycol. Propylene-glycol also has poorer heat transfer characteristics than ethylene-glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene-glycol.

HOAT COOLANT

WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5Year 160,000 km (100,000 Mile) Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water-Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 % Ethylene-Glycol-The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 % ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water-Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 %, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 % antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

DIESEL ENGINE

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Glysantin G 30-91 Antifreeze/Coolant, 5 Year/150,000 Mile Formula (ASTM D3306), or the equivalent ethylene glycol based coolant. This coolant offers the best engine cooling without corrosion when mixed with 50% coolant and 50% distilled water to obtain a freeze point of -36°C (-34°F). It is dyed purple to distinguish it's unique chemistry from traditional green and yellow silicate coolants. If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The purple coolant **MUST NOT BE MIXED** with the orange, green or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Glysantin G 30-91 Antifreeze/Coolant, 5 Year/150,000 Mile Formula (ASTM D3306) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure.

OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the

cooling fins in the radiator transfers the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol coolant prevents water present in the cooling system from freezing within temperatures indicated by mixture ratio of coolant to water.

DIAGNOSIS AND TESTING

COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene-glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer, Tool 8286 (Refer to 7 - COOLING - SPECIAL TOOLS) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene-glycol is the most common new coolant. However, propylene-glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.

CONTAINER-COOLANT RECOVERY

DESCRIPTION

GAS ENGINE

The coolant reserve/overflow system consists of a radiator mounted pressurized cap, a plastic coolant recovery bottle, a hose connecting the radiator and recovery bottle, and an overflow tube on the side of the bottle.

The reservoir bottle also has an anti-slosh insert located within the bottle, this insert will aid in reducing coolant loss from splash and spillage.

DIESEL ENGINE

The coolant recovery system consists of a radiator, a plastic coolant recovery container with a pressurized cap, a hose connecting the radiator and the pressurized coolant recovery container, and an overflow tube on the side of the bottle.

OPERATION

GAS ENGINE

The system works along with the radiator pressure cap. This is done by using thermal expansion and contraction of the coolant to keep the coolant free of trapped air. It provides:

- A volume for coolant expansion and contraction.
- A convenient and safe method for checking/adjusting coolant level at atmospheric pressure. This is done without removing the radiator pressure cap.
- Some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant tank and returned to a proper level in the radiator.

REMOVAL

GAS ENGINE

1. Disconnect the hose from radiator filler neck.
2. Remove coolant recovery bottle.

DIESEL ENGINE

1. Remove coolant recovery container pressure cap.
2. Remove and plug coolant recovery tube.
3. Remove mounting nuts.

4. Remove coolant recovery container from vehicle.

INSTALLATION

GAS ENGINE

1. Position the tabs on the overflow bottle into the slots on the fan shroud.
2. Reconnect the overflow hose onto the radiator filler neck.
3. Fill coolant recovery container (Refer to 7 - COOLING - STANDARD PROCEDURE).

DIESEL ENGINE

1. Position coolant recovery container.
2. Install mounting nuts. Tighten to 10 N·m (89 in. lbs.).
3. Install coolant recovery tube.
4. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Install coolant recovery container pressure cap.

HEATER-ENGINE BLOCK

DESCRIPTION

WARNING: Do not operate engine unless block heater cord has been disconnected from power source and secured in place.

An optional engine block heater is available for all models. The heater is equipped with a power cord. The cord

is attached to an engine compartment component with tie-straps. The heater warms the engine providing easier engine starting and faster warm-up in low temperatures. The heater is mounted in a core hole of the engine cylinder block (in place of a freeze plug) with the heating element immersed in engine coolant.

OPERATION

Connecting the power cord to a grounded 110-120 volt AC electrical outlet with a grounded, three-wire extension cord, supplies the electricity required to heat the element thus heating the engine coolant.

REMOVAL

3.8L ENGINE

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Raise vehicle on hoist.
3. Detach power cord plug from heater.
4. Loosen screw in center of heater. Remove heater assembly.

INSTALLATION

3.8L ENGINE

1. Thoroughly clean core hole and heater seat.
2. Insert heater assembly with element loop positioned **upward**.
3. With heater seated, tighten center screw securely to assure a positive seal.

CAUTION: To prevent damage, the power cord must be secured in it's retaining clips, and not positioned so it could contact linkages or exhaust manifold.

4. Connect power cord to heater.
5. Lower vehicle.
6. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

SENSOR-ENGINE COOLANT TEMPERATURE

DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- For engine coolant temperature gauge operation through CCD or PCI (J1850) communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times
- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O2 sensor closed loop times
- Purge solenoid on/off times
- EGR solenoid on/off times (if equipped)
- Leak Detection Pump operation (if equipped)
- Radiator fan relay on/off times (if equipped)
- Target idle speed

REMOVAL

3.8L ENGINE

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

1. Remove air cleaner assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
2. Partially drain the cooling system.
3. Disconnect the electrical connector (2) from the engine coolant sensor (1).
4. Remove the sensor from the intake manifold.

2.8L DIESEL

WARNING: Do not remove or loosen the coolant pressure/vent cap, cylinder block drain plugs, or the draincock when the system is hot and under pressure because serious burns from the coolant can occur.

1. Disconnect negative battery cable.
2. Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Disconnect coolant temperature sensor electrical connector.
4. Remove coolant temperature sensor (3) from cylinder head.

INSTALLATION

3.8L ENGINE

1. Apply sealant to ECT sensor threads (new replacement

- ECT sensors will have sealant already applied).
2. Install ECT sensor (1) into intake manifold. Tighten to 11 N·m (8 ft. lbs.) torque.
 3. Connect electrical connector (2).
 4. Fill cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE).
 5. Install air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

2.8L DIESEL ENGINE

1. Install coolant temperature sensor in thermostat housing.
2. Connect coolant temperature sensor electrical connector .
3. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
4. Connect negative battery cable.

FAN-RADIATOR

DESCRIPTION

The electric cooling fan replaces the engine driven mechanical fan. The electric cooling fan is integral to the fan shroud and is located between the radiator and the engine.

The electric fan is controlled by the electronic control module (ECM).

The electric cooling fan is not serviceable. Any failure of the fan blade, electric motor or fan shroud requires replacement of the fan module.

CAUTION: Do not attempt to service the electric cooling fan or fan blades separately, replace the cooling module as an assembly. Failure to do so may cause severe damage to the electric cooling fan assembly.

REMOVAL

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

2. Remove upper radiator hose (3).
3. Remove hose (2).
4. Remove the coolant recovery container (1) and position out of the way.

5. Disconnect the electrical connector (1).
6. Remove radiator upper seal (2).
7. Remove the mounting screws.
8. Remove the cooling fan assembly .

CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

INSPECTION

WARNING: Do not attempt to bend or straighten fan blades if fan is not within specifications.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

1. Remove fan blade assembly from viscous fan drive unit (four bolts).
2. Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.
3. Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

INSTALLATION

1. Position the cooling fan assembly.
2. Install mounting screws. Tighten to 5.5 N·m (50 in. lbs.)

3. Install upper radiator hose (3)

4. Install upper radiator seal (2).

5. Connect the electrical connector (1).

6. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

THERMOSTAT-ENGINE COOLANT

DESCRIPTION

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

The thermostat on all gas powered engines is located beneath the thermostat housing at the front of the intake manifold.

The thermostat is a wax pellet driven, reverse poppet choke type.

Coolant leakage into the pellet container will cause the thermostat to fail in the open position. Thermostats very rarely stick. Do not attempt to free a thermostat with a prying device.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes longer engine warm-up time, unreliable warm-up performance, increased exhaust emissions and

crankcase condensation that can result in sludge formation.

OPERATION

The wax pellet is located in a sealed container at the spring end of the thermostat. When heated, the pellet expands, overcoming closing spring tension and water pump pressure to force the valve to open.

DIAGNOSIS AND TESTING

ENGINE COOLANT THERMOSTAT

ON-BOARD DIAGNOSTICS

All models are equipped with On-Board Diagnostics for certain cooling system components. If the powertrain control module (PCM) detects low engine coolant temperature, it will record a Diagnostic Trouble Code (DTC). For other DTC numbers, (Refer to 25 - EMISSIONS CONTROL/ON-BOARD DIAGNOSTICS - OPERATION).

REMOVAL

3.8L ENGINE

1. Disconnect negative battery cable.
2. Remove air filter housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

3. Drain cooling system down below the thermostat level. (Refer to 7 - COOLING - STANDARD PROCEDURE)
4. Disconnect throttle body electrical connector (3).
5. Remove radiator upper hose at thermostat housing (2).
6. Remove thermostat housing bolts (1) and thermostat housing (2).

7. Remove thermostat (2) from thermostat housing (1)..
8. Clean both sealing surfaces.

2.8L DIESEL ENGINE

NOTE: The thermostat is not serviced separately. The thermostat and housing must be replaced as an assembly.

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL) .
3. Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
4. Disconnect upper radiator hose and bypass hoses at thermostat housing (2) .
5. Remove thermostat housing retaining bolts, support bracket and housing from cylinder head, discard gasket.

INSTALLATION

3.8L ENGINE

1. Position thermostat (2) in thermostat housing (1).

2. Install thermostat housing and thermostat assembly on intake manifold. Tighten bolts (1) to 28 N·m (250 in. lbs.).
3. Install the radiator upper hose to thermostat housing (2).
4. Connect throttle body electrical connector (3).
5. Refill the cooling system to the proper level. (Refer to 7 - COOLING - STANDARD PROCEDURE)
6. Connect negative battery cable.
7. Install air filter housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

2.8L DIESEL ENGINE

1. Clean old gasket material from cylinder head and thermostat housing.
2. Install thermostat housing with gasket and support bracket to cylinder head. Torque bolts to 28 N·m. (250 in. lbs.).
3. Connect coolant bypass hose and upper radiator hose to thermostat housing.
4. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
6. Connect negative battery cable.

FAN-VISCOUS RADIATOR

DESCRIPTION

CAUTION: Engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word **REVERSE** to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

The thermal viscous fan drive is a silicone-fluid-filled coupling used to connect the fan blades to the water pump shaft. The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds.

OPERATION

A thermostatic bimetallic spring coil is located on the front face of the viscous fan drive unit. This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, the fan will remain at a reduced rpm regardless of engine speed.

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bimetallic coil. It then increases fan speed to provide the necessary additional

engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bimetallic coil again reacts and the fan speed is reduced to the previous disengaged speed.

DIAGNOSIS AND TESTING

VISCOUS FAN DRIVE

NOISE

NOTE: It is normal for fan noise to be louder (roaring) when:

- The under hood temperature is above the engagement point for the viscous drive coupling. This may occur when ambient (outside air temperature) is very high.
- Engine loads and temperatures are high such as when towing a trailer.
- Cool silicone fluid within the fan drive unit is being redistributed back to its normal disengaged (warm) position. This can occur during the first 15 seconds to one minute after engine start-up on a cold engine.

LEAKS

Viscous fan drive operation is not affected by small oil stains near the drive bearing. If leakage appears excessive, replace the fan drive unit.

TESTING

If the fan assembly free-wheels without drag (the fan blades will revolve more than five turns when spun by hand), replace the fan drive. This spin test must be performed when the engine is cool.

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

WARNING: Be sure that there is adequate fan blade clearance before drilling.

1. Drill a 3.18 mm (1/8 in.) diameter hole in the top center of the fan shroud.
2. Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18° - 105°C (-4° - 220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.
3. Connect a tachometer and an engine ignition timing light (timing light is to be used as a strobe light).
4. Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator (or air conditioner condenser). Use tape at the top to secure the plastic and be sure that the air flow is blocked.
5. Be sure that the air conditioner (if equipped) is turned off.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing.

6. Start the engine and operate at 2400 rpm. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 88° C (190° F). Fan drive **engagement** should have started to occur at between 91° - 100° C (197° - 213° F). Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan.
7. When the air temperature reaches 88° C (190° F), remove the plastic sheet. Fan drive **disengagement** should have started to occur at between 80.5° - 89.4° C (177° - 193° F). A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

CAUTION: Engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word REVERSE to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

REMOVAL

DIESEL ENGINE

1. Disconnect negative battery cable from battery.

NOTE: The thermal viscous fan drive/fan blade assembly is attached (threaded) to water pump hub shaft.

2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Remove fan shroud to radiator bolts.
4. Do not unbolt fan blade assembly from viscous fan drive at this time.
5. Remove fan blade/viscous fan drive assembly from water pump using spanner wrench, tool 6958 and adapters (1) 8346, by turning mounting nut counterclockwise as viewed

from front. Threads on viscous fan drive (2) are **RIGHT HAND**.

6. Do not attempt to remove fan/viscous fan drive assembly from vehicle at this time.

7. Remove fan shroud and fan blade/viscous fan drive assembly as a complete unit from vehicle.

8. After removing fan blade/viscous fan drive assembly, **do not** place viscous fan drive in horizontal position. If stored horizontally, silicone fluid in the viscous fan drive could drain into its bearing assembly and contaminate lubricant.

CAUTION: Do not remove water pump pulley-to-water pump bolts . This pulley is under belt tension.

9. Remove four bolts securing fan blade assembly to viscous fan drive .

INSTALLATION

DIESEL ENGINE

1. Assemble fan blade to viscous fan drive. Tighten mounting bolts to 23.7 N·m (210 in. lbs.) torque.

NOTE: The viscous fan and fan shroud must be installed as an assembly.

2. Position fan drive assembly and fan shroud, thread the fan drive assembly onto the water pump pulley. Tighten nut using spanner wrench, tool 6958 and adapters, tool 8346, to 50 N·m (37 ft. lbs.).

3. Install the fan shroud to radiator mounting bolts. Tighten bolts to 9 N·m (80 in·lbs).

4. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS -

INSTALLATION).

RADIATOR

DESCRIPTION

A heavy duty cross-flow aluminum/plastic radiator is used. The radiator consists of an aluminum core and plastic end tanks, which are fastened to the core with clinch tabs and sealed with a high temperature rubber gasket.

Vehicles equipped with automatic transmissions use a combination A/C condenser/transmission oil cooler located on the front of the radiator.

If the plastic tank has been damaged, individual parts are not available, and the radiator must be replaced.

OPERATION

As air passes through the radiator core, the heat within the coolant is dissipated into the ambient air.

DIAGNOSIS AND TESTING - RADIATOR COOLANT FLOW

The following procedure will determine if coolant is flowing through the cooling system.

If engine is cold, idle engine until normal operating temperature is reached. Then feel the upper radiator hose. If hose is hot, the thermostat is open and water is circulating through cooling system.

REMOVAL

CAUTION: When removing the radiator or A/C condenser for any reason, note the location of all radiator-to-body and radiator-to-A/C condenser rubber air seals. These are used at the top, bottom and sides of the radiator and A/C condenser. To prevent overheating, these seals must be installed to their original positions.

1. Disconnect negative battery cable at battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE) drain coolant into a clean container for reuse.
3. Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).

4. Remove radiator upper seal (2).
5. Remove the electric cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Remove lower radiator seal.
7. Remove lower radiator hose.
8. Remove front grill (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
9. Remove two A/C condenser mounting bolts. Lift A/C condenser out of J-clips.
10. Loosen horn mounting bolt. Rotate horn out of the way.
11. Remove A/C tubing mounting bracket bolt.
12. Remove radiator mounting bolts.
13. The lower part of radiator is equipped with two alignment dowel pins. They are located on the bottom of radiator tank and fit into rubber grommets. These rubber grommets are pressed into the radiator lower crossmember.
14. Lift radiator straight up and out of vehicle taking care not to damage radiator fins.
15. When removing radiator, note position of the rubber seals located on the top and bottom of radiator (on certain models only). To prevent possible overheating, these seals must be installed to their original positions.

CLEANING

Clean radiator fins. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

The radiator cooling fins should be checked for damage or deterioration. Inspect cooling fins to make sure they are not bent or crushed, these areas result in reduced heat exchange causing the cooling system to operate at higher temperatures. Inspect the plastic end tanks for cracks, damage or leaks. Inspect the radiator neck for damage or distortion.

INSTALLATION

CAUTION: Before installing the radiator or A/C condenser, be sure the radiator-to-body and radiator-to-A/C condenser rubber air seals are properly fastened to their original positions. These are used at the top, bottom and sides of the radiator and A/C condenser. To prevent overheating, these seals must be installed to their original positions.

1. Guide the two radiator alignment dowels into the rubber grommets located in lower radiator crossmember. Install and tighten mounting bolts to 8 N·m (70 in. lbs.) torque.
 2. Position combination A/C condenser/transmission oil cooler in J-clips and install mounting bolts.
 3. Tighten bolts to 8 N·m (70 in. lbs.).
 4. Position evaporator line tapping block and install mounting bolt. Tighten to 8 N·m (70 in. lbs.).
 5. Position horn and tighten mounting bolt to 8 N·m (70 in. lbs.).
 6. Install the electric cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
 7. Position and install the lower radiator seal.
 8. Install upper radiator seal.
-
9. Install front grill (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
 10. Connect radiator hoses and install hose clamps.
 11. Install coolant recovery container.
 12. Fill cooling system with correct coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
 13. Connect battery negative cable.
 14. Start engine and check for leaks.

CAP-RADIATOR PRESSURE

DESCRIPTION

All radiators are equipped with a pressure cap. This cap releases pressure at some point within a range of 124-145 kPa (18-21 psi). The pressure relief point (in pounds) is engraved on top of the cap

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve. This valve opens when system pressure reaches the release range of 124-145 kPa (18-21 psi).

A rubber gasket seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

OPERATION

A vent valve in the center of the cap will remain shut as long as the cooling system is pressurized. As the coolant cools, it contracts and creates a vacuum in cooling system. This causes the vacuum valve to open and coolant in reserve/overflow tank to be drawn through connecting hose into radiator. If the vacuum valve is stuck shut, or overflow hose is kinked, radiator hoses will collapse on cool-down.

DIAGNOSIS AND TESTING

RADIATOR CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool 7700 (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 69-124 kPa (10-18 psi) and hold pressure at a minimum of 55 kPa (8 psi).

WARNING: The warning words - **DO NOT OPEN HOT** - on radiator pressure cap, are a safety precaution, when hot, pressure builds up in cooling system. To prevent scalding or injury, radiator cap should not be removed while system is hot and/or under pressure.

Do not remove radiator cap at any time **except** for the following purposes:

1. Check and adjust antifreeze freeze point.
2. Refill system with new antifreeze.
3. Conducting service procedures.
4. Checking for vacuum leaks.

WARNING: If vehicle has been run recently, wait at least 15 minutes before removing radiator cap. With a rag, squeeze radiator upper hose to check if system is under pressure. Place a rag over cap and without pushing cap down, rotate it counter-clockwise to first stop. Allow fluid to escape through the coolant reserve/overflow hose into reserve/overflow tank. Squeeze radiator upper hose to determine when pressure has been released. When coolant and steam stop being pushed into tank and system pressure drops, remove radiator cap completely.

DIAGNOSIS AND TESTING - RADIATOR CAP

Remove cap from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap on pressure tester 7700 or an equivalent.

Operate tester pump to bring pressure to 117 kPa (17 psi) on gauge. If pressure cap fails to hold pressure of at least 110 kPa (16 psi) replace cap. Refer to the following **CAUTION**.

The pressure cap may test properly while positioned on tool 7700 (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

CLEANING

Use only a mild soap and water to clean the radiator cap. Using any type solvent may cause damage to the seal in the radiator cap.

INSPECTION

Hold cap at eye level, right side up. The vent valve at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

PUMP-WATER

DESCRIPTION

3.8L ENGINE

The water pump has a die-cast aluminum body and a plastic impeller. It bolts directly to the timing chain case cover, using a rubber seal for sealing. It is driven by the accessory drive belt.

2.8L DIESEL ENGINE

The water pump on the 2.8L diesel has a die cast aluminum housing. It bolts to an aluminum housing which attaches to the engine block.

OPERATION

2.8L DIESEL ENGINE

The water pump is used to circulate coolant through the cooling system. The coolant is pumped through the engine block, cylinder head, heater core, EGR cooler, viscous heater, and radiator.

REMOVAL

3.8L ENGINE

1. Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
2. Remove the accessory drive belt shield.
3. Remove the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
4. Remove water pump pulley bolts.

NOTE: To remove the water pump pulley, it MUST first be positioned between water pump housing and drive hub. The pulley can then be removed with the water pump assembly.

5. Rotate pulley until openings in pulley align with water pump drive hub spokes. Move pulley inward between pump housing and hub.

6. Position pulley to allow access to water pump mounting bolts. Remove water pump mounting bolts.
7. Remove water pump with the pulley loosely positioned between hub and the pump body.
8. Remove and discard the seal.
9. Clean seal groove and sealing surfaces on pump and timing chain case cover. Take care not to scratch or gouge sealing surfaces.

2.8L DIESEL ENGINE

1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove timing belt inner and outer covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
4. Remove water pump retaining bolts and pump (4).

CLEANING

Clean the gasket mating surface. Use caution not to damage the gasket sealing surface.

INSPECTION

Inspect the water pump assembly for cracks in the housing, Water leaks from shaft seal, loose or rough turning bearing or impeller rubbing either the pump body or timing chain case/cover.

INSTALLATION

3.8L ENGINE

1. Install new seal into water pump housing groove.

NOTE: The water pump pulley MUST be positioned loosely between the pump housing and drive hub BEFORE water pump installation.

2. Position the water pump pulley loosely between pump

housing and drive hub.

3. Install water pump and pulley to the timing chain case cover. Tighten water pump bolts to 12 N·m (105 in. lbs.).

4. Position pulley on water pump hub. Install bolts and tighten to 28 N·m (250 in. lbs.).

5. Rotate pump by hand to check for freedom of movement.

6. Install the accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

7. Install drive belt shield.

8. Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

2.8L DIESEL ENGINE

1. Clean mating surfaces of water pump housing and engine block as necessary.

2. Place new O-ring in groove in water pump housing. Install water pump and retaining bolts. Torque bolts to 24 N·m (212 in. lbs.).

3. Install both inner and outer timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

4. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

5. Connect negative battery cable.

COOLER-EGR

REMOVAL

1. Drain coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

2. Remove coolant hoses.

3. Remove five mounting bolts.

4. Remove EGR cooler.

INSTALLATION

1. Position new gasket and EGR Cooler.
2. Install five mounting bolts. Tighten bolts to 10 N·m (89 in lbs.).

3. Install cooler hoses.
4. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

RELAY-RADIATOR FAN

DESCRIPTION

The electric cooling fan HI and LOW relays are located in the Power Distribution Center (PDC) in the engine compartment. See the fuse and relay layout label affixed to

the inside surface of the PDC cover for cooling fan relay identification and location.

The HI and LOW cooling fan relays cannot be adjusted or repaired. If the HI or LOW relay is damaged or faulty, it must be replaced.

HOSES-COOLING SYSTEM-2.8L DIESEL

REMOVAL

HEATER HOSES - 2.8L DIESEL

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE)
2. Remove engine cover from engine (Refer to 9 - ENGINE COVER - REMOVAL) .
3. Disconnect heater core supply line at heater core and viscous heater. Remove hose from vehicle.
4. Disconnect heater core return line (5) from heater core and EGR cooler. Remove hose from vehicle.

INSTALLATION

HEATER HOSES - 2.8L DIESEL

80cd9f38

1. Connect heater core supply hose to heater core and viscous heater. Position hose clamps into proper position.
2. Connect heater core return hose to heater core and EGR cooler. Position hose clamps into proper position.
3. Install engine cover to engine (Refer to 9 - ENGINE COVER - INSTALLATION) .
4. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

TRANSMISSION

COOLER-TRANSMISSION

DESCRIPTION

The automatic transmission oil cooler is located in the front of the radiator and behind the front grill and is combined with the A/C condenser. The transmission oil cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The Transmission oil cooler/A/C condenser assembly is equipped with quick connect fitting for the transmission oil cooler lines and a tapping block for the evaporator condenser.

The Transmission oil cooler/A/C condenser assembly.

80cd9f38

OPERATION

Transmission oil is routed through the cooler where heat is removed from the transmission oil before returning to the transmission.

REMOVAL

1. Remove electric cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
2. Position cooling fan out of the way.
3. Remove the transmission cooler line retaining block nut.
4. Remove transmission cooler lines from transmission lines.
5. Using Release Tool 8875A, disconnect transmission cooler tube from the transmission.
6. Remove the transmission cooler mounting bolts.
7. Remove transmission cooler from vehicle.

INSTALLATION

1. Position transmission cooler in vehicle.
2. Install transmission mounting bolts. Tighten to 14 N·m (123 in. lbs.)
3. Install transmission cooler lines into transmission.
4. Install locking plate and nut. Tighten nut to 22.5 N·m (200 in. lbs.)
5. Install electric cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

LINES-TRANSMISSION COOLER

STANDARD PROCEDURE

QUICK CONNECT FITTING DISASSEMBLY/ASSEMBLY

DISCONNECT

1. Remove dust cap by pulling it straight back off of quick connect fitting (1).
2. Place Release Tool 8875A (4) onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide Release Tool 8875A down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the release tool 60° to expand the retaining clip.

5. While holding the release tool against the quick connect fitting, pull back on the transmission cooler line to remove.
6. If quick connect fitting is damaged or leaking at transmission oil cooler or transmission, remove fitting.

81019138

CONNECT

1. If removed, install quick connect fitting into transmission oil cooler or transmission. Tighten fitting to 15 N·m (132 in. lbs.).
2. Align transmission cooler line (3) with quick connect fitting while pushing straight into the fitting.
3. Push in on transmission cooler line until a “click” is heard or felt .
4. Slide dust cap (4) down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: If dust cap will not snap into place, repeat assembly step #2.

8A - AUDIO/VIDEO

AUDIO/VIDEO SYSTEMS - ELECTRICAL DIAGNOSTICS

AUDIO/VIDEO SYSTEMS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

8180215

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.

- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND
(X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Left Audio Speaker harness connector.

Measure the resistance between ground and the (X201) Left Front Speakers (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X201) Left Front Speakers (+) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (X291) Left Front Speakers (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X291) Left Front Speakers (-) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. SPEAKER

Connect the Radio harness connector.

With the Front Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Replace the Front Left Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

819c0219

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE
(X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.

Does the scan tool display active: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Radio harness connector.
Disconnect the Left Front Audio Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X201) Left Front Speakers (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X201) Left Front Speakers (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE

Measure for voltage on the (X291) Left Front Speakers (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X291) Left Front Speakers (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Radio in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

8180215

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT OPEN
(X291) LEFT FRONT SPEAKERS (-) CIRCUIT OPEN
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X201) LEFT FRONT SPEAKERS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Left Audio Speaker harness connector.

Measure the resistance of the (X201) Left Front Speakers (+)

circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [3](#)

No

- Repair the (X201) Left Front Speakers (+) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT OPEN

Measure the resistance of the (X291) Left Front Speakers (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [4](#)

No

- Repair the (X291) Left Front Speakers (-) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. SPEAKER

Connect the Radio harness connector.

With the Front Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Replace the Front Left Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

919c057c

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes
(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND
(X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Radio harness connector.
 Disconnect the Front Right Audio Speaker harness connector.
 Measure the resistance between ground and the (X202) Right Front Speakers (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X202) Right Front Speakers (+) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (X292) Right Front Speakers (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X292) Right Front Speakers (-) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. SPEAKER

Connect the Radio harness connector.

With the Front Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Replace the Front Right Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

919c057c

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE
(X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.

Does the scan tool display active: B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Radio harness connector.
Disconnect the Right Front Audio Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X202) Right Front Speakers (+)

circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X202) Right Front Speakers (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

819c073b

3. (X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE

Measure for voltage on the (X292) Right Front Speakers (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X292) Right Front Speakers (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Radio in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

819c0746

819c057c

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT OPEN
(X292) RIGHT FRONT SPEAKERS (-) CIRCUIT OPEN
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X202) RIGHT FRONT SPEAKERS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Right Audio Speaker harness connector.

Measure the resistance of the (X202) Right Front Speakers (+) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [3](#)

No

- Repair the (X202) Right Front Speakers (+) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (X292) RIGHT FRONT SPEAKERS (-) CIRCUIT OPEN

Measure the resistance of the (X292) Right Front Speakers (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [4](#)

No

- Repair the (X292) Right Front Speakers (-) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. SPEAKER

Connect the Radio harness connector.

With the Front Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Replace the Front Right Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

019c00a

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes
(X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Rear Left Audio Speaker harness connector. Measure the resistance between ground and the (X205) Left Rear Speaker (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X205) Left Rear Speaker (+) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (X295) Left Rear Speaker (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X295) Left Rear Speaker (-) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. SPEAKER

Connect the Radio harness connector.

With the Rear Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Replace the Rear Left Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

019c00a

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO VOLTAGE
(X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.

Does the scan tool display active: B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Radio harness connector.
Disconnect the Left Rear Audio Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X205) Left Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X205) Left Rear Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO VOLTAGE

Measure for voltage on the (X295) Left Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X295) Left Rear Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Radio in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC
CONTROL MODULES - STANDARD
PROCEDURE)

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

01Sc000b

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
(X205) LEFT REAR SPEAKER (+) CIRCUIT OPEN
(X295) LEFT REAR SPEAKER (-) CIRCUIT OPEN
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X205) LEFT REAR SPEAKER (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Rear Left Audio Speaker harness connector.

Measure the resistance of the (X205) Left Rear Speaker (+)

circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [3](#)

No

- Repair the (X205) Left Rear Speaker (+) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (X295) LEFT REAR SPEAKER (-) CIRCUIT OPEN

Measure the resistance of the (X295) Left Rear Speaker (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [4](#)

No

- Repair the (X295) Left Rear Speaker (-) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. SPEAKER

Connect the Radio harness connector.

With the Rear Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Replace the Rear Left Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

019c0004

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes
(X206) RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X296) RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X206) RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Rear Right Audio Speaker harness connector.

Measure the resistance between ground and the (X206) Right Rear Speaker (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X206) Right Rear Speaker (+) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (X296) RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (X296) Right Rear Speaker (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X296) Right Rear Speaker (-) circuit for a short to ground condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. SPEAKER

Connect the Radio harness connector.

With the Rear Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Replace the Rear Right Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

019c0004

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(X206) RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO VOLTAGE
(X296) RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.

Does the scan tool display active: B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X206) RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Radio harness connector.
Disconnect the Right Rear Audio Speaker harness connector.

Turn the ignition on.
Measure for voltage on the (X206) Right Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X206) Right Rear Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (X296) RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO VOLTAGE

Measure for voltage on the (X296) Right Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X296) Right Rear Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Radio in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC
CONTROL MODULES - STANDARD
PROCEDURE)

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

019c000d

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the radio on.

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
(X206) RIGHT REAR SPEAKER (+) CIRCUIT OPEN
(X296) RIGHT REAR SPEAKER (-) CIRCUIT OPEN
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (X206) RIGHT REAR SPEAKER (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Rear Right Audio Speaker harness connector.

Measure the resistance of the (X206) Right Rear Speaker (+) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [3](#)

No

- Repair the (X206) Right Rear Speaker (+) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (X296) RIGHT REAR SPEAKER (-) CIRCUIT OPEN

Measure the resistance of the (X296) Right Rear Speaker (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

- Go To [4](#)

No

- Repair the (X296) Right Rear Speaker (-) circuit for an open condition.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. SPEAKER

Connect the Radio harness connector.

With the Rear Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Replace the Rear Right Audio Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Continuously with the ignition on and the radio CD player turned on.
- **Set Condition:**
- The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

Possible Causes
CD READ FAILURE

Diagnostic Test

1. RADIO

Replace the problem CD with a good, clean, unscratched, music CD.

Turn the radio CD player on.

With the scan tool, read DTC's.

Does the scan tool display: B1421 AUDIO CD READ ERROR/INOPERABLE DISC?

Yes

- Eject the inoperative CD and replace the CD in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on and the Satellite Radio in seek mode.
- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna connection or does not receive a radio satellite signal.

Possible Causes
BAD ANTENNA CONNECTION

SATELLITE RADIO RECEIVER

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.
Disconnect the Satellite Radio Antenna connector.
Inspect the Satellite Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes

- Go To [2](#)

No

- Repair the Antenna connection as needed.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. SATELLITE RADIO ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes

- Go To [3](#)

No

- Repair or replace the Antenna assembly as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. SATELLITE RADIO RECEIVER

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft (9.144m) from any structure.

Turn the ignition and radio on.
With the scan tool, erase the audio DTC's, put the satellite radio in seek up and down mode for 2 loops around the band cycle before proceeding.
With the scan tool, read the audio DTC's.

Did this DTC reset?

Yes

- Replace the Satellite Radio Receiver in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

- Replace the amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW

810c0e17

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X201) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X291) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (X201) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Left I/P Speaker harness connector.

Measure the resistance between ground and the (X201) Amplified Left Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X201) Amplified Left Front I/P Speaker (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X291) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X291) Amplified Left Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X291) Amplified Left Front I/P Speaker (-) for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT I/P SPEAKER

Reconnect and reinstall the Left Front I/P Speaker. Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

- Replace the Left Front I/P Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Amplifier in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

810c0e17

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK FOR VOLTAGE ON THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Amplified Left I/P Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X201) Amplified Left I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X201) Amplified Left I/P Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK FOR VOLTAGE ON THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT

Measure for voltage on the (X291) Amplified Left I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X291) Amplified Left I/P Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.

- o Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.
- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT OPEN
(X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT OPEN
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER

Turn the ignition off.

Disconnect the Left I/P Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker circuits in the Amplified Left I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Amplified Left I/P Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.
 Disconnect the Amplifier C2 harness connector.
 Measure the resistance of the (X201) Amplified Left I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (X201) Amplified Left I/P Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (X291) amplified Left I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the Amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1.

810c0e17

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT
AMPLIFIED LEFT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER

Turn the ignition off.

Disconnect the Amplified Left I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

- Replace the Amplified Left I/P Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT, AND THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Disconnect the Amplifier C2 harness connector.
Measure the resistance between the (X201) Amplified Left I/P Speaker (+) circuit, and the (X291) Amplified Left I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X201) Amplified Left I/P Speaker (+) circuit, and the (X291) Amplified Left I/P Speaker (-) circuit for a short together.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read amplifier DTCs.

Does the scan tool display active: B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

- Replace the amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW

**AMPLIFIER-
RADIO C2**

**SPEAKER-
INSTRUMENT
PANEL-
RIGHT**

010c13a5

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X292) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (X202) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Right Front I/P Speaker harness connector.

Measure the resistance between ground and the (X202) Amplified Right Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X202) Amplified Right Front I/P Speaker (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X292) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X292) Amplified Right Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X292) Amplified Right Front I/P Speaker (-) for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT I/P SPEAKER

Reconnect and reinstall the Right Front I/P Speaker. Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

- Replace the Right Front I/P Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

019c13a5

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK FOR VOLTAGE ON THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Amplified Right I/P Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X202) Amplified Right I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X202) Amplified Right I/P Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK FOR VOLTAGE ON THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT

Measure for voltage on the (X292) Amplified Right I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X292) Amplified Right I/P Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

919c13a9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT OPEN
(X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT OPEN
RIGHT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE RIGHT FRONT I/P SPEAKER

Turn the ignition off.

Disconnect the Right I/P Speaker harness connector.
 Turn the ignition on.
 Turn the radio on and turn the volume to mid level.
 With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right I/P Speaker circuits in the Amplified Right I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Amplified Right I/P Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.
 Disconnect the Amplifier C2 harness connector.
 Measure the resistance of the (X202) Amplified Right I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (X202) Amplified Right I/P Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (X292) Amplified Right I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (X292) Amplified Right I/P Speaker (-) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

019c13a5

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT I/P SPEAKER

Turn the ignition off.

Disconnect the Amplified Right I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

- Replace the Amplified Right I/P Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT, AND THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Disconnect the Amplifier C2 harness connector.
Measure the resistance between the (X202) Amplified Right I/P Speaker (+) circuit, and the (X292) Amplified Right I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X202) Amplified Right I/P Speaker (+) circuit, and the (X292) Amplified Right I/P Speaker (-) circuit for a short together.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

819c16fd

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

- Replace the amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW

819c18af

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Amplifier C1 harness connector.
Disconnect the Left Front Speaker harness connector.

Measure the resistance between ground and the (X209) Amplified Left Front Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X209) Amplified Left Front Speaker (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X299) Amplified Left Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X299) Amplified Left Front Speaker (-) for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

Reconnect and reinstall the Left Front Speaker.
Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.

Is the resistance below 10K ohms?

Yes

- Replace the Left Front Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

819c18af

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK FOR VOLTAGE ON THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C1 harness connector.
Disconnect the Amplified Left Front Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X209) Amplified Left Front Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X209) Amplified Left Front Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK FOR VOLTAGE ON THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT

Measure for voltage on the (X299) Amplified Left Front Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X299) Amplified Left Front Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

819c18a1

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT OPEN
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT OPEN
AMPLIFIED LEFT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Left Front Speaker harness connector.
 Turn the ignition on.
 Turn the radio on and turn the volume to mid level.
 With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Front Speaker circuits in the Amplified Left Front Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Amplified Left Front Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.
 Disconnect the Amplifier C1 harness connector.
 Measure the resistance of the (X209) Amplified Left Front Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (X209) Amplified Left Front Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (X299) Amplified Left Front Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (X299) Amplified Left Front Speaker (-) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

819c18af

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORTED TO THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT
AMPLIFIED LEFT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Left Front Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

- Replace the Amplified Left Front Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT, AND THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Disconnect the Amplifier C1 harness connector.
Measure the resistance between the (X209) Amplified Left Front Speaker (+) circuit, and the (X299) Amplified Left Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X209) Amplified Left Front Speaker (+) circuit, and the (X299) Amplified Left Front Speaker (-) circuit for a short together.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read amplifier DTCs.

Does the scan tool display active: B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

- Replace the amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW

819c2659

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Amplifier C1 harness connector.
Disconnect the Right Front Speaker harness connector.

Measure the resistance between ground and the (X208) Amplified Right Front Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X208) Amplified Right Front Speaker (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X298) Amplified Right Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X298) Amplified Right Front Speaker (-) for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Reconnect and reinstall the Right Front Speaker.
Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.

Is the resistance below 10K ohms?

Yes

- Replace the Right Front Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

819c2659

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK FOR VOLTAGE ON THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C1 harness connector.
Disconnect the Amplified Right Front Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X208) Amplified Right Front Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X208) Amplified Right Front Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK FOR VOLTAGE ON THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT

Measure for voltage on the (X298) Amplified Right Front Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X298) Amplified Right Front Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

019c2659

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT OPEN
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT OPEN
AMPLIFIED RIGHT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Right Front Speaker harness connector.
 Turn the ignition on.
 Turn the radio on and turn the volume to mid level.
 With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Front Speaker circuits in the Amplified Right Front Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Amplified Right Front Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.
 Disconnect the Amplifier C1 harness connector.
 Measure the resistance of the (X208) Amplified Right Front Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (X208) Amplified Right Front Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (X298) Amplified Right Front Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (X298) Amplified Right Front Speaker (-) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

819c2659

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORTED TO THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Right Front Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

- Replace the Amplified Right Front Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT, AND THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Disconnect the Amplifier C1 harness connector.
Measure the resistance between the (X208) Amplified Right Front Speaker (+) circuit, and the (X298) Amplified Right Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X208) Amplified Right Front Speaker (+) circuit, and the (X298) Amplified Right Front Speaker (-) circuit for a short together.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

- Replace the amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW

019c2b73

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Left Rear Speaker harness connector.

Measure the resistance between ground and the (X205) Amplified Left Rear Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X205) Amplified Left Rear Speaker (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X295) Amplified Left Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X295) Amplified Left Rear Speaker (-) for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

Reconnect and reinstall the Left Rear Speaker. Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

- Replace the Left Rear Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

019c2b73

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK FOR VOLTAGE ON THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Amplified Left Rear Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X205) Amplified Left Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X205) Amplified Left Rear Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK FOR VOLTAGE ON THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT

Measure for voltage on the (X295) Amplified Left Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X295) Amplified Left Rear Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.

- Perform the BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC
CONTROL MODULES - STANDARD
PROCEDURE)

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

019c2b73

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT OPEN
(X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT OPEN
LEFT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

Turn the ignition off.

Disconnect the Left Rear Speaker harness connector.
 Turn the ignition on.
 Turn the radio on and turn the volume to mid level.
 With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Speaker circuits in the Amplified Left Rear Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Amplified Left Rear Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.
 Disconnect the Amplifier C2 harness connector.
 Measure the resistance of the (X205) Amplified Left Rear Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (X205) Amplified Left Rear Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (X295) Amplified Left Rear Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (X295) Amplified Left Rear Speaker (-) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

819c2df0

019c2b73

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT
AMPLIFIED LEFT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

Turn the ignition off.

Disconnect the Amplified Left Rear Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

- Replace the Amplified Left Rear Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT, AND THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Disconnect the Amplifier C2 harness connector.
Measure the resistance between the (X205) Amplified Left Rear Speaker (+) circuit, and the (X295) Amplified Left Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X205) Amplified Left Rear Speaker (+) circuit, and the (X295) Amplified Left Rear Speaker (-) circuit for a short together.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

819c2e06

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

- Replace the amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW

819c306d

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Right Rear Speaker harness connector.

Measure the resistance between ground and the (X206) Amplified Right Rear Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X206) Amplified Right Rear Speaker (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X296) Amplified Right Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X296) Amplified Right Rear Speaker (-) for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK OPERATION OF THE AMPLIFIED RIGHT REAR SPEAKER

Reconnect and reinstall the Right Rear Speaker.
Measure the resistance of the speaker circuit between the
Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

- Replace the Right Rear Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

819c306d

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK FOR VOLTAGE ON THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Amplified Right Rear Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X206) Amplified Right Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X206) Amplified Right Rear Speaker (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK FOR VOLTAGE ON THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT

Measure for voltage on the (X296) Amplified Right Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (X296) Amplified Right Rear Speaker (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service

information.

- Perform the BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC
CONTROL MODULES - STANDARD
PROCEDURE)

B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

819c306

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT OPEN
(X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT OPEN
RIGHT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE RIGHT REAR SPEAKER

Turn the ignition off.

Disconnect the Right Rear Speaker harness connector.
 Turn the ignition on.
 Turn the radio on and turn the volume to mid level.
 With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Rear Speaker circuits in the Amplified Right Rear Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

- Replace the Amplified Right Rear Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.
 Disconnect the Amplifier C2 harness connector.
 Measure the resistance of the (X206) Amplified Right Rear Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (X206) Amplified Right Rear Speaker (+) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (X296) Amplified Right Rear Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (X296) Amplified Right Rear Speaker (-) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

819c306

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, clear Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT REAR SPEAKER

Turn the ignition off.

Disconnect the Amplified Right Rear Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

- Replace the Amplified Right Rear Speaker in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT, AND THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Disconnect the Amplifier C2 harness connector.
Measure the resistance between the (X206) Amplified Right Rear Speaker (+) circuit, and the (X296) Amplified Right Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (X206) Amplified Right Rear Speaker (+) circuit, and the (X296) Amplified Right Rear Speaker (-) circuit for a short together.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2222-SATELLITE RADIO RECEIVER INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**

819c320d

The Satellite Radio Receiver detects a software checksum test failure.

Possible Causes
SATELLITE RADIO RECEIVER

Diagnostic Test

1. REPLACE THE SATELLITE RADIO RECEIVER

When this code is set, the Satellite Radio must be replaced.

Repair

- Replace the Satellite Radio Receiver in accordance with the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
-

U0019–CAN INTERIOR BUS

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Continuously.
- **Set Condition:**
- Whenever the CAN INTERIOR BUS (+) or INTERIOR BUS (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN INTERIOR BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE
(D264) CAN INTERIOR BUS (–) CIRCUIT OPEN
(D265) CAN INTERIOR BUS (+) CIRCUIT OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0019–CAN INTERIOR BUS CIRCUIT?

Yes

- Go To [2](#)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST - VER 1.

2. CHECK TOTALLY INTEGRATED POWER MODULE DTCs

With the scan tool, read Totally Integrated Power Module DTCs

Does the scan tool display any CAN INTERIOR BUS DTCs – ACTIVE?

Yes

- Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.
-

No

- Go to [3](#)
-

3. CAN INTERIOR BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Totally Integrated Power Module C7 harness connector.

Measure the resistance of the (D265) CAN INTERIOR BUS (+) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

- Go To [4](#)
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the CAN INTERIOR BUS (+) circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CAN INTERIOR BUS (–) CIRCUIT OPEN

Measure the resistance of the (D264) CAN INTERIOR BUS (–) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

- Replace the Amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the CAN INTERIOR BUS (–) circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0020-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Continuously.
- **Set Condition:**
- Whenever the CAN INTERIOR BUS (+) or INTERIOR BUS (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN INTERIOR BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE
(D264) CAN INTERIOR BUS (–) CIRCUIT OPEN
(D265) CAN INTERIOR BUS (+) CIRCUIT OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0020-CAN INTERIOR BUS OFF PERFORMANCE?

Yes

- Go To [2](#)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK FRONT CONTROL MODULE DTCs

With the scan tool, read Totally Integrated Power Module DTCs.

Does the scan tool display any CAN INTERIOR BUS DTCs – ACTIVE?

Yes

- Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No

- Go to [3](#)
-

3. CAN INTERIOR BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Totally Integrated Power Module C7 harness connector.

Measure the resistance of the (D265) CAN INTERIOR BUS (+) circuit between the Totally Integrated Power module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

- Go To [4](#)
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the CAN INTERIOR BUS (+) circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CAN INTERIOR BUS (–) CIRCUIT OPEN

Measure the resistance of the (D264) CAN INTERIOR BUS (–) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

- Replace the Amplifier in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the CAN INTERIOR BUS (–) circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0195-LOST COMMUNICATION WITH SDAR

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0197-LOST COMMUNICATION WITH HANDS FREE MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0199-LOST COMMUNICATION WITH DRIVERS DOOR MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

B1420-AUDIO CASSETTE ERROR/INOPERABLE CASSETTE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition on and the Radio Cassette player turned on.

- **Set Condition:**

The code will set when a damaged Cassette is placed in the Cassette Player.

Possible Causes
CASSETTE READ FAILURE

Diagnostic Test

1. RADIO

Replace the problem Cassette with a good, clean, undamaged, cassette.

Turn the Radio cassette player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1420–AUDIO CASSETTE ERROR/INOPERABLE CASSETTE?

Yes

- Eject the inoperative cassette and replace the Radio/Cassette Player in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1422-AUDIO DVD READ ERROR/INOPERABLE DISC

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition on and the DVD player turned on.

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1422-AUDIO DVD READ ERROR/INOPERABLE DISC?

Yes

- Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1423-VES DVD READ ERROR/INOPERABLE DISC

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition on and the DVD player turned on.

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1423-VES DVD READ ERROR/INOPERABLE DISC?

Yes

- Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1424-IMPROPER DVD-WRONG REGION

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition on and the DVD player turned on.

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1424-IMPROPER DVD-WRONG REGION?

Yes

- Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1429-RADIO DISPLAY HIGH TEMPERATURE

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Continuously with the ignition and Radio on.

◦ **Set Condition:**

The code will set if the temperature inside the Radio is above +65°C (+145°F)

Possible Causes
HIGH TEMPERATURE FAILURE

Diagnostic Test

1. VERIFY THAT DTC B1429-RADIO DISPLAY HIGH TEMPERATURE IS ACTIVE.

With the scan tool, clear all DTC's.
Start the engine and allow the engine to reach normal operating temperature.
If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.
The Radio should operate between —23°C and +65°C (—10°F and +145°F).
With the scan tool, read DTC's.

Does the scan tool display active: B1429-RADIO DISPLAY HIGH TEMPERATURE?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B1430 SATELLITE RADIO ANTENNA INTERNAL PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The Satellite Radio Antenna detects a software checksum test failure.

Possible Causes
SATELLITE RADIO ANTENNA

Diagnostic Test

1. REPLACE THE SATELLITE RADIO ANTENNA

When this code is set, the Satellite Radio Antenna must be replaced.

Repair

- Replace the Satellite Radio Antenna in accordance with the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
-

B142A-RADIO UNIT HIGH TEMPERATURE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition and Radio on.

- **Set Condition:**

The code will set if the temperature inside the Radio is above +65°C (+145°F)

Possible Causes
HIGH TEMPERATURE FAILURE

Diagnostic Test

1. VERIFY THAT DTC B142A-RADIO UNIT HIGH TEMPERATURE IS ACTIVE.

With the scan tool, erase the DTC's.
Start the engine and allow the engine to reach normal operating temperature.
If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.
The Radio should operate between —23°C and +65°C (—10°F and +145°F).
With the scan tool, read DTC's.

Does the scan tool display active: B142A-RADIO UNIT HIGH TEMPERATURE?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B142C-VES VIDEO SCREEN DISCONNECTED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on and the Radio in Video mode.

- **Set Condition:**

With the Radio in Video mode, the Radio does not detect a VES Video Screen.

Possible Causes
BAD VES VIDEO SCREEN CONNECTION
RADIO

Diagnostic Test

1. TEST VES VIDEO SCREEN CONNECTION

Turn the ignition off.
Disconnect the VES Video Screen connector.
Inspect the VES Video Screen connection.

Was the VES Video Screen connection clean and secure?

Yes

- Go To [2](#)

No

- Repair the VES Video Screen connection as needed.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. VES VIDEO SCREEN

Refer to the Audio System in the Service Information and test the VES Video Screen in accordance with the Service Procedure.

Is the Antenna ok?

Yes

- Go To [3](#)

No

- Repair or replace the VES Video Screen in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft (9.14m) from any structure.

Turn the ignition on.

Turn the Radio on.

With the scan tool, clear all DTC's, put the Radio in mode.

With the scan tool, read DTC's.

Does the scan tool display active: B142C-VES VIDEO SCREEN DISCONNECTED?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B142D-AUDIO ANTENNA NOT CONNECTED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on and the Radio in seek mode.

- **Set Condition:**

With the Radio in seek mode for two loops around the band. The Radio does not detect an Antenna connection or does not receive a Radio station signal.

Possible Causes
BAD ANTENNA CONNECTION
RADIO

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.
 Disconnect the Radio Antenna connector.
 Inspect the Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes

- Go To [2](#)

No

- Repair the Antenna connection as needed.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. ANTENNA

Refer to the Audio System in the Service Information and test the antenna in accordance with the Service Procedure.

Is the Antenna ok?

Yes

- Go To [3](#)

No

- Repair or replace the Antenna assembly in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft (9.14m) from any structure.

Turn the ignition on.

Turn the Radio on.

With the scan tool, clear all DTC's, put the Radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the scan tool, read DTC's.

Does the scan tool display active: B142D-AUDIO ANTENNA NOT CONNECTED?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

B142E-GPS ANTENNA NOT CONNECTED

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on and the Radio in Navigation mode.

◦ **Set Condition:**

With the Radio in Navigation mode. The Radio does not detect an Antenna connection or does not receive a Navigation (GPS) signal.

Possible Causes
BAD ANTENNA CONNECTION
RADIO
ANTENNA

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.
Disconnect the GPS Antenna connector.
Inspect the GPS Antenna connection.

Was the Antenna connection clean and secure?

Yes

- Go To [2](#)

No

- Repair the Antenna connection as needed.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. ANTENNA

Refer to the Audio System in the Service Information and test the antenna in accordance with the Service Procedure.

Is the Antenna ok?

Yes

- Go To [3](#)

No

- Repair or replace the Antenna assembly in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft (9.14m) from any structure.

Turn the ignition and Radio on.
With the scan tool, clear all DTC's and operate the Navigation system.
With the scan tool, read DTC's.

Does the scan tool display active: B142E-GPS ANTENNA NOT CONNECTED?

Yes

- Replace the Radio in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test Complete.

AUDIO - SERVICE INFO

AUDIO - SERVICE INFO

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered.

The audio system includes the following components:

- Antenna (Radio, Satellite, GPS)
- Amplifier (if equipped)
- Radio noise suppression components
- Radio
- Satellite receiver (Integrated within the radio unit)
- Speakers
- Subwoofer (if equipped)

Certain functions and features of the audio system rely upon resources shared with other electronic modules in the vehicle over the Controlled Area Network (CAN). The data bus network allows the sharing of sensor information. For diagnosis of these electronic modules or of the data bus network, the use of a scan tool and the proper Diagnostic Procedures manual are recommended.

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The audio system components operate on battery current received through a fuse in the Junction Block (JB) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the Run or Accessory positions.

DIAGNOSIS AND TESTING

AUDIO

Any diagnosis of the Audio system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service Manual.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: On vehicles equipped with air bags, (refer to electrical/restraints) before attempting any

steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

Audio System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
NO AUDIO.	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw fuse in Power Distribution Center. Replace fuses, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Speakers inoperative.	5. Refer to speaker diagnosis.
	6. Radio inoperative.	6. Exchange or replace radio, if required.
NO DISPLAY.	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw fuse in Power Distribution Center. Replace fuses, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Exchange or replace radio, if required.
POOR RADIO RECEPTION.	1. Antenna inoperative.	1. See antenna diagnosis, in this group. Repair or replace antenna, if required.
	2. Ground damaged.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	3. Radio inoperative.	3. Exchange or replace radio, if required.

NO COMPACT DISC/DVD OPERATION	1. CD/DVD damaged.	1. Insert known good CD/DVD and test operation.
	2. Foreign material on CD/DVD.	2. Clean CD/DVD and test operation.
	3. Condensation on CD/DVD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Radio inoperative	4. Exchange or replace radio, if required.

AMPLIFIER

DESCRIPTION

The amplifier is located under the steering column behind the steering column opening cover. The amplifier can not be adjusted or repaired. If faulty the unit as a whole must be replaced.

OPERATION

The amplifier receives fused battery current from a fuse in the rear Totally Integrated Power Module (TIPM) at all times. The internal circuitry of the amplifier switches the amplifier ON based upon a CAN bus message that is received from the radio receiver whenever the radio is turned on. The amplifier receives the sound signal inputs from the radio, then sends the amplified outputs to the speakers.

DIAGNOSIS AND TESTING

AMPLIFIER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

REMOVAL

1. Disconnect the battery negative cable.
2. Remove the steering column opening cover.
3. Remove the steering column opening cover bracket.
4. Remove the mounting fastener.
5. Disconnect the electrical connector and remove the amplifier.

INSTALLATION

1. Connect the electrical connector and install the amplifier.
2. Install the mounting fastener.
3. Install the steering wheel opening cover support bracket.
4. Install the steering wheel opening cover.
5. Connect the battery negative cable.

ANTENNA BODY & CABLE

DESCRIPTION

All models use a fixed-length stainless steel rod-type antenna mast, installed on the right front cowl side panel of the vehicle. The antenna mast is connected to the center wire of the coaxial antenna cable, and is not grounded to any part of the vehicle.

To eliminate static, the antenna base must have a good ground. The antenna coaxial cable shield (the outer wire mesh of the cable) is grounded to the antenna base and the radio chassis.

The antenna coaxial cable has an additional disconnect, located behind the right end of the instrument panel between the radio and the right cowl side panel. This additional disconnect allows the instrument panel assembly to be removed and installed without removing the radio.

DIAGNOSIS AND TESTING

ANTENNA BODY AND CABLE

WARNING: On vehicles equipped with airbags, (refer to electrical/restraints) before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

The following four tests are used to diagnose the antenna with an ohmmeter:

- **Test 1** - Mast to ground test
- **Test 2** - Tip-of-mast to tip-of-conductor test
- **Test 3** - Body ground to battery ground test
- **Test 4** - Body ground to coaxial shield test.

The ohmmeter test lead connections for each test are shown in Antenna Tests .

NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate an antenna cable problem. First, test the primary antenna cable (integral to the antenna body and cable) from the coaxial cable connector behind the right side of the instrument panel between the radio and the right side cowl panel, to the antenna body. Then, test the secondary antenna cable (instrument panel antenna cable) from the coaxial connector behind the right side of the instrument panel between the radio and the right side cowl panel, to the coaxial cable connector at the radio.

TEST 1

Test 1 determines if the antenna mast is insulated from the base. Proceed as follows:

1. Unplug the antenna coaxial cable connector from the radio chassis and isolate.
2. Connect one ohmmeter test lead to the tip of the antenna mast. Connect the other test lead to the antenna base. Check for continuity.
3. There should be no continuity. If continuity is found, replace the faulty or damaged antenna base and cable assembly.

TEST 2

Test 2 checks the antenna for an open circuit as follows:

1. Unplug the antenna coaxial cable connector from the radio chassis.
2. Connect one ohmmeter test lead to the tip of the antenna mast. Connect the other test lead to the center pin of

the antenna coaxial cable connector.

3. Continuity should exist (the ohmmeter should only register a fraction of an ohm). High or infinite resistance indicates damage to the base and cable assembly. Replace the faulty base and cable, if required.

TEST 3

Test 3 checks the condition of the vehicle body ground connection. This test should be performed with the battery positive cable removed from the battery. Disconnect both battery cables, the negative cable first. Reconnect the battery negative cable and perform the test as follows:

1. Connect one ohmmeter test lead to the vehicle fender. Connect the other test lead to the battery negative post.
2. The resistance should be less than one ohm.
3. If the resistance is more than one ohm, check the braided ground strap connected to the engine and the vehicle body for being loose, corroded, or damaged. Repair or replace the ground strap connection, if required.

TEST 4

Test 4 checks the condition of the ground between the antenna base and the vehicle body as follows:

1. Connect one ohmmeter test lead to the vehicle fender. Connect the other test lead to the outer crimp on the antenna coaxial cable connector.
2. The resistance should be less than one ohm.
3. If the resistance is more than one ohm, clean and/or tighten the antenna base to fender mounting hardware.

REMOVAL

WARNING: On vehicles equipped with airbags, (refer to electrical/restraints) before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Disconnect and isolate the battery negative cable.
2. Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
3. Reach through the instrument panel glove box opening to unplug the two antenna coaxial cables in line connector.
4. Unscrew the antenna mast from the antenna body base on the right outer cowl side panel.

5. Using a trim stick, gently pry the edge of the antenna base trim cover to unsnap it from the antenna body base.
6. Remove the three screws that secure the antenna body base to the right outer cowl side panel.
7. From inside the passenger compartment, push the coaxial cable grommet on the antenna body half of the coaxial cable out through the hole in the right inner cowl side panel.
8. From the outside of the vehicle, pull the antenna body base and cable assembly out through the hole in the right outer cowl side panel.

INSTALLATION

WARNING: On vehicles equipped with airbags, (refer to electrical/restraints) before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. From outside the vehicle, feed the antenna cable and base assembly through the outer cowl side panel and into the inner cowl side panel hole.
2. From inside the passenger compartment, pull the cable and grommet into the hole in the inside cowl side panel until the grommet is fully seated.
3. Install the three screws retaining the antenna body base to right outer cowl side panel. Tighten the screws to 3.3 N·m (30 in. lbs.).

4. Snap on the antenna base trim cover to the antenna body base.
5. Install antenna mast. Tighten to 5 N·m (46 in. lbs.).
Ensure that the antenna mast is fully seated on antenna base and that there is no gap between the mast and base.
6. Reach through the glove box opening and connect the two antenna coaxial cables in line connector.
7. Install the glove box to the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
8. Connect the battery negative cable.

ANTENNA-SATELLITE

OPERATION

The satellite radio antenna receives signals from orbiting satellites and sends these signals to the radio. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the hard top.
3. Remove the fasteners from mounting plate.
4. Disconnect the antenna connector.
5. Remove the antenna fastener and remove antenna.

INSTALLATION

1. Install the antenna mounting fastener.
2. Connect the antenna connector.
3. Install mounting plate and fasteners
4. Install the hard top.
5. Connect the battery negative cable.

RADIO

DESCRIPTION

Available factory-installed radio receivers for this model include:

- AM/FM (1-CD/MP3), with & without integral satellite & input jacks (RES)
- AM/FM (6-DVD/MP3), with & without integral satellite & input jacks (REQ)
- AM/FM (1-CD/DVD/MP3), full map navigation (6.5" integrated touch screen display), 1-disc data drive, integral satellite & input jacks (RER)

All factory-installed radio receivers can communicate on the Controller Area Network (CAN). All factory-installed receivers are stereo Electronically Tuned Radios (ETR).

These radio receivers can only be serviced by an authorized radio repair station. See the latest Warranty Policies and Procedures manual for a current listing of authorized radio repair stations.

STANDARD PROCEDURE – RADIO BACKUP

The radio hard drive (HDD) can be backed up to save customer data in the event that a radio replacement is required. This procedure can only be done with all radios with a hard disk drive. All other radios do not have a HDD.

1. Turn the ignition to RUN, engine OFF.
2. Power on the external HDD.
3. Connect the external HDD to the radio using the USB (Universal Serial Bus) cable. The radio display will change to the "Manage My Files" screen.
4. Connect the scan tool and preform the following steps to place the radio into "Dealership Mode":
 - ECU View
 - Radio
 - Misc. Functions
 - Service Mode
 - Start
 - Next
5. Follow the on screen instructions on the radio to back up the radio HDD.

REMOVAL

WARNING: On vehicles equipped with airbags, (refer to electrical/restraints) before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the

proper precautions could result in accidental airbag deployment and possible personal injury.

NOTE: For REQ and RET radios, turn ignition to RUN and press the SET + SCAN buttons simultaneously to place the radio into transportation mode. The radio will display "Transportation" on the display within 5 seconds. If the radio is inoperative or not REQ/RET, skip this step.

1. Disconnect the battery negative cable.
2. Remove the center bezel.
3. Remove the radio mounting fasteners.
4. Pull out the radio and disconnect the electrical connectors.
5. Remove the radio.

INSTALLATION

WARNING: On vehicles equipped with airbags, (refer to electrical/restraints) before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Connect the electrical connectors and install the radio.
2. Install the radio mounting fasteners.
3. Install the center bezel.
4. Connect the battery negative cable.

RADIO NOISE SUPPRESSION COMPONENTS

DESCRIPTION

Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) noise suppression is accomplished primarily through circuitry internal to the radio receivers. These internal suppression devices are only serviced as part of the radio receiver.

External suppression devices that are used on this vehicle to control RFI or EMI noise include the following:

- Radio antenna base ground
- Radio receiver chassis ground wire
- Engine-to-body ground strap
- Resistor-type spark plugs
- Radio suppression-type secondary ignition wiring.

DIAGNOSIS AND TESTING

RADIO NOISE SUPPRESSION COMPONENTS

WARNING: On vehicles equipped with airbags, (refer to electrical/restraints) before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and

retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds. Inspect the ground paths and connections at the following locations:

- Blower motor
- Electric fuel pump
- Engine-to-body ground strap
- Generator
- Ignition module
- Radio antenna base ground
- Radio receiver chassis ground wire or strap
- Wiper motor.

If the source of RFI or EMI noise is identified as a component on the vehicle (i.e., generator, blower motor, etc.), the ground path for that component should be checked. If excessive resistance is found in any ground circuit, clean, tighten, or repair the ground circuits or connections to ground as required before considering any component replacement.

- Ignition coil
- Spark plugs
- Spark plug wire routing and condition.

Reroute the spark plug wires or replace the faulty components as required.

If the source of the RFI or EMI noise is identified as two-way mobile radio or telephone equipment, check the equipment installation for the following:

- Power connections should be made directly to the battery, and fused as closely to the battery as possible.
- The antenna should be mounted on the roof or toward the rear of the vehicle. Remember that magnetic antenna mounts on the roof panel can adversely affect the operation of an overhead console compass, if the vehicle is so equipped.
- The antenna cable should be fully shielded coaxial cable, should be as short as is practical, and should be routed away from the factory-installed vehicle wire harnesses whenever possible.
- The antenna and cable must be carefully matched to ensure a low Standing Wave Ratio (SWR).

REMOVAL

ENGINE-TO-BODY GROUND STRAP

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Remove the screw that secures the engine-to-body ground strap eyelet to the hood panel center reinforcement.
2. Remove the screw that secures the engine-to-body ground strap eyelet to the dash panel.

3. Remove the nut that secures the engine-to-body ground strap eyelet to the stud on the left upper rear corner of the engine cylinder head.
4. Remove the engine-to-body ground strap eyelet from the stud on the left upper rear corner of the engine cylinder head.
5. Remove the engine-to-body ground strap from the engine compartment.

INSTALLATION

ENGINE-TO-BODY GROUND STRAP

1. Position the engine-to-body ground strap in the engine compartment.
2. Position the engine-to-body ground strap eyelet over the stud on the left upper rear corner of the engine cylinder head.
3. Install and tighten the nut that secures the engine-to-body ground strap eyelet to the stud on the left upper rear corner of the engine cylinder head. Tighten the nut to 5.6 N·m (50 in. lbs.).
4. Install and tighten the screw that secures the engine-to-body ground strap eyelet to the dash panel. Tighten the screw to 48.5 N·m (430 in. lbs.).
5. Install and tighten the screw that secures the engine-to-body ground strap eyelet to the hood panel center reinforcement. Tighten the screw to 1.9 N·m (17 in. lbs.).

CABLE-SATELLITE ANTENNA

REMOVAL

1. Disconnect the battery negative cable.
2. Remove the top.
3. Remove the B-pillars. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

4. Remove the cowl trim. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
5. Remove the glove box.
6. Remove the instrument panel speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
7. Remove the satellite antenna cable.

INSTALLATION

1. Install the satellite antenna cable.
2. Install the instrument panel speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
3. Install the glove box.
4. Install the cowl trim.
5. Install the lower B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).
6. Install the top.
7. Connect the battery negative cable.

SPEAKER

DESCRIPTION

The standard equipment speaker system includes four full-range speakers. The two front speakers are mounted behind a removable bezel located on each outboard end of the lower instrument panel. With the premium speaker system, the standard front speakers are replaced with an enclosure assembly that includes a 4 inch speaker and a 1 inch tweeter. The two rear speakers are mounted behind a grille located on each outboard end of the sport bar, above the rear seating area of the vehicle.

OPERATION

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current to flow through the speaker voice coil.

DIAGNOSIS AND TESTING

SPEAKER

Any diagnosis of the Audio system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service Manual.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

CAUTION: The speaker output of the radio is a “floating ground” system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

NOTE: If poor sound quality is noted in the audio system, check the Cabin Equalization curve programmed in the instrument cluster. Make sure a base speaker system has the Base Cabin Equalization Curve programmed to the vehicle. If the vehicle has a premium speaker system, make sure the Premium Cabin Equalization Curve is programmed to the vehicle

1. If all speakers are inoperative, check the fuses in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 3.
3. Turn the radio receiver OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. Remove the radio receiver. Go to Step 4.
4. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the radio receiver wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.
5. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

Tweeter	Refer to TWEETER removal procedure.
Instrument panel speaker – driver	Refer to INSTRUMENT PANEL SPEAKER – DRIVER removal procedure.
Instrument panel speaker – passenger	Refer to INSTRUMENT PANEL SPEAKER – PASSENGER removal procedure.
Sound bar speaker	Refer to SOUND BAR removal procedure.
Subwoofer	Refer to SUBWOOFER removal procedure.

TWEETER

1. Disconnect the battery negative cable.
2. Remove the mounting fastener.
3. Remove the tweeter (1).
4. Disconnect the electrical connector.

INSTRUMENT PANEL SPEAKER – DRIVER

1. Disconnect the battery negative cable.
2. Remove the instrument panel end cap.
3. Remove the steering column opening cover.
4. Remove the amplifier. Refer to (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - REMOVAL).

5. Disconnect the electrical connector.
6. Remove the mounting fasteners in the left side of the instrument panel.
7. Remove the speaker mounting fasteners.
8. Remove the speaker (2) by carefully pulling the left side of the instrument panel outward until there is sufficient room to remove the speaker through the end cap area.

INSTRUMENT PANEL SPEAKER – PASSENGER

1. Disconnect the battery negative cable.
2. Remove the glove box.
3. Remove the instrument panel end cap.
4. Disconnect the electrical connectors.
5. Remove the speaker mounting fasteners.
6. Remove the speaker.

SOUND BAR

1. Disconnect the battery negative cable.
2. Remove the mounting fasteners and remove the speaker cover grille.
3. Remove the speaker.
4. Disconnect the electrical connector.

SUBWOOFER

1. Disconnect the battery negative cable.
2. Remove the mounting fasteners and remove the speaker cover grille.
3. Remove the speaker.
4. Disconnect the electrical connector.

INSTALLATION

WARNING: On vehicles equipped with airbags, (refer to electrical/restraints) before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

Tweeter	Refer to TWEETER installation procedure.
---------	--

Instrument panel speaker – driver	Refer to INSTRUMENT PANEL SPEAKER – DRIVER installation procedure.
Instrument panel speaker – passenger	Refer to INSTRUMENT PANEL SPEAKER – PASSENGER installation procedure.
Sound bar	Refer to SOUND BAR installation procedure.
Subwoofer	Refer to SUBWOOFER installation procedure.

TWEETER

1. Connect the electrical connector.
2. Install the tweeter (1).
3. Install the mounting fastener.
4. Connect the battery negative cable.

INSTRUMENT PANEL SPEAKER – DRIVER

1. Install the speaker (2).
2. Install the speaker mounting fasteners.
3. Connect the electrical connector.
4. Install the instrument panel mounting fasteners.
5. Install the amplifier. Refer to (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - INSTALLATION).
6. Install the steering column opening cover.
7. Install the instrument panel end cap.
8. Connect the battery negative cable.

INSTRUMENT PANEL SPEAKER – PASSENGER

1. Install the speaker.
2. Install the mounting fasteners.
3. Connect the electrical connectors.
4. Install the glove box.
5. Install the instrument panel end cap.
6. Connect the battery negative cable.

SOUND BAR

1. Connect the electrical connector.
2. Install the speaker.
3. Install the mounting fasteners.
4. Connect the battery negative cable.

SUBWOOFER

1. Install the subwoofer.
2. Connect the electrical connector.
3. Install the mounting fasteners.
4. Connect the battery negative cable.

8B - CHIME/BUZZER

CHIME/BUZZER

DESCRIPTION

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the ElectroMechanical Instrument Cluster (EMIC) (1) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The EMIC also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher

operation. The microprocessor-based EMIC utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus and the Local Interface Network (LIN) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the EMIC allow it to control the audible outputs that are produced through its on-board transducer and relay.

The EMIC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **chime** tone.
- **Slow Rate Repetitive Chime** - Repeated **chime** tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated **chime** tones that are issued at a fast rate of about 180 chimes per minute.

Hard wired circuitry connects the EMIC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC chime warning system circuits and components cannot be adjusted or repaired. If the EMIC circuitry, the on-board transducer or the relay are damaged or ineffective, the EMIC unit must be replaced.

OPERATION

The chime warning system operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the ON position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **Airbag Indicator Warning** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) transducer will generate one short chime when the ignition switch is in the ON position, and the airbag indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the operation of the Supplemental Restraint System (SRS) related components or circuits. This warning will only occur following completion of the airbag indicator bulb test, and will only occur once during any ignition cycle.
- **Door Ajar Warning** - The EMIC/CCN will generate one short chime when the ignition switch is in the ON position, when the door ajar indicator is illuminated, or when a **DOOR(S) OPEN** textual message is displayed in the odometer Vacuum Fluorescent Display (VFD) unit of the instrument cluster. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle is moving.
- **Fasten Seat Belt Indicator Warning** - The EMIC/CCN transducer will generate repetitive chimes at a slow rate to announce that the seat belt switches and the ignition switch indicate that a front seat belt is not fastened with the ignition switch in the ON position. Vehicles with the optional Occupant Classification

System (OCS) monitor both outboard front seat belts, while vehicles without OCS monitor only the driver side front seat belt. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/SEAT BELT INDICATOR - OPERATION).

- **Gate Ajar Indicator Warning** - The EMIC/CCN transducer will generate one short chime when the swing gate/trunk ajar indicator is illuminated, or when a **SWING GATE OPEN** textual message is displayed in the odometer VFD unit of the instrument cluster. This warning indicates that the swing gate is not closed or completely latched while the vehicle is moving.
- **Head/Park Lamps-On Warning** - The EMIC/CCN transducer will generate repetitive chimes at a fast rate to indicate that inputs from the headlamp switch and the ignition switch indicate that the exterior lamps are turned ON with the ignition switch in the OFF position, and a hard wired input is received indicating that the driver side front door is open. The chimes will continue to sound until the exterior lamps are turned OFF, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Key-In-Ignition Warning** - The EMIC/CCN transducer will generate repetitive chimes at a fast rate to indicate that inputs from the key-in ignition switch, the ignition switch, and the driver side front door ajar switch indicate that the key is in the ignition lock cylinder with the ignition switch in the OFF position with the driver side front door open. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.
- **Low Fuel Indicator Warning** - The EMIC/CCN transducer will generate one short chime when the low fuel indicator is illuminated in the instrument cluster. This warning indicates that the monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.
- **Park Brake Reminder** - The EMIC/CCN transducer will generate one short chime when the brake/park brake indicator is illuminated to announce that the park brake is applied or not fully released and the vehicle is moving. This chime will repeat each time the input conditions are met.
- **Overspeed Warning** - The EMIC transducer will generate one short chime when the vehicle speed is over a pre-programmed speed value. This feature is only enabled on vehicles that have been configured for sale in a Middle East Gulf Coast Country (GCC).
- **Park Brake Reminder** - The instrument cluster chime tone generator will generate ten repetitive chimes at a slow rate to announce that the hard wired input from the park brake switch and a vehicle speed message input received from the PCM over the PCI data bus indicates that the park brake is applied and the vehicle is moving. This chime feature will repeat each time the input conditions are met.
- **Sentry Key Customer Learn Mode Announcement** - The EMIC/CCN transducer will generate one short chime to confirm that the Sentry Key electronic **Customer Learn** mode is active, which indicates that the Sentry Key Remote Entry Module/Wireless Control Module (SKREEM/WCM) is prepared for programming additional Sentry Key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where Customer Learn programming is an allowed feature.
- **Turn Signal On Warning** - The EMIC/CCN transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers (2.49 miles) for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.
- **Warning Indicator Announcement** - The EMIC/CCN transducer will generate one short chime each time the Malfunction Indicator Lamp (MIL) lamp or certain other indicators are illuminated by the instrument cluster circuitry. The MIL and certain other indicators may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors electronic messages received over the CAN data bus to determine when to illuminate these indicators.

The EMIC/CCN provides chime service for all available features in the chime warning system. The EMIC/CCN

relies upon its internal programming, numerous hard wired inputs, and electronic message inputs received from other modules over the Controller Area Network (CAN) and the Local Interface Network (LIN) data buses to provide the chime warning system features. The internal programming of the EMIC/CCN determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

***DIAGNOSTIC CAN C (+) AND/OR DIAGNOSTIC CAN C (-)
CIRCUITS HIGH**

MODULE-TOTALLY INTEGRATED POWER C7

DATA LINK CONNECTOR

81875cc9

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

When the scan tool queries the TIPM.

- **Set Condition:**

The scan tool has detected a shorted high condition on either or both Diagnostic CAN C circuits.

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO VOLTAGE
(D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.
 Disconnect the scan tool from the Data Link Connector (DLC).
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.

Does the scan tool display this same error message?

Yes

- Go To [2](#)

No

- The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. DIAGNOSTIC CAN C CIRCUITS SHORTED TO VOLTAGE

Turn the ignition off.
 Disconnect the TIPM C7 harness connector.
 Disconnect the scan tool from the DLC.
 Turn the ignition on.
 Measure the voltage of the Diagnostic CAN C circuits.

Is the voltage above 6.0 volts for either circuit?

Yes

- Repair the Diagnostic CAN C circuits for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***DIAGNOSTIC CAN C (+) CIRCUIT LOW**

MODULE-TOTALLY INTEGRATED POWER C7

DATA LINK CONNECTOR

81875cc9

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

When the scan tool queries the TIPM.

- **Set Condition:**

The scan tool has detected a shorted low condition on the (D72) Diagnostic CAN C (+) circuit.

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes

- Go To [2](#)

No

- The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the TIPM C7 harness connector.
 Disconnect the scan tool from the DLC.
 Measure the resistance between ground and the (D72) Diagnostic CAN C (+) circuit.

Is the resistance below 100.0 ohms?

Yes

- Repair the (D72) Diagnostic CAN C (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***DIAGNOSTIC CAN C (-) CIRCUIT LOW**

81875cc9

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

When the scan tool queries the TIPM.

- **Set Condition:**

The scan tool has detected a shorted low condition on the (D71) Diagnostic CAN C (-) circuit.

Possible Causes
(D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes

- Go To [2](#)

No

- The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
 Disconnect the TIPM C7 harness connector.
 Disconnect the scan tool from the DLC.
 Measure the resistance between ground and the (D71) Diagnostic CAN C (-) circuit.

Is the resistance below 100.0 ohms?

Yes

- Repair the (D71) Diagnostic CAN C (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***DIAGNOSTIC CAN C (+) SHORTED TO DIAGNOSTIC CAN C (-)**

MODULE-TOTALLY INTEGRATED POWER C7

DATA LINK CONNECTOR

81875cc9

2. (D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO (D71) DIAGNOSTIC CAN C (-) CIRCUIT

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between the (D72) Diagnostic CAN C (+) circuit and the (D71) Diagnostic CAN C (-) circuit.

Is the resistance below 100.0 ohms?

Yes

- Repair the (D72) Diagnostic CAN C (+) circuit for a short to the (D71) Diagnostic CAN C (-) circuit.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***DIAGNOSTIC CAN C (-) CIRCUIT OPEN**

MODULE-TOTALLY INTEGRATED POWER C7

DATA LINK CONNECTOR

81875cc8

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

When the scan tool queries the TIPM.

- **Set Condition:**

The scan tool has detected an open condition on the (D71) Diagnostic CAN C (-) circuit.

Possible Causes
(D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes

- Go To [2](#)

No

- The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance of the (D71) Diagnostic CAN C (-) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance below 5.0 ohms?

Yes

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair the (D71) Diagnostic CAN C (-) circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***DIAGNOSTIC CAN C (+) CIRCUIT OPEN**

81875cc9

For a complete wiring diagram **Refer to Section 8W.**

Measure the resistance of the (D71) Diagnostic CAN C (-) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance below 5.0 ohms?

Yes

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

PROCEDURE).

No

- Repair the (D71) Diagnostic CAN C (-) circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0001-CAN C BUS CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

◦ When Monitored:

With the ignition on.

- **Set Condition:**

The Totally Integrated Power Module (TIPM) detects a corrupt CAN C Bus message.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
ENGINE CONTROL MODULE (DIESEL ONLY)
TRANSMISSION CONTROL MODULE
STEERING ANGLE SENSOR
AUTOMATIC SWAY BAR SYSTEM MODULE
WIRELESS CONTROL MODULE
OCCUPANT RESTRAINT CONTROLLER MODULE
OCCUPANT CLASSIFICATION MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001-CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [2](#)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANTILOCK BRAKE MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001-CAN C BUS OFF PERFORMANCE as active?

Yes

- Go To [3](#)

No

- Inspect the wiring and connectors for damage or shorted circuits in accordance with the service information.
- Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001-CAN C BUS CIRCUIT as active?

Yes

- Go To [4](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the

Powertrain Control Module in accordance with the service information.

- Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

4. ENGINE CONTROL MODULE (DIESEL ONLY) — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Engine Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes

- Go To [5](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Engine Control Module in accordance with the service information.
- Perform the ECM VERIFICATION TEST.

5. TRANSMISSION CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Transmission Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes

- Go To [6](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the

Transmission Control Module in accordance with the service information.

- Perform the TCM VERIFICATION TEST.

6. STEERING ANGLE SENSOR — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes

- Go To [7](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Steering Angle Sensor in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

7. AUTOMATIC SWAY BAR SYSTEM MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Automatic Sway Bar System Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes

- Go To [8](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Automatic Sway Bar System Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. WIRELESS CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Wireless Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes

- Go To [9](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Wireless Control Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

9. OCCUPANT RESTRAINT CONTROLLER MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Occupant Restraint Controller Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes

- Go To [10](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Restraint Controller Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

10. OCCUPANT CLASSIFICATION MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Occupant Classification Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes

- Go To [11](#)

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Classification Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

11. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [12](#)

12. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [13](#)

13. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0010-CAN INTERIOR BUS

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The TIPM detects a short to ground on either CAN Interior Bus (125K) circuit.

Possible Causes
(D265) CAN INTERIOR BUS (125K)(+) CIRCUIT SHORTED TO GROUND
ANY CAN INTERIOR BUS MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANY CAN INTERIOR BUS (125K) MODULE— INTERNAL SHORT

NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

NOTE: This step is to determine if the fault is internal within a module.

While monitoring the scan tool, disconnect each CAN Interior Bus (125K) module one at a time.

Check for this DTC to become active after disconnecting each CAN Interior Bus (125K) module the vehicle is

equipped with.

NOTE: If the DTC becomes stored when a particular module is disconnected, that module is causing the DTC to set.

With all the CAN Interior Bus modules disconnected does the scan tool display this DTC as active?

Yes

- Go To [3](#)

No

- Replace the module that when disconnected caused this DTC to become stored in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (D265) CAN INTERIOR BUS (125K)(+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D265) CAN Interior Bus (125K)(+) circuit at the TIPM C7 harness connector.

Is any resistance present?

Yes

- Repair the (D265) CAN Interior Bus (125K)(+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0011–CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

A module detects a short in either CAN Interior Bus circuit.

Perform the CAN Interior Bus Communication Failure diagnostic test procedure. **(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) .**

U0100-LOST COMMUNICATION WITH ECM/PCM

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the ECM/PCM for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ECM/PCM POWER AND GROUND
ECM/PCM
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ECM/PCM is active on the bus.

Is the ECM/PCM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ECM/PCM?

Yes

- Replace/update the ECM/PCM in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the ECM/PCM.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0101-LOST COMMUNICATION WITH TCM

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the TCM for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TCM POWER AND GROUND
TCM (PCM)
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the TCM?

Yes

- Replace/update the Transmission Control Module in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the TCM.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0114-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE (FDCM)

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Final Drive Control Module for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
FINAL DRIVE CONTROL MODULE POWER AND GROUND
FINAL DRIVE CONTROL MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE FDCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FDCM is active on the bus.

Is the FDCM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the FDCM?

Yes

- Replace/update the Final Drive Control Module (FDCM/ASBS) in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the FDCM.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Antilock Brake Module for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ANTILOCK BRAKE MODULE POWER AND GROUND
ANTILOCK BRAKE MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCS from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

Does the scan tool display any active DTCS to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE ABS IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ABS is active on the bus.

Is the ABS active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the ABS?

Yes

- Replace/update the Antilock Brake Module in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the ABS.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (SAS)

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the SCM (Steering Angle Sensor or SAS) for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
STEERING ANGLE SENSOR
STEERING ANGLE SENSOR POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
- Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. VERIFY THAT THE SCM (SAS) IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SCM (SAS) is active on the bus.

Is the SCM (SAS) active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the SCM (SAS)?

Yes

- Replace/update the SCM (Steering Angle Sensor or SAS) in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the SCM (SAS).
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.

- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE (TOTALLY INTEGRATED POWER MODULE)

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately 2 to 5 seconds.

Possible Causes
DIAGNOSTIC CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TOTALLY INTEGRATED POWER MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the TIPM?

Yes

- Replace/update the Totally Integrated Power Module (TIPM) in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information
- Perform the appropriate VERIFICATION TEST.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Occupant Restraint Controller for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
OCCUPANT RESTRAINT CONTROLLER POWER AND GROUND
OCCUPANT RESTRAINT CONTROLLER
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCS from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

Does the scan tool display any active DTCS to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE ORC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ORC is active on the bus.

Is the ORC active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the ORC?

Yes

- Replace/update the Occupant Restraint Controller in accordance with the service information.

Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the ORC.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0154–LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Occupant Classification Module for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
OCCUPANT CLASSIFICATION MODULE POWER AND GROUND
OCCUPANT CLASSIFICATION MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE OCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the OCM is active on the bus.

Is the OCM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the OCM?

Yes

- Replace/update the Occupant Classification Module in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the OCM.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Cluster/CCN for approximately 2 to 5 seconds.

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
CLUSTER/CCN POWER AND GROUND
CLUSTER/CCN
MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE CCN IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the CCN is active on the bus.

Is the CCN active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the CCN?

Yes

- Replace/update the Cluster (CCN) in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0164-LOST COMMUNICATION WITH HVAC CONTROL

MODULE

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the A/C Heater Control (HVAC) for approximately 2 to 5 seconds.

Possible Causes
CAN C INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
A/C HEATER CONTROL POWER AND GROUND
A/C HEATER CONTROL
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE HVAC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Verify that the HVAC is active on the bus.

Is the HVAC active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the HVAC?

Yes

- Replace/update the A/C Heater Control in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set the DTC in accordance with the service information
- Perform the appropriate VERIFICATION TEST.

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCIEVER CONTROL MODULE

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Intrusion Transceiver Control Module (ITM) for approximately 2 to 5 seconds.

Possible Causes
CAN C INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
INTRUSION TRANSCIEVER CONTROL MODULE POWER AND GROUND
INTRUSION TRANSCIEVER CONTROL MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE ITM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ITM is active on the bus.

Is the ITM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ITM?

Yes

- Replace/update the Intrusion Transceiver Control Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set the DTC in accordance with the service information
- Perform the appropriate VERIFICATION TEST.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Sentry Key Remote Entry Module (SKREEM/WCM) for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
SENTRY KEY REMOTE ENTRY MODULE POWER AND GROUND
SENTRY KEY REMOTE ENTRY MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE WCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the WCM is active on the bus.

Is the WCM active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the WCM?

Yes

Replace/update the Sentry Key Remote Entry Module (SKREEM/WCM) in accordance with the service information.

- Perform the appropriate VERIFICATION TEST.

No

- Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the WCM.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0184-LOST COMMUNICATION WITH RADIO

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Radio for approximately 2 to 5 seconds.

Possible Causes
CAN C INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
RADIO POWER AND GROUND
RADIO
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE RADIO IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Radio is active on the bus.

Is the Radio active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the Radio?

Yes

- Replace/update the Radio in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the Amplifier for approximately 2 to 5 seconds.

Possible Causes
CAN C INTERIOR BUS (125K) CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
AMPLIFIER POWER AND GROUND
AMPLIFIER
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE AMPLIFIER IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Amplifier is active on the bus.

Is the Amplifier active on the bus?

Yes

- Go To [4](#)

No

- Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the Amplifier?

Yes

- Replace/update the Amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

Replace/update the module that set this DTC in accordance with the service information.

- Perform the appropriate VERIFICATION TEST.

U1159-LOST COMMUNICATION WITH AUTOMATIC SWAY BAR SYSTEM (ASBS) MODULE

819951b9

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received from the ASBS for approximately 2 to 5 seconds.

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
AUTOMATIC SWAY BAR SYSTEM MODULE POWER AND GROUND
AUTOMATIC SWAY BAR SYSTEM MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To [2](#)

No

- Refer to the Stored Lost Communication diagnostic procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No

- Go To [3](#)

3. VERIFY THAT THE ASBS IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ASBS is active on the bus.

Is the ASBS active on the bus?

Yes

- Go To [4](#)

No

- Perform the No Response diagnostic procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ASBS?

Yes

- Replace/update the ASBS in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

Go To [5](#)

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the ASBS.
Clear active DTCs.

Is this DTC still active?

Yes

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [6](#)

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To [7](#)

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To [8](#)

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

- Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [9](#)

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (D64) CAN C Bus (-) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE)**

010956ad

For a complete wiring diagram Refer to Section 8W.

Possible Causes

(A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z907) (Z917) GROUND CIRCUIT OPEN
(F941) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ANTILOCK BRAKE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector. Using a 12-volt test light connected to ground, check each (A107) and (A111) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [3](#)

No

- Repair the Fused B(+) circuit for an open or short.
- Perform the ABS VERIFICATION TEST - VER 1.

3. (Z907) (Z917) GROUND CIRCUITS OPEN

Using a 12-volt test light connected to 12-volts, check each (Z907) and (Z917) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [4](#)

No

- Repair the (Z907) or (Z917) ground circuit for an open.
- Perform the ABS VERIFICATION TEST - VER 1.

4. (F941) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.
Using a 12-volt test light connected to ground, check the (F941) Fused Run/Relay Output circuit.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Repair the (F941) Fused Run/Relay Output circuit for an open or short.
- Perform the ABS VERIFICATION TEST - VER 1.

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.
Disconnect the TIPM C1 harness connector.
Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Antilock Brake Module connector.

Is resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (D65) CAN C Bus (+) circuit for an open.
- Perform the ABS VERIFICATION TEST - VER 1.

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Antilock Brake Module connector.

Is resistance below 5.0 ohms?

Yes

- Replace the Antilock Brake Module in accordance with the service information.
- Perform the ABS VERIFICATION TEST - VER 1.

No

- Repair the (D64) CAN C Bus (-) circuit for an open.
- Perform the ABS VERIFICATION TEST - VER 1.

***NO RESPONSE FROM AMP (AMPLIFIER)**

0199480*

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A116) FUSED B(+) (I.O.D.) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Radio Amplifier C1 harness connector.

Using a 12-volt test light connected to ground, check the

(A116) Fused B(+) (I.O.D.) circuit.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the (A116) Fused B(+) (I.O.D.) circuit for an open or short.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z910) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [4](#)

No

- Repair the (Z910) ground circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D265) OR (D264) CAN C INTERIOR BUS (125K) CIRCUIT OPEN

Measure the resistance of the (D264) CAN C Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and

the Radio Amplifier C1 harness connector.
Measure the resistance of the (D265) CAN C Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Radio Amplifier C1 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

- Replace the Radio Amplifier in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair the (D265) or (D264) CAN C Interior Bus (125K) circuit for an open. Inspect the connector for damage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A959) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
 Disconnect the Stabilizer Bar Control Module harness connector.
 Using a 12-volt test light connected to ground, check each (A959) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [3](#)

No

- Repair the (A959) Fused B(+) circuit for an open or short.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z905) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z905) ground circuit.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (Z905) ground circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.
Using a 12-volt test light connected to ground, check the (F943) Fused Run/Relay Output circuit.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Repair the (F943) Fused Run/Relay Output circuit for an open or short.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.
Disconnect the TIPM C1 harness connector.
Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Stabilizer Bar Control Module connector.

Is resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (D65) CAN C Bus (+) circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Stabilizer Bar Control Module connector.

Is resistance below 5.0 ohms?

Yes

- Replace the Final Drive Control Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair the (D64) CAN C Bus (-) circuit for an open.

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM CCN
(CLUSTER)**

01007103

For a complete wiring diagram **Refer to Section 8W.**

(A418) (A412) FUSED B(+) CIRCUITS OPEN OR SHORTED
(Z914) GROUND CIRCUITS OPEN
(F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(D264) AND (D265) CAN C INTERIOR BUS (125K) CIRCUITS OPEN
CLUSTER (CCN)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A418) (A412) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Cluster C1, C2 and C3 harness connectors. Using a 12-volt test light connected to ground, check each (A418) and (A412) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [3](#)

No

- Repair the Fused B(+) circuit for an open or short.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z914) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z914) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [4](#)

No

- Repair the (Z914) ground circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F943) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Repair the (F943) Fused Run/Start Relay Output circuit for an open or short.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. (D265) OR (D264) CAN C INTERIOR BUS (125K) CIRCUIT OPEN

Measure the resistance of the (D264) CAN C Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the Cluster C2 harness connector.

Measure the resistance of the (D265) CAN C Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Cluster C2 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

- Replace the Cluster in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair the (D265) or (D264) CAN C Interior Bus (125K) circuit for an open. Inspect the connector for damage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM ECM
(ENGINE CONTROL MODULE) - DIESEL**

Possible Causes

ENGINE CONTROL MODULE POWER AND GROUND
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ENGINE CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware and any ignition related DTCs, perform DTCs before proceeding.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. CHECK ECM POWER AND GROUND

Check the ECM power and ground circuits. Refer to 9 - ENGINE ELECTRICAL DIAGNOSTICS - DIESEL for

the diagnostic test procedure.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ECM VERIFICATION TEST.

No

- Go To [3](#)

3. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Disconnect the ECM C2 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the ECM connector.

Is resistance below 5.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (D65) CAN C Bus (+) circuit for an open.
- Perform the ECM VERIFICATION TEST.

4. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the ECM connector.

Is resistance below 5.0 ohms?

Yes

- Replace and program the Engine Control Module in accordance with the service information.
- Perform the ECM VERIFICATION TEST.

No

- Repair the (D64) CAN C Bus (-) circuit for an open.
- Perform the ECM VERIFICATION TEST.

***NO RESPONSE FROM ITM

INTRUSION TRANSCIEVER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A412) FUSED B(+) (I.O.D.) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Intrusion Transceiver Module harness connector.

Using a 12-volt test light connected to ground, check the (A412) Fused B(+) (I.O.D.) circuit.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the (A412) Fused B(+) (I.O.D.) circuit for an open or short.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z910) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (Z910) ground circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D265) OR (D264) CAN C INTERIOR BUS (125K) CIRCUIT OPEN

Measure the resistance of the (D264) CAN C Interior Bus (-)

(125K) circuit between the TIPM C7 harness connector and the Intrusion Transceiver Module harness connector.
 Measure the resistance of the (D265) CAN C Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Intrusion Transceiver Module harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

- Replace the Intrusion Transceiver Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair the (D265) or (D264) CAN C Interior Bus (125K) circuit for an open. Inspect the connector for damage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
OCCUPANT CLASSIFICATION MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (Z913) GROUND CIRCUIT OPEN

Disconnect the Occupant Restraint Controller Module

harness connectors.

Using a 12-volt test light connected to 12-volts, check the (Z913) ground circuit.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the (Z913) ground circuit for an open.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

3. (A27) FUSED B+ CIRCUIT OPEN OR SHORTED

Using a 12-volt test light connected to ground, check the (A27) Fused B+ circuit.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (A27) Fused B+ circuit for an open or short.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

4. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Occupant

Classification Module connector.

Is resistance below 5.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (D65) CAN C Bus (+) circuit for an open.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

5. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Occupant Classification Module connector.

Is resistance below 5.0 ohms?

Yes

- Replace the Occupant Classification Module in accordance with the service information.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

No

- Repair the (D64) CAN C Bus (-) circuit for an open.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (Z913) (Z916) GROUND CIRCUITS OPEN

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Occupant Restraint Controller Module harness connectors.

Connect the appropriate Load Tool ACM Adaptor to the ORC connectors.

Measure the resistance between ground and the (Z913) and (Z916) ground circuits.

Is the resistance below 10k ohms?

Yes

- Go To [3](#)

No

- Repair the (Z913) or (Z916) ground circuit for an open.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

3. (F100) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

NOTE: Check the TIPM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Using a 12-volt test light connected to ground, check the (F100) Fused Run Relay Output circuit.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (F100) Fused Run Relay Output circuit for an open or short.

- Perform the AIRBAG VERIFICATION TEST - VER 1.

4. (F201) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Using a 12-volt test light connected to ground, check the (F201) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Repair the (F201) Fused Run/Start Relay Output circuit for an open or short.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Occupant Restraint Controller Module connector.

Is resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (D65) CAN C Bus (+) circuit for an open.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Occupant Restraint Controller Module connector.

Is resistance below 5.0 ohms?

Yes

- Replace the Occupant Restraint Controller Module in accordance with the service information.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

No

- Repair the (D64) CAN C Bus (-) circuit for an open.
- Perform the AIRBAG VERIFICATION TEST - VER 1.

POWERTRAIN CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. ATTEMPT TO COMMUNICATE WITH THE PCM

With the scan tool in ECU View, observe the status of the PCM.

Does the scan tool display a red X next to the PCM?

Yes

- Refer to the No Response From PCM test procedure. Refer to the table of contents in this section.

No

- Go To [3](#)

3. (A209) FUSED B(+) CIRCUITS OPEN OR SHORTED

Turn the ignition off.

Disconnect the TCM C1 harness connector.

CAUTION: Do not probe the TCM harness connectors. Probing the TCM harness connectors will damage the TCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (A209) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (A209) Fused B(+) circuit for an open or short.
- Perform the appropriate POWERTRAIN VERIFICATION TEST VER - 5.

4. (Z903) GROUND CIRCUITS OPEN

Turn the ignition off.

Disconnect the TCM C2 harness connector.

CAUTION: Do not probe the TCM harness connectors.

Probing the TCM harness connectors will damage the TCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to 12-volts, check each (Z903) ground circuits.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open.
- Perform the appropriate POWERTRAIN VERIFICATION TEST VER - 5.

5. (F202) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

CAUTION: Do not probe the TCM harness connectors. Probing the TCM harness connectors will damage the TCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (F202) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

- Go To [6](#)

No

- Repair the (F202) Fused Run/Start Relay Output circuit for an open or short.
- Perform the appropriate POWERTRAIN VERIFICATION TEST VER - 5.

6. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [7](#)

No

- Repair the (D65) CAN C Bus (+) circuit for an open.
- Perform the appropriate POWERTRAIN VERIFICATION TEST VER - 5.

7. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Replace and program the Transmission Control Module in accordance with the service information.
- Perform the appropriate POWERTRAIN VERIFICATION TEST VER - 5.

No

- Repair the (D64) CAN C Bus (-) circuit for an open.
- Perform the appropriate POWERTRAIN VERIFICATION TEST VER - 5.

***NO RESPONSE FROM TIPM
(TOTALLY INTEGRATED POWER
MODULE)**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
FUSED B (+) CIRCUITS OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUITS OPEN
GROUND CIRCUITS OPEN
DIAGNOSTIC CAN C CIRCUITS OPEN
DIAGNOSTIC CAN C CIRCUITS SHORTED TO GROUND
DIAGNOSTIC CAN C CIRCUITS SHORTED TOGETHER
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

NOTE: Ensure the scan tool is updated to the latest software.

NOTE: If the scan tool displays any error messages involving the Diagnostic CAN C circuits, diagnose and repair the error message before proceeding. Refer to the Table of Contents.

NOTE: A loss of communication with the TIPM can cause the ECU View button on the scan tool to be inoperative (not highlighted).

With the scan tool, attempt to select ECU View.

Can the scan tool communicate with the TIPM?

Yes

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

No

- Go To [2](#)

2. FUSED B (+) CIRCUITS OPEN AT TIPM

Disconnect the scan tool from the DLC.

Using a 12-volt test light connected to ground, and using the wiring diagram as a guide, check all Fused B (+) circuits at the TIPM.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [3](#)

No

- Repair the Fused B(+) circuit for an open or short.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. FUSED IGNITION SWITCH OUTPUT CIRCUITS OPEN AT TIPM

Turn the ignition on.

Using a 12-volt test light connected to ground, and using the wiring diagram as a guide, check each Fused Ignition Switch Output circuit at the TIPM.

Does the test light illuminate brightly for each circuit?

Yes

- Go To [4](#)

No

- Repair the Fused Ignition Switch Output circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. GROUND CIRCUITS OPEN AT TIPM

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, and using the wiring diagram as a guide, check all ground circuits at the TIPM.

Does the test light illuminate brightly on each circuit?

Yes

- Go To [5](#)

No

- Repair the ground circuit that did not light the test light for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. CHECK FOR (D52) DIAGNOSTIC CAN C (+) CIRCUIT OPEN AT DLC

Disconnect the TIPM C7 harness connector.

Measure the resistance on the (D52) Diagnostic CAN C (+) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance above 10.0 ohms?

Yes

- Repair the (D52) Diagnostic CAN C (+) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK FOR (D51) DIAGNOSTIC CAN C (-) CIRCUIT OPEN AT DLC

Measure the resistance on the (D51) Diagnostic CAN C (-) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance above 10.0 ohms?

Yes

- Repair the (D51) Diagnostic CAN C (-) circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK FOR DIAGNOSTIC CAN C CIRCUITS SHORTED TOGETHER

Measure the resistance between the (D52) Diagnostic CAN C (+) circuit and the (D51) Diagnostic CAN C (-) circuit at the TIPM C7 harness connector.

Is the resistance below 100.0 ohms?

Yes

- Repair the (D52) Diagnostic CAN C (+) circuit for a short to the (D51) Diagnostic CAN C (-) circuit.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace the Totally Integrated Power Module in

accordance with the service information.

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM WCM (SENTRY KEY REMOTE ENTRY MODULE)**

(D64) CAN C BUS (-) CIRCUIT OPEN
SENTRY KEY REMOTE ENTRY MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

- Go To [2](#)

No

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A412) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
 Disconnect the Sentry Key Remote Entry Module harness connector.
 Using a 12-volt test light connected to ground, check the (A412) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the (A412) Fused B(+) circuit for an open or short.
- Perform SKREEM VERIFICATION TEST.

3. (Z914) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z914) ground circuit.

Does the test light illuminate brightly?

Yes

- Go To [4](#)

No

- Repair the (Z914) ground circuit for an open.
- Perform SKREEM VERIFICATION TEST.

4. (F20) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED

Turn the ignition on.
 Using a 12-volt test light connected to ground, check the (F20) Fused Ignition Switch Output (Run/Start) circuit.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Repair the (F20) Fused Ignition Switch Output (Run/Start) circuit for an open or short.
- Perform SKREEM VERIFICATION TEST.

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Sentry Key Remote Entry Module connector.

Is resistance below 5.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (D65) CAN C Bus (+) circuit for an open.
- Perform the SKREEM VERIFICATION TEST.

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Sentry Key Remote Entry Module connector.

Is resistance below 5.0 ohms?

Yes

- Replace the Sentry Key Remote Entry Module in accordance with the service information.
- Perform the SKREEM VERIFICATION TEST.

No

- Repair the (D64) CAN C Bus (-) circuit for an open.
- Perform the SKREEM VERIFICATION TEST.

STANDARD PROCEDURE

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

NOTE: If the SKREEM or PCM/ECM was replaced, refer to the service information for proper programming procedures.

- Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
- Ensure that all accessories are turned off.
- Ensure that the battery is fully charged.
- Turn the ignition on.
- With the scan tool, record and erase DTC's from all modules.
- If an electronic control module was replaced, select the applicable module from the scan tool menu and press "Misc. Functions". If the module has programmable features, program as necessary.

(Export only) If the Intrusion Transceiver Module (ITM) and/or Siren was replaced, select ITM from the scan tool ECU View menu then “Misc. Functions” and perform the applicable replacement procedure.

- Turn the ignition off, wait 10 seconds, and then turn the ignition on.
- Operate all functions of the system that caused the original concern.
- With the scan tool, select ECU View and check for DTC's in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes

- The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No

- The repair is complete.

ELECTRONIC CONTROL MODULES

ELECTRONIC CONTROL MODULES

STANDARD PROCEDURE

SKREEM PROGRAMMING

When a Powertrain Control Module (PCM) for a gasoline engine, or an Engine Control Module (ECM) for a diesel engine and the Sentry Key Remote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM) on vehicles equipped with the Sentry Key Immobilizer System (SKIS) are replaced at the same time, perform the following steps in order:

NOTE: If the PCM and the SKREEM are replaced at the same time, program the PCM VIN into the PCM first.

1. If applicable first replace the PCM/ECM with the original WCM still connected to the vehicle.
2. Using the appropriate service information program the new PCM/ECM. (This will ensure the Secret Key Transfer from the original WCM into the new PCM/ECM).
3. Now replace and program the WCM. This will retain the Secret Key from the PCM/ECM back into the new WCM.
4. With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
5. If the vehicle is equipped with Tire Pressure Monitoring System program the Placard Pressure Values into the WCM/SKREEM.
6. Ensure all the customer's keys have been programmed into the new module if necessary.

NOTE: If the original keys do not successfully program to the new SKREEM after the proper procedures are followed correctly, programming new keys will be necessary.

PROGRAMMING THE SKREEM

The SKIS Secret Key is an ID code that is unique to each SKREEM/WCM. This code is programmed and stored in the SKREEM/WCM, the PCM/ECM, and each ignition key transponder chip. When the PCM/ECM or SKREEM/WCM is replaced, it is necessary to program the Secret Key into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for **PCM REPLACED**, **ECM REPLACED**, **WCM REPLACED**, or **GATEWAY REPLACED** under **MISCELLANEOUS FUNCTIONS** for the **WIRELESS CONTROL MODULE/WCM** menu item as appropriate.

NOTE: Programming the PCM/ECM or SKREEM is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. Be certain that all accessories are turned OFF. Also monitor the battery state and connect a battery charger if necessary.

NOTE: Before replacing the ECU for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most ECM driver/control circuit failures are caused by internal component failures (i.e. relay and solenoids) and shorted circuits (i.e. pull-ups, drivers and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

ECM/SKIM/WCM PROGRAMMING

When a ECM and the SKIM are replaced at the same time perform the following steps in order:

1. Program the new SKIM
2. Program the new ECM
3. Replace all ignition keys and program them to the new SKIM.

ECM/SKIM/WCM PROGRAMMING

When an ECM (Bosch) and the SKIM are replaced at the same time perform the following steps in order:

1. Program the new SKIM
2. Program the new ECM (Bosch)
3. Replace all ignition keys and program them to the new SKIM.

PROGRAMMING THE SKIM

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the StarSCAN®.

CAUTION: If the ECM/PCM and SKREEM/WCM are replaced at the same time, the ECM/PCM MUST be programmed before the SKREEM/WCM.

3. Select "ECU View".
4. Select "WCM Wireless Control Module".
5. Select "Miscellaneous Functions".

6. Select WCM replaced.
7. Enter the PIN when prompted.
8. Verify the correct information.

NOTE: If the ECM and the SKIM are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new SKIM.

PROGRAMMING IGNITION KEYS TO THE SKREEM

Each ignition key transponder also has a unique ID code that is assigned at the time the key is manufactured. When a key is programmed into the SKREEM/WCM, the transponder ID code is learned by the module and the transponder acquires the unique Secret Key ID code from the SKREEM/WCM. To program ignition keys into the SKREEM/WCM, follow the programming steps outlined in the diagnostic scan tool for **PROGRAM IGNITION KEYS OR KEY FOBS** under **MISCELLANEOUS FUNCTIONS** for the **WIRELESS CONTROL MODULE/WCM** menu item.

NOTE: If the original keys do not successfully program to the new SKREEM after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: A maximum of eight keys can be learned to each SKREEM. Once a key is learned to a SKREEM, that key has acquired the Secret Key for that SKREEM and cannot be transferred to any other SKREEM or vehicle.

If ignition key programming is unsuccessful, the scan tool will display one of the following error messages:

- **PROGRAMMING NOT ATTEMPTED** - The scan tool attempts to read the programmed key status and there are no keys programmed into SKREEM memory.
- **PROGRAMMING KEY FAILED (POSSIBLE USED KEY FROM WRONG VEHICLE)** - SKREEM is unable to program an ignition key transponder due to one of the following:
 - The ignition key transponder is ineffective.
 - The ignition key transponder is or has been already programmed to another vehicle.
- **8 KEYS ALREADY LEARNED, PROGRAMMING NOT DONE** - The SKREEM transponder ID memory is full.
- **LEARNED KEY IN IGNITION** - The ID for the ignition key transponder currently in the ignition lock cylinder is already programmed into SKREEM memory.

COMMUNICATION

DESCRIPTION

The primary on-board communication network between microprocessor-based electronic control modules in this vehicle is the Controller Area Network (CAN) data bus system. A data bus network minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one module (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The CAN bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The CAN bus is used for communication between most vehicle nodes. However, in addition to the CAN bus network, certain nodes may also be equipped with a Local Interface Network (LIN) data bus. The LIN data bus is a single wire low-speed (9.6 Kbps) serial link bus used to

provide direct communication between a LIN master module and certain switch or sensor inputs.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-Interior (also known as CAN Interior High Speed/IHS), the CAN-C and the Diagnostic CAN-C. The CAN-Interior and CAN-C systems provide on-board communication between all nodes in the vehicle. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps). The CAN-C is used typically for communications between more critical nodes, while the slower (125 Kbps) CAN-Interior system is used for communications between less critical nodes.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle.

The Diagnostic CAN-C bus is also capable of 500 Kbps communication, and is sometimes informally referred to as the CAN-D system to differentiate it from the other high speed CAN-C bus. The Diagnostic CAN-C is used exclusively for the transmission of diagnostic information between the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) and a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located beneath the instrument panel on the driver side of the vehicle.

The TIPM is located in the engine compartment near the battery. The central CAN gateway or hub module integral to the TIPM is connected to all three CAN buses. This gateway physically and electrically isolates the CAN buses from each other and coordinates the bi-directional transfer of messages between them.

OPERATION

The Controller Area Network (CAN) data bus allows all electronic modules or nodes connected to the bus to share information with each other. Regardless of whether a message originates from a module on the lower speed CAN-Interior (also known as CAN Interior High Speed/IHS) bus or on the higher speed CAN-C or CAN-D bus, the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores a Diagnostic Trouble Code (DTC) for certain bus network faults.

All modules (also referred to as nodes) transmit and receive messages over one of these buses. Data exchange between nodes is achieved by serial transmission of encoded data messages. Each node can both send and receive serial data simultaneously. Each digital bit of a CAN bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is the Local Interface Network (LIN) master module in this vehicle and it gathers information from the compass module, the instrument panel switch bank, the Steering Control Module (SCM), and the Heated Seat Module (HSM) through the LIN data bus. There is also LIN bus communication between the individual Tire Pressure Monitor (TPM) transponders and the Sentry Key REmote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM). Both the EMIC and the SKREEM either act directly upon the information received through the LIN data bus, relay the information to other nodes in the vehicle using electronic messages placed on the CAN bus, or both.

The voltage network used to transmit messages requires biasing and termination. Each module on the CAN bus network provides its own biasing and termination. There are two types of nodes used in the CAN bus network. On the CAN-C or the IHS bus, a dominant node has a 120 ohm termination resistance while a non-dominant (or recessive) node has about a 2500 to 3000 ohm (2.5 to 3.0 kilohm) termination resistance. The dominant nodes on the CAN-C bus are the TIPM and the Powertrain Control Module (PCM). The dominant nodes on the IHS bus are the EMIC and the TIPM.

The termination resistance of two dominant nodes is combined in parallel to provide a total of about 60 ohms. This resistance value may vary somewhat by application, depending upon the number of non-dominant nodes on the bus. On the CAN-D bus (or Diagnostic CAN-C) all of the 60 ohm termination resistance is present in the Central GateWay (TIPMCGW).

NOTE: All measurement of termination resistance is done with the vehicle battery disconnected.

The communication protocol being used for the CAN data bus is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b. The CAN-C is the faster of the two primary buses in the CAN bus system, providing near real-time communication (500 Kbps).

The CAN bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter (yard). While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (–) wire. Refer to the CAN Bus Voltages table.

CAN Bus Voltages (Normal Operation)																		
CAN-C Bus Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN-L Short to Ground	CAN-H Short to Ground	CAN-L Short to Battery	CAN-H Short to Battery	CAN-H Short to CAN-L										
CAN-L (–)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V										
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V										
CAN-Interior Bus Circuits	Key-Off (Bus Asleep)		Key-On (Bus Active)	CAN-L Short to Ground	CAN-H Short to Ground	CAN-L Short to Battery	CAN-H Short to Battery	CAN-H Short to CAN-L										
CAN-L (–)	0.0 V		1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V										
CAN-H (+)	0.0 V		2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V										
Notes																		
All measurements taken between node ground and CAN terminal with a standard DVOM.																		
DVOM will display average network voltage.																		
Total resistance of CAN-C network can also be measured (60 ohms). Total resistance of CAN-Interior network varies,																		

depending upon the number of optional non-dominant nodes on the bus. CAN-Interior total resistance should range between about 60 ohms with the minimal number of nodes, to about 42 ohms with the maximum number of nodes.

In order to minimize the potential effects of Ignition-OFF Draw (IOD), the CAN-Interior network employs a sleep strategy. However, a network sleep strategy should not be confused with the sleep strategy of the individual nodes on that network, as they may differ. For example: The CAN-C bus network is awake only when the ignition switch is in the ON or START positions; however, the TIPM, which is on the CAN-C bus, may still be awake with the ignition switch in the ACCESSORY or UNLOCK positions. The integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

The CAN-Interior bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a **bus sleep acknowledgment** message that causes the network to sleep. Once the CAN-Interior bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The TIPM will keep either the CAN-Interior or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

In the CAN system, available options are configured into the TIPM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The TIPM also has two 64-bit registers, which track each of the **as-built** and **currently responding** nodes on the CAN-Interior and CAN-C buses. The TIPM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

If there are intermittent or active faults in the CAN network, a diagnostic scan tool connected to the Diagnostic CAN-C bus through the 16-way Data Link Connector (DLC) may only be able to communicate with the TIPM. To aid in CAN network diagnosis, the TIPM will provide CAN-Interior and CAN-C network status information to the scan tool using certain diagnostic signals. In addition, the transceiver in each node on the CAN-C bus will identify a **bus off hardware failure**, while the transceiver in each node on the CAN-Interior bus will identify a **general bus hardware failure**. The transceivers for some CAN-Interior nodes will also identify certain failures for both CAN-Interior bus signal wires.

DATA LINK CONNECTOR

DESCRIPTION

The Data Link Connector (DLC) (3) is a 16-way molded plastic connector insulator on a dedicated take out of the instrument panel wire harness. This connector is located at the lower edge of the instrument panel (1), just outboard of the steering column opening cover (2). The connector insulator is retained by integral latch features within a rectangular cutout in the instrument panel lower structural support just below the lower instrument panel base trim and

just inboard of the cowl side inner panel.

OPERATION

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the Controller Area Network (CAN) data bus for interfacing with, configuring, and retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the data bus network of the vehicle.

MODULE-ANTILOCK BRAKE

DESCRIPTION

The Antilock Brake Module (ABM) is mounted to the Hydraulic Control Unit (HCU) and operates the ABS system.

OPERATION

The ABM voltage source is through the ignition switch in the RUN position. The ABM contains dual microprocessors. A logic block in each microprocessor receives identical sensor signals. These signals are processed and compared simultaneously. The ABM contains a self check program that illuminates the ABS warning light when a system fault is detected. Faults are stored in a diagnostic program memory and are accessible with the scan tool. ABS faults remain in memory until cleared, or until after the vehicle is started approximately 50 times. Stored faults are **not** erased if the battery is disconnected.

REMOVAL

1. Remove the master cylinder (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL).
2. Install prop rod on the brake pedal to keep pressure on the brake system.
3. Remove negative battery cable from the battery.
4. Pull up on the ABM harness connector release (1) and remove connector (2).

5. Remove brake lines (2) from the HCU (4).

6. Remove HCU/ABM mounting nuts and bolt (4) and remove HCU (2) / ABM (3) as an assembly.
7. Remove the ABM from the HCU.

INSTALLATION

NOTE: If the ABM is being replaced with a new ABM is

must be reprogrammed with the use of a scan tool.

1. Install the ABM on the HCU and tighten then screws to 2 N·m (16 in. lbs.).
2. Install HCU/ABM (2&3) on the mounting studs (4).
3. Install mounting nuts and bolt (4). Tighten to 11.5 N·m (102 in. lbs.).

4. Install brake lines (2) to the HCU (4) and tighten to 19 N·m (170 in. lbs.).

5. Install wiring harness connector (2) to the ABM and push down on the release (1) to secure the connector.
6. Install the master cylinder (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION).
7. Install negative battery cable to the battery.
8. Bleed ABS brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).

MODULE -ENGINE CONTROL

STANDARD PROCEDURE

ECM/PCM PROGRAMMING

MODULE REPROGRAMING

Replacement ECM's will require programming utilizing the StarSCAN® or equivalent. The ECM will not operate the engine until it is programmed. A Diagnostic Trouble Code (DTC) will be set - "not programmed".

CAUTION: Extreme care must be taken when programming a calibration into a generic ECM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The module can only be reprogrammed to a more recent version of that calibration.

SPECIAL TOOLS/EQUIPMENT OR EQUIVALENT REQUIRED:

NPN	Battery Charger
CH9401	StarSCAN® Tool
CH9404	StarSCAN® Vehicle Cable
CH9409	StarSCAN® Documentation Kit
CH9410	StarSCAN® Ethernet Cable, 12 ft.
CH9412	StarSCAN® Software Update Device Kit
	TechCONNECT PC or equivalent
	StarSCAN® Software Update CD

**REPAIR PROCEDURE - USING THE INTERNET TO RETRIEVE THE FLASH FILE:

NOTE: The StarSCAN® or equivalent diagnostic scan tool fully supports Internet connectivity. However, in order to take advantage of this feature you must first configure the StarSCAN® or equivalent for your dealership's network. For instruction on setting up your StarSCAN® or equivalent for the dealer's network; refer to the StarSCAN® or equivalent Quick Start Networking Guide available on DealerCONNECT > Service > StarSCAN and StarMOBILE or equivalent Tools > Online Documentation or at www.dcctools.com website under the "download center".

NOTE: If this flash process is interrupted/aborted, the flash should be restarted.

1. Open the hood, install a battery charger and verify that the charging rate provides approximately 13.5 volts. Set the battery charger timer to maintain the charging voltage for the duration of the flash process.
2. Connect the CH9410 StarSCAN® or equivalent ethernet cable to the StarSCAN® or equivalent and the

dealer's network drop.

3. Connect the CH9404 StarSCAN® or equivalent vehicle cable to the StarSCAN® or equivalent and the vehicle.

4. Power ON the StarSCAN® or equivalent .

5. Retrieve the old ECU part number. Using the StarSCAN® or equivalent at the “Home” screen:

- Select “ECU View”
- Touch the screen to highlight the ECM in the list of modules.
- Select “More Options”
- Select “ECU Flash”
- Record the part number at the top of the “Flash ECM” screen for later reference.

NOTE: For the Cummins Diesel, if the ECM is not operational, the “ECM part number” can be obtained from the label on the controller. If the label on the controller is not legible, record the “Reference No.” for use later. The “Reference No.” is located in the Reference No. box at the top, center of the Engine Data Plate . Do not use the reference number shown in the figure. The Engine Data Plate is located on the intake side of the breather cover or affixed to the APPS bracket.

 MANUFACTURED BY CUMMINS INC. FOR DAWLECHRYSLER Assembled in the USA © 3931342 WARNING: Injury may result and warranty is voided if fuel rate, rpm or altitudes exceed published maximum values for this model and application. This engine conforms to California Regulations applicable to XXXX model year medium duty vehicles. This engine is certified to operate on diesel fuel. 08011 Certified.						

813377b9

6. Replace the ECM with the appropriate Generic ECM. Refer to the detailed service information available in TechCONNECT, under: Service Info, 8-Electrical, Electronic Control Module, Engine Control Module, Removal.

7. Program the ECM as follows:

- Using the StarSCAN® or equivalent at the “Home” screen, Select “ECU View”
- Touch the screen to highlight the ECM in the list of modules.
- Select “More Options”
- Select “ECU Flash”
- Select “Browse for New File”. Follow the on screen instructions.
- Highlight the appropriate calibration based on the part number recorded in Step 5.
- Select “Download to Scantool”.
- Select “Close” after the download is complete, then select “Back”.

- i. Highlight the listed calibration.
- j. Select “Update Controller”. Follow on screen instructions.
- k. When the update is complete, select “OK”.
- l. Verify the part number at the top of the “Flash ECM” screen has updated to the new part number.
8. Is “WCM - Wireless Control Module” displayed in the “ECU Overview” screen list of modules?
 - a. Yes >> go to [STEP 9](#).
 - b. No >> go to [STEP 10](#).
9. Program the ECM to the Wireless Control Module (WCM).
 - a. Highlight the WCM.
 - b. Select “Misc. Function”.
 - c. Highlight “ECM Replaced”.
 - d. Select “Start”
 - e. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.
- f. When complete proceed to .
10. Program the VIN into the ECM.
 - a. Scroll through the list of controllers and highlight the ECM.
 - b. Select “Misc. Function”.
 - c. Highlight “Check ECM VIN”.
 - d. Select “Start”
 - e. Follow the on screen instructions. Select “Next” after each step . When the window appears with 17 boxes, select “Show Keyboard”. Place the cursor to the right of the last box and then backspace to delete the boxes from the window. Enter the VIN. Select “Finish” after completing the last step.
 - f. Unplug the scan tool from the Data Link Connector.
 - g. At the “Vehicle Disconnected” screen, press “OK”.
 - h. Connect the scan tool to the Data Link Connector and verify that the VIN is visible at the top of the “Home” screen.

NOTE: Due to the ECM programming procedure, a DTC may be set in other modules (TCM, BCM, MIC, SKREEM, etc.) within the vehicle, if so equipped. Some DTC's may cause the MIL to illuminate. From the “Home” screen select “System View”. Then select “All DTCs”. Press “Clear All Stored DTCs” if there are any DTCs shown on the list.

NOTE: The following step is required by law when reprogramming a ECM and/or TCM.

11. Type the necessary information on the “Authorized Modification Label” p/n 04275086AB and attach near the VECI label .

DaimlerChrysler AUTHORIZED MODIFICATIONS THESE MODIFICATIONS HAVE BEEN APPROVED AS APPROPRIATE, BY EPA AND CALIF.

THE FOLLOWING MODIFICATIONS HAVE BEEN MADE:

REPAIR PROCEDURE USING SOFTWARE UPDATE CD TO RETRIEVE THE FLASH FILE:

NOTE: If this flash process is interrupted/aborted, the flash should be restarted.

NOTE: For detailed information on the operation of the StarSCAN®, refer to the Quick Reference documentation provided in the StarSCAN® or equivalent documentation kit. In addition, more recent information may also be available at the www.dcctools.com website. Look under "Training Aids" and also under "Download Center > Frequently Asked Questions" for more help.

1. Open the hood, install a battery charger and verify that the charging rate provides approximately 13.5 volts. Set the battery charger timer to maintain the charging voltage for the duration of the flash process.
2. Connect the CH9404 StarSCAN® or equivalent vehicle cable to the StarSCAN® or equivalent or equivalent and the vehicle.
3. Power ON the StarSCAN® or equivalent .
4. Retrieve the old ECU part number. Using the StarSCAN® or equivalent at the "Home" screen:
 - a. Select "ECU View"
 - b. Touch the screen to highlight the ECM in the list of modules.
 - c. Select "More Options"
 - d. Select "ECU Flash"
 - e. Record the part number at the top of the "Flash ECM" screen for later reference.
5. Replace the ECM with the appropriate Generic ECM. Refer to the detailed service information available in TechCONNECT, under: Service Info, 8-Electrical, Electronic Control Module, Engine Control Module, Removal.
6. Insert the StarSCAN® or equivalent Software Update CD into the TechCONNECT or equivalent PC. The StarSCAN® Software Update CD will start automatically. Select "Download Flash Updates".
7. At the "**Select a method for looking up controller flash updates.**" screen:
 - a. Select "Enter part number". Enter the "Part Number" recorded in [STEP 4](#) when prompted to do so.
 - b. Using the mouse highlight the appropriate "Calibration". Select "Next".
 - c. Follow the on screen instructions.
 - d. When completed, proceed to [STEP 8](#).
8. With the StarSCAN® or equivalent powered OFF, connect the USB Key and Gender Changer to the StarSCAN® or equivalent USB port .

9. Connect the StarSCAN® or equivalent to the vehicle (if not already connected).
10. Power ON the StarSCAN® or equivalent .
11. Download the flash file from the USB key to the StarSCAN® or equivalent. Using the StarSCAN® or equivalent at the "Home" screen:
 - a. Select "Flash Download", then select "Retrieve files from the USB storage device"
 - b. Highlight the appropriate calibration. Select "Download to Scan Tool"
 - c. When the download is complete, select "Close" and "Back".
12. Reprogram the ECU. Using the StarSCAN® or equivalent at the "Home" screen:
 - a. Select "ECU View".
 - b. Select "More Options".
 - c. Select "ECU Flash".
 - d. Highlight the appropriate calibration.
 - e. Select "Update Controller". Follow the on screen instructions.
 - f. When the update is complete, select "OK".
 - g. Verify the part number at the top of the "Flash ECM" screen has updated to the new part number.
13. Is "WCM - Wireless Control Module" displayed in the "ECU Overview" screen list of modules?

- a. Yes >> go to [STEP 14](#).
 - b. No >> go to [STEP 15](#).
14. Program the ECM to the Wireless Control Module (WCM). Using the StarSCAN at the “Home” screen:
- a. Select “ECU View”
 - b. Scroll through the list of controllers and highlight the WCM.
 - c. Select “Misc. Function”.
 - d. Highlight “ECM Replaced”.
 - e. Select “Start”
 - f. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.
- g. When complete proceed to [STEP 16](#).
15. Program the VIN into the ECM.
- a. Scroll through the list of controllers and highlight the ECM.
 - b. Select “Misc. Function”.
 - c. Highlight “Check ECM VIN”.
 - d. Select “Start”
 - e. Follow the on screen instructions. Select “Next” after each step . When the window appears with 17 boxes, select “Show Keyboard”. Place the cursor to the right of the last box and then backspace to delete the boxes from the window. Enter the VIN. Select “Finish” after completing the last step.
 - f. Unplug the scan tool from the Data Link Connector.
 - g. At the “Vehicle Disconnected” screen, press “OK”.
 - h. Connect the scan tool to the Data Link Connector and verify that the VIN is visible at the top of the “Home” screen.
16. Is the vehicle is equipped with a 3.7L or 4.7L engine?
- a. Yes >> go to [STEP 18](#).
 - b. No >> go to [STEP 17](#).
17. Using the StarSCAN® or equivalent at the “Home” screen:
- a. Select “ECU View”
 - b. Scroll through the list of controllers and highlight the ECM.
 - c. Select “Misc. Function”.
 - d. Highlight “Learn ETC”.
 - e. Select “Start”
 - f. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.

NOTE: Due to the ECM programming procedure, a DTC may be set in other modules (TCM, BCM, MIC, SKIM, etc.) within the vehicle, if so equipped. Some DTC's may cause the MIL to illuminate. Check all modules using “ECU View” from the Home screen, record the DTC's, and erase these DTC's prior to returning the vehicle to the customer. Erase any DTC's in the ECM only after all other modules have had their DTC's erased.

NOTE: The following step is required by law.

18. Type the necessary information on the “Authorized Modification Label” p/n 04275086AB and attach near the VECI label . **

REMOVAL

The ECM (Engine Control Module) (2) is located in the engine compartment.

Use a diagnostic scan tool to reprogram the new ECM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

To avoid possible voltage spike damage to the ECM, ignition key must be off, and negative battery cable must be disconnected before unplugging ECM connectors.

1. Disconnect negative battery cable at battery.
2. Remove plastic shields from over electrical connectors. Shields snap to connectors.
3. Carefully unplug two electrical connectors (1) from ECM.
4. Remove ECM mounting bolts (3) and remove ECM (2) from vehicle.

INSTALLATION

Use a diagnostic scan tool to reprogram the new Engine Control Module (ECM) with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

1. Check pin connectors in ECM and electrical connectors for corrosion or damage. Also check pin heights in connectors. Pin heights should all be the same. Repair as necessary before installing electrical connectors.
2. Install two electrical connectors to ECM.
3. Install ECM (2) and mounting screws (3) to vehicle.
4. Tighten screws to 4 N·m (35 in. lbs.).
5. Install plastic shield to electrical connectors. Shields snap to connectors.
6. Install negative battery cable.
7. Use a diagnostic scan tool to reprogram new ECM with vehicles original Vehicle Identification Number (VIN) and original vehicle mileage.

MODULE-POWERTRAIN CONTROL

STANDARD PROCEDURE

PCM/ECM REPROGRAMMING - GAS

MODULE REPROGRAMING

Replacement PCM's will require programming utilizing the StarSCAN® or equivalent. The PCM will not operate the engine until it is programmed. A Diagnostic Trouble Code (DTC) will be set - "not programmed".

CAUTION: Extreme care must be taken when programming a calibration into a generic PCM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The module can only be reprogrammed to a more recent version of that calibration.

SPECIAL TOOLS/EQUIPMENT OR EQUIVALENT REQUIRED:

NPN	Battery Charger
CH9401	StarSCAN® Tool
CH9404	StarSCAN® Vehicle Cable
CH9409	StarSCAN® Documentation Kit
CH9410	StarSCAN® Ethernet Cable, 12 ft.
CH9412	StarSCAN® Software Update Device Kit
	TechCONNECT PC or equivalent
	StarSCAN® Software Update CD

**REPAIR PROCEDURE - USING THE INTERNET TO RETRIEVE THE FLASH FILE:

NOTE: The StarSCAN® or equivalent diagnostic scan tool fully supports Internet connectivity. However, in order to take advantage of this feature you must first configure the StarSCAN® or equivalent for your dealership's network. For instruction on setting up your StarSCAN® or equivalent for the dealer's network; refer to the StarSCAN® or equivalent Quick Start Networking Guide available on DealerCONNECT > Service > StarSCAN® or equivalent and StarMOBILE Tools > Online Documentation or at www.dcctools.com website under the download center.

NOTE: If this flash process is interrupted/aborted, the flash should be restarted.

1. Open the hood, install a battery charger and verify that the charging rate provides approximately 13.5 volts. Set the battery charger timer to maintain the charging voltage for the duration of the flash process.
2. Connect the CH9410 StarSCAN® or equivalent ethernet cable to the StarSCAN® or equivalent and the

dealer's network drop.

3. Connect the CH9404 StarSCAN® or equivalent vehicle cable to the StarSCAN® or equivalent and the vehicle.
4. Power ON the StarSCAN® or equivalent.
5. Retrieve the old ECU part number. Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select “ECU View”
 - b. Touch the screen to highlight the PCM in the list of modules.
 - c. Select “More Options”
 - d. Select “ECU Flash”
 - e. Record the part number at the top of the “Flash PCM” screen for later reference.
6. Replace the PCM with the appropriate Generic PCM. Refer to the detailed service information available in TechCONNECT, under: Service Info, 8-Electrical, Electronic Control Module, Powertrain Control Module, Removal.
7. Program the PCM as follows:
 - a. Using the StarSCAN® or equivalent at the “Home” screen, Select “ECU View”
 - b. Touch the screen to highlight the PCM in the list of modules.
 - c. Select “More Options”
 - d. Select “ECU Flash”
 - e. Select “Browse for New File”. Follow the on screen instructions.
 - f. Highlight the appropriate calibration based on the part number recorded in Step 5.
 - g. Select “Download to Scantool”.
 - h. Select “Close” after the download is complete, then select “Back”.
 - i. Highlight the listed calibration.
 - j. Select “Update Controller”. Follow on screen instructions.
 - k. When the update is complete, select “OK”.
 - l. Verify the part number at the top of the “Flash PCM” screen has updated to the new part number.
8. Is this a GPEC Module?
 - a. Yes >> go to [STEP 9](#).
 - b. No >> go to [STEP 12](#).
9. Do not start the engine prior to completing the following steps (a. and b.)
 - a. Turn the ignition switch to the OFF position for no less than 15 seconds.
 - b. Turn the ignition to the RUN position (DO NOT CRANK THE ENGINE) for no less than 20 seconds.
10. Is this vehicle equipped with a CVT?
 - a. Yes >> go to [STEP 11](#).
 - b. No >> go to [STEP 17](#).
11. The TCM must be reprogrammed as follows:
 - a. Using the StarSCAN® or equivalent at the “Home” screen, Select “ECU View”
 - b. Touch the screen to highlight the TCM in the list of modules.
 - c. Select “More Options”
 - d. Select “ECU Flash”
 - e. Record the part number at the top of the “Flash TCM” screen for later reference.
 - f. Select “Browse for New File”. Follow the on screen instructions.

NOTE: If the part number recorded in step “11e” is the same as the new p/n shown on the “Flash File List” screen no further action is required. Cancel the TCM reprogram procedure. Continue to step [STEP 17](#).

- g. Highlight the appropriate calibration.
- h. Select “Download to Scantool”.
- i. Select “Close” after the download is complete, then select “Back”.
- j. Highlight the listed calibration.
- k. Select “Update Controller”. Follow on screen instructions.
- l. When the update is complete, select “OK”.

- m. Verify the part number at the top of the “Flash TCM” screen has updated to the new part number.
- n. Continue to step [STEP 15](#)
- 12. Is “WCM - Wireless Control Module” displayed in the “ECU Overview” screen list of modules?
 - a. Yes >> go to [STEP 13](#).
 - b. No >> go to [STEP 14](#).
- 13. Program the PCM to the Wireless Control Module (WCM).
 - a. Highlight the WCM.
 - b. Select “Misc. Function”.
 - c. Highlight “PCM Replaced”.
 - d. Select “Start”
 - e. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.
- f. When complete proceed to [STEP 15](#).
- 14. Program the VIN into the PCM.
 - a. Scroll through the list of controllers and highlight the PCM.
 - b. Select “Misc. Function”.
 - c. Highlight “Check PCM VIN”.
 - d. Select “Start”
 - e. Follow the on screen instructions. Select “Next” after each step . When the window appears with 17 boxes, select “Show Keyboard”. Place the cursor to the right of the last box and then backspace to delete the boxes from the window. Enter the VIN. Select “Finish” after completing the last step.
 - f. Unplug the scan tool from the Data Link Connector.
 - g. At the “Vehicle Disconnected” screen, press “OK”.
 - h. Connect the scan tool to the Data Link Connector and verify that the VIN is visible at the top of the “Home” screen.
- 15. Is the vehicle equipped ETC?
 - a. Yes >> go to [STEP 17](#).
 - b. No >> go to [STEP 16](#).
- 16. Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select ECU View
 - b. Scroll through the list of controllers and highlight the PCM.
 - c. Select Misc. Function.
 - d. Highlight “Learn ETC”.
 - e. Select “Start”
 - f. Follow the on screen instructions. Select Next after each step . Select Finish after completing the last step.

NOTE: Due to the PCM programming procedure, a DTC may be set in other modules (TCM, BCM, MIC, SKREEM, etc.) within the vehicle, if so equipped. Some DTC's may cause the MIL to illuminate. From the Home screen select System View. Then select All DTCs. Press Clear All Stored DTCs if there are any DTCs shown on the list.

NOTE: The following step is required by law when reprogramming a PCM and/or TCM.

- 17. Type the necessary information on the Authorized Modification Label p/n 04275086AB and attach near the VECI label .

REPAIR PROCEDURE USING SOFTWARE UPDATE CD TO RETRIEVE THE FLASH FILE:

NOTE: If this flash process is interrupted/aborted, the flash should be restarted.

NOTE: For detailed information on the operation of the StarSCAN® or equivalent, refer to the Quick Reference documentation provided in the StarSCAN® or equivalent documentation kit. In addition, more recent information may also be available at the www.dcctools.com website. Look under Training Aids and also under Download Center > Frequently Asked Questions for more help.

1. Open the hood, install a battery charger and verify that the charging rate provides approximately 13.5 volts. Set the battery charger timer to maintain the charging voltage for the duration of the flash process.
2. Connect the CH9404 StarSCAN® or equivalent vehicle cable to the StarSCAN® or equivalent and the vehicle.
3. Power ON the StarSCAN® or equivalent.
4. Retrieve the old ECU part number. Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select “ECU View”
 - b. Touch the screen to highlight the PCM in the list of modules.
 - c. Select “More Options”
 - d. Select “ECU Flash”
 - e. Record the part number at the top of the “Flash PCM” screen for later reference.
5. Replace the PCM with the appropriate Generic PCM. Refer to the detailed service information available in TechCONNECT, under: Service Info, 8-Electrical, Electronic Control Module, Powertrain Control Module, Removal.
6. Insert the StarSCAN® or equivalent Software Update CD into the TechCONNECT or equivalent PC. The StarSCAN® or equivalent Software Update CD will start automatically. Select “Download Flash Updates”.
7. At the “**Select a method for looking up controller flash updates.**” screen:
 - a. Select “Enter part number”. Enter the “Part Number” recorded in [STEP 4](#) when prompted to do so.
 - b. Using the mouse highlight the appropriate “Calibration”. Select “Next”.
 - c. Follow the on screen instructions.
 - d. When completed, proceed to [STEP 8](#).
8. With the StarSCAN® or equivalent powered OFF, connect the USB Key and Gender Changer to the StarSCAN® or equivalent USB port .
9. Connect the StarSCAN® or equivalent to the vehicle (if not already connected).
10. Power ON the StarSCAN® or equivalent.
11. Download the flash file from the USB key to the StarSCAN® or equivalent. Using the StarSCAN® or equivalent at the “Home” screen:
 - a. Select “Flash Download”, then select “Retrieve files from

the USB storage device”

b. Highlight the appropriate calibration. Select “Download to Scan Tool”

c. When the download is complete, select “Close” and “Back”.

12. Reprogram the ECU. Using the StarSCAN® or equivalent at the “Home” screen:

a. Select “ECU View”.

b. Select More Options”.

c. Select “ECU Flash”.

d. Highlight the appropriate calibration.

e. Select “Update Controller”. Follow the on screen instructions.

f. When the update is complete, select “OK”.

g. Verify the part number at the top of the “Flash PCM” screen has updated to the new part number.

13. Is “WCM - Wireless Control Module” displayed in the “ECU Overview” screen list of modules?

a. Yes >> go to [STEP 14](#).

b. No >> go to [STEP 15](#).

14. Program the PCM to the Wireless Control Module (WCM). Using the StarSCAN® or equivalent at the “Home” screen:

a. Select “ECU View”

b. Scroll through the list of controllers and highlight the WCM.

c. Select “Misc. Function”.

d. Highlight “PCM Replaced”.

e. Select “Start”

f. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.

g. When complete proceed to [STEP 16](#).

15. Program the VIN into the PCM.

a. Scroll through the list of controllers and highlight the PCM.

b. Select “Misc. Function”.

c. Highlight “Check PCM VIN”.

d. Select “Start”

e. Follow the on screen instructions. Select “Next” after each step . When the window appears with 17 boxes, select “Show Keyboard”. Place the cursor to the right of the last box and then backspace to delete the boxes from the window. Enter the VIN. Select “Finish” after completing the last step.

f. Unplug the scan tool from the Data Link Connector.

g. At the “Vehicle Disconnected” screen, press “OK”.

h. Connect the scan tool to the Data Link Connector and verify that the VIN is visible at the top of the “Home” screen.

16. Is the vehicle equipped with a 3.7L or 4.7L engine?

a. Yes >> go to [STEP 18](#).

b. No >> go to [STEP 17](#).

17. Using the StarSCAN® or equivalent at the “Home” screen:

a. Select “ECU View”

b. Scroll through the list of controllers and highlight the PCM.

c. Select “Misc. Function”.

- d. Highlight “Learn ETC”.
- e. Select “Start”
- f. Follow the on screen instructions. Select “Next” after each step . Select “Finish” after completing the last step.

NOTE: Due to the PCM programming procedure, a DTC may be set in other modules (TCM, BCM, MIC, SKIM, etc.) within the vehicle, if so equipped. Some DTC's may cause the MIL to illuminate. Check all modules using “ECU View” from the Home screen, record the DTC's, and erase these DTC's prior to returning the vehicle to the customer. Erase any DTC's in the PCM only after all other modules have had their DTC's erased.

NOTE: The following step is required by law.

18. Type the necessary information on the “Authorized Modification Label” p/n 04275086AB and attach near the VECI label . **

REMOVAL

The PCM (Powertrain Control Module) (1) is located in the engine compartment near the windshield washer reservoir tank (2).

Use a diagnostic scan tool to reprogram the new Powertrain Control Module (PCM) with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

1. Disconnect negative battery cable at battery.
2. Remove plastic shields from over four electrical connectors. Shields snap to connectors.
3. Carefully unplug four electrical connectors from PCM.
4. Remove three PCM mounting bolts (3) and remove PCM from vehicle.

INSTALLATION

Use a diagnostic scan tool to reprogram the new Powertrain Control Module (PCM) with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

1. Install PCM (1) and three mounting screws (3) to vehicle.
2. Tighten screws to 4 N·m (35 in. lbs.).
3. Check pin connectors in PCM and four electrical connectors for corrosion or damage. Also check pin heights in connectors. Pin heights should all be the same. Repair as necessary before installing electrical connectors.
4. Install four electrical connectors to PCM.
5. Install plastic shield to electrical connectors. Shields snap to connectors.
6. Install battery cable.
7. Use a diagnostic scan tool to reprogram new PCM with vehicles original Vehicle Identification Number (VIN) and original vehicle mileage.

MODULE-STEERING CONTROL

DESCRIPTION

This vehicle is equipped with a Steering Control Module (SCM) that is internal to the left multi-function switch housing (2). The left (lighting) multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the interior and exterior lighting systems. The only visible components of the switch are the control stalk (1), control knob and control sleeve that extend through

the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions and electrical connections are concealed beneath the shrouds.

The switch housing and controls are constructed of molded black plastic. A single screw (7) through a mounting tab integral to the back of the switch housing, and a slide tab integral to the bottom of the switch housing secure the switch to the mounting bracket integral to the clockspring (3). A connector receptacle containing seven terminal pins is integral to the inboard end of the switch housing and connects the SCM through a jumper wire harness (5) directly to the right (wiper) multi-function switch (6). A second connector receptacle containing four terminal pins is integral to the back of the switch housing and connects the SCM to the vehicle electrical system through a dedicated takeout and connector of the instrument panel wire harness.

The SCM cannot be adjusted or repaired. If ineffective or damaged the entire left multi-function switch must be replaced. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LEFT MULTI-FUNCTION SWITCH - REMOVAL). The clockspring (with the multi-function switch mounting bracket), the left multi-function switch (with the SCM), the right multi-function switch and the jumper wire harness are each available for separate service replacement.

OPERATION

The microprocessor-based Steering Control Module (SCM) utilizes integrated circuitry to monitor hard wired analog and multiplexed inputs from both the right and left multi-function switches. In response to those inputs, the internal circuitry of the SCM allow it to transmit electronic message outputs to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Local Interface Network (LIN) data bus.

In response to those inputs the internal circuitry and programming of the EMIC, which is also the LIN master module in the vehicle, allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION - CAN-LIN BUS).

The SCM is connected to both a fused B(+) circuit and a fused ignition switch output (run-start) circuit. It receives a path to ground at all times. These connections allow it to remain functional regardless of the ignition switch position. Any input to the SCM that controls a vehicle system function that does not require that the ignition switch be in the ON position such as turning on the lights, prompts the SCM to wake up and transmit on the LIN data bus.

The hard wired circuits between components related to the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCM or the electronic controls or communication between modules and other devices that provide some features of the SCM. The most reliable, efficient, and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

STEERING CONTROL MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Steering Control Module (SCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCM or the electronic controls or communication between modules and other devices that provide some features of the SCM. The most reliable, efficient, and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

TRANSMISSION CONTROL MODULE

DESCRIPTION

The Transmission Control Module (TCM) is a sub-module within the Powertrain Control Module (PCM) (2).

The PCM (2) is located on the right side of the dash panel in the engine compartment on left hand drive vehicles. The PCM is referred to as the NGC.

The PCM (1) is located on the left side of the dash panel in the engine compartment on right hand drive vehicles.

OPERATION

The TCM is the controlling unit for all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and

selects the operational mode of the transmission. Direct inputs are hard-wired to, and used specifically by the TCM. Indirect inputs originate from other components/modules, and are shared with the TCM via the CAN bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition “ON” voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor (CKP)
- Transmission Range Sensor (TRS)
- Pressure Switches (L/R, 2/4, OD)
- Transmission Temperature Sensor (Integral to TRS)
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Speed Control ON/OFF Switch
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Brake Switch Status
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids (L/R, 2/4, OD and UD)
- Vehicle Speed (to PCM)
- Torque Reduction Request (to PCM)

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to BCM)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indices (CVI)
- Storing and selecting appropriate Shift Schedules

- System self-diagnostics
 - Diagnostic capabilities (with scan tool)

NOTE: If the TCM has been replaced, the “Quick Learn Procedure” must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

CLUTCH VOLUME INDEX (CVI)

An important function of the TCM is to monitor Clutch Volume Index (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur .

Gear ratios can be determined by using the Scan Tool and reading the Input/Output Speed Sensor values in the “Monitors” display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly (broken return springs, out of position snap rings, excessive clutch pack clearance, improper assembly, etc.) can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

CLUTCH VOLUMES		
	When Updated	

Clutch				Proper Clutch Volume
	Shift Sequence	Oil Temperature	Throttle Angle	
L/R	2-1 or 3-1 coast downshift	> 21° C (70° F)	< 5°	35 to 83
2/4	1-2 shift	> 43° C (110° F)	5 - 54°	20 to 77
OD	2-3 shift			48 to 150
UD	4-3 or 4-2 shift		> 5°	24 to 70

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following table [42RLE Shift Schedule](#) to determine the appropriate operation expected, depending on driving conditions.

42RLE Shift Schedule

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature at start-up below -27° C (-16° F)	Park, Reverse, Neutral and 2nd gear only (prevents shifting which may fail a clutch with frequent shifts)
Cold	Oil temperature at start-up above -25° C (-12° F) and below 2° C (36° F)	- Delayed 2-3 upshift (approximately 22-31 mph)
		- Delayed 3-4 upshift (45-53 mph)
		- Early 4-3 coastdown shift (approximately 30 mph)
		- Early 3-2 coastdown shift (approximately 17 mph)
		- High speed 4-2, 3-2, 2-1 kickdown shifts are prevented
		- No EMCC
Warm	Oil temperature at start-up above 2° C (36° F) and below 27° C (80° F)	- Normal operation (upshift, kickdowns, and coastdowns)

		- No EMCC		
Hot	Oil temperature at start-up above 27° C (80° F)	- Normal operation (upshift, kickdowns, and coastdowns)		
		- Full EMCC, no PEMCC except to engage FEMCC (except at closed throttle at speeds above 70-83 mph)		
Overheat	Oil temperature above 115° C (240° F) or engine coolant temperature above 118° C (244° F)	- Delayed 2-3 upshift (25-32 mph)		
		- Delayed 3-4 upshift (41-48 mph)		
		- 3rd gear FEMCC from 30-48 mph		
		- 3rd gear PEMCC from 27-31 mph		
Super Overheat	Oil temperature above 127° C (260° F)	- All "Overheat" shift schedule features apply		
		- 2nd gear PEMCC above 22 mph		
		- Above 22 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made		

STANDARD PROCEDURE - TCM QUICK LEARN

The quick learn procedure requires the use of the scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Solenoid Pack Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay in PARK until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 60°F (16°C) and below 200°F (93°C)

8F - ENGINE SYSTEMS

BATTERY SYSTEM - SERVICE INFORMATION

BATTERY SYSTEM - SERVICE INFORMATION

DESCRIPTION

This vehicle is equipped with a single 12-volt battery. All of the components of the battery system are located within the engine compartment of the vehicle. The battery system for this vehicle contains the following components:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negative charged battery terminal posts to the vehicle electrical system.
- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray.
- **Battery Thermal Guard** - The battery thermal guard insulates the battery to protect it from engine compartment temperature extremes.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). For the proper jump starting procedures, (Refer to LUBRICATION & MAINTENANCE/JUMP STARTING - STANDARD PROCEDURE).

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING

BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the

Powertrain Control Module (PCM). Use of an induction-type milliammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for the proper charging system on-board diagnostic test procedures.

MICRO 420 BATTERY TESTER (GASOLINE ENGINES)

The Micro 420 automotive battery tester is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) which includes the directions for using the Micro 420 battery tester.

OTC ONE STEP BATTERY ANALYZER AND CHARGER (DIESEL ENGINES)

The OTC One Step Battery Analyzer and Charger is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - IGNITION-OFF DRAW TEST) for the appropriate test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is inoperative.	2. Determine if the charging system is performing to specifications. (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for the appropriate charging system diagnosis and testing procedures. Repair the inoperative charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the appropriate battery tester. Charge the inoperative battery, as required.
	4. The battery terminal connections are loose or corroded.	4. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DIAGNOSIS AND TESTING) for the appropriate battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper battery size and rating. Replace an incorrect battery, as required.
	6. The battery is inoperative.	6. Test the battery using the appropriate battery tester. Replace the inoperative battery, as required.

	7. The starting system is inoperative.	7. Determine if the starting system is performing to specifications. (Refer to 8 - ELECTRICAL/STARTING - SPECIFICATIONS). Repair the inoperative starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper battery size and rating. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DIAGNOSIS AND TESTING) for the appropriate battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is excessive.	3. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - IGNITION-OFF DRAW TEST) for the appropriate test procedures. Repair the excessive ignition-off draw, as required.
	4. The battery is inoperative.	4. Test the battery using the appropriate battery tester. Replace the inoperative battery, as required.
	5. The starting system is inoperative.	5. Determine if the starting system is performing to specifications. (Refer to 8 - ELECTRICAL/STARTING - SPECIFICATIONS). Repair the inoperative starting system, as required.
	6. The charging system is inoperative.	6. Determine if the charging system is performing to specifications. (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for the appropriate charging system diagnosis and testing procedures. Repair the inoperative charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw loads in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is inoperative.	1. Test the battery using the appropriate battery tester. Replace the inoperative battery, as required.

STANDARD PROCEDURE

BATTERY RECONNECTION

NOTE: This reconnection procedure is to be performed anytime the battery has been disconnected.

1. Connect the battery negative cable to the battery post and tighten the clamp nut.
2. Install the rear compartment floor trim panel.

CAUTION: Once the battery has been connected, review and perform the following information as applicable.

ELECTRONIC STABILITY PROGRAM (ESP)

If the vehicle is equipped with ESP, once the battery is reconnected, the Steering Angle Sensor (SAS) in the clockspring needs to be calibrated. The SAS requires calibration anytime the battery or an ABS (ESP) component has been disconnected for any length of time. **If the SAS is not calibrated following battery reconnection, the ESP/BAS indicator lamp is illuminated following five ignition cycles indicating the need for calibration.**

To calibrate, perform the following:

1. Start the engine.
2. Center the steering wheel.
3. Turn the steering wheel all the way to the left until the internal stop in the steering gear is met, then turn the wheel all the way to the right until the opposite internal stop in the steering gear is met.
4. Center the steering wheel.
5. Stop the engine.

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the Owner's Manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush (1) or a post and terminal cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution.
2. Clean the battery tray and battery holddown hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

3. If the removed battery is to be reinstalled, clean the outside of the battery case (3) and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.

5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time

the battery or related components must be removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case (if equipped). Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage (if equipped). Replace any battery thermal guard that has been damaged.
5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to Standard Procedures for detailed instructions.

SPECIFICATIONS

BATTERY

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

NOTE: Vehicles equipped with a diesel engine utilize a unique battery. The specifications for this battery may differ from the standards shown here. Refer to the battery manufacturer for detailed specifications.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.

- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.
- **Load Test Amperage** - The Load Test Amperage rating specifies the current (in amperes) that a battery should be tested at with the battery load test equipment. This value should always be 50 percent of the CCA. For example: if the CCA for this battery is 700 amps, the Load Test Amperage is 50 percent of that or 350 amps.

BATTERY CLASSIFICATIONS & RATINGS											
Part Number	BCI Group Size Classification	Cold Cranking Amperage	Reserve Capacity	Ampere - Hours	Load Test Amperage

SPECIAL TOOLS

BATTERY SYSTEM SPECIAL TOOLS

Micro 420 Battery Tester

BATTERY

DESCRIPTION

There are two different batteries available for this vehicle. Vehicles equipped with a diesel engine utilize a spiral cell battery with recombination technology. This is a maintenance-free battery that is capable of delivering more power than a conventional battery. This additional power is required by a diesel engine during cold cranking. Vehicles equipped with a gasoline engine utilize a conventional battery. Refer to the following information for detailed differences and descriptions of these two batteries.

SPIRAL CELL BATTERY - DIESEL ENGINE

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery damage may result.

By tightly winding layers of spiral grids and acid-permeated vitreous separators into cells, the battery has more power and service life than conventional batteries of the same size. The spiral cell battery is completely, permanently sealed. Through gas recombination, hydrogen and oxygen within the battery are captured during normal charging and reunited to

form the water within the electrolyte, eliminating the need to add distilled water. Therefore, these batteries have non-removable battery vent caps.

The acid inside a spiral cell battery is bound within the vitreous separators, ending the threat of acid leaks. This feature allows the battery to be installed in any position anywhere in the vehicle.

Spiral cell technology is the process by which the cells holding the active material in the battery are wound tightly in coils instead of hanging flat, like conventional batteries. This design has a lower internal resistance and also increases the active material surface area.

Due to the maintenance-free design, distilled water cannot be added to this battery. Therefore, if more than 14.4 volts are used during the spiral cell battery charging process, water vapor can be exhausted through the pressure-sensitive battery vents and lost for good. This can permanently damage the spiral cell battery.

CONVENTIONAL BATTERY - GASOLINE ENGINE

Low-maintenance conventional batteries are used on vehicles equipped with a gasoline engine, these batteries have non-removable battery cell caps. Under normal service, the composition of this battery reduces gassing and water loss at normal charge rates.

Conventional batteries are made up of six individual cells that are connected in series. Each cell contains positive charged cell groups made of lead oxide, and negatively charged cell groups made of sponge lead. The cells are submerged in a sulfuric acid and water solution called electrolyte.

The battery is used to store electrical energy potential in a chemical form. When an electrical load is applied to the battery terminals, an electrochemical reaction occurs within the battery. This reaction causes the battery to discharge electrical current.

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery.

terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) for the proper battery cleaning procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

MICRO 420 BATTERY TESTER (GASOLINE ENGINES)

The Micro 420 automotive battery tester is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro 420 battery tester.

OTC ONE STEP BATTERY ANALYZER AND CHARGER (DIESEL ENGINES)

The OTC One Step Battery Analyzer and Charger is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle.

WARNING: If the battery shows signs of freezing, leaking or loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery

damage may result.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be tested to determine its cranking capacity. A battery that is fully-charged, but fails the OTC One Step Battery Analyzer and Charger or other load test, is faulty and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

STANDARD PROCEDURE

SPIRAL CELL BATTERY CHARGING

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery damage may result.

Vehicles equipped with a diesel engine utilize a unique spiral cell battery. This battery has a maximum charging voltage that must not be exceeded in order to restore the battery to its full potential, failure to use the following spiral cell battery charging procedure could result in damage to the battery or personal injury.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- OTC One Step Battery Analyzer and Charger special tool number OT-3641 or equivalent tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

WARNING: If the battery shows signs of freezing, leaking, loose posts or low electrolyte level, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Charge the battery directly at the battery terminals. Do not exceed 14.4 volts while charging a battery.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.6 volts or greater, perform a load test to determine the battery cranking capacity. If the battery passes a load test, return the battery to service. If the battery fails a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) for the proper battery system cleaning procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY – SPIRAL CELL BATTERY

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery damage may result.

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. Refer to Battery Removal and Installation for access instructions. If the reading is below ten volts, the battery charging current will be low. It could take several hours before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the OTC One Step Battery Analyzer and Charger special tool number OT-3641 or equivalent.

NOTE: Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

SPIRAL-PLATE BATTERY CHARGE RATE TABLE

Voltage	Minutes
14.4 volts maximum	up to 10 minutes
13.0 to 14 volts	up to 20 minutes
12.9 volts or less	up to 30 minutes

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies eight amperes will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

SPIRAL-PLATE BATTERY CHARGING TIME TABLE

Charging Amperage	5 Amps	8 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)	
12.25 to 12.49	6 hours	3 hours
12.00 to 12.24	10 hours	5 hours
10.00 to 11.99	14 hours	7 hours
Below 10.00	18 hours	9 hours

STANDARD PROCEDURE - CONVENTIONAL BATTERY CHARGING

CAUTION: Vehicles equipped with a diesel engine utilize a unique spiral cell battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the spiral cell battery charging procedure could result in damage to the battery or personal injury. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - SPIRAL CELL BATTERY CHARGING) for the appropriate procedure.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 battery tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

WARNING: If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

WARNING: If the battery is equipped with removable cell caps, be certain that each of the cell caps is in place and tight before the battery is returned to service. Personal injury and/or vehicle damage may result from loose or missing cell caps.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to an open-circuit voltage reading of 12.4 volts or greater, retest the battery with the Micro 420 tester or perform a load test to determine the battery cranking capacity. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for the proper battery test procedures. If the battery passes a load test, return the battery to service. If the battery fails a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) for the proper battery system cleaning procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED CONVENTIONAL BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the

ammeters built into many battery chargers.

2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CONVENTIONAL BATTERY CHARGE RATE TABLE

Voltage	Minutes
16.0 volts maximum	up to 10 min.
14.0 to 15.9 volts	up to 20 min.
13.9 volts or less	up to 30 min.

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18°C (0°F) than at 27°C (80°F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Conventional Battery Charging Time Table gives an indication of the time required to charge a typical

battery at room temperature based upon the battery state-of-charge and the charger capacity.

CONVENTIONAL BATTERY CHARGING TIME TABLE

Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

USING MICRO 420 BATTERY TESTER (GASOLINE ENGINES)

NOTE: The Micro 420 Battery Tester should only be used to test vehicles equipped with gasoline engines. If the vehicle being tested has a diesel engine the OTC One Step Battery Analyzer and Charger special tool number OT-3641 or equivalent should be used to test the battery.

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: Always wear appropriate eye protection and use extreme caution when working with batteries.

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.

2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition.
3. Connect the tester to the battery, the red clamp to the positive (+) terminal and the black clamp to the negative (-) terminal.

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the BATTERY TEST RESULTS TABLE.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

6. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

STANDARD PROCEDURE - OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery.

Before proceeding with this test, completely charge the battery, refer to the appropriate battery charging procedure.

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes

for the battery voltage to stabilize.

2. Disconnect and isolate both battery cables, negative cable first.

3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity.

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Totally Integrated Power Module (TIPM). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes.
2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Disconnect the battery negative cable.
4. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.
5. After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Totally Integrated Power Module (TIPM), one at a time until the amperage reading becomes very low, or nonexistent. **Refer to the appropriate wiring information for complete TIPM fuse, circuit breaker, and circuit identification.** This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliamperage scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliamperage scale selected, or the multi-meter may be damaged.

6. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in [STEP 5](#). The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

REMOVAL

WARNING:

To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves should be worn when removing or servicing a battery. Safety glasses also should be worn.

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Left hand drive gasoline engine shown, left hand drive diesel similar. Right hand drive gasoline and diesel similar with the battery and related components packaged on the left side of the engine compartment.

1. Loosen the pinch clamp bolt and disconnect and isolate the battery negative cable (8).
2. Loosen the pinch clamp bolt and disconnect the battery positive cable (4).

3. On gasoline engine equipped vehicles, loosen bolt (2) and remove the retainer (1) that holds the battery (3) down to the tray (4).

4. On diesel engine equipped vehicles, loosen the bolts (2 and 3) and remove the retaining bracket that holds the battery (4) down to the tray (5).
5. Remove the battery from the vehicle.
6. Remove thermal guard (if equipped) from battery.

INSTALLATION

WARNING:

To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves should be worn when removing or servicing a battery. Safety glasses also should be worn.

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

NOTE: When replacing battery, the thermal guard MUST be transferred to the new battery (if equipped).

1. Install battery into the vehicle making sure that the thermal guard (if equipped) is present and battery is properly positioned on battery tray.

On diesel engine equipped vehicles, position the retaining bracket onto the battery (4) and install the bracket bolts (2 and 3). Tighten the bolts to 7 N·m (62 in. lbs.)

2. On gasoline engine equipped vehicles, install the battery hold down retainer (1) and bolt (2) making sure that it is properly positioned on battery (3). Tighten the hold down bolt to 7 N·m (62 in. lbs.)

WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Left hand drive gasoline engine shown, left hand drive diesel similar. Right hand drive gasoline and diesel similar with the battery and related components packaged on the left side of the engine compartment.

3. Connect the battery positive cable (4) and tighten the pinch clamp nut to 5 N·m (45 in. lbs.)
4. Connect the battery negative cable (8) and tighten the pinch clamp nut to 5 N·m (45 in. lbs.)
5. Verify proper vehicle operation.

BATTERY CABLES

DESCRIPTION

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a clamping type female battery terminal made of stamped sheet metal that is die cast onto one end of the battery cable wire. A pinch-bolt and nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then soldered. The battery positive cable wires feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a smaller female battery terminal clamp.

Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some vehicles.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Totally Integrated Power Module (TIPM), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp has one wire as an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a ground connection, typically on the engine cylinder block.

DIAGNOSIS AND TESTING

BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and load tested. Refer to Standard Procedures for the proper battery charging and load test procedures.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay can

be found in the Fuse Block located in the left front bumper fascia. See the fuse and relay layout label affixed to the underside of the Fuse Block cover for ASD relay identification and location.

1. Connect the positive lead of the voltmeter (1) to the battery (2) negative terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

2. Connect the positive lead of the voltmeter (1) to the battery (2) positive terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

3. Connect the voltmeter (2) to measure between the battery positive cable terminal clamp (1) and the starter solenoid B(+) terminal stud (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

4. Connect the voltmeter (1) to measure between the battery (2) negative cable terminal clamp and a good clean ground on the engine block (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is

above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

REMOVAL

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Left hand drive gasoline engine shown, left hand drive diesel similar. Right hand drive gasoline and diesel similar with the battery and related components packaged on the left side of the engine compartment.

1. Loosen the pinch clamp bolt and disconnect and isolate the battery negative cable (8).

2. Loosen the pinch clamp bolt and disconnect the battery positive cable (4).
3. Remove the positive cable retaining nut (12) from the mounting stud on the Totally Integrated Power Module (1). Remove the cable (11) from the stud.
4. Remove the negative cable retaining nut (3) from the mounting stud on the inner fender. Remove the cable (2) from the stud.
5. Disconnect the cable assembly (5) routing clips (6) from the mounting studs (7).

6. Remove the battery cable nut (1) from the B+ terminal of the generator. Remove the cable from the generator.

7. Remove the battery cable from the B+ terminal of the starter motor (1).
8. Remove the negative battery cable from the engine block ground.
9. One at a time, trace any remaining battery cable retaining pushpins, fasteners and routing clips until the cables are free from the vehicle.
10. Remove the battery cables from the engine compartment.

INSTALLATION

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

1. Position the battery cables in the engine compartment.

2. One at a time, install the battery cable retaining pushpins, fasteners and routing clips until the cables are installed exactly where they were in the vehicle.
3. Install the negative battery cable to the engine block ground.
4. Connect the battery cable to the B+ terminal of the starter motor (1). Tighten the cable nut to 13 N·m (115 in. lbs.).

5. Connect the battery cable to the B+ terminal of the generator (1). Tighten the cable nut to 14 N·m (125 in. lbs.).

WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Left hand drive gasoline engine shown, left hand drive diesel similar. Right hand drive gasoline and diesel similar with the battery and related components packaged on the left side of the engine compartment.

6. Connect the cable assembly (5) routing clips (6) to the mounting studs (7).
7. Install the nut (3) securing the negative cable (2) to the body ground stud. Tighten the cable nut to 12 N·m (9 ft. lbs.)
8. Install the nut (12) securing the Totally Integrated Power Module (TIPM) cable (11) to the battery cable stud (5).
9. Connect the battery positive cable (4). Tighten the cable clamp nut to 5 N·m (45 in. lbs.)
10. Connect the battery negative cable (8). Tighten the cable clamp nut to 5 N·m (45 in. lbs.)

BATTERY TRAY

DESCRIPTION

NOTE: Left hand drive gasoline engine shown, left hand drive diesel similar. Right hand drive gasoline and diesel

similar with the battery and related components packaged on the left side of the engine compartment.

The battery is placed and secured in a plastic battery tray (4). The battery tray is located next to the inner front fender and is secured in place by one nut (3) and four bolts (2 and 5).

REMOVAL

WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Left hand drive gasoline engine shown, left hand drive diesel similar. Right hand drive gasoline and diesel similar with the battery and related components packaged on the left side of the engine compartment.

1. Disconnect and isolate the battery negative cable.
2. Disconnect the fresh air tube (2) from the air cleaner assembly (1).
3. Remove the air cleaner assembly (1) from the battery tray (4) by pulling up on the air cleaner to disengage the mounting pins.
4. Remove the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
5. Remove the Totally Integrated Power Module, (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - REMOVAL).

6. Remove the four bolts (2 and 5) and one nut (3) securing the battery tray (4) to the vehicle.
7. Lift the battery tray out of the engine compartment and remove from the vehicle.

INSTALLATION

WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Left hand drive gasoline engine shown, left hand drive diesel similar. Right hand drive gasoline and diesel similar with the battery and related components packaged on the left side of the engine compartment.

1. Position the battery tray (4) into the engine compartment.
2. Loosely install the one nut (3) and four bolts (2 and 5) securing the battery tray (4) to the vehicle.
3. Tighten the nut to 10.5 N·m (93 in. lbs.)
4. Tighten the bolts to 10.5 N·m (93 in. lbs.)
5. Install the Totally Integrated Power Module (TIPM), (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - INSTALLATION)
6. Install the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

819d0109

7. Install the air cleaner assembly (1) to the battery tray (4) by pushing down on the air cleaner to fully engage the mounting pins.
8. Connect the fresh air tube (2) to the air cleaner assembly (1).
9. Connect the battery negative cable.

THERMAL GUARD (DIESEL ENGINES ONLY)

DESCRIPTION

On diesel engine equipped vehicles, a flexible thermal guard wraps around the battery case (2) to enclose the sides of the battery. The thermal guard (1) consists of a plastic cloth outer skin with a polyester based insulator fiber.

REMOVAL

WARNING:

To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves, not the household type, should be worn when removing or servicing a battery. Safety

glasses also should be worn.

1. Disconnect and isolate the battery negative cable.
2. Remove the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
3. Carefully lift the thermal guard off over the battery taking care not to tear it.
4. Remove the thermal guard from battery.

INSTALLATION

NOTE: When replacing battery, the thermal guard MUST be transferred to the new battery.

1. Slip the battery thermal guard over the battery being careful not to tear it.
2. Install the battery into the vehicle, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).
3. Connect the battery negative cable.

CHARGING

CHARGING

DESCRIPTION

The charging system consists of:

- Generator
- Generator Decoupler Pulley (if equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch
- Battery (refer to 8, Battery for information)
- Battery temperature sensor
- Generator Lamp (if equipped)

- Check Gauges Lamp (if equipped)
- Voltmeter (refer to 8, Instrument Cluster for information)
- Wiring harness and connections (refer to 8, Wiring for information)

OPERATION - CHARGING SYSTEM

1 - PCM
2 - TIPM
3 - Battery
4 - Generator
5 - Feed Back Circuit B+
6 - Control Circuit
7 - Battery Sense

On gasoline powered engines, the charging system is turned on and off with the PCM (Powertrain Control Module) and ignition switch with engine running. On diesel powered engines, the charging system is turned on and off with the ECM (Engine Control Module) and ignition switch with engine running. The field circuit will not be energized until engine is running and ignition switch on. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source B+) at the back of the generator. The generator is internally grounded. The generator regulates the field using pin-1 of the field connector (high side driver).

The generator is driven by the engine through a serpentine belt and pulley, or a decoupler pulley arrangement.

The PCM, or ECM receives a voltage input from the generator (5) and also a battery voltage input (7) from the TIPM (Totally Integrated Power Module), it then compares the voltages to the desired voltage programed in the EVR (Electronic Voltage Regulator) software, and, if there is a difference it sends a signal to the generator EVR

circuit to increase or decrease output. It uses a Pulse Width Modulation (PWM) to send signals to the generator circuitry to control the amount of output from the generator. The amount of DC current produced by the generator is controlled by the EVR circuitry contained within the generator.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage**, engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The lamp is located on the instrument panel. Refer to the Instrument Cluster section for additional information.

Voltage is monitored at the B+ terminal stud to insure it is connected. If the B+ cable is loose, the PCM will shut down generator field. Because of this new feature, pin-2 of the field connector is internally connected to the B+ terminal.

The generator used with diesel engines is internally regulated. The generator and ECM communicate for diagnostics, etc. If the generator regulator becomes disconnected from the ECM, it will still operate, but in a default mode.

DIAGNOSIS AND TESTING - CHARGING SYSTEM

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp (if equipped) is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test in 8, Battery for more information.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

To perform a complete test of the charging system, refer to a diagnostic scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to 8, Battery for procedures.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications.

5. Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications in 7, Cooling System.
6. Inspect automatic belt tensioner (if equipped). Refer to 7, Cooling System for information.
7. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

GENERATOR 3.8L

DESCRIPTION

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into

the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The Y type stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicle electrical system through the generator battery terminal.

Although the generators appear the same externally, different generators with different output ratings are used on this vehicle. Be certain that the replacement generator has the same output rating and part number as the original unit. Refer to Generator Ratings in the Specifications section at the back of this group for amperage ratings and part numbers.

Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

REMOVAL - 3.8L

WARNING: Disconnect negative cable from battery before removing battery output wire (b+ wire) from generator. Failure to do so can result in injury or damage to electrical system.

1. Disconnect negative battery cable at battery.
2. Remove generator drive belt. Refer to 7, Cooling System for procedure.
3. Remove generator mounting bolts (1) and (3). Remove nut (2),

4. Unsnap plastic cover (1) from B+ terminal.
5. Remove B+ cable output terminal mounting nut. Disconnect terminal from generator.
6. Disconnect field wire connector (2) at rear of generator by pushing on connector tab.
7. Remove generator from vehicle.

INSTALLATION - 3.8L

1. Install generator mounting fasteners (1), (2), and (3) and tighten. Refer to Torque Specifications.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.

2. Install generator drive belt. Refer to 7, Cooling System for procedure.

3. Snap field wire connector (2) into generator.
4. Install B+ terminal to generator mounting stud. Tighten mounting nut. Refer to Torque Specifications.
5. Snap plastic cover (1) to B+ terminal.
6. Install negative battery cable to battery.

GENERATOR 2.8L VM

REMOVAL - 2.8L DIESEL

WARNING: Disconnect negative cable from battery

before removing battery output wire (b+ wire) from generator. Failure to do so can result in injury or damage to electrical system.

1. Disconnect negative battery cable at battery.
2. Disconnect field wire connector (2) at side of generator by pushing on connector tab.
3. Remove B+ cable output terminal mounting nut (1). Disconnect terminal from generator.
4. Remove generator drive belt. Refer to 7, Cooling System for procedure.

5. Remove two upper generator mounting bolts (1).
6. Remove two lower generator mounting bolts (2).
7. Remove generator from vehicle.

INSTALLATION - 2.8L DIESEL

81911119

1. Position generator to engine. Install two upper mounting bolts (1).
2. Install two lower mounting bolts (2). Tighten upper and lower bolts. Refer to Torque Specifications.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.

81911101

3. Install generator drive belt. Refer to 7, Cooling System for procedure.

4. Snap field wire connector (2) into generator.
5. Install B+ terminal to generator mounting stud. Tighten mounting nut (1). Refer to Torque Specifications.
6. Install negative battery cable to battery.

PULLEY - GENERATOR DECOUPLER

DESCRIPTION

The generator decoupler is used only with certain engines. The decoupler is used in place of the standard generator drive pulley .

8191110b

OPERATION

The generator decoupler is used only with certain engines. The decoupler is a one-way clutch designed to help reduce belt tension fluctuation, vibration, reduce fatigue loads, improve belt life, reduce hubloads on components, and reduce noise. Dry operation is used (no grease or lubricants). The decoupler is not temperature sensitive and also has a low sensitivity to electrical load. The decoupler is a non-serviceable item and is to be replaced as an assembly.

DIAGNOSIS AND TESTING - GENERATOR DECOUPLER

80a9349e

CONDITION	POSSIBLE CAUSES	CORRECTION
Does not drive generator (generator not charging)	Internal failure	Replace decoupler
Noise coming from decoupler	Internal failure	Replace decoupler

REMOVAL

The generator decoupler (2) is used only with certain

engines.

Two different type generator decoupler pulleys are used. One can be identified by the use of machined splines (3).

The other can be identified by a hex opening (2) and will not use splines.

Different special tools are required to service each different decoupler. Refer to following procedure.

INA Decoupler

1. Disconnect negative battery cable.
2. Remove generator and accessory drive belt. Refer to Generator Removal.
3. Position Special Tool #8823 (VM.1048) (2) into decoupler (1).

4. Determine if end of generator shaft is hex shaped (2) or.....

5.or
is splined
(2).

6. If hex is used, insert a 10mm deep socket (1) into tool
#8823 (VM.1048) (2).

7. If splined, insert a 5/16" 6-point hex driver, or a 10mm 12-point triple square driver (1) into tool #8823 (VM.1048) (2).

8. The generator shaft uses conventional right-hand threads to attach decoupler. To break decoupler loose from generator threads, rotate tools as shown

9. After breaking loose with tools, unthread decoupler by hand from generator.

Litens Decoupler

1. Disconnect negative battery cable.
2. Remove generator and accessory drive belt. Refer to Generator Removal.
3. Position Special Tool #8433 into decoupler. Align to hex end of generator shaft.

80a9c046

4. The generator shaft uses conventional right-hand threads to attach decoupler. To break decoupler loose from generator threads, rotate end of tool clockwise.

5. After breaking loose with tool, unthread decoupler by hand from generator.

INSTALLATION

80cabb87

INA Decoupler

1. Thread decoupler pulley onto generator shaft by hand (right-hand threads).
2. Position Special Tool #8823 (VM.1048) (2) into decoupler.
3. Determine if end of generator shaft is hex shaped or is splined. If hex is used, insert a 10mmM deep socket (1) into tool #8823 (VM.1048) (2).

4. If splined, insert a 5/16" 6-point hex driver, or a 10mm 12-point triple square driver (1) into tool #8823 (VM.1048) (2).

5. **Do not use an adjustable, ratcheting "click type" torque wrench. Most "click type" wrenches will only allow torque to be applied in a clockwise rotation. Use a dial-type or beam-type wrench.** Tighten in directions as shown. Refer to torque specifications.

6. Install accessory drive belt, and generator. Refer to Generator Installation.

7. Connect negative battery cable.

Litens Decoupler

1. Thread decoupler pulley onto generator shaft by hand (right-hand threads).

2. Position Special Tool 8433 into decoupler. Align tool to hex end of generator shaft.

3. **Do not use an adjustable, ratcheting "click type" torque wrench. Most "click type" wrenches will only allow torque to be applied in a clockwise rotation. Use a dial-type or beam-type wrench.** Tighten in direction as

shown. Refer to torque specifications.

4. Install accessory drive belt, and generator. Refer to Generator Installation.

5. Connect negative battery cable.

VOLTAGE REGULATOR

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and battery temperature (refer to Battery Temperature Sensor for more information). It then determines a target charging voltage. If sensed battery voltage is 0.5 volts or lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is 0.5 volts above target voltage. A circuit in the PCM cycles the ground side of the generator field up to 100 times per second (100Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. Also refer to Charging System Operation for additional information.

STARTING

STARTING

DESCRIPTION

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery

- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

OPERATION

The starting system components form two separate circuits. A high-amperage feed circuit that feeds the starter motor between 150 and 350 amperes (700 amperes - diesel engine), and a low-amperage control circuit that operates on less than 20 amperes. The high-amperage feed circuit components include the battery, the battery cables, the contact disc portion of the starter solenoid, and the starter motor. The low-amperage control circuit components include the ignition switch, the clutch pedal position switch (manual transmission), the park/neutral position switch (automatic transmission), the starter relay, the electromagnetic windings of the starter solenoid, and the connecting wire harness components.

If the vehicle is equipped with a manual transmission, it has a clutch pedal position switch installed in series between the ignition switch and the coil battery terminal of the starter relay. This normally open switch prevents the starter relay from being energized when the ignition switch is turned to the momentary Start position, unless the clutch pedal is depressed. This feature prevents starter motor operation while the clutch disc and the flywheel are engaged. The starter relay coil ground terminal is always grounded on vehicles with a manual transmission.

If the vehicle is equipped with an automatic transmission, battery voltage is supplied through the low-amperage control circuit to the coil battery terminal of the starter relay when the ignition switch is turned to the momentary Start position. The park/neutral position switch is installed in series between the starter relay coil ground terminal and ground. This normally open switch prevents the starter relay from being energized and the starter motor from operating unless the automatic transmission gear selector is in the Neutral or Park positions.

When the starter relay coil is energized, the normally open relay contacts close. The relay contacts connect the relay common feed terminal to the relay normally open terminal. The closed relay contacts energize the starter solenoid coil windings.

The energized solenoid pull-in coil pulls in the solenoid plunger. The solenoid plunger pulls the shift lever in the starter motor. This engages the starter overrunning clutch and pinion gear with the starter ring gear on the manual transmission flywheel or on the automatic transmission torque converter or torque converter drive plate.

As the solenoid plunger reaches the end of its travel, the solenoid contact disc completes the high-amperage starter feed circuit and energizes the solenoid plunger hold-in coil. Current now flows between the solenoid battery terminal and the starter motor, energizing the starter.

Once the engine starts, the overrunning clutch protects the starter motor from damage by allowing the starter

pinion gear to spin faster than the pinion shaft. When the driver releases the ignition switch to the On position, the starter relay coil is de-energized. This causes the relay contacts to open. When the relay contacts open, the starter solenoid plunger hold-in coil is de-energized.

When the solenoid plunger hold-in coil is de-energized, the solenoid plunger return spring returns the plunger to its relaxed position. This causes the contact disc to open the starter feed circuit, and the shift lever to disengage the overrunning clutch and pinion gear from the starter ring gear.

DIAGNOSIS AND TESTING

STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these three systems must perform within specifications.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO OPERATE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits, if required.
	3. Starter relay faulty.	3. The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to “no crank condition” in 9 - Engine - Electrical Diagnosis.
	4. Ignition switch faulty.	4. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	5. Clutch pedal position switch faulty.	5. Refer to Clutch Pedal Position Switch.
	6. Park/Neutral position switch faulty or misadjusted.	6. Refer to Park/Neutral Position Switch. Replace park/neutral position switch if required.
	7. Starter solenoid faulty.	7. Refer to Starter Motor. Replace starter motor assembly if required.
	8. Starter motor faulty.	8. If all other starting system components and circuits test OK, replace starter motor.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits if required.

	3. Starter motor faulty.	3. If all other starting system components and circuits test OK, replace starter motor assembly.
	4. Engine seized.	4. Refer to Engine Diagnosis in the Diagnosis and Testing section of 9, Engine.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Starter ring gear faulty.	1. Refer to Starter Motor Removal and Installation. Remove starter motor to inspect starter ring gear. Replace starter ring gear if required.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace starter motor assembly.
STARTER DOES NOT DISENGAGE.	1. Starter motor improperly installed.	1. Refer to Starter Motor Removal and Installation. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to “no crank condition” in 9 - Engine - Electrical Diagnosis.
	3. Ignition switch faulty.	3. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace starter motor.

INSPECTION

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

WARNING: On vehicles equipped with airbags, refer to 8, passive restraint systems, before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

- **Battery** - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **Battery** in 8, Battery. **Note: If equipped with diesel engine, a dual battery system may be used, and both batteries must be inspected.**
- **Ignition Switch** - Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Ignition Switch and Key Lock Cylinder**.
- **Clutch Pedal Position Switch** - If equipped with manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Clutch Pedal Position Switch** in 6, Clutch.
- **Park/Neutral Position Switch** - If equipped with automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Starter Relay** - The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to “no crank condition” in 9 - Engine - Electrical Diagnosis.
- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or

corroded wire harness connections.

- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to 8, Wiring Diagrams.

TESTING

COLD CRANKING TEST

NOTE: For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. The battery must be fully-charged and load-tested before proceeding. Refer to Battery in 8, Battery.

1. Connect volt-ampere tester (1) and (2) to battery terminals. See instructions provided by manufacturer of volt-ampere tester being used. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, tester should be connected to battery on left side of vehicle only. Also, tester current reading must be taken from positive battery cable lead that connects to starter motor.**

2. Fully engage parking brake.

3. If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.

4. Verify that all lamps and accessories are turned off.

5. To prevent a gasoline engine from starting, remove either the ignition run fuse, or the fuel pump control fuse. To prevent a diesel engine from starting, disconnect the electrical connectors at both the camshaft and crankshaft position sensors.

WARNING: Attempt to start engine a few times before proceeding with following step.

NOTE: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.

6. Rotate and hold ignition switch in Start position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.

a. If voltage reads below 9.6 volts, refer to **Starter Motor** in Diagnosis and Testing. If starter motor is OK, refer to **Engine Diagnosis** in 9, Engine for further testing of engine. If starter motor is not OK, replace faulty starter motor.

b. If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **Feed Circuit Test** in this section.

c. If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **Control Circuit Testing** in this section.

d. If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **Feed Circuit Test** in this section.

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer to Wiring Diagrams.

When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

Example: When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **Battery** in 8, Battery.
- Fully engage parking brake.
- If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
- Verify that all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Connect positive lead of voltmeter (1) to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, procedure must be performed twice, once for each battery.**

2. Connect positive lead of voltmeter to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**

3. Connect voltmeter to measure between battery positive terminal post and starter solenoid battery terminal stud . Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**

4. Connect voltmeter to measure between negative battery terminal post and a good clean ground on engine block . Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten negative battery cable attachment on engine block. Repeat test. If reading is still above 0.2 volt, replace faulty negative battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**

5. Connect positive lead of voltmeter to starter housing. Connect negative lead of voltmeter to negative battery terminal post . Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must**

be performed on driver side battery only.

6. If equipped with dual battery system (certain diesel equipped models), connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

If resistance tests detect no feed circuit problems, refer to **Starter Motor** in the Diagnosis and Testing.

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- **Starter Relay** - Refer to **Starter Relay** The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to “no crank condition” in 9 - Engine - Electrical Diagnosis.
- **Starter Solenoid** - Refer to **Starter Motor** Diagnosis and Testing.
- **Ignition Switch** - Refer to **Ignition Switch and Key Lock Cylinder**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, refer to **Clutch Pedal Position Switch** in 6, Clutch.
- **Park/Neutral Position Switch** - If equipped with automatic transmission, refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Wire harnesses and connections** - Refer to 8, Wiring Diagrams.

INSPECTION - STARTING SYSTEM

The following starting system components should be carefully inspected whenever any starting system problem is encountered.

WARNING: On vehicles equipped with airbags, disable airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate battery negative (ground) cable, then wait two minutes for airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable airbag system. Failure to take proper precautions could result in accidental airbag deployment and possible personal injury.

Battery

- Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery, if required. Refer to **Battery** for battery cleaning and inspection procedures.

Ignition Switch

- Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Wiring Diagrams**. Refer to **Ignition Switch and Key Lock Cylinder** for ignition switch service procedures.

Clutch Pedal Position Switch

- If vehicle is equipped with a manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Clutch Hydraulic Linkage** for clutch pedal position switch service procedures.

Park/Neutral Position Switch

- If vehicle is equipped with an automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Park/Neutral Position Switch** for park/neutral position switch service procedures.

Starter Relay

- Visually inspect starter relay for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Starter Relay** for starter relay service procedures.

Starter Motor

- Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. If problem being diagnosed involves improper starter engagement, disengagement or noise complaints, starter motor should be removed. With starter motor removed, inspect starter pinion and ring gears for damaged or missing teeth. Replace faulty components as required. Refer to **Starter Motor** for removal/installation procedures.

Starter Solenoid

- Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Starter Motor** for starter solenoid service procedures.

Wiring

- Visually inspect starting system wire harnesses for indications of physical damage. Repair or replace any faulty wiring, as required. Refer to **Wiring Diagrams** for repair or connector and terminal service procedures.

MOTOR - STARTER

DIAGNOSIS AND TESTING - STARTER MOTOR

Correct starter motor operation can be confirmed by performing the following free running bench test. This test can only be performed with starter motor removed from vehicle. Refer to Specifications for starter motor specifications.

1. Remove starter motor from vehicle. Refer to Starter Motor Removal and Installation.
2. Mount starter motor securely in a soft-jawed bench vise. The vise jaws should be clamped on the mounting flange of starter motor. Never clamp on starter motor by field frame.
3. Connect a suitable volt-ampere tester and a 12-volt battery to starter motor in series, and set ammeter to 100 ampere scale. See instructions provided by manufacturer of volt-ampere tester being used.
4. Install jumper wire from solenoid terminal to solenoid battery terminal. The starter motor should operate. If starter motor fails to operate, replace faulty starter motor assembly.
5. Adjust carbon pile load of tester to obtain free running test voltage. Refer to Specifications for starter motor free running test voltage specifications.
6. Note reading on ammeter and compare reading to free running test maximum amperage draw. Refer to Specifications for starter motor free running test maximum amperage draw specifications.
7. If ammeter reading exceeds maximum amperage draw specification, replace faulty starter motor assembly.

STARTER SOLENOID

Certain vehicles with certain engines may require starter motor removal for the following test.

1. If necessary, remove starter motor from vehicle. Refer to Starter Motor Removal and Installation.
2. Disconnect solenoid connector wiring from starter motor.

3. Check for continuity between solenoid terminal (2) and solenoid case (3). There should be continuity. If not OK, replace faulty starter motor assembly.

REMOVAL

REMOVAL - 3.8L

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. While supporting starter motor (1), remove two bolts (2) securing starter motor to transmission.

4. Lower starter motor far enough to access and remove nut (1) securing battery cable to starter solenoid B(+) terminal stud. Always support starter motor during this process. Do not let starter motor hang from wire harness.

5. Remove battery cable at starter.
6. Disconnect solenoid terminal wire harness connector from starter solenoid.
7. Remove starter motor.

REMOVAL - 2.8L DIESEL

81911753

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. While supporting starter motor (1), remove two bolts (2) securing starter motor to transmission.

81911895

4. Lower starter motor far enough to access and remove nut (1) securing battery cable to starter solenoid B(+) terminal stud. Always support starter motor during this process. Do not let starter motor hang from wire harness.
5. Remove battery cable at starter.
6. Disconnect solenoid terminal wire harness connector from starter solenoid.
7. Remove starter motor.

INSTALLATION

INSTALLATION - 3.8L

1. Connect solenoid terminal wire harness connector to starter solenoid. Always support starter motor during this process. Do not let starter motor hang from wire harness.
2. Install battery cable eyelet onto starter solenoid stud. Install and tighten nut (1). Refer to Torque Specifications.

3. Position starter motor to transmission. Install and tighten two mounting bolts (2). Refer to Torque Specifications.
4. Lower vehicle.
5. Connect negative battery cable.

INSTALLATION - 2.8L DIESEL

1. Connect solenoid terminal wire harness connector to starter solenoid. Always support starter motor during this process. Do not let starter motor hang from wire harness.
2. Install battery cable eyelet onto starter solenoid stud. Install and tighten nut (1). Refer to Torque Specifications.

3. Position starter motor to transmission. Install and tighten two mounting bolts (2). Refer to Torque Specifications.
4. Lower vehicle.
5. Connect negative battery cable.

RELAY - STARTER MOTOR

DESCRIPTION

The starter motor relay is located in the TPIM (Totally Integrated Power Module).

81911895

8G - HEATED SYSTEMS

HEATED GLASS-ELECTRICAL DIAGNOSTICS

HEATED GLASS-ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1016-REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW (CCN)

01559c78

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With ignition on, and the rear Defroster Grid activated.

◦ **Set Condition:**

When the Instrument Cluster (CCN) detects a low condition on the Rear Window Defogger Switch Signal circuit..

Possible Causes
(C215) REAR WINDOW DEFOGGER SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER (CCN)
HVAC CONTROL MODULE

1. VERIFY REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW IS ACTIVE

Turn the ignition on.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR DTC WITH THE A/C HEATER CONTROL DISCONNECTED

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Using the scan tool, check for DTC's

Does the scan tool display this DTC as active?

Yes

- Go To [3](#)

No

- Replace A/C Heater Control in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. CHECK THE (C215) REAR WINDOW DEFOGGER SWITCH SIGNAL CIRCUIT FOR SHORT TO GROUND

Disconnect the Instrument Cluster (CCN) C3 harness connector.

Using an ohm meter measure the resistance from the (C215) Rear Window Defogger Switch Signal circuit to ground.

Does the ohm meter read open circuit?

Yes

- Replace the Instrument Cluster (CCN) in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair short to ground on the (C215) Rear Window Defogger Switch Signal circuit.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10C2 – REAR DEFROST SWITCH

STUCK (CCN)

0100070

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Continuously

◦ **Set Condition:**

When the Rear Defrost Switch in the Switch Bank is held in the On position for over 10 seconds, this code will set.

Possible Causes
(D506) LIN BUS CIRCUIT SHORTED TO GROUND
SWITCH BANK STUCK
INSTRUMENT CLUSTER

1. VERIFY DTC B10C2 – REAR DEFROST SWITCH STUCK IS ACTIVE

Turn the ignition on.

With the scan tool, check for DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR DTC B10C2 – REAR DEFROST SWITCH STUCK WITH SWITCH BANK (REAR DEFOGGER SWITCH) DISCONNECTED

Turn the ignition off.

With the scan tool, erase DTC's.

Disconnect the Switch Bank connector.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display this code as active?

No

- Replace the Switch Bank in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Yes

- Go To [3](#)

3. (D506) LIN BUS CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster (CCN) C2 harness connector.

Measure the resistance between ground and the (D506) LIN Bus circuit.

Does the ohm meter read open circuit?

Yes

- Replace the Instrument Cluster (CCN) in accordance with service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (D506) LIN Bus circuit for a short to ground.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

HEATED GLASS - SERVICE INFORMATION

HEATED GLASS - SERVICE INFORMATION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned on or off by a switch located in the A/C-heater control at the center of the instrument panel (refer to 8 - ELECTRICAL/HEATED GLASS/SWITCH-REAR WINDOW DEFOGGER - DESCRIPTION).

OPERATION

When equipped, the electric backlight (EBL) system is controlled by a momentary switch (2) located in the A/C-heater control (1) in the instrument panel. When the rear window defogger switch is pressed to ON with the ignition switch in RUN, the cabin compartment node (CCN) sends a request signal over the CAN I-HS Bus to the totally integrated power module (TIPM) to energize the internal EBL high side driver. When energized, the EBL high side driver provides battery current to the rear window defogger grid lines. The grid lines heat the glass to help clear the rear window surface of fog or frost.

An amber indicator (3) in the rear window defogger switch will illuminate to indicate when the EBL system is ON.

NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent (refer to 8 - ELECTRICAL/HEATED GLASS/GRID-REAR WINDOW DEFOGGER - STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR).

The EBL control system is diagnosed using a scan tool (refer to 8G - Heated Glass Electrical Diagnostics for more information).

DIAGNOSIS AND TESTING

ELECTRIC BACKLIGHT (EBL) SYSTEM

NOTE: Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear window glass heating grid.

NOTE: For circuit descriptions and diagrams of the rear window defogger (EBL), refer to 8W - WIRING DIAGRAM INFORMATION.

Operation of the electric backlight (EBL) system can be confirmed by the following:

NOTE: Typical heated rear window glass shown.

1. Use a scan tool and check for diagnostic trouble codes (DTCs) related to the rear window defogger switch, cabin compartment node (CCN) and the totally integrated power module (TIPM). If no DTCs are found, go to [STEP 2](#). If any DTCs are found, repair as required, then proceed to [STEP 2](#).
2. Turn the ignition switch to RUN. Set the rear window defogger switch to ON. Rear window defogger operation can be checked by feeling the surfaces of the rear window glass. A distinct difference in temperature between the grid lines (5) and the adjacent clear glass should be detected within three to four minutes of operation.

3. If a temperature difference is not detected, use a 12-volt DC voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:

- Confirm the ignition switch is in RUN.
- Confirm the rear window defogger switch is ON.
- Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the TIPM and the heating grid.
- Confirm the EBL ground wire (6) is connected to the heating grid negative terminal and that there is continuity to ground.

4. If broken defogger grid lines or bus bars are suspected, use a 12-volt DC voltmeter and contact terminal A with the negative lead and each rear glass heating grid line at its mid-point C (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s) (refer to 8 - ELECTRICAL/HEATED GLASS/GRID-REAR WINDOW DEFOGGER - STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR).

5. If the EBL system operation has been verified but the rear window defogger indicator does not illuminate, replace the A/C-heater control (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL - A/C HEATER - REMOVAL).

GRID-REAR WINDOW DEFOGGER

STANDARD PROCEDURE

GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow the warnings may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).

2. Follow the instructions in the repair kit for preparing the damaged area.

3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.

4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).

5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.

6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.

7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).

9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

SWITCH-REAR WINDOW DEFOGGER

DESCRIPTION

The switch (2) for the rear window defogger (EBL) system is located in the A/C-heater control (1) in the instrument panel. When the rear window defogger switch is pressed to ON, the amber indicator (3) in the switch illuminates and a request signal is sent to the totally integrated power module (TIPM) to operate the EBL system.

When the EBL high side driver in the TIPM is energized, current is directed to the rear defogger grid lines to heat the glass to help clear the surface of fog or frost.

OPERATION

An amber indicator will illuminate when the rear window defogger switch is activated. When activated, the cabin compartment node (CCN) sends a request signal to the totally integrated power module (TIPM) to energize the internal EBL high side driver to provide battery current to the rear window defogger grid lines.

NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

The rear window defogger switch is diagnosed using a scan tool (refer to 8G - Heated Glass Electrical Diagnostics for more information).

The rear window defogger switch and indicator lamp cannot be adjusted or repaired and the A/C-heater control must be replaced if found inoperative or damaged (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).

8H - HORN

HORN SYSTEM-ELECTRICAL DIAGNOSTICS

HORN SYSTEM-ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B2339–HORN SWITCH STUCK – CLUSTER

01945006

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Continuously

- **Set Condition:**

When the Cluster senses the Horn Switch input for over 30 seconds, this code will set.

Possible Causes
HORN SWITCH
CLOCKSPRING
(X3) HORN SWITCH SENSE CIRCUIT SHORTED TO GROUND
(X3) HORN SWITCH SENSE CIRCUIT SHORTED TO (Y13) RADIO CONTROL RETURN
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display HORN SWITCH STUCK?

Yes

- Go To [2](#)

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. HORN SWITCH SHORTED

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Horn switch connector.
 With the scan tool, erase DTC's
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read DTC's.

Does the scan tool display HORN SWITCH STUCK?

Yes

- Go To [3](#)

No

- Replace the Horn Switch.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. STEERING WHEEL HARNESS SHORTED

Disconnect the Steering Control Module C5 connector.
 With the scan tool, erase DTC's
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read DTC's.

Does the scan tool display HORN SWITCH STUCK?

Yes

- Go To [4](#)

No

- Repair/replace the steering wheel jumper harness.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CLOCKSPRING SHORTED

Disconnect the Steering Control Module C2 connector.
 With the scan tool, erase DTC's
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read DTC's.

Does the scan tool display HORN SWITCH STUCK?

Yes

- Go To [5](#)

No

- Replace the clockspring.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. (X3) HORN SWITCH SENSE SHORTED TO GROUND

Turn the ignition off.
 Disconnect the Cluster C2 and C3 connector.
 Measure the resistance between (X3) Horn Switch Sense and the (X13) Radio Control Return circuit.

Is the resistance below 1000.0 ohms?

Yes

- Repair the (X3) Horn Switch Sense circuit for a short to (X13) Radio Control Return circuit.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (X3) HORN SWITCH SENSE SHORTED TO GROUND

Measure the (X3) Horn Switch Sense circuit to ground.

Is the resistance below 1000.0 ohms?

Yes

- Repair the Horn Switch Sense circuit for a short to ground.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Cluster.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

HORN SYSTEM - SERVICE INFO

HORN SYSTEM - SERVICE INFO

DESCRIPTION

The horn system features one low-note horn unit. The horn system uses a non-switched source of battery current so that the system will remain functional, regardless of the ignition switch position. The horn system includes the following components:

- Clockspring
- Horn
- Horn relay
- Horn switch

OPERATION

The horn system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

HORN

DIAGNOSIS AND TESTING

HORN

For complete circuit diagrams, refer to the appropriate wiring information.

1. Disconnect the wire harness connectors from the horn connector receptacles. Measure the resistance between the ground circuit cavity of the horns wire harness connectors and a good ground. There should be continuity. If OK, go to [STEP 2](#). If not OK, repair the open ground circuit to ground as required.
2. Check for battery voltage at the horn relay output circuit cavity of the horns wire harness connectors. There should be zero volts. If OK, go to [STEP 3](#). If not OK, repair the shorted horn relay output circuit or replace the faulty horn relay as required.
3. Depress the horn switch. There should now be battery voltage at the horn relay output circuit cavity of the horns wire harness connectors. If OK, replace the faulty horns. If not OK, repair the open horn relay output circuit to the horn relay as required.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the horn.
3. Remove the screw that secures the horn and mounting bracket.
4. Remove the horn and mounting bracket.

INSTALLATION

1. Install the horn to the mounting bracket.
2. Install the horn and bracket mounting fastener.
3. Connect the electrical connector.
4. Connect the battery negative cable.

HORN SWITCH

DESCRIPTION

A center-blow, normally open, resistive membrane-type horn switch is secured in a plastic tray that is inserted in a pocket sewn on the front of the driver side airbag retainer strap. The horn switch is concealed behind the driver side airbag module trim cover.

The steering wheel and steering column must be properly grounded in order for the horn switch to function properly. The horn switch and plastic tray are serviced as a unit. If the horn switch is damaged or faulty, or if the driver side airbag is deployed, the horn switch and tray must be replaced as a unit.

OPERATION

When the center area of the driver side airbag trim cover is depressed, the electrically conductive grids on the facing surfaces of the horn switch membranes contact each other, closing the switch circuit. The completed horn switch circuit provides a ground for the control coil side of the horn relay, which activates the relay. When the horn switch is released, the resistive tension of the convex membrane separates the two electrically conductive grids and opens the switch circuit.

DIAGNOSIS AND TESTING

HORN SWITCH

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Disconnect and isolate the battery negative cable. Remove the steering column opening cover from the instrument panel.
2. Check for continuity between the metal steering column jacket and a good ground. There should be continuity. If OK, go to [STEP 3](#). If not OK, refer to Steering, Column for proper installation of the steering column.
3. Remove the driver side airbag module from the steering wheel. Disconnect the horn switch wire harness connectors from the driver side airbag module.
4. Remove the horn fuse from the Totally Integrated Power Module (TIPM). Check for continuity between the steering column half of the horn switch feed wire harness connector and a good ground. There should be no continuity. If OK, go to [STEP 5](#). If not OK, repair the shorted horn relay control circuit to the horn relay in the TIPM as required.
5. Check for continuity between the steering column half of the horn switch feed wire harness connector and the horn relay control circuit cavity for the horn relay in the TIPM. There should be continuity. If OK, go to [STEP 6](#). If not OK, repair the open horn relay control circuit to the horn relay in the TIPM as required.
6. Check for continuity between the horn switch feed wire and the horn switch ground wire on the driver side airbag module. There should be no continuity. If OK, go to [STEP 7](#). If not OK, replace the faulty horn switch.
7. Depress the center of the driver side airbag module trim cover and check for continuity between the horn switch feed wire and the horn switch ground wire on the driver side airbag module. There should now be continuity. If not OK, replace the faulty horn switch.

REMOVAL

WARNING:

- On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.
- The horn switch is integral to the driver side airbag module. Service of this component should be performed only by Chrysler trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or

improper airbag deployment and possible occupant injuries.

1. Disconnect and isolate the battery negative cable.
2. Remove the trim cover from the driver side airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Remove the mounting fasteners.
4. Disconnect the electrical connector.
5. Remove horn switches by gently rocking the switch side to side while pulling outwards.

INSTALLATION

WARNING:

- On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.
- The horn switch is integral to the driver side airbag module. Service of this component should be performed only by Chrysler trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

1. Install the horn switches.
2. Connect the electrical connector.
3. Install the trim cover onto the driver side airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION) for the procedure.
4. Reconnect the battery negative cable.

8I - IGNITION CONTROL

IGNITION CONTROL- ELECTRICAL DIAGNOSTICS

IGNITION CONTROL- ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B2101-IGNITION RUN/START INPUT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition switch on.

- **Set Condition:**

The WCM/WIN (SKREEM) Module has detected the ignition switch input voltage below a calibrated value.

Possible Causes
(F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN
(A106) FUSED B+ SHORTED TO GROUND
IGNITION SWITCH
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With a scan tool, read, record and erase TIPM DTCs.

Turn the ignition off for 30 seconds, then back on.

Using the scan tool, read TIPM DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN

NOTE: Check the related fuse (TIPM 46) to the (F20) Ignition Switch Output (Run-Start) circuit. If blown, use the wiring diagrams as a guide to make necessary repairs.

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F20) Ignition Switch output (Run-Start) circuit in the TIPM C7 harness connector.

Does the test light illuminate brightly?

Yes

- Replace the TIPM in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (F20) Ignition switch output circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2102-IGNITION RUN/START INPUT CIRCUIT HIGH

01591128

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition switch on.

◦ **Set Condition:**

The WCM/WIN (SKREEM) Module has detected the ignition switch input voltage above a calibrated value.

Possible Causes
(F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORTED TO BATTERY VOLTAGE
WCM/WIN (SKREEM) MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: Check to make sure the battery and charging system are operating properly. Battery and charging system problems may cause these DTC's to set.

NOTE: Diagnose any related Powertrain DTC(s) before continuing.

Turn the ignition on.

With a scan tool, read, record and erase WCM/WIN (SKREEM) DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read WCM/WIN (SKREEM) DTC(s).

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (F20) IGNITION SWITCH OUTPUT (RUN-START) SHORTED TO BATTERY VOLTAGE

Turn the ignition off.
 Disconnect the WCM/WIN (SKREEM) harness connector.
 Using a 12-volt test light connected to ground, probe the (F20) Ignition Switch Output (Run-Start) circuit in the WCM/WIN (SKREEM) harness connector.

Does the test light illuminate brightly?

Yes

- Repair the (F20) Ignition Switch Output (Run-Start) circuit for a short to battery voltage.
- Perform SKREEM VERIFICATION TEST.

No

- Replace and program the WCM/WIN (SKREEM) in accordance with the service information.
- Perform SKREEM VERIFICATION TEST.

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

Battery voltage greater than 16 volts for approximately 15 seconds.

Possible Causes
GENERATOR
PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

NOTE: Make sure the generator drive belt is in good operating condition.

NOTE: Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.
With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes

- (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

No

- Check the above conditions that can cause a high voltage condition. Repair as necessary.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2142 IGNITION OFF DRAW (IOD) FUSE NOT PRESENT

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Ignition on. This DTC will set only if vehicle has less that 50 miles on it. After 50 miles, DTC B219F will set.

- **Set Condition:**

IOD Fuse not installed in the TIPM.

Possible Causes
IOD FUSE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. IOD FUSE INSTALLED

Verify IOD Fuse installed in TIPM

Is IOD Fuse present?

Yes

- Go To [3](#)

No

- Install the IOD Fuse.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. IOD FUSE BLOWN CHECK

Is IOD Fuse blown?

Yes

- Replace the IOD Fuse.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test complete.

B219A-IGNITION UNLOCK RUN/START CONTROL CIRCUIT OVERCURRENT

01991151

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

Over current condition detected on the (F200) Fused Ignition Switch Output (Run-Start) circuit.

Possible Causes
(F1) IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT SHORT TO GROUND
TERMINAL DAMAGE OR CORROSION
HIGH RESISTANCE ON THE (F1) FUSED IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT
POWERTRAIN CONTROL MODULE (PCM)
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. CHECK THE (F1) IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT FOR A SHORT TO GROUND

Disconnect the TIPM C1 harness connector.
 Disconnect the PCM harness connector.
 Using a 12-volt test light connected to 12-volts, probe the (F1) Ignition Switch Output (Unlock-Run-Start) circuit in the TIPM harness connector.

Does the test light illuminate brightly?

Yes

- Repair the (F1) Ignition Switch Output (Unlock-Run-Start) circuit for a short to ground.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. INSPECT THE TIPM & PCM TERMINALS & WIRE HARNESS FOR A CONDITION CAUSING HIGH CIRCUIT RESISTANCE

Disconnect the TIPM C1 harness connector.
 Disconnect the PCM harness connector.
 Inspect the connector terminals for signs of corrosion build up and damage.
 Visually inspect the wiring harness for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes

- Repair as necessary.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (F1) IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT FUNCTION

Connect one end of a jumper wire to the (F1) Ignition Switch Output (Unlock-Run-Start) circuit, and connect the other end to a clean chassis ground.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to battery.

Using a 12 volt test light connected to 12 volts, probe the (F1) Ignition Switch Output (Unlock-Run-Start) circuit in the TIPM C7 harness connector.

Does the test light illuminate brightly?

Yes

- Go To [5](#)
-

No

- Repair the Fused Ignition Switch Output (Run-Start) Circuit for high resistance.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. CHECK THE OUTPUT FROM THE TIPM ON THE (F1) IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT

Reconnect the TIPM C1 harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the (F1) Ignition Switch Output (Unlock-Run-Start) circuit.

Does the test light illuminate brightly?

Yes

- Replace the PCM in accordance with the service information.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the TIPM in accordance with the service

- information.
- Perform BODY VERIFICATION TEST VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC
CONTROL MODULES - STANDARD
PROCEDURE)

B219F IGNITION OFF DRAW (IOD) FUSE BLOWN

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. This DTC will only set if vehicle has over 50 miles on it.
- **Set Condition:**

IOD Fuse not installed or blown.

Possible Causes
IOD FUSE NOT INSTALLED
IOD FUSE BLOWN

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. IOD FUSE

Verify IOD Fuse installed in TIPM.

Is IOD Fuse present?

Yes

- Go To [3](#)

No

- Replace the IOD Fuse.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. IOD FUSE BLOWN

Verify IOD Fuse is blown.

Is IOD Fuse blown?

Yes

- Using the wiring diagrams, diagnose for a short to ground condition.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test complete.

B2206-CURRENT VIN MISSING / MISMATCH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

A PCM from another vehicle has been installed in the vehicle.

Possible Causes
PCM FROM ANOTHER VEHICLE INSTALLED

Diagnostic Test

1. PCM FROM ANOTHER VEHICLE INSTALLED

NOTE: This DTC is set when a PCM from another vehicle is installed into the current vehicle.

Has another PCM been installed?

Yes

- Replace the PCM in accordance with the service information.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [2](#)

2. OTHER CAN-C MODULES SET VIN MISMATCH

Is VIN Mismatch DTC set in other CAN-C modules?

Yes

- Replace the PCM in accordance with the service information.

- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the TIPM in accordance with the service information.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously

- **Set Condition:**

The TIPM is not configured for the vehicle.

Possible Causes
TIPM

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- Test complete.

2. ACTIVE TIPM DTC

Cycle the ignition from off to run remaining in run.
With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [3](#)

No

- Test complete.

3. VIN MISMATCH DTC PRESENT

Turn the ignition on.
With the scan tool, read DTCs.

Is DTC: B2206-CURRENT VIN MISSING / MISMATCH also active?

Yes

- Refer to repair procedure for DTC-B2206-CURRENT VIN MISSING / MISMATCH. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING)

No

- Replace the TIPM in accordance with the service information.
- Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0100-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0101-LOST COMMUNICATION WITH TCM

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0114-LOST COMMUNICATION WITH FINAL DRIVE

CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0164-LOST COMMUNICATION WITH HVAC CONTROL

MODULE

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

IGNITION CONTROL - SERVICE INFORMATION

IGNITION CONTROL - SERVICE INFORMATION

DESCRIPTION - IGNITION SYSTEM

NOTE: The 3.8L V-6 engine uses a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on this engine is referred to as the Direct Ignition System (DIS). The system's four main components are the coils, crankshaft position sensor, spark plugs, and camshaft position sensor.

SPECIFICATIONS

TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Camshaft Sensor Mounting Bolt — 3.8L V-6 Gas	14.1	-	125
Camshaft Sensor Mounting Bolt — 2.8L Diesel	11	8	97
Ignition coil bolts — 3.8L V-6 Gas	11.8	-	105
Spark Plugs — 3.8L V-6 Gas	17.5	13	-

FIRING ORDER — 3.8L

RELAY - AUTO SHUT DOWN

DESCRIPTION

The ASD (Automatic Shutdown Relay) is located in the TPIM (Totally Integrated Power Module).

SENSOR - CAMSHAFT POSITION 3.8L

REMOVAL - 3.8L

The CMP (Camshaft Position Sensor) (3) is bolted to front of engine. The CMP uses a pigtail wiring harness (2). This connects the sensor to the engine harness.

1. Disconnect negative battery cable.
2. Disconnect electrical connectors (1).
3. Remove sensor mounting bolt (4).
4. An O-ring is used to seal the sensor to engine. Remove sensor (3) from engine by pulling while rotating.

INSTALLATION - 3.8L

If the removed sensor is reinstalled, clean off old spacer (3) on sensor face. A NEW SPACER (3) must be attached to face before installation. Inspect O-ring (2) for damage, replace if necessary. If sensor is being replaced, confirm that paper spacer (3) is attached to face, and O-ring (2) is positioned in groove of new sensor.

1. Apply a couple drops of clean engine oil to the O-ring (2) prior to installation.

2. Install sensor (3) into engine and rotate into position.
3. Push sensor down until contact is made with camshaft gear. While holding sensor in this position, install and tighten mounting bolt (4) to 14 N·m (125 in. lbs.) torque.
4. Connect sensor pigtail connector (1) to engine harness connector.
5. Connect negative battery cable.

SENSOR - CAMSHAFT POSITION 2.8L DIESEL

DESCRIPTION

The Camshaft Position Sensor (CMP) (3) is located at the front/top of the cylinder head.

OPERATION

The Camshaft Position (CMP) sensor is a hall effect switch. A tooth made of a ferromagnetic material is attached to the camshaft. When this tooth (2) passes the CMP sensor, an electronic signal is created. This signal is then sent to the Engine Control Module (ECM) to determine Top Dead Center (TDC), and which cylinder has just entered its compression phase.

REMOVAL

The Camshaft Position Sensor (CMP) (3) is located at the front/top of the cylinder head.

1. Remove electrical connector from CMP sensor (3).
2. Clean area at base of sensor.
3. Remove sensor mounting bolt (1) and washer (2).
4. Pull sensor (3) straight up for removal.

INSTALLATION

1. Position CMP sensor (3) into mounting hole.
2. Install sensor mounting bolt (1) and washer (2). Tighten bolt to 11 N·m (8 ft. lbs.) (97 in. lbs.) torque.
3. Connect electrical connector to CMP sensor (3).

COIL - IGNITION 3.8L

REMOVAL - 3.8L

The ignition coil pack (1) is located above the left valve cover

1. Disconnect negative battery cable.
2. Remove six spark plug cables (4).
3. Disconnect electrical connector (3) from ignition coil.
4. Remove two coil mounting nuts (2).
5. Pull coil pack from mounting studs.

INSTALLATION - 3.8L

1. Install coil pack over mounting studs.
2. Install two mounting nuts (2).
3. Connect electrical connector (3) to ignition coil.
4. Install six ignition cables (4) to ignition coil.
5. Connect negative battery cable.

SENSOR - KNOCK 3.8L

REMOVAL - 3.8L

Only one knock sensor (4) is used. It is located on the right side of engine block, to the rear of right engine mount (3).

1. Disconnect negative battery cable.
2. Raise vehicle and support.
3. Disconnect electrical connector (1) from knock sensor.
4. Remove mounting bolt (2).
5. Remove sensor (4) from engine.

INSTALLATION - 3.8L

1. Thoroughly clean knock sensor mounting hole.
2. Position sensor (4) to engine.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock sensor bolt is relatively light for an 8 mm bolt (2).

NOTE: Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant

assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

3. Install and tighten mounting bolt (2). Tighten to 15 +/- 2 ft. lbs. (20 N·m) (176 in.lbs.).
4. Attach electrical connector (1) to knock sensor.
5. Lower vehicle.
6. Connect negative cable.

SPARK PLUG

DESCRIPTION - PLATINUM PLUGS

The V6 engine uses platinum resistor spark plugs. They have resistance values of 6,000 to 20,000 ohms when checked with at least a 1000 volt tester.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

CAUTION: Cleaning of the platinum plug may damage the platinum tip.

Apply anti-seize compound to spark plug threads only at point (1).

When the spark plug has a single or double platinum tip (2), a thin platinum pad may be welded to both, or just the center electrode end(s).

1. Extreme care (1) must be used to prevent spark plug

cross-threading, mis-gapping and ceramic insulator damage during plug removal and installation.

REMOVAL

When replacing the spark plugs and spark plug cables, route the cables correctly and secure them in the appropriate retainers. Failure to route the cables properly can cause the radio to reproduce ignition noise, cross ignition of the spark plugs or **short circuit the cables to ground**.

Always remove cables by grasping at the boot, rotating the boot 1/2 turn, and pulling straight back in a steady motion.

1. Prior to removing the spark plug, spray compressed air around the spark plug hole and the area around the spark plug.
2. Remove the spark plug using a quality socket with a foam insert.
3. Inspect the spark plug condition.

INSTALLATION

When replacing the spark plugs and spark plug cables, route the cables correctly and secure them in the appropriate retainers. Failure to route the cables properly can cause the radio to reproduce ignition noise, cross ignition of the spark plugs or **short circuit the cables to ground**.

1. Coat threads of spark plug with anti-seize. Be sure not to get anti-seize **ANYWHERE BUT ON THE THREADS OF THE SPARK PLUG..**
2. To avoid cross threading, start the spark plug into the cylinder head by hand.
3. Tighten spark plugs by referring to the Torque Specifications chart.
4. Install spark plug cables over spark plugs. A click will be heard and felt when the cable properly attaches to the spark plug.

CABLE - SPARK PLUG

DIAGNOSIS AND TESTING

Check the spark plug cable connections for good contact at the coil(s) and spark plugs. Terminals should be fully seated. The insulators should be in good condition and should fit tightly on the coil and spark plugs. Spark plug cables with insulators that are cracked or torn must be replaced.

Clean high voltage ignition cables with a cloth moistened with a non-flammable solvent. Wipe the cables dry. Check for brittle or cracked insulation.

When testing secondary cables for damage with an oscilloscope, follow the instructions of the equipment manufacturer.

If an oscilloscope is not available, spark plug cables may be tested as follows:

CAUTION: Do not leave any one spark plug cable disconnected for longer than necessary during testing. This may cause possible heat damage to the catalytic converter. Total test time must not exceed ten minutes.

With the engine running, remove spark plug cable from spark plug (one at a time) and hold next to a good engine ground. If the cable and spark plug are in good condition, the engine rpm should drop and the engine will run poorly. If engine rpm does not drop, the cable and/or spark plug may not be operating properly and should be replaced. Also check engine cylinder compression.

With the engine not running, connect one end of a test probe to a good ground. Start the engine and run the other end of the test probe along the entire length of all spark plug cables. If cables are cracked or punctured, there will be a noticeable spark jump from the damaged area to the test probe. Cracked, damaged or faulty cables should be replaced with resistance type cable. This can be identified by the words ELECTRONIC SUPPRESSION printed on the cable jacket.

Use an ohmmeter to test for open circuits, excessive resistance or loose terminals. Remove the cable at ignition coil, and from spark plug. Connect ohmmeter to each end of cable. Resistance should be 250 to 1000 Ohms per inch of cable. If resistance is not within specifications as found in the SPARK PLUG CABLE RESISTANCE chart, replace the cable. Test all spark plug cables in this manner.

PLUG - GLOW 2.8L DIESEL

DESCRIPTION

CAUTION: The glow plugs operate on a 4.4-volt system. The glow plugs DO NOT tolerate any over voltage. Full battery voltage will destroy the glow plug immediately. DO NOT test the glow plugs with a 12V source as damage will occur to the glow plug.

CAUTION:

- Never bend, bump or knock the fast metallic glow plugs.
- Fast metallic glow plugs must not be handled loose in a container. Store, handle, and transport them only in original boxes.
- If there is any doubt about the proper condition of a glow plug, do not reuse it.
- Do not clean the glow plugs with abrasive or aggressive media.
- Avoid dipping the glow plug into fluids.
- Read Diagnostic Trouble Codes (DTCs). If a glow plug problem is indicated, do not start the engine.

CAUTION: Disregarding these instructions may cause severe engine damage.

Glow plugs are used to help start a cold or cool engine. The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder.

OPERATION

CAUTION: The glow plugs operate on a 4.4-volt system. DO NOT test the glow plugs with a 12 V source as damage will occur to the glow plug(s).

The Engine Control Module (ECM) monitors various engine sensors. When the ignition key is turned to the ON position, the ECM sends a signal to the glow plug module (relay) to turn on, and cycle, the glow plugs for a pre-determined amount of time, plus illuminate the glow plug light in the instrument panel. Once activated, the element inside of the core of the glow plug begins to glow. Each glow plug draws approximately 8 amps, for a total system amperage of 32 amps at 22° C (72° F) ambient temperature. If there is a fault with the glow plug system, the ECM will store a fault code.

DIAGNOSIS AND TESTING - GLOW PLUGS

CAUTION: DO NOT attempt to start the engine until the glow plug system tests correctly.

1. Measure the electrical resistance of each glow plug while it is still installed in the cylinder head. Resistance should be less than 0.8 Ω between the electrical connector point on the glow plug and the cylinder head. The ground contact on the DVOM must be as close as possible to the point where the glow plug contacts the cylinder head to avoid erratic resistance measurements.
2. If the resistance is out of tolerance, remove the glow plug from the cylinder head and check the resistance again.
3. Use the actuator test function of the scan tool to test the glow plug module and glow plug lamp. The glow plug module's on-board diagnostic tests will automatically check the electrical condition of the entire glow plug system.
4. After the scan tool glow plug actuator test function is complete, if MIL is OFF and no glow plug DTCs are present, testing is complete and the engine can be started.
5. If MIL is still ON, check the harness connectors of glow plugs, repair any loose or damaged connections, and run the glow plug actuator test again.
6. If MIL is still ON and glow plug DTCs are present, refer to 9 - Engine Electrical Diagnostics - Diesel, and follow the diagnostic test(s) related to the active or stored DTCs.

REMOVAL

The four glow plugs (1) are attached to cylinder head below fuel rail.

1. Disconnect negative battery cable.

2. Remove fuel rail and high-pressure fuel lines.
3. Disconnect glow plug wiring harness (2) at all four glow plugs (1).

81b16a21

4. Use a socket to loosen glow plug(s) (1), (2), (3) or (4). After loosening, attach a flexible tool such as a rubber hose to remove glow plug from cylinder head.

CAUTION: After plug removal, do not bend, knock, or drop the glow plugs while handling (any mechanical impact may damage the glow plug).

INSTALLATION

81b120af

1. Apply a small amount of clean diesel oil or motor oil to glow plug threads.
2. Attach a flexible tool such as a rubber hose to install glow plug into cylinder head. Tighten each plug to 14 N·m (10 ft. lbs.) (124 in. lbs.) torque.

3. Connect glow plug wiring harness (2) to all four glow plugs (1).
4. Install fuel rail and high-pressure fuel lines.
5. Connect negative battery cable.

GLOW PLUG RELAY

REMOVAL

1. **RIGHT HAND DRIVE:**
2. The glow plug relay (3) is located near the front of the battery (1).
3. Disconnect negative battery cable.
4. Carefully pull out mounting pin (2).
5. Disconnect electrical connector (4) from relay.

6. **LEFT HAND DRIVE:**

7. The glow plug relay (3) is located near the side of the battery (1).
8. Disconnect negative battery cable.
9. Carefully pull out mounting pin (2).
10. Disconnect electrical connector (4) from relay.

INSTALLATION

1. **RIGHT HAND DRIVE:**

2. The glow plug relay (3) is located near the front of the battery (1).
3. Connect electrical connector (4) to relay.
4. Push mounting pin (2) through relay (3).
5. Connect negative battery cable.

6. LEFT HAND DRIVE:

7. The glow plug relay (3) is located near the side of the battery (1).
8. Connect electrical connector (4) to relay.
9. Push mounting pin (2) through relay (3).
10. Connect negative battery cable.

8J - INSTRUMENT CLUSTER**INSTRUMENT CLUSTER -
ELECTRICAL DIAGNOSTICS****INSTRUMENT CLUSTER -
ELECTRICAL DIAGNOSTICS****DIAGNOSIS AND TESTING****B123F-MENU SWITCH STUCK**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Instrument Cluster detects the Menu Switch active for greater than 20 seconds.

Possible Causes
INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Press the MENU switch three times.
With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Replace the Instrument Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test complete

B127A-COMPASS PERFORMANCE

CLUSTER C2

MODULE-COMPASS

01041958

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

Compass performance.

Possible Causes
(F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN
(Z916) GROUND CIRCUIT OPEN
COMPASS MODULE
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

NOTE: Remove any electronic devices (laptop computers, cell phones) from the instrument panel.

NOTE: Before proceeding, check the compass variance and calibration in accordance with the service information.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN

Measure the voltage of the (F921) Fused Run Relay Output circuit for an open.

Is the voltage above 10 volts?

Yes

- Go To [3](#)

No

- Repair the (F921) Fused Run Relay Output circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (Z916) GROUND CIRCUIT OPEN

Measure the resistance of the (Z916) Ground circuit for an open.

Is the resistance above 10K ohms?

Yes

- Repair the (Z916) Ground circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Compass Module in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1288-TRIP/TOGGLE SWITCH PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Instrument Cluster detects the Trip/Toggle Switch active for greater than 20 seconds.

Possible Causes
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Press the Trip/Toggle switch three times.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Replace the Instrument Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Test complete

B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW

0194000

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on and the Panel Illumination active.

- **Set Condition:**

Panel Illumination Status LOW.

Possible Causes
(E12) PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND
A/C HEATER CONTROL LAMP (FRONT AND/OR REAR) SHORTED TO GROUND
FRONT WINDOW SWITCH LAMP SHORTED TO GROUND
SHIFT ASSEMBLY LAMP SHORTED TO GROUND
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Panel Illumination.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK EACH NON-FUNCTIONING COMPONENT FOR AN INTERNAL SHORT TO GROUND

NOTE: Using the wiring diagram as a guide disconnect each non-functioning component one at a time while checking for the DTC to become stored. Repeat these steps for each component.

Turn the ignition off.

Disconnect the non-functioning component harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

Is the DTC still active?

Yes

- Go To [3](#)

No

- Replace the non-functioning component that when disconnected caused the DTC to become stored in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster C1 harness connector.

With all (E12) Panel Lamps Driver circuit components disconnected, measure the resistance to ground on the (E12) Panel Lamps Driver Circuit from the Instrument Cluster C1 harness connector.

Is the resistance less than 10K ohms?

Yes

- Repair the (E12) Panel Lamps Driver circuit for a short to ground.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC
CONTROL MODULES - STANDARD
PROCEDURE)

B1615-PANEL ILLUMINATION CONTROL CIRCUIT OPEN

0194000

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on and the Panel Illumination circuit active.

◦ **Set Condition:**

The Instrument Cluster detects an open condition on the Panel Illumination Control circuit.

Possible Causes
(E12) PANEL LAMPS DRIVER CIRCUIT OPEN
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Panel Illumination.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Cluster C1 harness connector.

Inspect the connector and associated wiring for the Panel

illumination circuit.
Using a fused jumper wire connected to 12 volts, probe cavity 2 of the Cluster C1 harness connector.

Did the components illuminate?

- Yes**
- Replace the Instrument Cluster in accordance with the service information.
 - Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

- No**
- Using the wiring diagrams as a guide, locate and repair the (E12) Panel Lamps Driver circuit for an open.
 - Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.
- **Set Condition:**

Battery voltage greater than 16 volts for approximately 15 seconds.

Possible Causes
GENERATOR
PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

NOTE: Make sure the generator drive belt is in good operating condition.

NOTE: Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes

- (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

No

- Check the above conditions that can cause a high voltage condition. Repair as necessary.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

P0853-OVERDRIVE/TOW SWITCH INPUT CIRCUIT STUCK

010220018

For a complete wiring diagram **Refer to Section 8W.**

(T6) TOW/HAUL OD OFF SIGNAL SHORTED TO GROUND
SHIFT LEVER ASSEMBLY
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

Press the TOW/HAUL switch 3 times.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. SHIFT LEVER ASSEMBLY

Disconnect the Shift Lever Assembly harness connector.

With the scan tool, read DTCs.

Does the scan tool display the DTC as active?

Yes

- Go To [3](#)

No

- Replace the Shift Lever Assembly in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (T6) TOW/HAUL OD OFF SIGNAL SHORTED TO GROUND

Turn the ignition off.

Disconnect the Cluster C3 harness connector.

Measure the resistance between ground and the (T6) TOW/HAUL OD OFF signal circuit at the Cluster C3 harness connector.

Is the resistance below 10K ohms?

Yes

- Repair the (T6) TOW/HAUL OD OFF Signal Circuit for a short to ground.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE (TOTALLY INTEGRATED POWER MODULE)

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0161-LOST COMMUNICATION WITH COMPASS MODULE

**CLUSTER C2****MODULE-COMPASS**

01041958

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The Cluster does not receive information from the Compass Module.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(F921) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN
(Z916) GROUND CIRCUIT OPEN
COMPASS MODULE
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

NOTE: Remove any electronic devices (laptop computers, cell phones) from the instrument panel.

NOTE: Before proceeding, check the compass variance and calibration in accordance with the service information.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (D506) LIN BUS CIRCUIT

Turn the ignition off.
Disconnect the Compass Module harness connector.
Turn the ignition on.
Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.
Disconnect the Instrument Cluster C2 harness connector.
Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

- Replace the Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (D506) LIN BUS circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (F921) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Ignition Switch Output (RUN) circuit at the Compass Module harness connector.

Does the test light illuminate brightly?

Yes

- Go To [5](#)
-

No

- Repair the (F921) Fused Ignition Switch Output (RUN) circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. (Z916) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z916) Ground circuit at the Compass Module harness connector.

Does the test light illuminate brightly?

Yes

- Replace the Compass Module in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (Z916) ground circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram **Refer to Section 8W.**

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U1008-LIN 1 BUS

01-06-1902

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

LIN 1 Bus Performance.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(D506) LIN BUS CIRCUIT SHORT TO GROUND
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: U1008–LIN 1 BUS?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. SHORTED COMPONENT

NOTE: After disconnecting each component, check DTCs with the scan tool.

Turn the ignition on.

Disconnect the Compass Module harness connector.

Disconnect the Switch Bank harness connector.

Disconnect the Steering Control Module C1 harness connector.

With each component disconnected, did the DTC U1008–LIN 1 BUS change from active to stored?

Yes

- Replace the component that caused the DTC U1008–LIN 1 BUS to change from active to stored.
- Perform BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)
-

3. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Disconnect the Multifunction Switch harness connector.

Measure the resistance of the (D506) LIN Bus circuit.

Is the resistance above 10K ohms?

Yes

- Repair the (D506) LIN Bus circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1.
(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (D506) LIN BUS CIRCUIT SHORT TO GROUND

Turn the ignition off.
Measure the resistance to ground on the (D506) LIN Bus circuit.

Is the resistance below 10K ohms?

Yes

- Repair the (D506) LIN Bus circuit for a short to ground.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

PROCEDURE)

**U113B-LOST COMMUNICATION
WITH SWITCH BANK MODULE**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

◦ **Set Condition:**

The Cluster does not receive information from the Switch Bank Module.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(A418) FUSED B+ CIRCUIT (EARLY PRODUCTION) OPEN
(A909) FUSED B+ CIRCUIT (LATE PRODUCTION) OPEN
(Z911) GROUND CIRCUIT OPEN
SWITCH BANK MODULE
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (D506) LIN BUS CIRCUIT

Turn the ignition off.
 Disconnect the Switch Bank Module harness connector.
 Turn the ignition on.
 Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Cluster C2 harness connector.
 Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

- Replace the Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (D506) LIN BUS circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (A418)/(A909) FUSED B+ CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (A418)/(A909) Fused B+ circuit at the Switch Bank Module harness connector.

Does the test light illuminate brightly?

Yes

- Go To [5](#)
-

No

- Repair the (A418)/(A909) Fused B+ circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. (Z911) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z911) Ground circuit at the Switch Bank Module harness connector.

Does the test light illuminate brightly?

Yes

- Replace the Switch Bank Module in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (Z911) ground circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U1149-LOST COMMUNICATION WITH MULTIFUNCTION SWITCH (STEERING CONTROL MODULE)

81310064

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on.

- **Set Condition:**

The Cluster does not receive information from the Steering Control Module.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN
(A412) FUSED B(+) (I.O.D.) CIRCUIT OPEN
(Z910) GROUND CIRCUIT OPEN
STEERING CONTROL MODULE
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (D506) LIN BUS CIRCUIT

Turn the ignition off.
 Disconnect the Steering Control Module harness connector.
 Turn the ignition on.
 Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.
 Disconnect the Cluster C2 harness connector.
 Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

- Replace the Cluster in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (D506) LIN BUS circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F943) Fused RUN/START Relay Output circuit at the Steering Control Module harness connector.

Does the test light illuminate brightly?

Yes

- Go To [5](#)
-

No

- Repair the (F943) Fused RUN/START Relay Output circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. (A412) FUSED B+ (I.O.D.) CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (A412) Fused B+ (I.O.D.) circuit at the Steering Control Module harness connector.

Does the test light illuminate brightly?

Yes

- Go To [6](#)
-

No

- Repair the (A412) Fused B+ (I.O.D.) circuit for an open.

- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (Z910) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z910) Ground circuit at the Steering Control Module harness connector.

Does the test light illuminate brightly?

Yes

- Replace the Steering Control Module in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (Z916) ground circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

INSTRUMENT CLUSTER

INSTRUMENT CLUSTER

DESCRIPTION

Diagram illustrating the location of the horn button (1) and the horn relay (2) in the steering column area.

1394

features, numerous textual warning or reminder indicators and certain diagnostic information depending upon vehicle equipment.

The EMIC gauges and indicators are visible through a dedicated opening in the instrument panel below the cluster bezel and are protected by a clear plastic cluster lens (5). Nine integral latch formations on the lens secure it to the cluster hood and mask unit (3) as well as the cluster housing (2). Just behind the cluster lens is the cluster hood and integral mask, which is constructed of molded black plastic. The mask is painted silver on vehicles with certain optional trim packages. The hood serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare, while the cluster mask serves to separate and define the individual gauges from the indicator areas and trims the outside perimeter of the cluster overlay. The hood and mask has eight integral latch features that secure it to the outer perimeter of the cluster housing. The hood and mask unit also has two integral mounting tabs on the lower corners that combine with the tabs integral to the cluster housing to secure the bottom of the EMIC to the molded plastic instrument panel cluster carrier with two screws.

The rear of the cluster housing and the EMIC electronic circuitry are protected by a molded white plastic rear cover (1), which is also secured to the cluster housing by integral latch features. The rear cover includes clearance holes for the four cluster connector receptacles. The connector receptacles on the back of the cluster electronic circuit board connect the EMIC to the vehicle electrical system through four take outs with connectors from the instrument panel wire harness.

Sandwiched between the rear cover and the lens and hood unit is the cluster housing. The molded white plastic cluster housing serves as the carrier for the cluster circuit board and circuitry, the cluster connector receptacles, the two major and two minor gauges, a Light Emitting Diode (LED) for each cluster indicator, the VFD display units, an audible tone transducer, several LED units for general cluster illumination, the cluster overlay, and the gauge pointers. The standard equipment molded black plastic odometer/trip odometer switch button as well as the optional CMTC display switch button extend from the face of the cluster housing through dedicated holes in the cluster mask and the cluster lens adjacent to their respective VFD units. A black rubber boot (4) seals each switch button to the clearance hole in the lens. The cluster housing also has four integral mounting tabs, one on each upper and lower corner of the housing.

The cluster overlay is a laminated plastic unit. The dark, visible, outer surface of the overlay is marked with all of the gauge dial faces and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated, while the translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the LED for each of the various indicators and illumination lamps behind it to be visible through the outer layer of the overlay through predetermined stencil-like cutouts. Openings in the overlay at the base of the speedometer and tachometer dial faces have smoked clear lenses through which the illuminated VFD units can be viewed.

Several versions of the EMIC module are offered on this vehicle. These versions accommodate all of the variations of optional equipment and regulatory requirements for the various markets in which the vehicle is offered. The microprocessor-based EMIC utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus and the Local Interface Network (LIN) data bus along with several hard wired

analog and multiplexed inputs to monitor sensors and switches throughout the vehicle. In response to those inputs, the internal circuitry and programming of the EMIC allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the CAN and LIN data busses. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION - CAN BUS).

Besides typical instrument cluster gauge and indicator support, the electronic functions and features that the EMIC supports or controls include the following:

- **A/C Select and Evaporator Probe Support** - The EMIC monitors hard wired inputs from the A/C select switch in the air conditioner-heater control and evaporator temperature sensor inputs, then transmits electronic **A/C clutch request** messages over the CAN data bus when appropriate to support the A/C clutch control feature.
- **Audible Warnings** - The EMIC electronic circuit board is equipped with an audible tone transducer and programming that allows it to provide various audible alerts to the vehicle operator. These alerts include single chime tones and continuous slow or fast tones. An electromechanical relay is also soldered onto the circuit board to produce audible clicks that are used to emulate the sound of a conventional turn signal or hazard warning flasher.
- **Compass Mini-Trip Computer Display Support** - The EMIC provides support for each of the functions and features of the Compass-Mini-Trip Computer (CMTC) display. This includes support for the compass, thermometer, trip computer and the switch inputs that are used to control and configure many of the displays. This also includes display arbitrator programming, which controls the priorities, sequences, and transition of information that is displayed in the CMTC display, particularly when multiple display requests are received simultaneously.
- **Electric Backlight Support** - The EMIC monitors Electric BackLight (EBL) switch hard wired inputs from the air conditioner-heater control, then transmits the appropriate electronic **EBL request** messages over the CAN data bus to support the EBL function.
- **Enhanced Accident Response Support** - The EMIC monitors inputs from the Occupant Restraint Controller (ORC) and the Powertrain Control Module (PCM) to automatically turn ON the interior lighting after an airbag deployment event, 10 seconds after the vehicle speed is zero. The interior lighting remains illuminated until the key is removed from the ignition switch lock cylinder, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lighting Switch Support** - The EMIC monitors electronic **exterior lighting switch**, and **turn signal switch status** messages from the Steering Control Module (SCM) on the steering column over the LIN data bus and transmits the appropriate electronic **exterior lighting** and **turn signal request** messages to the Totally Integrated Power Module (TIPM) over the CAN data bus to support the exterior lighting functions.
- **Four Wheel Drive (4WD) Lock Switch Support** - The EMIC monitors a hard wired input from the 4WD Lock switch on the center floor console then transmits the appropriate electronic **4WD Lock request** and **Unlock request** messages to the Totally Integrated Power Module (TIPM) over the CAN data bus to support the 4WD Lock mode functions.
- **Horn Switch Support** - The EMIC receives a hard wired input from the horn switch on the steering wheel then provides electronic **horn request** messages over the CAN data bus to support the horn function.
- **Interior Lamp Load Shedding** - The EMIC provides a battery saver feature which will automatically turn OFF all interior lamps if they remain ON after a timed interval of about ten minutes.
- **Interior Lighting Control** - The EMIC monitors electronic messages and hard wired inputs from the interior lighting switch, the door ajar switches, the liftgate ajar switch, the reading lamp switches, and the Sentry Key REmote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM) to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-OFF and courtesy illumination DEFEAT features.
- **Local Interface Network Master Module** - The EMIC is the master module for the LIN data bus. In this

role it gathers information from the compass sensor, the Heated Seat Module (HSM), the instrument panel switch pod and the SCM, then either acts on that information directly or places electronic messages on the CAN data bus for use by other modules

- **Panel Lamps Dimming Control** - The EMIC monitors electronic **dimming level** messages received from the panel lamps dimmer switch input to the SCM over the LIN data bus, then provides both a hard wired 12-volt Pulse-Width Modulated (PWM) output and electronic message outputs over the LIN data bus that synchronizes the dimming level of all panel lamps dimmer controlled lamps with that of the cluster general illumination lighting.
- **Wiper and Washer Switch Support** - The EMIC monitors electronic **wiper switch** and **washer switch status** messages from the SCM on the steering column over the LIN data bus and transmits the appropriate electronic **wiper** and **washer request** messages to the TIPM over the CAN data bus to support the wiper and washer system functions, including the headlamps-on with wipers programmable feature.

The EMIC houses 4 analog gauges and has provisions for up to 25 indicators. Some of the EMIC indicators are automatically configured when the EMIC is connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each EMIC may have provisions for indicators to support every available option, the configurable indicators will not be functional in a vehicle that does not have the equipment that an indicator supports.

The EMIC includes the following analog gauges:

- **Engine Temperature Gauge (23)**
- **Fuel Gauge (36)**
- **Speedometer (5)**
- **Tachometer (16)**

The EMIC includes the following VFD units:

- **Odometer Display (25)** - includes Cruise indicator (17), Gear Selector indicator (15), Malfunction Indicator Lamp (MIL) (27) (domestic market vehicles only), Off Road indicator (26) (Not Used), Push Buttons (24), Tire Pressure Monitor (TPM) indicator (19) and 4WD indicator (18) (domestic market vehicles only).
- **Compass Mini-Trip Computer Display (34)** - includes Push Button (35).

The EMIC includes provisions for the following indicators:

- **Airbag Indicator (14)**
- **Ajar Indicators** - text in odometer display (25) for doors and swing gate
- **Antilock Brake System (ABS) Indicator (13)**
- **Brake Indicator (11)** - text only for U.S. market, icon only for markets outside U.S.
- **Change Oil Indicator** - textual message in odometer display (25) on all domestic market vehicles and only BUX market vehicles equipped with a 2.8L diesel engine and an optional diesel particulate filter
- **Charging Indicator (1)**
- **Cruise Indicator (17)**
- **Electronic Stability Program (ESP)/Brake Assist System (BAS) Indicator (33)**
- **Electronic Throttle Control (ETC) Indicator (32)**
- **Engine Coolant Temperature Indicator (20)**
- **Four-Wheel Drive (4WD) Indicator (18)** - with optional four-wheel drive system only on domestic market vehicles. On export market vehicles, this indicator is located on the right side of the cluster overlay near the top, above the engine coolant temperature gauge.
- **Four-Wheel Drive Lock (Off Road) Indicator (26)** - Not Used
- **Front Axle Lock Indicator (9)** - with optional axle lockers only
- **Front Fog Lamp Indicator (3)** - with optional front fog lamps only
- **Front Sway Bar Disconnect Indicator (31)** - with optional electronic sway bar disconnect only
- **Gas Cap Indicator** - textual message in odometer display (25)
- **Gear Selector Indicator (15)** - with automatic transmission only
- **High Beam Indicator (10)**
- **Low Fuel Indicator (4)**
- **Low Oil Pressure Indicator (8)**
- **Malfunction Indicator Lamp (MIL) (27)** - only on domestic market vehicles. On export market vehicles, this indicator is located on the right side of the cluster overlay near the top, above the engine coolant temperature gauge.
- **No Fuse Indicator** - textual message in odometer display (25)
- **Overdrive Off Indicator (28)** - with automatic transmission only
- **Rear Axle Lock Indicator (12)** - with optional axle lockers only
- **Rear Fog Lamp Indicator (21)** - in markets where rear fog lamps are available only
- **Seat Belt Indicator (7)**
- **Security Indicator (22)**
- **Tire Pressure Monitor (TPM) Indicator (19)**
- **Traction Control/Electronic Stability Program (ESP) Indicator (29)**
- **Turn Signal (Right and Left) Indicators (6)**
- **Wait-To-Start Indicator (30)** - with diesel engine only
- **Water-In-Fuel Indicator (2)** - with diesel engine only

Each indicator in the EMIC, except those located within a VFD unit, is illuminated by a dedicated LED that is soldered onto the EMIC electronic circuit board. Cluster illumination is accomplished by several dimmable LED units, which illuminate each of the gauge dial faces for visibility when the exterior lighting is turned ON. These LED units are not available for service replacement and, if damaged or ineffective, the entire EMIC must be replaced.

Hard wired circuitry connects the EMIC to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC module for this vehicle is serviced only as a complete unit. The EMIC module cannot be adjusted or repaired. If a gauge, an LED unit, a VFD unit, the electronic circuit board, the circuit board hardware, the cluster overlay or the cluster housing are damaged or ineffective, the entire EMIC module must be replaced. The cluster lens and the cluster hood and mask unit are available for separate service replacement.

OPERATION

The ElectroMechanical Instrument Cluster (EMIC) in this vehicle also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN. The following information deals primarily with the instrument cluster functions of this unit. Additional details of the electronic body control functions of this unit may be found within the service information for the system or component that the EMIC controls. For example: Additional details of the audible warning functions of the EMIC are found within the Chime/Buzzer service information.

The EMIC is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the EMIC provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The EMIC is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service.

The microprocessor-based EMIC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus or the Local Interface Network (LIN) data bus. The EMIC is the master node for the LIN data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

The EMIC microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The EMIC may also produce audible warnings for other electronic modules in the vehicle based upon electronic **tone request** messages received over the CAN or LIN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The EMIC circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the EMIC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the ON or START positions. The EMIC circuitry is grounded through a ground circuit and take out of the instrument panel wire harness with an eyelet terminal connector that is secured by a ground screw to a ground location on the instrument panel structural support.

The EMIC also has a self-diagnostic actuator test capability, which will test each of the CAN or LIN bus message-controlled functions of the cluster by lighting the appropriate indicators, positioning the gauge needles at several predetermined calibration points across the gauge faces, and illuminating all segments of the Vacuum-Fluorescent Display (VFD) units. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

GAUGES

All gauges receive battery current through the EMIC circuitry only when the ignition switch is in the ON or START positions. With the ignition switch in the OFF position battery current is not supplied to any gauges, and the EMIC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the ON or START positions.

Each of the EMIC gauges contains an electronically controlled stepper motor unit. The EMIC circuitry completely controls the activation and deactivation of these stepper motors to position each gauge needle in the appropriate position based upon cluster programming and electronic messages received over the CAN or LIN data bus.

The gauges are diagnosed using the self-diagnostic Cab Compartment Node (CCN) actuator test. Proper testing of the CAN or LIN data bus and the electronic data bus message inputs to the EMIC that control each gauge requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service information.

VACUUM-FLUORESCENT DISPLAYS

The Vacuum-Fluorescent Display (VFD) units are soldered to the EMIC electronic circuit board. Both the standard one located below the tachometer and the optional Compass Mini-Trip Computer (CMTC) display located below the speedometer are fixed segment displays. With the ignition switch in the OFF or ACCESSORY positions, both VFD displays are activated and the total odometer information is displayed when the driver door is opened (Rental Car Mode) and are deactivated when the driver door is closed or after five minutes, whichever occurs first. Otherwise, both display units are active when the ignition switch is in the ON or START positions, and inactive when the ignition switch is in the OFF or ACCESSORY positions.

The illumination intensity of the VFD units is controlled by the EMIC circuitry based upon electronic **dimming level** messages received over the CAN data bus indicating the exterior lighting is turned ON and the dimming level selected using the panel dimmer function of the control sleeve on the control stalk of the left (lighting) multi-function switch. The illumination intensity of the EMIC VFD units is synchronized with that of other display units in the vehicle by sending the same electronic **dimming level** message inputs to all electronic modules in the vehicle over the CAN or LIN data bus. However, on domestic market vehicles only, if the Tire Pressure Monitor (TPM) indicator or Malfunction Indicator Lamp (MIL) is active, the odometer VFD will illuminate at full daytime brightness until both the TPM indicator and the MIL are extinguished.

The odometer VFD unit has several display capabilities including odometer, trip odometer A and B, gear selector indication (PRNDL) for vehicles with an automatic transmission, several warning or reminder indications, and various diagnostic information when certain fault conditions exist. On vehicles not equipped with the optional CMTC, the odometer display toggles to an outside temperature display following Trip B. The CMTC VFD unit displays numerous warning or reminder textual messages, all CMTC data including compass, temperature, trip computer, the customer programmable features interface and various diagnostic information when certain fault conditions exist. An odometer/trip odometer switch and a CMTC display switch on the EMIC circuit board are used to control many of the display modes of the VFD units. These switches are actuated manually by depressing the odometer/trip odometer or CMTC push button that extends through the lower edge of the cluster lens, adjacent to the VFD that it controls.

Actuating the odometer/trip odometer push button momentarily with the ignition switch in the ON position will toggle the odometer VFD between the odometer and trip odometer modes. Depressing the odometer/trip odometer push button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero. Holding the odometer/trip odometer push button depressed while turning the ignition

switch from the OFF position to the ON position will initiate the CCN self-diagnostic actuator test. Refer to the instrument cluster diagnosis and testing service information for additional details on this cluster function. The EMIC microprocessor remembers which odometer display mode is active when the ignition switch is turned to the OFF position, and returns the display to that mode when the ignition switch is turned ON again.

Actuating the CMTC VFD push button momentarily with the ignition switch in the ON position will toggle the CMTC VFD between the various trip computer functions and the various customer programmable feature selectors. The EMIC microprocessor remembers which display modes are active when the ignition switch is turned to the OFF position, and returns the display to that mode when the ignition switch is turned ON again.

Both VFD units are diagnosed using the self-diagnostic Cab Compartment Node (CCN) actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN or LIN data bus message inputs to the EMIC that control some of the VFD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer, the trip odometer, the gear selector indicator, the CMTC and the various warning and reminder indicator functions of the VFD units may be found elsewhere in this service information.

INDICATORS

Indicators are located in various positions within the EMIC and are all connected to the EMIC electronic circuit board. Some indicators operate based upon hard wired inputs to the EMIC, but most are controlled by CAN or LIN data bus messages from other electronic modules in the vehicle. Some are controlled by a combination of hard wired inputs, electronic messaging and EMIC programming. If the EMIC loses CAN data bus communication, the EMIC circuitry will automatically turn ON the Malfunction Indicator Lamp (MIL) until CAN data bus communication is restored.

The various EMIC indicators are controlled by different strategies; some receive fused ignition switch output from the EMIC circuitry and have a switched ground, while others are grounded through the EMIC circuitry and have a switched battery feed. However, all indicators are completely controlled by the EMIC microprocessor based upon various hard wired and electronic message inputs. The cruise and 4WD indicators located within the odometer VFD unit are dimmable. All other indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the EMIC general illumination LED units. The illumination intensity of the dimmable indicators is synchronized with that of the general illumination lighting.

In addition, certain indicators in this instrument cluster are automatically or self-configured. This feature allows the configurable indicators to be enabled by the EMIC circuitry for compatibility with certain optional equipment. These indicators are enabled or disabled by an electronic **configuration** message sent to the EMIC by the Totally Integrated Power Module (TIPM). The TIPM defaults for the ABS indicator and airbag indicator are enabled, and these configuration settings must be programmatically disabled in the TIPM using a diagnostic scan tool for vehicles that do not have this equipment. The automatically or self-configured indicators remain latent in each EMIC at all times and will be active only when the EMIC receives the appropriate CAN or LIN bus message inputs for that optional system or equipment.

The hard wired indicator inputs may be diagnosed using conventional diagnostic tools and procedures. However, the EMIC circuitry and electronic CAN or LIN data bus message controlled indicators are diagnosed using the self-diagnostic Cab Compartment Node (CCN) actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN or LIN data bus and the electronic data bus message inputs to the EMIC that control each indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

CLUSTER ILLUMINATION

The EMIC has several Light Emitting Diode (LED) units that provide cluster back lighting whenever the exterior lighting is turned ON. The illumination intensity of these LED units is adjusted when the panel lamps dimmer function of the control sleeve on the control stalk of the left (lighting) multi-function switch is rotated to one of six available minor detent positions. The EMIC monitors an electronic **dimming level** message input received over the LIN data bus from the Steering Control Module (SCM) to determine the selected lighting level. In response to that input, the EMIC electronic circuitry converts a fused 12-volt input it receives on a hard wired panel lamps dimmer switch signal circuit into a 12-volt Pulse Width Modulated (PWM) output.

The EMIC uses this PWM output to control the illumination intensity of the cluster general illumination lighting and the VFD units on the EMIC circuit board, then provides a synchronized PWM output on various hard wired fused panel lamps dimmer switch signal circuits to control and synchronize the illumination intensity of other incandescent illumination lamps in the vehicle. The EMIC also transmits electronic **dimming level** messages over the CAN and LIN data bus to other electronic modules in the vehicle to control and synchronize the illumination intensity of their display units to that of the EMIC displays.

The hard wired panel lamps dimmer outputs from the EMIC may be diagnosed using conventional diagnostic tools and procedures. However, proper testing of the PWM processing of the EMIC and the electronic **dimming level** messages received by the EMIC over the LIN data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If all of the instrument cluster gauges and indicators are ineffective, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard wired gauge or indicator is ineffective, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) or Local Interface Network (LIN) data bus message-controlled gauge or indicator is ineffective, perform the Actuator Test as follows:

CAUTION: Instrument clusters used in this vehicle automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus, and through certain hard wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected

electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN, and the certified odometer and engine hours values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.

NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of the cruise indicator, the electronic throttle control indicator, the fog lamp indicator, any of the four-wheel drive indicators, the transmission overtemp indicator, the security indicator or the gear selector indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

ACTUATOR TEST

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges and the indicators are capable of operating as designed. During the actuator test the instrument cluster circuitry will position each of the gauge needles at various calibration points, illuminate each of the segments in the Vacuum-Fluorescent Display (VFD) units, and turn all of the indicators ON and OFF again.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the CAN or LIN data bus, the Powertrain Control Module (PCM), the Totally Integrated Power Module (TIPM), the Controller Antilock Brake (CAB), the All-Wheel Drive Control Module (AWDCM), the Occupant Restraint Controller (ORC), the compass module, the Sentry Key REmote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM), or the inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the OFF position.
2. Depress the odometer/trip odometer switch button.
3. While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the ON position, but do not start the engine.
4. Release the odometer/trip odometer switch button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in the VFD units, and perform a bulb check of each operational LED indicator. The VFD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a VFD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The actuator test will be aborted if the ignition switch is turned to the OFF position, or if an electronic **vehicle speed** message indicating that the vehicle is moving is received over the CAN data bus during the test.
7. Go back to [STEP 1](#) to repeat the test, if necessary.

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the cluster bezel from the instrument panel.
(Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
3. Remove the four screws (3) that secure the instrument cluster (1) to the instrument panel armature (2).
4. Pull the top of the instrument cluster rearward far enough to access and disconnect the instrument panel wire harness connectors from the connector receptacles on the back of the cluster housing.
5. Remove the instrument cluster from the instrument panel.

DISASSEMBLY

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Some of the components for the instrument cluster used in this vehicle are serviced individually. The serviced components include the cluster lens and the cluster hood and mask unit. Following are the procedures for disassembling these components from the instrument cluster.

CLUSTER LENS

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster from the instrument panel.
(Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
3. Working around the perimeter of the cluster, disengage each of the nine integral latch features that secure the cluster

lens (5) to the cluster hood and mask unit (3) and to the cluster housing (2).

4. Remove the lens from the face of the cluster hood and mask unit.

CLUSTER HOOD AND MASK

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
3. Remove the cluster lens (5) from the face of the cluster hood and mask unit (3). Refer to [CLUSTER LENS](#).
4. Working around the perimeter of the cluster, disengage each of the eight integral latch features that secure the cluster hood and mask unit to the cluster housing (2).
5. Remove the hood and mask unit from the face of the instrument cluster.

ASSEMBLY

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Some of the components for the instrument cluster used in this vehicle are serviced individually. The serviced components include the cluster lens and the cluster hood and mask unit. Following are the procedures for assembling these components onto the instrument cluster.

CLUSTER LENS

1. Position the cluster lens (5) over the face of the cluster hood and mask unit (3). Be certain that the rubber boots (4) for the odometer/trip odometer switch and reconfigurable display switch push buttons are installed in the clearance holes in the lens, and that the push buttons are engaged into the boots.
2. Working around the perimeter of the cluster, press the lens over the face of the hood and mask until each of the nine integral latch features is fully engaged in the receptacles of the hood and mask or the cluster housing (2).
3. Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
4. Reconnect the battery negative cable.

CLUSTER HOOD AND MASK

1. Position the cluster hood and mask unit (3) over the face of the cluster housing (2). Be certain that the odometer/trip odometer switch and reconfigurable display switch push buttons are inserted through the proper clearance holes in the mask.
2. Working around the perimeter of the cluster, press the hood and mask over the face of the cluster housing until each of the eight integral latch features is fully engaged in the receptacles of the housing.
3. Reinstall the cluster lens (5) onto the face of the cluster hood and mask unit. Refer to [CLUSTER LENS](#).
4. Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
5. Reconnect the battery negative cable.

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Position the instrument cluster (1) close enough to the instrument panel to reconnect the instrument panel wire harness connectors to the connector receptacles on the back of the cluster housing.
2. Position the instrument cluster mounting tabs to the mounting holes in the instrument panel armature (2).
3. Install and tighten the four screws (3) that secure the mounting tabs of the instrument cluster. Tighten the screws to 2 N·m (17 in. lbs.).
4. Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
5. Reconnect the battery negative cable.

NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If a problem is noted that involves improper illumination of an indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

ABS INDICATOR

DESCRIPTION

An Antilock Brake System (ABS) indicator is standard equipment on all instrument clusters. This indicator is located near the top of the cluster overlay, between the speedometer

and the tachometer. Illumination of this indicator may also be accompanied by the display of certain textual messages in the cluster odometer display.

The ABS indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Failure of Anti-lock Braking System** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ABS indicator is serviced as a unit with the instrument cluster.

OPERATION

The ABS indicator gives an indication to the vehicle operator when the ABS system, or a circuit or component of the system is ineffective. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The ABS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the ABS indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the ABS indicator is illuminated for about three seconds as a bulb test. The entire bulb test is a function of the CAB.
- **ABS Indicator Lamp-On Message** - Each time the cluster receives an electronic **ABS indicator lamp-ON** message from the CAB, the ABS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the CAB for five consecutive message cycles, the ABS indicator is illuminated. The indicator remains illuminated until the cluster receives a valid message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test and the Totally Integrated Power Module (TIPM) is configured for the ABS option, the ABS indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.
- **ABS Diagnostic Test** - The ABS indicator is blinked ON and OFF by lamp-ON and lamp-OFF messages from the CAB during the performance of the ABS diagnostic tests.

The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the CAB sends a lamp-ON message after

the bulb test, it indicates that the CAB has detected a system malfunction or that the ABS system has become ineffective. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the cluster ABS indicator circuit, the cluster sends a message notifying the CAB of the condition, then the instrument cluster and the CAB will each store a DTC and the cluster will flash the brake indicator ON and OFF as a backup to notify the vehicle operator.

For proper diagnosis of the antilock brake system, the CAB, the EMIC, the CAN data bus or the electronic communication related to ABS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

AIRBAG INDICATOR

DESCRIPTION

An airbag indicator is standard equipment on all instrument clusters. However, the instrument cluster can be programmed to disable this indicator on vehicles that are not equipped with the airbag system, which is not available in some markets. This indicator is located near the top of the cluster overlay, between the speedometer and tachometer.

The airbag indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Airbag** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The airbag indicator is serviced as a unit with the instrument cluster.

OPERATION

The airbag indicator gives an indication to the vehicle operator when the airbag system, or a circuit or component of the system is ineffective. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Occupant Restraint Controller (ORC) over the Controller Area Network (CAN) data bus.

The airbag indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the airbag indicator for the following reasons:

Bulb Test - Each time the ignition switch is turned to the ON position the airbag indicator is illuminated for about six to eight seconds. The entire bulb test is a function of the ORC.

- **Airbag Indicator Lamp-On Message** - Each time the cluster receives an electronic **airbag indicator lamp-ON** message from the ORC, the airbag indicator will be illuminated. The indicator remains illuminated for about 12 seconds or until the cluster receives a lamp-OFF message from the ORC, whichever is longer. This indicator will also be extinguished when the ignition switch is turned to the OFF position.
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the ORC for 10 consecutive message cycles, the airbag indicator is illuminated. The indicator remains illuminated until the cluster receives a single lamp-OFF message from the ORC.
- **Actuator Test** - Each time the cluster is put through the actuator test, the airbag indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the airbag indicator is a function of the instrument cluster.

The ORC continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ORC then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the ORC sends a lamp-ON message after the bulb test, it indicates that the ORC has detected a system malfunction or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ORC will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ORC of the condition, then the instrument cluster and the ORC will each store a DTC.

For proper diagnosis of the airbag system, the ORC, the EMIC, the CAN data bus or the electronic communication related to airbag indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

AJAR INDICATORS

DESCRIPTION

Door and swing gate ajar indicators are standard equipment on all instrument clusters. The ajar indications appear within the fixed segment odometer Vacuum-Fluorescent Display (VFD) unit. The odometer VFD ajar indicators are textual messages that appears in place of the odometer/trip odometer information.

The odometer VFD unit is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located at the base of the cluster overlay tachometer dial face. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The ajar indicator textual messages appear in the same blue-green color and at the same lighting level as the other information displayed in the odometer VFD when they are illuminated by the instrument cluster electronic circuit board.

The ajar indicators are serviced as a unit with the odometer VFD unit in the instrument cluster.

OPERATION

The ajar indicators give an indication to the vehicle operator that one or more of the passenger compartment doors or the swing gate may be open or not completely latched. These indicators are controlled by the instrument cluster logic circuit based upon cluster programming and electronic **ajar switch status** messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The ajar indicator function of the odometer Vacuum-Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the VFD ajar indications can occur regardless of the ignition switch position. The instrument cluster will turn ON the ajar indicator for the following reasons:

- **Ajar Switch Message Input** - Each time the cluster receives a door or swing gate ajar switch status message indicating that a door, the swing gate or any combination of these is open or not completely latched with the ignition switch in any position, the appropriate ajar textual message will be illuminated. If the cluster detects a vehicle speed input greater than zero (kilometers or miles-per-hour) while the ignition switch is in the ON or START positions, the ajar indication will be accompanied by a single chime tone. When the ignition switch is in any position except ON or START, any and all ajar indications will time out after about five minutes.

The TIPM continually monitors the door and swing gate ajar switches to determine the status of the doors and swing gate. The TIPM then sends the proper ajar switch status messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). The door and swing gate ajar switches and their circuits may be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

BRAKE/PARK BRAKE INDICATOR

DESCRIPTION

A brake indicator is standard equipment on all instrument clusters. This indicator is located near the top of the cluster overlay, between the speedometer and tachometer.

The brake indicator consists of a stencil-like cutout in the opaque layer of the instrument cluster overlay. The word **BRAKE** is cutout for vehicles manufactured for sale in the U.S. market, or the International Control and Display Symbol icon for **Brake Failure** is cutout for vehicles manufactured for all other markets. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The brake indicator is serviced as a unit with the instrument cluster.

OPERATION

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition, or when

the brake fluid level switch is disconnected. The brake indicator can also give an indication when certain faults are detected in the Antilock Brake System (ABS). This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus, and a hard wired input from the park brake switch.

The brake indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the brake indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the brake indicator is illuminated by the instrument cluster for about three seconds as a bulb test.
- **Brake Indicator Lamp-On Message** - Each time the cluster receives an electronic **brake indicator lamp-ON** message from the CAB, the brake indicator will be illuminated. The CAB may also send lamp-ON messages as feedback during ABS diagnostic procedures. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Park Brake Switch Input** - Each time the cluster detects ground on the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released) while the ignition switch is in the ON position, the brake indicator flashes ON and OFF. The indicator continues to flash until the park brake switch sense input to the cluster is an open circuit (park brake switch open = park brake fully released), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Antilock Brake System (ABS) Indicator Backup** - If the instrument cluster detects a fault in the ABS indicator circuit it will send a message indicating the fault to the Controller Antilock Brake (CAB), then flash the brake indicator ON and OFF. The cluster will continue to flash the brake indicator until the ABS indicator circuit fault is resolved, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the brake indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The park brake switch on the park brake lever mechanism provides a hard wired ground input to the instrument cluster circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The Totally Integrated Power Module (TIPM) monitors the brake fluid level switch on the brake master cylinder reservoir, then sends the appropriate electronic messages to the CAB. The CAB continually monitors the ABS system circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the CAB sends a lamp-ON message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction or that the ABS system has become ineffective. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects.

The hard wired park brake switch input to the EMIC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the brake fluid level switch, the ABS, the CAB, the EMIC, the TIPM, the CAN data bus or the electronic communication related to brake indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

BRAKE INDICATOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired park brake switch input to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the Controller Antilock Brake (CAB), the Totally Integrated Power Module (TIPM), the Controller Area Network (CAN) data bus, or the electronic message inputs also used by the EMIC to provide brake indicator operation. The most reliable, efficient, and accurate means to diagnose the EMIC, the CAB, the TIPM, the CAN data bus or the electronic communication related to brake indicator operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CHANGE OIL INDICATOR

DESCRIPTION

A change oil indicator is standard equipment on all instrument clusters. However, on vehicles manufactured for export markets except those equipped with a 2.8 liter diesel engine and an optional diesel particulate filter, this indicator is electronically disabled. This indicator is located within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. The change oil indicator consists of cycling textual **CHAngE** and **OIL** messages which appear in place of the odometer/trip odometer information in the odometer VFD unit.

The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The change oil textual messages appear in the same blue-green color and at the same lighting level as the odometer information when they are illuminated by the instrument cluster electronic circuit board.

The change oil indicator is serviced as a unit with the VFD in the instrument cluster.

OPERATION

The change oil indicator gives an indication to the vehicle operator when a duty-cycle algorithm contained within the software of the Powertrain Control Module (PCM) determines that a recommended oil change interval has been attained. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the PCM.

The change oil indicator function of the Vacuum Fluorescent Display (VFD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD change oil indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the change oil indicator for the following reasons:

Change Oil Indicator Lamp-On Message - Each time the ignition switch is turned to the ON position and the cluster receives an electronic **change oil indicator lamp-ON** message from the PCM indicating that a duty-cycle based recommended oil change interval has been attained, the change oil indicator will be illuminated for about three seconds, until the trip odometer reset switch button is depressed, or until the ignition switch is turned to the OFF position, whichever occurs first.

- **Change Oil Indicator Reset Procedure** - Once an engine oil change has been completed, the PCM duty cycle counters can be reset using the following procedure. Turn the ignition switch to the ON position, but DO NOT start the engine. Slowly depress and release the accelerator pedal fully three times within ten seconds. Turn the ignition switch to the OFF position. If the change oil indicator illuminates the next time the engine is started, repeat this procedure.

The PCM continually monitors numerous sensor inputs to determine the duty-cycles to which the engine is being subjected. A pre-programmed algorithm within the PCM then determines when to send the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the change oil indicator, the PCM, the EMIC, the CAN data bus or the electronic communication related to change oil indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CHARGING INDICATOR

DESCRIPTION

A charging indicator is standard equipment on all instrument clusters. This indicator is located above the fuel gauge on the cluster overlay, to the left of speedometer.

The charging indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Battery Charging Condition** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The charging indicator is serviced as a unit with the instrument cluster.

OPERATION

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The charging indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic

circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the charging indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the charging indicator is illuminated by the instrument cluster for about three seconds as a bulb test.
- **Voltage Low Message** - Each time the cluster receives an electronic **system voltage** message from the PCM indicating the voltage is low (less than about 11.5 volts is a charge fail condition), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Voltage High Message** - Each time the cluster receives an electronic **system voltage** message from the PCM indicating the voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the voltage is normal (less than about 15.5 volts, but greater than 11.5 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the charging indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the electrical system voltage to control the generator output. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the instrument cluster turns ON the charging indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service.

For proper diagnosis of the charging system, the PCM, the EMIC, the CAN data bus or the electronic communication related to charging indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CRUISE INDICATOR

DESCRIPTION

A cruise indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional speed control system, this indicator is electronically disabled. This indicator is located within the odometer Vacuum Fluorescent Display (VFD) unit.

The cruise indicator consists of the text **CRUISE** in the VFD display. The odometer VFD unit is soldered onto the instrument cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The cruise indicator text appears in a blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

CRUISE

During daylight hours (exterior lamps are OFF) the odometer VFD unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD unit to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The cruise indicator is serviced as a unit with the odometer VFD unit in the instrument cluster.

OPERATION

The cruise indicator gives an indication to the vehicle operator when the speed control system is ON, regardless of whether the speed control is engaged. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The cruise indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is energized by the instrument cluster logic circuit. The instrument cluster will turn ON the cruise indicator for the following reasons:

- **Cruise Indicator Lamp-On Message** - Each time the cluster receives an electronic **cruise indicator lamp-ON** message from the PCM indicating the speed control system is ON, the cruise indicator is illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the cruise indicator will be turned ON, then OFF again during the Vacuum Fluorescent Display (VFD) portion of the test in order to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the speed control switches to determine the appropriate outputs to the speed control servo. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the speed control system, the PCM, the EMIC, the CAN data bus or the electronic communication related to cruise indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE GAUGE

DESCRIPTION

An engine coolant temperature gauge is standard equipment on all instrument clusters. This gauge is located on the right side of the instrument cluster, just right and below the tachometer. The gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree gauge scale on the cluster overlay that reads left-to-right from **C** (or Cold) to **H** (or Hot). An International Control and Display Symbol icon for **Engine**

Coolant Temperature is located on the cluster overlay, directly above the hub of the gauge needle.

The engine coolant temperature gauge graphics are white and gray against a black field except for a single red graduation at the high end of the gauge scale, making them clearly visible within the instrument cluster in daylight.

When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned ON, the white and gray text and graphics still appear white or gray and the red graphics still appear red. The red gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The engine coolant temperature gauge is serviced as a unit with the instrument cluster.

OPERATION

The engine coolant temperature gauge gives an indication to the vehicle operator of the engine coolant temperature. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine coolant temperature gauge is driven by an electronic stepper motor unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is between the low end of normal [about 41 °C (105 °F) for gasoline engines, or about 28 °C (82 °F) for diesel engines] and the high end of normal [about 124 °C (255 °F) for gasoline engines, or about 118 °C (244 °F) for diesel engines], the gauge needle is moved to the actual relative temperature position on the gauge scale.
- **Engine Temperature Low Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is low [at or below about 40 °C (104 °F) for gasoline engines, or about 27 °C (81 °F) for diesel engines], the gauge needle is held below the graduation on the far left end of the gauge scale. The gauge needle remains below the low end of the gauge scale until the cluster receives a message from the PCM indicating that the temperature is above the low end of normal, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Engine Temperature High or Critical Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is high [at or above about 127 °C (261 °F) for gasoline engines, or about 118 °C (244 °F) for diesel engines], the gauge needle is moved to the red graduation at the high end of the gauge scale, the engine temperature indicator is illuminated and a single chime tone is sounded. The gauge needle remains at the red graduation and the engine temperature indicator remains illuminated until the cluster receives a message from the PCM indicating that the

temperature is below about 124 °C (255 °F) for gasoline engines, or about 115 °C (239 °F) for diesel engines, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled OFF and then ON again by the appropriate messages from the PCM.

- **Communication Error** - If the cluster fails to receive an **engine temperature** message, it will hold the gauge needle at the last indication for about five seconds or until the ignition switch is turned to the OFF position, whichever occurs first. After five seconds, the cluster will move the gauge needle to the low end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine coolant temperature gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the instrument cluster turns ON the engine temperature indicator due to a high or critical engine coolant temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to engine coolant temperature gauge operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE INDICATOR

DESCRIPTION

An engine temperature indicator is standard equipment on all instrument clusters. The engine temperature indicator is located above the engine coolant temperature gauge in the cluster overlay, to the right of the tachometer.

The engine temperature indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Engine Coolant Temperature** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The engine temperature indicator is serviced as a unit with the instrument cluster.

OPERATION

The engine temperature indicator gives an indication to the vehicle operator when the engine temperature gauge reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the

instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the engine temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the engine temperature indicator is illuminated for about two seconds as a bulb test. The entire bulb test is a function of the PCM.
- **Engine Temperature High or Critical Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is high [at or above about 127 °C (261 °F) for gasoline engines, or about 118 °C (244 °F) for diesel engines], the engine temperature indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the temperature is below about 124 °C (255 °F) for gasoline engines, or about 115 °C (239 °F) for diesel engines, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled OFF, then ON again by the appropriate messages from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine temperature indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). For further diagnosis of the engine temperature indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns ON the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to engine temperature indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ELECTRONIC STABILITY PROGRAM/BRAKE ASSIST SYSTEM INDICATOR

DESCRIPTION

An Electronic Stability Program (ESP)/Brake Assist System (BAS) indicator is standard equipment on all instrument clusters. This indicator is located near the bottom of the cluster overlay, between the speedometer and the tachometer.

The ESP/BAS indicator consists of a stencil-like cutout of the text **ESP BAS** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents

the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ESP/BAS indicator is serviced as a unit with the instrument cluster.

OPERATION

The ESP/BAS indicator gives an indication to the vehicle operator when the Electronic Stability Program (ESP)/Brake Assist System (BAS) has been activated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) and the All-Wheel Drive Control Module (AWDCM) over the Controller Area Network (CAN) data bus.

The ESP/BAS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the ESP/BAS indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the ESP/BAS indicator is illuminated for about four seconds as a bulb test.
- **ESP/BAS Indicator Lamp-On Message** - Each time the cluster receives an electronic **ESP/BAS indicator lamp-ON** message from the CAB indicating that the ESP/BAS system has been activated, the ESP/BAS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **ESP Full Off Textual Message** - Each time the cluster receives an electronic **ESP Full OFF indicator lamp-ON** message from the CAB indicating that the ESP/BAS system has been manually disabled, an **ESP Full OFF** textual message will appear within the cluster odometer display. The **ESP Full OFF** textual message remains displayed until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **ESP Permanent Disable Textual Message** - Each time the cluster receives an electronic **ESP Permanent Disable** message from the CAB indicating that the ESP/BAS system has been permanently disabled, an **ESP OFF** textual message will appear within the cluster odometer display for about 10 seconds each time the ignition switch is turned to the ON position.
- **Actuator Test** - Each time the cluster is put through the actuator test, the ESP/BAS indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors the ESP/BAS circuits and sensors to decide whether the system is in good operating condition and the proper outputs to the components of the system. The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the ESP/BAS system, the CAB, the AWDCM, the EMIC, the CAN data bus or the electronic communication related to the ESP/BAS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ETC INDICATOR

DESCRIPTION

An Electronic Throttle Control (ETC) indicator is standard equipment on all instrument clusters. This indicator is located near the bottom of the cluster overlay, between the speedometer and the tachometer.

The ETC indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Electronic Throttle Control** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ETC indicator is serviced as a unit with the instrument cluster.

OPERATION

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system, or a circuit or component of the system is ineffective. The ETC indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The ETC indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the ETC indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the ETC indicator is illuminated for about three seconds. The entire bulb test is a function of the instrument cluster.
- **ETC Indicator Lamp-On Message** - Each time the cluster receives an electronic **ETC indicator lamp-**

ON message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about 12 seconds or until the cluster receives a lamp-OFF message from the PCM, whichever is longer. If the indicator is illuminated solid with the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service. The indicator will be extinguished when the ignition switch is turned to the OFF position.

- **Actuator Test** - Each time the cluster is put through the actuator test, the ETC indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the ETC indicator is a function of the PCM.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the PCM sends a lamp-ON message after the bulb test, it indicates that the PCM has detected an ETC system malfunction or that the ETC system is ineffective. The PCM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the cluster ETC indicator circuit, the cluster sends a message notifying the PCM of the condition, then the EMIC and the PCM will each store a DTC.

For proper diagnosis of the ETC system, the PCM, the EMIC, the CAN data bus or the electronic communication related to ETC indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FOUR-WHEEL DRIVE INDICATOR

DESCRIPTION

A four-wheel drive indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system, this indicator is electronically disabled. For domestic market vehicles, this indicator is located within the odometer Vacuum Fluorescent Display (VFD) unit. For export market vehicles, this indicator is located on the right side of the cluster overlay near the top, above the engine coolant temperature gauge.

The domestic four-wheel drive indicator consists of the text **4WD** in the VFD display. The odometer VFD unit is soldered onto the instrument cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The four-wheel drive indicator text appears in an amber color and at the same lighting level as the other odometer VFD information when it is illuminated by the cluster electronic circuit board.

During daylight hours (exterior lamps are OFF) the VFD unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD unit lighting level is adjusted with the other cluster general

illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD unit to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The export four-wheel drive indicator consists of a stencil-like cutout of the text **4WD** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The four-wheel drive indicator is serviced as a unit with the instrument cluster.

OPERATION

The four-wheel drive indicator gives an indication to the vehicle operator when a four-wheel drive (4WD) mode of the transfer case is selected. This indicator is controlled either by the instrument cluster circuit board (domestic market vehicles) or by a transistor on the circuit board (export market vehicles) based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The four-wheel drive indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is energized by the instrument cluster logic circuit. The instrument cluster will turn ON the four-wheel drive indicator for the following reasons:

- **Four-Wheel Drive Indicator Lamp-On Message** - Each time the cluster receives an electronic **four-wheel drive indicator lamp-ON** message from the TIPM indicating that a four-wheel drive mode is selected, the four-wheel drive indicator is illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the four-wheel drive indicator will be turned ON, then OFF again during the Vacuum Fluorescent Display (VFD) portion (domestic market vehicles) or the Light Emitting Diode (LED) portion (export market vehicles) of the test in order to confirm the functionality of the VFD or LED and the cluster control circuitry.

The TIPM continually monitors inputs from the four-wheel drive switch to determine the status of the transfer case. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the four-wheel drive switch, the EMIC, the TIPM, the CAN data bus or the electronic communication related to four-wheel drive indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FRONT AXLE LOCK INDICATOR

DESCRIPTION

A front axle lock indicator is standard equipment on all

instrument clusters. However, on vehicles not equipped with the optional off-road package, this indicator is electronically disabled. This indicator is located near the top of the cluster overlay, between the speedometer and tachometer.

The front axle lock indicator consists of a stencil-like cutout of the word **FRONT** above the International Control and Display Symbol icon for **Lock** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The front axle lock indicator is serviced as a unit with the instrument cluster.

OPERATION

The front axle lock indicator gives an indication to the vehicle operator when the locking mechanism in the front axle of vehicles equipped with the optional off-road package is engaged. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus

The front axle lock indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the front axle lock indicator for the following reasons:

- **Front Axle Lock Indicator Lamp-On Message** - Each time the cluster receives an electronic **front axle lock lamp-ON** message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the front axle lock indicator will be turned ON, then OFF again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors an input from the front axle lock solenoid to determine the status of the front axle lock mechanism. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the front axle lock system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to front axle lock indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FRONT FOG LAMP INDICATOR

DESCRIPTION

A front fog lamp indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional front fog lamps, this indicator is electronically disabled. This indicator is located on the left side of the cluster overlay, above the fuel gauge and just left of the speedometer.

The front fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Front Fog Light** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The front fog lamp indicator is serviced as a unit with the instrument cluster.

OPERATION

The front fog lamp indicator gives an indication to the vehicle operator whenever the front fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The front fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the front fog lamp indicator for the following reasons:

- **Front Fog Indicator Lamp-On Message** - Each time the cluster receives an electronic **front fog indicator lamp-ON** message from the TIPM indicating the front fog lamps are turned ON, the front fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the front fog lamp indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors electronic **exterior lighting request** messages from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the appropriate outputs to the front fog lamps. The TIPM activates or deactivates the front fog lamps then sends the proper lamp-ON or lamp-OFF message back to the EMIC.

For proper diagnosis of the front fog lamp system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to front fog lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FRONT SWAY BAR INDICATOR

DESCRIPTION

A front sway bar disconnect indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional off-road package, this indicator is electronically disabled. This indicator is located near the bottom of the cluster overlay, between the speedometer and tachometer.

The front sway bar disconnect indicator consists of a stencil-like cutout of the words **SWAY BAR** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The front sway bar disconnect indicator is serviced as a unit with the instrument cluster.

OPERATION

The front sway bar disconnect indicator gives an indication to the vehicle operator when the locking mechanism of the front sway bar of vehicles equipped with the optional off-road package is disengaged. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The front sway bar disconnect indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the front sway bar disconnect indicator for the following reasons:

- **Front Sway Bar Disconnect Indicator Lamp-On Message** - Each time the cluster receives an electronic **front sway bar disconnect lamp-ON** message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the front sway bar disconnect

indicator will be turned ON, then OFF again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors an input from the front sway bar disconnect solenoid to determine the status of the front sway bar disconnect mechanism. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the front sway bar disconnect system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to front sway bar disconnect indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FUEL GAUGE

DESCRIPTION

A fuel gauge is standard equipment on all instrument clusters. This gauge is located on the left side of the instrument cluster, just left and below the speedometer. The gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree gauge scale on the cluster overlay that reads left-to-right from **E** (or Empty) to **F** (or Full). An International Control and Display Symbol icon for **Fuel** is located on the cluster overlay, directly above the hub of the gauge needle. An arrowhead pointed to the left side of the vehicle is imprinted on the cluster overlay next to the **Fuel** icon on the gauge to provide the driver with a reminder as to the location of the fuel filler access.

The fuel gauge graphics are white and gray against a black field except for a single red graduation at the low end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned ON, the white and gray text and graphics still appear white or gray and the red graphics still appear red. The red gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The fuel gauge is serviced as a unit with the instrument cluster.

OPERATION

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic **fuel level** messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The fuel gauge is driven by an electronic stepper motor unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition

switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Fuel Level Message** - The TIPM provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level rises and decreases as the fuel level falls causing changes in the fuel level sense input voltage. The TIPM then sends the appropriate electronic **fuel level** messages to the cluster. The cluster programming applies an algorithm to calculate the proper fuel gauge needle position based upon the fuel level message input, then moves the gauge needle to the proper relative position on the gauge scale. This algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the TIPM.
- **Less Than 11 Percent Tank Full Message** - Each time the fuel level message to the cluster indicates the fuel tank is about 11 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to about the one-sixteenth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level message indicates that the fuel tank is greater than about 14 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate messages from the TIPM.
- **Less Than Empty Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is less than the **E** (or Empty) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is a short circuit.
- **More Than Full Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is more than the **F** (or Full) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is an open circuit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the fuel gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The TIPM continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The TIPM then sends the proper electronic **fuel level** message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The TIPM will store a Diagnostic Trouble Code (DTC) for any fault detected in the fuel level sense circuit.

For proper diagnosis of the fuel tank sending unit, the TIPM, the EMIC, the CAN data bus or the electronic communication related to fuel gauge operation or fuel level data processing a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

GAS CAP INDICATOR

DESCRIPTION

A gas cap indicator is standard equipment on all instrument clusters. However, on vehicles equipped with the optional diesel engine, as well as those manufactured for the Chinese market, this indicator is electronically disabled. The gas cap indication appears within the odometer Vacuum Fluorescent Display (VFD) unit. The gas cap indicator consists of a textual **gascap** message which appears in place of the odometer information in the odometer display.

The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The gas cap textual message appears in the same blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

The gas cap indicator is serviced as a unit with the VFD in the instrument cluster.

OPERATION

The gas cap indicator gives an indication to the vehicle operator when there is a gross leak detected in the on-board fuel vapor recovery system. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the Powertrain Control Module (PCM).

The gas cap indicator function of the odometer Vacuum Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer VFD gas cap indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the gas cap indicator for the following reasons:

- **Gas Cap Indicator Lamp-On Message** - Each time the cluster receives an electronic **gas cap indicator lamp-ON** message from the PCM indicating there is a gross leak in the vapor recovery system, the gas cap indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM continually monitors the on board vapor recovery system to determine whether there are air leaks in the system. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the EMIC turns ON the gas cap indicator due to a monitored gross leak in the vapor recovery system, it may indicate that the gas cap has been removed or is improperly installed.

For proper diagnosis of the on board vapor recovery system, the PCM, the EMIC, the CAN data bus or the electronic communication related to gas cap indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

GEAR SELECTOR INDICATOR

DESCRIPTION

An electronic automatic transmission gear selector indicator is standard factory-installed equipment on this vehicle. However, on vehicles not equipped with an optional automatic transmission, this indicator is electronically disabled. The gear selector indicator information is displayed in the upper portion of the odometer Vacuum Fluorescent Display (VFD) unit. This VFD unit is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge

of the tachometer dial face of the cluster overlay. The dark lens over the VFD unit prevents the indicator from being clearly visible when it is not illuminated.

The gear selector indicator displays the following characters from left to right: **P**, **R**, **N**, **D** and a fifth, reconfigurable character. The reconfigurable character can be any number **1** through **6**. Each character appears in a blue-green color and at the same lighting level as the odometer information.

Respectively, these characters represent the PARK, REVERSE, NEUTRAL, DRIVE and each of the forward drive gear positions of the transmission gear selector lever on the floor panel transmission tunnel. The indicator also illuminates a box around the character that represents the currently selected lever position.

During daylight hours (exterior lamps are OFF) the VFD unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD unit lighting level is adjusted with the other cluster general illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD unit to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The gear selector indicator is serviced as a unit with the VFD unit in the instrument cluster.

OPERATION

The electronic gear selector indicator gives an indication to the vehicle operator of the transmission gear that has been selected with the automatic transmission gear selector lever. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The gear selector indicator information is displayed by the odometer Vacuum Fluorescent Display (VFD) unit soldered onto the instrument cluster electronic circuit board, and the VFD will not display the gear selector indicator information after the ignition switch is turned to the OFF position. Each time the cluster is disconnected from battery current for more than about five minutes, it must configure itself for the automatic transmission type that is in the vehicle once it is reconnected to battery current. The instrument cluster circuitry operates the gear selector indicator to provide the following features:

- **Selected Gear Message** - Each time the cluster receives an electronic **selected gear** message from the PCM, a box will be illuminated around the appropriate character in the gear selector indicator. The box will remain illuminated until the cluster receives a different **selected gear** message, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a **selected gear** message from the PCM within three seconds, the instrument cluster circuitry will display all gear selector positions boxed (selected) until a valid **selected gear** message is received or until the ignition switch is turned to the OFF position, whichever occurs first.

Actuator Test - Each time the cluster is put through the actuator test, the odometer VFD unit will display all of its characters at once to confirm the functionality of the VFD unit and the cluster control circuitry.

The PCM continually monitors a hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the proper message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the TRS, the PCM, the EMIC, the CAN data bus or the electronic communication related to gear selector indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

HIGH BEAM INDICATOR

DESCRIPTION

A high beam indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the cluster overlay, between the speedometer and the tachometer.

The high beam indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **High Beam** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A blue Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in blue through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The high beam indicator is serviced as a unit with the instrument cluster.

OPERATION

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The high beam indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the high beam indicator for the following reasons:

- **High Beam Indicator Lamp-On Message** - Each time the cluster receives an electronic **high beam indicator lamp-ON** message from the TIPM indicating the high beam lamps are turned ON, the high beam indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the exterior lamp load shedding (battery saver) timed interval

expires, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the high beam indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors electronic **exterior lighting request** messages from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the appropriate outputs to the headlamps. The TIPM activates or deactivates the headlamp high beams then sends the proper lamp-ON or lamp-OFF message back to the EMIC.

For proper diagnosis of the headlamp system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to high beam indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

INSTRUMENT PANEL SWITCH POD

DESCRIPTION

The instrument panel switch pod (1) is located just below the heater and air conditioner controls in the center stack area of the instrument panel. This switch is available in multiple configurations, which varies from two single push button switches to as many as five push button switches, depending upon the optional equipment in the vehicle. The pod may include the following switches:

- **Axle Locker Switch (5)**
- **Electronic Stability Program (ESP) Switch (4)**
- **Front Sway Bar Disconnect Switch (2)**
- **Hazard Warning Switch (3)**
- **Headlamp Leveling Switch (Not Shown)**

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active. Only the hazard warning switch push button latches, while the remaining switches feature momentary operation.

Four screws secure the switch to the back of the instrument panel center bezel through integral mounting tabs that are molded into each corner of the switch housing. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches in the lower instrument panel switch pod cannot be repaired and are not serviced separately. If any component within the switch pod is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

For information covering details of operation for the individual switches contained within the instrument panel switch pod, refer to the specific service information covering the system to which that switch belongs.

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel (1) from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Disconnect the wire harness connector from the back of the instrument panel switch pod (2).
4. Remove the four screws (3) that secure the switch pod to the back of the center bezel.
5. Remove the switch pod from the center bezel.

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: There are several different instrument panel switch pods available, depending upon the optional equipment content of the vehicle. Be certain that a replacement switch pod matches the optional equipment of the vehicle into which it is being installed.

1. Position the instrument panel switch pod (2) to the back of the center bezel (1).
2. Install and tighten the four screws (3) that secure the switch pod to the center bezel. Tighten the screws to 2 N·m (17 in. lbs.).
3. Reconnect the wire harness connector to the back of the switch pod.
4. Reinstall the center bezel onto the instrument panel. (Refer

to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

5. Reconnect the battery negative cable.

LOW FUEL INDICATOR

DESCRIPTION

A low fuel indicator is standard equipment on all instrument clusters. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The low fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Fuel** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The low fuel indicator is serviced as a unit with the instrument cluster.

OPERATION

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic **fuel level** messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The low fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the low fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the low fuel indicator is illuminated for about three seconds as a bulb test.
- **Less Than 11 Percent Tank Full Message** - The TIPM provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level rises and decreases as the fuel level falls causing changes in the fuel level sense input voltage. The TIPM then sends the appropriate electronic **fuel level** messages to the cluster. Each time the fuel level messages to the cluster indicate the fuel tank is about 11 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to the appropriate position on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level messages indicate that the fuel tank is greater than about 14 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate messages from the TIPM.
- **Less Than Empty Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is less than the **E** (or Empty) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is a short circuit.
- **More Than Full Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is more than the **F** (or Full) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is an open circuit.

The TIPM continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The TIPM then sends the proper electronic **fuel level** message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The TIPM will store a Diagnostic Trouble Code (DTC) for any fault detected in the fuel level sense circuit.

For proper diagnosis of the fuel tank sending unit, the TIPM, the EMIC, the CAN data bus or the electronic communication related to low fuel indicator operation or fuel level data processing a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW OIL PRESSURE INDICATOR

DESCRIPTION

A low oil pressure indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the cluster overlay, between the speedometer and the tachometer.

The low oil pressure indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Engine Oil** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The low oil pressure indicator is serviced as a unit with the instrument cluster.

OPERATION

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The low oil pressure indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the low oil pressure indicator for the following reasons:

- **Engine Oil Pressure Low Message** - Each time the cluster receives an electronic **engine oil pressure** message from the PCM indicating the pressure is about 6.9 kPa (1 psi) or lower, the low oil pressure indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or flashing until the cluster receives a message from the PCM indicating that the pressure is above about 6.9 kPa (1 psi), or until the ignition switch is turned to the OFF position, whichever occurs first. The cluster will only turn the indicator ON in response to low engine oil pressure if the engine speed is greater than zero.
- **Actuator Test** - Each time the cluster is put through the actuator test, the low oil pressure indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the EMIC turns ON the indicator after the bulb test, it may indicate that the engine or the engine oiling system requires service.

For proper diagnosis of the engine oil pressure sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to low oil pressure indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

MALFUNCTION INDICATOR LAMP (MIL)

DESCRIPTION

A Malfunction Indicator Lamp (MIL) is standard equipment on all instrument clusters. For domestic market vehicles, this indicator is located within the odometer Vacuum Fluorescent Display (VFD) unit. For export market vehicles, this indicator is located on the right side of the cluster overlay near the top, above the engine coolant temperature gauge.

The domestic MIL indicator consists of the International Control and Display Symbol icon for **Engine** in the VFD

display. The odometer VFD unit is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer dial face of the cluster overlay. The dark lens over the VFD unit prevents the indicator from being clearly visible when it is not illuminated. The MIL icon appears in an amber color when it is illuminated by the cluster electronic circuit board, and the MIL as well as all of the odometer VFD information is illuminated at full (daytime) brightness and cannot be dimmed until the MIL is extinguished.

The export MIL indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Engine** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The MIL is serviced as a unit with the instrument cluster.

OPERATION

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the Powertrain Control Module (PCM) has recorded a Diagnostic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Controller Area Network (CAN) data bus.

The MIL is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is energized by the instrument cluster logic circuit. The instrument cluster will turn ON the MIL for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the indicator is illuminated for about 15 seconds as a bulb test. The entire bulb test is a function of the PCM.
- **MIL Lamp-On Message** - Each time the cluster receives an electronic **MIL lamp-ON** message from the PCM, the indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. For some DTCs, if a problem does not recur, the PCM will send a lamp-OFF message automatically. Other DTCs may require that a fault be repaired and the PCM be reset before a lamp-OFF message will be sent. For more information on the PCM, and the DTC set and reset parameters, refer to Group 25 - EMISSIONS.
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the PCM for 10

consecutive message cycles, the MIL is illuminated by the instrument cluster to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the PCM.

- **Actuator Test** - Each time the cluster is put through the actuator test, the MIL indicator will be turned ON, then OFF again during the odometer VFD portion of the test in order to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the EMIC turns ON the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems require service.

For proper diagnosis of the fuel and emissions systems, the PCM, the EMIC, the CAN data bus or the electronic communication related to MIL operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

NO FUSE INDICATOR

DESCRIPTION

A no fuse indicator is standard equipment on all instrument clusters. However, in vehicles built for the Chinese market this indicator is electronically disabled. The no fuse indication appears within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. The no fuse indicator consists of a textual **noFUSE** message which appears in place of the odometer/trip odometer information in the odometer display.

The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The no fuse textual message appears in the same blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

The no fuse indicator is serviced as a unit with the odometer VFD in the instrument cluster.

OPERATION

The no fuse indicator gives an indication to the vehicle operator when the Ignition Off Draw (IOD) fuse is ineffective or is not installed. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the Totally Integrated Power Module (TIPM).

The no fuse indicator function of the odometer Vacuum Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer VFD no fuse indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the no fuse indicator for the following reasons:

- **No Fuse Indicator Lamp-On Message** - Each time the ignition switch is turned to the ON position and the cluster receives an electronic **no fuse indicator lamp-ON** message from the TIPM indicating that the IOD fuse is missing or ineffective, the no fuse indicator will be illuminated. The indicator remains illuminated for about three seconds, until the IOD fuse is installed, until the trip odometer reset switch button is depressed or until the ignition switch is turned to the OFF position, whichever occurs first.

The TIPM continually monitors the IOD circuit to determine the status of the IOD fuse, then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the CAN data bus.

For proper diagnosis of the no fuse indicator, the TIPM, the EMIC, the CAN data bus or the electronic communication related to no fuse indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ODOMETER

DESCRIPTION

An odometer and trip odometer are standard factory-installed equipment in all instrument clusters. The odometer and trip odometer are displayed in a common electronic, blue-green Vacuum-Fluorescent Display (VFD) unit. This VFD unit is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer in the lower right area of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated.

The odometer and trip odometer information are not displayed simultaneously. The trip odometer reset switch on the instrument cluster circuit board toggles the display between odometer and trip odometer modes by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just left of the minor gauge set. When the trip odometer information is displayed, the text **TRIP A** or **TRIP B** is also illuminated in the lower right corner of the odometer/trip odometer VFD in a blue-green color and at the same lighting level as the trip odometer information.

The odometer and trip odometer information are stored in the instrument cluster memory. This information can be increased when the proper inputs are provided to the instrument cluster, but the information cannot be decreased. The odometer can display values up to 999,999 kilometers (999,999 miles). The odometer latches at these values, and will not roll over to zero. The trip odometer can display values up to 999.9 kilometers (999.9 miles) before it rolls over to zero.

The odometer display does not show leading zeroes, does not have a decimal point and will not show values less than a full unit (kilometer or mile). The unit of measure (**km** or **miles**) for the odometer display is not shown in the VFD. The unit of measure for the instrument cluster odometer/trip odometer is selected at the time that it is manufactured, and cannot be changed. The odometer has a RENTAL CAR mode, which will illuminate the odometer information in the VFD whenever the driver side front door is opened with the ignition switch in the OFF or ACCESSORY positions.

During daylight hours (exterior lamps are OFF) the odometer VFD is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD lighting level is adjusted with the other cluster general illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left

multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours. On vehicles manufactured for domestic markets, the odometer VFD is also illuminated at full brightness whenever the Malfunction Indicator Lamp (MIL) indicator is illuminated, and cannot be dimmed until the MIL indicator is extinguished.

The odometer/trip odometer VFD, the trip odometer switch and the trip odometer push button are serviced as a unit with the instrument cluster.

OPERATION

The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. This indicator is controlled by the instrument cluster circuitry based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The odometer and trip odometer information is displayed by the instrument cluster odometer/trip odometer Vacuum Fluorescent Display (VFD). The VFD will display the odometer information whenever the driver side front door is opened with the ignition switch in the OFF or ACCESSORY positions. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch button momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer A and B information. Each time the VFD is illuminated with the ignition switch in the ON or START positions, the display will automatically return to the last mode previously selected (odometer or trip odometer).
- **Trip Odometer Reset** - When the trip odometer reset switch button is pressed and held for longer than about two seconds with the ignition switch in the ON or START positions, the trip odometer will be reset to **0.0** kilometers (miles). The VFD must be displaying the trip odometer information in order for the trip odometer information to be reset.
- **GasCap Message Display** - On vehicles manufactured with a United States country code, each time the cluster receives an electronic message from the PCM indicating a monitored leak in the evaporative emissions system, the cluster replaces the displayed odometer/trip odometer value with the textual message, **gascap**. This message serves as a reminder to the vehicle operator to check that the gas cap is properly installed and tightened, but could also indicate another source of air leakage in the on-board evaporative and vapor recovery emissions systems. Unless the leak is corrected, this message will latch and remain displayed during the current and each subsequent ignition cycle until the trip odometer reset button is pressed and released momentarily, which will revert the display to the odometer/trip odometer information that was last displayed for the remainder of that ignition cycle. Once the source of a leak has been corrected, either momentarily pressing the trip odometer reset button or cycling the ignition switch will unlatch the message and return the odometer/trip odometer to normal operation.
- **Communication Error** - If the cluster fails to receive an electronic **distance** message during normal operation, it will hold and display the last data received until the ignition switch is turned to the OFF position. If the cluster does not receive a **distance** message within one second after the ignition switch is turned to the ON position, it will display the last distance value stored in the cluster memory. If the cluster is unable to display odometer information due to an error internal to the cluster, the VFD will display **error**.
- **Actuator Test** - Each time the cluster is put through the actuator test, the odometer VFD will display all of its segments simultaneously during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the vehicle speed pulse information received from the wheel speed sensors, then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab

Compartment Node/CCN).

For proper diagnosis of the wheel speed sensors, the PCM, the EMIC, the CAN data bus or the electronic communication related to odometer/trip odometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

OVERDRIVE OFF INDICATOR

DESCRIPTION

An overdrive off indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional overdrive automatic transmission, this indicator is electronically disabled. This indicator is located near the bottom of the cluster overlay, between the speedometer and the tachometer.

The overdrive off indicator consists of a stencil-like cutout of the text **O/D OFF** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The overdrive off indicator is serviced as a unit with the instrument cluster.

OPERATION

The overdrive off indicator gives an indication to the vehicle operator when the overdrive-OFF position of the overdrive switch has been selected, disabling the electronically controlled overdrive feature of the automatic transmission. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The overdrive off indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the overdrive off indicator for the following reasons:

- **Overdrive Off Indicator Lamp-On Message** - Each time the cluster receives an electronic **overdrive off indicator lamp-ON** message from the PCM indicating that the overdrive-OFF position of the tow/haul switch has been selected, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF

position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the overdrive off indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the overdrive switch to determine the proper outputs to the automatic transmission. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). For further diagnosis of the overdrive off indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transmission control system, the PCM, the EMIC, the CAN data bus or the electronic communication related to overdrive off indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

REAR AXLE LOCK INDICATOR

DESCRIPTION

A rear axle lock indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional off-road package, this indicator is electronically disabled. This indicator is located near the top of the cluster overlay, between the speedometer and tachometer.

The rear axle lock indicator consists of a stencil-like cutout of the word **REAR** above the International Control and Display Symbol icon for **Lock** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The rear axle lock indicator is serviced as a unit with the instrument cluster.

OPERATION

The rear axle lock indicator gives an indication to the vehicle operator when the locking mechanism in the rear axle of vehicles equipped with the optional off-road package is engaged. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The rear axle lock indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic.

circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the rear axle lock indicator for the following reasons:

- **Rear Axle Lock Indicator Lamp-On Message** - Each time the cluster receives an electronic **rear axle lock lamp-ON** message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the rear axle lock indicator will be turned ON, then OFF again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors an input from the rear axle lock solenoid to determine the status of the rear axle lock mechanism. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the rear axle lock system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to rear axle lock indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

REAR FOG LAMP INDICATOR

DESCRIPTION

A rear fog lamp indicator is standard equipment on all instrument clusters for certain markets where rear fog lamps are available. However, on vehicles not equipped with the optional rear fog lamps, this indicator is electronically disabled. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The rear fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Rear Fog Light** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The rear fog lamp indicator is serviced as a unit with the instrument cluster.

OPERATION

The rear fog lamp indicator gives an indication to the vehicle operator whenever the rear fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The rear fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the rear fog lamp indicator for the following reasons:

- **Rear Fog Indicator Lamp-On Message** - Each time the cluster receives an electronic **rear fog indicator lamp-ON** message from the TIPM indicating the rear fog lamps are turned ON, the rear fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the rear fog lamp indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors electronic **exterior lighting request** messages from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the appropriate outputs to the rear fog lamps. The TIPM activates or deactivates the rear fog lamps then sends the proper lamp-ON or lamp-OFF message back to the EMIC.

For proper diagnosis of the rear fog lamp system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to rear fog lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SEATBELT INDICATOR

DESCRIPTION

A seatbelt indicator is standard equipment on all instrument clusters. This indicator is located near the top of the cluster overlay, between the speedometer and the tachometer.

The seatbelt indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Seat Belt** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The seatbelt indicator is serviced as a unit with the instrument cluster.

OPERATION

The seatbelt indicator gives an indication to the vehicle operator of the status of the driver side front seat belt. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired input from the seatbelt switch on the driver side front seat belt retractor through the seat belt switch sense circuits.

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or BELTMINDER feature that is enabled when the vehicle is shipped from the factory. This BELTMINDER feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seatbelt indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function** - Each time the cluster receives a battery current input on the fused ignition switch output (run-start) circuit, the indicator will be illuminated as a seatbelt reminder for about six seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. This reminder function will occur regardless of the status of the seatbelt switch inputs to the cluster.
- **Front Seatbelt Not Buckled - Beltminder Active** - Following the seatbelt reminder function, each time the cluster detects an open circuit on the front seat belt switch sense circuit (seatbelt switch open = seatbelt unbuckled) with the ignition switch in the START or ON positions, the indicator will be illuminated. In addition, if the front seat belt remains unbuckled about 4 seconds after the conclusion of the seatbelt reminder function, the seatbelt indicator will begin to cycle between flashing ON and OFF for 3 seconds, then lighting solid for 2 seconds. The seatbelt indicator will continue to cycle between flashing and solid illumination for 13 complete cycles, until the seat belt switch sense input to the cluster is a closed circuit to ground (seatbelt switch closed = seatbelt buckled), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Front Seatbelt Not Buckled - Beltminder Inactive** - Following the seatbelt reminder function, each time the cluster detects an open circuit on the seat belt switch sense circuit (seatbelt switch open = seatbelt

unbuckled) with the ignition switch in the START or ON positions, the indicator will be illuminated. The seatbelt indicator remains illuminated until the seat belt indicator input to the cluster is a closed circuit to ground (seatbelt switch closed = seatbelt buckled), or until the ignition switch is turned to the OFF position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the seatbelt indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The seatbelt switch is connected in series between ground and the seat belt switch sense circuit input to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). The seatbelt switch input to the instrument cluster circuitry may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

STANDARD PROCEDURE

ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or BELTMINDER feature that is enabled when the vehicle is shipped from the factory. This BELTMINDER feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side front seat belt. The BELTMINDER feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool.

CUSTOMER PROGRAMMING SEQUENCE

NOTE: The following sequence of events must occur within 60 seconds of the ignition switch being placed in the ON position in order for the programming to be completed successfully.

1. With all doors closed and the ignition switch in any position except ON or START, buckle the driver side front seat belt.
2. Turn the ignition switch to the ON position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.
4. Turn the ignition switch to any position except ON or START to toggle the BELTMINDER feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

SECURITY INDICATOR

DESCRIPTION

A security indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional Vehicle Theft Security System (VTSS), this indicator is electronically disabled. This indicator is located

above the coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The security indicator consists of a small round cutout in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The security indicator is serviced as a unit with the instrument cluster.

OPERATION

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Security System (VTSS) is arming or is armed. On vehicles equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, and electronic **security indicator request** messages received by the cluster from the Totally Integrated Power Module (TIPM) or the Sentry Key REmote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM) over the Controller Area Network (CAN) data bus.

The security indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Depending upon the programmed condition, the indicator can be illuminated solid, flashed at a slow rate (0.5 Hertz, 12.5 percent duty cycle), or flashed at a fast rate (1 Hertz, 50 percent duty cycle). The instrument cluster will turn ON the security indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the security indicator illuminates for about two seconds as a bulb test. The entire bulb test is a function of the SKREEM.
- **Security Indicator Lamp-On Message** - During the 16 second VTSS arming function, the TIPM will request the cluster flash the security indicator ON and OFF repeatedly at a steady, fast rate to indicate that the VTSS is in the process of arming. Following successful VTSS arming, the TIPM will request the cluster flash the security indicator ON and OFF continuously at a slower rate to indicate that the VTSS is armed. The security indicator continues flashing at the slower rate until the VTSS is disarmed or triggered. If the VTSS has alarmed and rearmed, the TIPM will request the cluster flash the security indicator at a steady, slow rate for about 30 seconds after the VTSS is disarmed.
- **SKIS Indicator Lamp-On Message** - Each time the cluster receives an electronic **SKIS indicator lamp-ON** message from the SKREEM, the security indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the SKREEM message. The indicator remains illuminated solid or continues to flash until the cluster receives a lamp-OFF message from the SKREEM, or until the ignition switch is turned to the OFF position, whichever occurs first. For more information on the SKIS and the security indicator control parameters, (Refer to 8 - ELECTRICAL/VEHICLE THEFT

SECURITY/SENTRY KEY IMMOBILIZER SYSTEM - OPERATION).

- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the TIPM or the SKREEM for 10 consecutive message cycles, the security indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid lamp-ON or lamp-OFF message is received from the SKREEM.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the security indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM sends electronic **security indicator request** messages to control the security indicator whenever the ignition switch is in the OFF position and the VTSS is arming, armed, or alarming. Whenever the ignition switch is in the ON or START positions, the SKREEM performs a self-test to decide whether the SKIS is in good operating condition and whether a valid key is present in the ignition lock cylinder. The SKREEM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the cluster flashes the security indicator upon ignition ON, or turns ON the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is ineffective.

For proper diagnosis of the VTSS, the SKIS, the SKREEM, the TIPM, the EMIC, the CAN data bus or the electronic communication related to security indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SPEEDOMETER

DESCRIPTION

A speedometer is standard equipment on all instrument clusters. The speedometer is located to the left of center in the instrument cluster, between the tachometer and the fuel gauge. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 185 degree primary scale on the gauge dial face that reads left-to-right either from **0** to **100** or **110** mph, or from **0** to **200** km/h, depending upon the market for which the vehicle is manufactured.

Each version also has a secondary inner scale on the gauge dial face that provides the equivalent opposite units from the primary scale. Text appearing on the cluster overlay above the hub of the speedometer needle and below the primary scale abbreviates the unit of measure for the primary scale (either **MPH** or **km/h**), and text above the hub of the speedometer needle and below the secondary scale indicates the unit of measure for that scale.

The speedometer graphics are white and gray against a black field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned ON, the white and gray graphics still appear white or gray. The red gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The speedometer is serviced as a unit with the instrument cluster.

OPERATION

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The speedometer is driven by an electronic stepper motor unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Vehicle Speed Message** - Each time the cluster receives an electronic **vehicle speed** message from the PCM it will calculate the correct vehicle speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be positioned at the relative vehicle speed position on the gauge scale until the vehicle stops moving, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the speedometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the Vehicle Speed Sensor (VSS) to determine the vehicle road speed. The PCM then sends the proper **vehicle speed** messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the VSS, the PCM, the EMIC, the CAN data bus or the electronic communication related to speedometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TACHOMETER

DESCRIPTION

A tachometer is standard equipment on all instrument clusters. The tachometer is located to the right of center in the instrument cluster, between the speedometer and the coolant temperature gauge. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 185 degree scale on the gauge dial face that reads left-to-right either from **0** to **7** for vehicles with a gasoline engine, or from **0** to **5** for vehicles with a diesel engine. The text **RPM X 1000** imprinted on the cluster overlay directly above the hub of the

tachometer needle identifies that each number on the tachometer scale is to be multiplied by 1000 rpm.

The tachometer graphics are white and gray against a black field except for several red graduations that designate the red line area at the high end of the gauge scale, making them clearly visible within the instrument cluster in daylight.

When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned ON, the white and gray text and graphics still appear white or gray and the red graphics still appear red. The red gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The tachometer is serviced as a unit with the instrument cluster.

OPERATION

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The tachometer is driven by an electronic stepper motor unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message** - Each time the cluster receives an electronic **engine speed** message from the PCM it will calculate the correct engine speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be repositioned at the relative engine speed position on the gauge scale until the engine stops running, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the tachometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the crankshaft position sensor to determine the engine speed. The PCM then sends the proper **engine speed** messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the crankshaft position sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to tachometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TIRE PRESSURE MONITOR INDICATOR

DESCRIPTION

A Tire Pressure Monitor (TPM) indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the TPM system, this indicator is electronically disabled. This indicator is located within the odometer Vacuum Fluorescent Display (VFD) unit.

The TPM indicator consists of a stencil-like cutout of an icon that represents a cross-section of a tire with a centered exclamation point in the VFD unit. The odometer VFD unit is soldered onto the instrument cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The indicator appears in an amber color (domestic market vehicles) or in the same blue-green color as the odometer information (export market vehicles) when it is illuminated by the cluster electronic circuit board. Once illuminated, the TPM indicator as well as all of the odometer VFD information is illuminated at full (daytime) brightness and cannot be dimmed until the TPM indicator is extinguished.

The TPM indicator is serviced as a unit with the odometer VFD unit in the instrument cluster.

OPERATION

The Tire Pressure Monitor (TPM) indicator gives an indication to the vehicle operator of the status of the TPM system. The TPM indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Sentry Key REMote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) over the Controller Area Network (CAN) data bus.

The TPM indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is energized by the instrument cluster logic circuit. The instrument cluster will turn ON the TPM indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position, the SKREEM sends an electronic **TPM indicator lamp-ON** message to the cluster to illuminate the TPM indicator for about three seconds as a bulb test.

TPM Indicator Lamp-On Message - Each time the cluster receives an electronic **TPM indicator lamp-ON** message from the SKREEM, the indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the SKREEM message. The indicator remains illuminated until the cluster receives a lamp-OFF message from the SKREEM, or until the ignition switch is turned to the OFF position, whichever occurs first.

- **Low Tire Textual Message** - On vehicles manufactured for export markets, each time the cluster receives an electronic **TPM indicator lamp-ON** message from the SKREEM requesting the TPM indicator be illuminated solid, a **LOtIRE** textual message will appear within the cluster odometer display. The **LOtIRE** textual message remains displayed until the cluster receives a lamp-OFF message from the SKREEM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster receives no TPM lamp-ON or lamp-OFF messages from the SKREEM for six consecutive seconds, the TPM indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid lamp-ON or lamp-OFF message is received from the SKREEM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the TPM indicator will be turned ON, then OFF again during the odometer VFD portion of the test in order to confirm the functionality of the VFD and the cluster control circuitry.

The SKREEM performs a self-test each time the ignition switch is turned to the ON position to decide whether the TPM system is in good operating condition and whether the tire inflation pressures are too high or too low. The SKREEM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the instrument cluster turns ON the TPM indicator after the bulb test, it indicates that the inflation pressure of a tire is too low or that a malfunction has occurred and the TPM system is ineffective.

For proper diagnosis of the TPM system, the SKREEM, the EMIC, the CAN data bus or the electronic communication related to TPM indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TRACTION CONTROL INDICATOR

DESCRIPTION

A traction control indicator is standard equipment on all instrument clusters. This indicator is located on the lower edge of the cluster overlay, between the speedometer and the tachometer.

The traction control indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Stability - Anti-Spin** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The traction control indicator is serviced as a unit with the instrument cluster.

OPERATION

The traction control indicator gives an indication to the vehicle operator when the Electronic Stability Program (ESP)/Brake Assist System (BAS)/Traction Control System (TCS) has been activated. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The traction control indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is provided a path to ground by the instrument cluster circuitry. The instrument cluster will turn ON the traction control indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the traction control indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **Traction Control Indicator Lamp-On Message** - Each time the cluster receives an electronic **traction control indicator lamp-ON** message from the CAB indicating that the ESP/BAS/TCS has been activated, the traction control indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the CAB message. The indicator remains illuminated solid or continues to flash until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the traction control indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors the traction control switch to determine the proper outputs to the components of the Antilock Brake System (ABS). The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the traction control switch, the ESP/BAS/TCS, the CAB, the EMIC, the CAN data bus or the electronic communication related to traction control indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TURN SIGNAL INDICATOR

DESCRIPTION

Two turn signal indicators, one right and one left, are standard equipment on all instrument clusters. The turn signal indicators are located near the top of the cluster overlay, between the speedometer and the tachometer. Illumination of this indicator may also be accompanied by the display of a turn signal-on warning textual message in the cluster reconfigurable Vacuum Fluorescent Display (VFD) unit.

Each turn signal indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Turn Warning** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents these icons from being clearly visible when they are not illuminated. A green Light Emitting Diode (LED) behind each cutout in the opaque layer of the overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The turn signal indicators are serviced as a unit with the instrument cluster.

OPERATION

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by transistors on the instrument cluster electronic circuit board based upon the cluster programming and electronic messages received from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

Each turn signal indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, each LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the turn signal indicators for the following reasons:

- **Turn Signal Indicator Lamp-On Message** - Each time the cluster receives an electronic **right** or **left turn signal-ON** message from the TIPM over the CAN data bus, the appropriate turn signal indicator will be flashed ON and OFF. The TIPM also sends the appropriate electronic message to the cluster to control the flash rate of the turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the cluster electronic circuit board that emulates the sound emitted by a conventional turn signal flasher. The turn signal indicators continue to flash ON and OFF until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs

first.

- **Hazard Warning Indicator Lamp-On Message** - Each time the cluster receives an electronic **hazard warning-ON** message from the TIPM over the CAN data bus, both turn signal indicators will be flashed ON and OFF. The TIPM also sends the appropriate electronic messages to the cluster to control the flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the cluster electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The turn signal indicators continue to flash ON and OFF until the cluster receives a hazard warning-OFF message from the TIPM.
- **Turn Signal-On Textual Warning Message** - When the cluster detects that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour) a chime tone will be sounded and, if the vehicle is so equipped, a **TURN SIGNAL ON** textual message will appear within the instrument cluster reconfigurable Vacuum Fluorescent Display (VFD) unit.
- **Lamp Out Mode** - If the TIPM detects an ineffective turn signal lamp or circuit, it increases the flash rate for the remaining operative turn signals and sends an electronic message to the instrument cluster. To provide an indication of the problem to the vehicle operator the instrument cluster then increases the flash rate of the turn signal indicators, the click rate of the electromechanical relay and, if the vehicle is so equipped, displays a **TURN SIGNAL LAMP OUT** textual message in the reconfigurable VFD unit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the turn signal indicators will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of each LED and the cluster control circuitry.

The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) continually monitors the electronic messages from the TIPM to determine the proper turn signal and hazard warning indicator operation.

For proper diagnosis of the turn signal and hazard warning system, the multi-function switch, the TIPM, the EMIC, the CAN data bus or the electronic communication related to turn signal indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WAIT-TO-START INDICATOR

DESCRIPTION

A wait-to-start indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional diesel engine, this indicator is electronically disabled. This indicator is located near the lower edge of the cluster overlay, between the speedometer and the tachometer.

The wait-to-start indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Diesel Preheat** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The wait-to-start indicator is serviced as a unit with the instrument cluster.

OPERATION

The wait-to-start indicator gives an indication to the vehicle operator when the diesel engine is too cool for efficient and reliable engine starting, and the engine glow plugs are energized in their pre-heat operating mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The wait-to-start indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the wait-to-start indicator for the following reasons:

- **Wait-To-Start Indicator Lamp-On Message** - Each time the cluster receives an electronic **wait-to-start indicator lamp-ON** message from the PCM indicating that the air temperature is too cool for efficient and reliable engine starting and the glow plugs are energized in their pre-heat mode, the wait-to-start indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, until the PCM detects that the engine is running, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the wait-to-start indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the glow plug control circuits to determine when they are energized in their pre-heat operating mode. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the glow plug control circuits, the PCM, the EMIC, the CAN data bus or the electronic communication related to wait-to-start indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WATER-IN-FUEL INDICATOR

DESCRIPTION

A water-in-fuel indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional diesel engine, this indicator is electronically disabled. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The water-in-fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Water In Fuel** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the

indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The water-in-fuel indicator is serviced as a unit with the instrument cluster.

OPERATION

The water-in-fuel indicator gives an indication to the vehicle operator when there is excessive water detected in the diesel fuel. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the Powertrain Control Module (PCM).

The water-in-fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the water-in-fuel indicator for the following reasons:

- **Water-In-Fuel Indicator Lamp-On Message** - Each time the cluster receives an electronic **water-in-fuel indicator lamp-ON** message from the PCM indicating there is excessive water in the diesel fuel system, the water-in-fuel indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM continually monitors the water-in-fuel sensor to determine whether there is excessive water in the diesel fuel system. The PCM then sends the proper electronic **water-in-fuel** message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the water-in-fuel-sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to water-in-fuel indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

8L - LAMPS

LAMPS/LIGHTING - EXTERIOR-ELECTRICAL/DIAGNOSTICS

LAMPS/LIGHTING - EXTERIOR-ELECTRICAL/DIAGNOSTICS

DIAGNOSIS AND TESTING

B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Headlamps activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L43) LEFT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND
LEFT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect

the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT LOW BEAM BULB

Turn the ignition off.

Disconnect the Left Low Beam Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Left Low Beam Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L43) LEFT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Left Headlamp harness connector.

Measure the resistance between ground and the (L43) Left Low Beam Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L43) Left Low Beam Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN
CHECK (L43) LEFT LOW BEAM CONTROL CIRCUIT
(L43) LEFT LOW BEAM CONTROL CIRCUIT OPEN
(L43) LEFT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, clear all DTC's.
Turn the Headlamps on.
With the scan tool, read DTC's.

Does the scan tool display active: B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Left Low Beam Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Left Low Beam harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L43) LEFT LOW BEAM CONTROL CIRCUIT

Turn the ignition on.

With a 12-volt test light connected to ground, check the

(L43) Left Low Beam Control circuit.

Does the test light illuminate brightly with the headlamps switch turned on, and shut off with the headlamps turned off?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L43) LEFT LOW BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L43) Left Low Beam Control circuit between the Left Low Beam harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L43) Left Low Beam Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L43) LEFT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L43) Left Low Beam Control circuit.

Is there any voltage present?

Yes

- Repair the (L43) Left Low Beam Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC

CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Headlamps activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L44) RIGHT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND
RIGHT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test**1. INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. RIGHT LOW BEAM BULB

Turn the ignition off.

Disconnect the Right Low Beam Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?**Yes**

- Go To [3](#)

No

- Replace the Right Low Beam Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L44) RIGHT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Right Headlamp harness connector.

Measure the resistance between ground and the (L44) Right Low Beam Control circuit.

Is the resistance above 10k ohms?**Yes**

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

Repair the (L44) Right Low Beam Control circuit for a short to ground.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN
CHECK (L44) RIGHT LOW BEAM CONTROL CIRCUIT
(L44) RIGHT LOW BEAM CONTROL CIRCUIT OPEN
(L44) RIGHT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE
RIGHT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Right Low Beam Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Right Low Beam harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L44) RIGHT LOW BEAM CONTROL CIRCUIT

Turn the ignition on.

With a 12-volt test light connected to ground, check the (L44) Right Low Beam Control circuit.

Does the test light illuminate brightly with the headlamps switch turned on, and shut off with the headlamps turned off?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L44) RIGHT LOW BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L44) Right Low Beam Control circuit between the Right Low Beam harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L44) Right Low Beam Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L44) RIGHT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L44) Right Low Beam Control circuit.

Is there any voltage present?

Yes

- Repair the (L44) Right Low Beam Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1633-LEFT HI BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the Headlamps activated.

◦ **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L33) LEFT HIGH BEAM CONTROL CIRCUIT SHORT TO GROUND
LEFT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, clear all DTC's.
Turn the High Beam Lamps on.
With the scan tool, read DTC's.

Does the scan tool display active: B1633-LEFT HIGH BEAM CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT HIGH BEAM BULB

Turn the ignition off.
Disconnect the Left High Beam Bulb.
Turn the ignition on.
With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Left High Beam Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L33) LEFT HIGH BEAM CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the TIPM C3 harness connector.
Disconnect the Left Headlamp harness connector.
Measure the resistance between ground and the (L33) Left High Beam Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L33) Left High Beam Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Continuously.

◦ **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN
CHECK (L33) LEFT HIGH BEAM CONTROL CIRCUIT
(L33) LEFT HIGH BEAM CONTROL CIRCUIT OPEN
(L33) LEFT HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE
LEFT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the High Beam Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B1634-LEFT HIGH BEAM CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Left High Beam Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Left High Beam harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L33) LEFT HIGH BEAM CONTROL CIRCUIT

Turn the ignition on.

With a 12-volt test light connected to ground, check the (L33) Left High Beam Control circuit.

Does the test light illuminate brightly with the headlamps switch turned on, and shut off with the headlamps turned off?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L33) LEFT HIGH BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L33) Left High Beam Control Circuit between the Left Headlamp harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L33) Left High Beam Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

(L33) LEFT HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE

6.

Turn the ignition on.

Measure for voltage on the (L33) Left High Beam Control circuit.

Is there any voltage present?

Yes

- Repair the (L33) Left High Beam Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1637-RIGHT HIGH BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the High Beam Headlamps activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L34) RIGHT HIGH BEAM CONTROL CIRCUIT SHORT TO GROUND
RIGHT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
 With the scan tool, clear all DTC's.
 Turn the High Beam Lamps on.
 With the scan tool, read DTC's.

Does the scan tool display active: B1637-RIGHT HIGH BEAM CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. RIGHT HIGH BEAM BULB

Turn the ignition off.
 Disconnect the Right High Beam Bulb.
 Turn the ignition on.
 With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Right High Beam Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L34) RIGHT HIGH BEAM CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
 Disconnect the TIPM C3 harness connector.
 Disconnect the Right Headlamp harness connector.
 Measure the resistance between ground and the Right High Beam Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L34) Right High Beam Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1638-RIGHT HIGH BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN
CHECK (L34) RIGHT HIGH BEAM CONTROL CIRCUIT
(L34) RIGHT HIGH BEAM CONTROL CIRCUIT OPEN
(L34) RIGHT HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE
RIGHT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamps on.
With the scan tool, read DTC's.

Does the scan tool display active: B1638-RIGHT HIGH BEAM CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.
Disconnect the Right High Beam Lamp harness connector.
With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Right High Beam harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L34) RIGHT HIGH BEAM CONTROL CIRCUIT

Turn the ignition on.

With a 12-volt test light connected to ground, check the (L34) Right High Beam Control circuit.

Does the test light illuminate brightly with the headlamps switch turned on, and shut off with the headlamps turned off?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L34) RIGHT HIGH BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L34) Right High Beam Control circuit between the Right Headlamp harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L34) Right High Beam Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L34) HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L34) High Beam Control circuit.

Is there any voltage present?

Yes

- Repair the (L34) High Beam Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B163B-FRONT LEFT TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Turn Signal activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND
FRONT LEFT TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test**1. INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B163B-FRONT LEFT TURN LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by

inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT LEFT TURN SIGNAL BULB

Turn the ignition off.

Disconnect the Front Left Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Front Left Turn Signal Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Front Left Turn Signal Lamp harness connector.

Measure the resistance between ground and the (L61) Front Left Turn Signal Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L61) Front Left Turn Signal Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B163C-FRONT LEFT TURN LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN
CHECK (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT
(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT OPEN
(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
FRONT LEFT TURN LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B163C-FRONT LEFT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC

CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Front Left Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Front Left Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Left Turn Signal still on and a 12-volt test light connected to ground, check the (L61) Front Left Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L61) Front Left Turn Signal Control circuit between the Front Left Turn Signal Lamp assembly harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L61) Front Left Turn Lamp Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L61) Front Left Turn Signal Control circuit.

Is there any voltage present?

No

- Repair the (L61) Front Left Turn Signal Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B163F-FRONT RIGHT TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Turn Signal activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND
FRONT RIGHT TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B163F-FRONT RIGHT TURN LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT RIGHT TURN SIGNAL BULB

Turn the ignition off.

Disconnect the Front Right Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Front Right Turn Signal Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the TIPM C3 harness connector.
Disconnect the Right Front Turn Signal Lamp harness connector.
Measure the resistance between ground and the (L60) Right Front Turn Signal Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L60) Right Front Turn Signal Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1640-FRONT RIGHT TURN LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN

CHECK (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT
(L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT OPEN
(L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
FRONT RIGHT TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1640-FRONT RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Front Right Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Front Right Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Right Turn Signal still on and a 12-volt test light connected to ground, check the (L60) Front Right Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L60) Front Right Turn Signal Control circuit between the Front Right Turn Signal Lamp assembly harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L60) Front Right Turn Signal Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L60) RIGHT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L60) Front Right Turn Signal Control circuit.

Is there any voltage present?

No

- Repair the (L60) Front Right Turn Signal Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1643-REAR LEFT TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Turn Signal activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L63) REAR LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND
REAR LEFT TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1643-REAR LEFT TURN LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REAR LEFT TURN SIGNAL BULB

Turn the ignition off.

Disconnect the Rear Left Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Rear Left Turn Signal Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L63) LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Disconnect the Left Rear Tail Lamp harness connector.

Measure the resistance between ground and the (L63) Rear Left Turn Signal Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L63) Rear Left Turn Signal Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1644-REAR LEFT TURN LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z910) GROUND CIRCUIT
(Z910) GROUND CIRCUIT OPEN
CHECK (L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT
(L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT OPEN
(L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1644-REAR LEFT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z910) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Left Rear Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z910) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z910) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z910) Ground circuit(s) at the Left Rear Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z910) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Left Turn Signal still on and a 12-volt test light connected to ground, check the (L63) Left Rear Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L63) LEFT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance of the (L63) Left Rear Turn Signal Control circuit between the Left Rear Tail Lamp assembly harness connector and the TIPM C4 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L63) Left Rear Turn Signal Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L63) Left Rear Turn Signal Control circuit.

Is there any voltage present?

Yes

- Repair short to voltage on the (L63) Left Rear Turn Signal Control circuit.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1647-REAR RIGHT TURN LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

◦ When Monitored:

With the Turn Signal activated.

◦ Set Condition:

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND
RIGHT REAR TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1647-REAR RIGHT TURN LAMP CONTROL CIRCUIT LOW?**Yes**

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REAR RIGHT TURN SIGNAL BULB

Turn the ignition off.

Disconnect the Right Rear Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?**Yes**

- Go To [3](#)

No

- Replace the Right Rear Turn Signal Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Disconnect the Right Rear Tail Lamp harness connector.

Measure the resistance between ground and the (L62) Right Rear Turn Signal Control circuit.

Is the resistance above 10k ohms?**Yes**

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

Repair the (L62) Right Rear Turn Signal Control circuit for a short to ground.

- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1648-REAR RIGHT TURN LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z910) GROUND CIRCUIT
(Z910) GROUND CIRCUIT OPEN
CHECK (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT
(L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT OPEN
(L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, clear all DTC's.
Turn the Right Turn Signal on.
With the scan tool, read DTC's.

Does the scan tool display active: B1648-REAR RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z910) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Right Rear Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z910) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z910) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z910) Ground circuit(s) at the Right Rear Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z910) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Right Turn Signal still on and a 12-volt test light connected to ground, check the (L62) Right Rear

Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance of the (L62) Right Rear Turn Signal Control circuit between the Right Rear Tail Lamp assembly harness connector and the TIPM C4 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L62) Right Rear Turn Lamp Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L62) Right Rear Turn Signal Control circuit.

Is there any voltage present?

Yes

- Repair the (L62) Right Rear Turn Signal Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1663-REAR FOG LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Rear Fog Lamps activated.

- **Set Condition:**

The Totally Integrated Power Module (TIPM) Detects a LOW condition.

Possible Causes
(L239) REAR FOG LAMP CONTROL CIRCUIT SHORT TO GROUND
LEFT REAR FOG LAMP BULB
RIGHT REAR FOG LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Rear Fog Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B1663-REAR FOG LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC

CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT REAR FOG LAMP BULB

Turn the ignition off.
Disconnect the Left Rear Fog Lamp Bulb.
Turn the ignition on.
With the scan tool, read DTC's.

Does the DTC reset?**Yes**

- Go To [3](#)

No

- Replace the Left Rear Fog Lamp Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. RIGHT REAR FOG LAMP BULB

Turn the ignition off.
Disconnect the Right Rear Fog Lamp Bulb.
Turn the ignition on.
With the scan tool, read DTC's.

Does the DTC reset?**Yes**

- Go To [4](#)

No

- Replace the Right Rear Fog Lamp Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L239) REAR FOG LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the TIPM C6 harness connector.
Disconnect the Left and Right Rear Fog Lamp harness connectors.
Measure the resistance between ground and the (L239) Rear Fog Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L239) Rear Fog Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1664-REAR FOG LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

The Totally Integrated Power Module (TIPM) Detects a HIGH condition.

Possible Causes
(L239) REAR FOG LAMP CONTROL CIRCUIT OPEN
(L239) REAR FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT AND/OR RIGHT REAR FOG LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test**1. INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Rear Fog Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B1664-REAR FOG LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT AND RIGHT REAR FOG LAMP BULBS

Turn the ignition off.

Remove the Left and Right Fog Lamp Bulbs.

Inspect the Left and Right Fog Lamp Bulbs.

Are the inoperative bulbs OK?

Yes

- Go To [3](#)

No

- Replace the Inoperative bulb(s) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L239) REAR FOG LAMP CONTROL CIRCUIT OPEN

Disconnect the TIPM C6 harness connector.

Disconnect the Left and Right Rear Fog Lamp harness connectors.

Measure the resistance of the (L239) Rear Fog Lamp Control circuit between the Left and Right Rear Fog Lamp harness connectors and the TIPM C6 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [4](#)

No

- Repair the (L239) Rear Fog Lamp Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

(L239) REAR FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

4.

Turn the ignition on.

Measure for voltage on the (L239) Rear Fog Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L239) Rear Fog Lamp Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B166B-LEFT TRAILER TOW LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Totally Integrated Power Module (TIPM) Detects a LOW condition.

Possible Causes
(L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.
 Turn on the Left Turn Signal.
 With the scan tool, read DTC's.

Does the scan tool display active: B166B-LEFT TRAILER TOW LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
 Disconnect the TIPM C6 harness connector.
 Measure the resistance between ground and the (L673) Left Trailer Tow Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L673) Left Trailer Tow Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B166C-LEFT TRAILER TOW LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Totally Integrated Power Module (TIPM) detects an HIGH condition.

Possible Causes
(L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT OPEN
(L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn on the Left Turn Signal.

With the scan tool, read DTC's.

Does the scan tool display active: B166C-LEFT TRAILER TOW LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Disconnect the Left Trailer Tow Lamp harness connectors.

Measure the resistance of the (L673) Left Trailer Tow Lamp Control circuit between the Left Trailer Tow Lamp harness connectors and the TIPM C6 harness connector.

Does the ohm meter read open circuit?

Yes

- Repair the (L673) Left Trailer Tow Lamp Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC

CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure the voltage on the (L673) Left Trailer Tow Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L673) Left Trailer Tow Lamp Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B166F-RIGHT TRAILER TOW LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

The Totally Integrated Power Module (TIPM) Detects a LOW condition.

Possible Causes
(L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn on the Right Turn Signal.

With the scan tool, read DTC's.

Does the scan tool display active: B166F-RIGHT TRAILER TOW LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Measure the resistance between ground and the (L674) Right Trailer Tow Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the (L674) Right Trailer Tow Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1670–RIGHT TRAILER TOW LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously

- **Set Condition:**

The Totally Integrated Power Module (TIPM) Detects a HIGH condition.

Possible Causes
(L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT OPEN
(L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn on the Right Turn Signal.

With the scan tool, read DTC's.

Does the scan tool display active: B1670-RIGHT TRAILER TOW LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Disconnect the Right Trailer Tow Lamp harness connectors.

Measure the resistance of the (L674) Right Trailer Tow Lamp Control circuit between the Right Trailer Tow Lamp harness connectors and the TIPM C6 harness connector.

Does the ohm meter read open circuit?**Yes**

- Repair the (L674) Right Trailer Tow Lamp Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage on the (L674) Right Trailer Tow Lamp Control circuit.

Is there any voltage present?**Yes**

- Repair the (L674) Right Trailer Tow Lamp Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B16B1–LEFT STOP LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z910) GROUND CIRCUIT
(Z910) GROUND CIRCUIT OPEN
CHECK (L53) LEFT STOP LAMP CONTROL CIRCUIT

(L53) LEFT STOP LAMP CONTROL CIRCUIT OPEN
(L53) LEFT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT STOP LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
 With the scan tool, clear all DTC's
 Turn the Stop Lamps on.
 With the scan tool, read DTC's.

Does the scan tool display active: B16B1–LEFT STOP LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z910) GROUND CIRCUITS

Turn the ignition off.
 Disconnect the Left Rear Tail Lamp harness connector.
 With a 12–volt test light connected to 12–volts, probe each (Z910) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z910) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z910) Ground circuit(s) at the Left Rear Tail Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z910) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L53) LEFT STOP LAMP CONTROL CIRCUIT

Turn the ignition on.

With the Stop Lamps still on and a 12-volt test light connected to ground, check the (L53) Left Stop Lamp Control circuit.

Does the test light illuminate brightly?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L53) LEFT STOP LAMP CONTROL CIRCUIT OPEN

Disconnect the TIPM C7 harness connector.

Measure the resistance of the (L53) Left Rear Turn Signal Control circuit between the Left Rear Tail Lamp harness connector and the TIPM C7 harness connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L53) Turn Signal Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L53) LEFT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L53) Left Stop Lamp Control circuit.

Is there any voltage present?**Yes**

- Repair the (L53) Left Stop Lamp Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B16B5–RIGHT STOP LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z910) GROUND CIRCUIT
(Z910) GROUND CIRCUIT OPEN
CHECK (L54) RIGHT STOP LAMP CONTROL CIRCUIT
(L54) RIGHT STOP LAMP CONTROL CIRCUIT OPEN
(L54) RIGHT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

RIGHT STOP LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Stop Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B16B5–RIGHT STOP LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST — VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z910) GROUND CIRCUITS

Disconnect the Right Rear Tail Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z910) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z910) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z910) Ground circuit(s) at the Right Rear Tail Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z910) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L54) RIGHT STOP LAMP CONTROL CIRCUIT

Turn the ignition on.

With the Stop Lamps still on and a 12-volt test light connected to ground, check the (L54) Right Stop Lamp Control circuit.

Does the test light illuminate brightly?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L54) RIGHT STOP LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C7 connector.

Measure the resistance of the (L54) Right Stop Lamp Control circuit between the Right Rear Tail Lamp harness connector and the TIPM C7 harness connector.

Is the resistance below 10.0 ohms?

No

- Go To [6](#)

Yes

- Repair the (L54) Right Stop Lamp Control circuit for an open.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L54) RIGHT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage between (L54) Right Stop Lamp Control circuit and ground.

Is there any voltage present?

Yes

- Repair the (L54) Right Stop Lamp Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B16F8–FRONT LEFT FOG LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the Front Fog Lamps activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT SHORT TO GROUND
FRONT LEFT FOG LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Front Fog Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B16F8–FRONT LEFT FOG LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT LEFT FOG LAMP BULB

Turn the ignition off.

Disconnect the Front Left Fog Lamp Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Front Left Fog Lamp Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance between ground and the (L89) Front Left Fog Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

No

- Repair the (L89) Front Left Fog Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B16F9–FRONT LEFT FOG LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN
CHECK (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT
(L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT OPEN
(L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
FRONT LEFT FOG LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Front Fog Lamps on.
With the scan tool, read DTC's.

Does the scan tool display active: B16F9–FRONT LEFT FOG LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Disconnect the Front Left Fog Lamp harness connector.
With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Front Left Fog Lamp harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT

Turn the ignition on.

With a 12-volt test light connected to ground, check the (L89) Front Left Fog Lamp Control circuit.

Does the test light illuminate brightly with the fog lamp switch turned on, and shut off with the fog lamps turned off?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance between the (L89) Front Left Fog Lamp Control circuit and the Front Left Fog Lamp harness connector to the TIPM C4 connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L89) Front Left Fog Lamp Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (L89) Front Left Fog Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L89) Front Left Fog Lamp Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B16FC-FRONT RIGHT FOG LAMP CONTROL CIRCUIT LOW

For a complete wiring diagramRefer to Section 8W.

- **When Monitored:**

With the Front Fog Lamps activated.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes
(L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT SHORT TO GROUND
FRONT RIGHT FOG LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, clear all DTC's.
Turn the Front Fog Lamps on.
With the scan tool, read DTC's.

Does the scan tool display active: B16FC— FRONT RIGHT FOG LAMP CONTROL CIRCUIT LOW?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by

inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT RIGHT FOG LAMP BULB

Turn the ignition off.

Disconnect the Front Right Fog Lamp Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

- Go To [3](#)

No

- Replace the Front Right Fog Lamp Bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance between ground and the Front Right Fog Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

No

- Repair the (L90) Front Right Fog Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B16FD-FRONT RIGHT FOG LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes
CHECK (Z904) GROUND CIRCUIT
(Z904) GROUND CIRCUIT OPEN
CHECK (L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT
(L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT OPEN
(L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
FRONT RIGHT FOG LAMP BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Front Fog Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B16FD—FRONT RIGHT FOG LAMP CONTROL CIRCUIT HIGH?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK (Z904) GROUND CIRCUITS

Disconnect the Front Right Fog Lamp assembly harness connector.
With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Front Right Fog Lamp harness connector.

Is the resistance below 10.0 ohms?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Repair the appropriate (Z904) Ground circuit(s) for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK (L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT

Turn the ignition on.
With a 12-volt test light connected to ground, check the (L90) Front Right Fog Lamp Control circuit.

Does the test light illuminate brightly with the fog lamp switch turned on, and shut off with the fog lamps turned off?

Yes

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance of the (L90) Front Right Fog Lamp Control circuit between the Front Right Fog Lamp assembly harness connector and the TIPM C4 connector.

Is the resistance below 10.0 ohms?

Yes

- Go To [6](#)

No

- Repair the (L90) Front Right Fog Lamp Control circuit for an open.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (L90) FRONT RIGHT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (L90) Front Right Fog Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L90) Front Right Fog Lamp Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B17B8—LEFT STOP LAMP CONTROL CIRCUIT OVERCURRENT

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a OVERCURRENT condition.

Possible Causes
(L53) LEFT STOP LAMP CONTROL CIRCUIT SHORT TO GROUND
(L53) LEFT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signals on.

With the scan tool, read DTC's.

Does the scan tool read active: B17B8–LEFT STOP LAMP CONTROL CIRCUIT OVERCURRENT?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT STOP LAMP BULB

Turn the ignition off.

Remove Left Stop Lamp Bulb.

Inspect the Left Stop Lamp Bulb.

Is the inoperative bulb OK?

Yes

- Go To [3](#)

No

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L53) LEFT STOP LAMP CONTROL CIRCUIT SHORT TO GROUND

Disconnect the TIPM C7 harness connector.

Disconnect the Left Stop Lamp harness connector.

Measure the resistance between ground and the (L53) Left Stop Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Go To [4](#)

No

- Repair the (L53) Left Stop Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L53) LEFT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L53) Left Stop Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L543) Left Stop Lamp Control circuit short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B17B9–RIGHT STOP LAMP CONTROL CIRCUIT OVERCURRENT

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a OVERCURRENT condition.

Possible Causes
(L54) RIGHT STOP LAMP CONTROL CIRCUIT SHORT TO GROUND
(L54) RIGHT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B17B9–RIGHT STOP LAMP CONTROL CIRCUIT OVERCURRENT?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. RIGHT STOP LAMP BULB

Turn the ignition off.

Remove Right Stop Lamp Bulb.
Inspect the Right Stop Lamp Bulb.

Is the inoperative bulb OK?

Yes

- Go To [3](#)

No

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L54) RIGHT STOP LAMP CONTROL CIRCUIT SHORT TO GROUND

Disconnect the TIPM C7 harness connector.
Disconnect the Right Stop Lamp harness connector.
Measure the resistance between ground and the (L54) Right Stop Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Go To [4](#)

No

- Repair the (L54) Right Stop Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L54) RIGHT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure for voltage on the (L54) Right Stop Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L54) Right Stop Lamp Control circuit short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B17BA-HEADLAMP LEVELING MOTOR CONTROL CIRCUIT OVERCURRENT

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a OVERCURRENT condition.

Possible Causes
(L133) HEADLAMP LEVELING MOTOR CONTROL CIRCUIT SHORT TO GROUND
(L133) HEADLAMP LEVELING MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B17BA-HEADLAMP LEVELING MOTOR CONTROL CIRCUIT OVERCURRENT?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC

CONTROL MODULES - STANDARD PROCEDURE)

2. (L133) HEADLAMP LEVELING MOTOR CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the Headlamp harness connector.

Measure the resistance between ground and the (L133) Headlamp Leveling Motor Control circuit.

Is the resistance above 10k ohms?

Yes

- Go To [3](#)

No

- Repair the (L133) Headlamp Leveling Motor Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L133) HEADLAMP LEVELING MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L133) Headlamp Leveling Motor Control circuit.

Is there any voltage present?

Yes

- Repair the (L133) Headlamp Leveling Motor Control circuit short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B17BF-LEFT SIDEMARKER LAMP CONTROL CIRCUIT OVERCURRENT

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

Set Condition:

When the Totally Integrated Power Module (TIPM) detects a OVERCURRENT condition.

Possible Causes
(L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORT TO GROUND
(L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B17BF-LEFT SIDEMARKER LAMP CONTROL CIRCUIT OVERCURRENT?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT REAR TURN SIGNAL BULB

Turn the ignition off.

Remove Left Rear Turn Signal Bulb.

Inspect the Left Rear Turn Signal Bulb.

Is the inoperative bulb OK?

Yes

- Go To [3](#)

No

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORT TO GROUND

Disconnect the TIPM C4 harness connector.

Disconnect the Left Sidemarker Lamp harness connector.

Measure the resistance between ground and the (L163) Left Sidemarker Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Go To [4](#)

No

- Repair the (L163) Left Sidemarker Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L163) Left Sidemarker Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L163) Left Sidemarker Lamp Control circuit short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B17C4–RIGHT SIDEMARKER LAMP CONTROL CIRCUIT OVERCURRENT

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a OVERCURRENT condition.

Possible Causes
(L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT SHORT TO GROUND
(L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B17C4–RIGHT SIDEMARKER LAMP CONTROL CIRCUIT OVERCURRENT?

Yes

- Go To [2](#)

No

- The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. RIGHT REAR TURN SIGNAL BULB

Turn the ignition off.
Remove Right Rear Turn Signal Bulb.
Inspect the Right Rear Turn Signal Bulb.

Is the inoperative bulb OK?

Yes

- Go To [3](#)

No

- Replace the Inoperative bulb in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT SHORT TO GROUND

Disconnect the TIPM C4 harness connector.
Disconnect the Right Sidemarker Lamp harness connector.
Measure the resistance between ground and the (L162) Right Sidemarker Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

- Go To [4](#)

No

- Repair the (L162) Right Sidemarker Lamp Control circuit for a short to ground.
- Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.
Measure for voltage on the (L162) Right Sidemarker Lamp Control circuit.

Is there any voltage present?

Yes

- Repair the (L162) Right Sidemarker Lamp Control circuit short to voltage.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC

CONTROL MODULES - STANDARD PROCEDURE)

LAMPS/LIGHTING - EXTERIOR**LAMPS/LIGHTING - EXTERIOR****DESCRIPTION**

819e53e1

The exterior lighting system for this vehicle includes the following exterior lamp units:

- **Center High Mounted Stop Lamp (5)** - A standard equipment Center High Mounted Stop Lamp (CHMSL) is mounted to a stanchion that is integral to the spare tire carrier centered on the swing gate at the rear of the vehicle.
- **Front Fog Lamps (4)** - Optional equipment front fog lamp units are mounted inboard of the bumperettes of the front bumper on vehicles manufactured for domestic markets, or outboard of the bumperettes on vehicles manufactured for export markets.
- **Front Park/Turn Lamps (3)** - A standard equipment front park/turn lamp unit is mounted at each lower

outboard corner of the grille panel.

- **Front Position Lamps** - A front position lamp is integral to each headlamp unit on vehicles manufactured for export markets where they are required.
- **Front Side Marker or Repeater Lamps (1)** - A standard equipment front side marker lamp is located near the front of each front fender flare on vehicles manufactured for domestic markets. The front side marker lamps are replaced with a standard repeater lamp mounted in the same location on vehicles manufactured for export markets where they are required.
- **Headlamps (2)** - A standard equipment front headlamp is mounted to the front end module support at each upper outboard corner of the grille panel.
- **License Plate Lamps (8)** - A single standard equipment rear license plate lamp unit is integral to the license plate mounting bracket just below the left rear lamp unit on vehicles manufactured for domestic markets. A bracket with two rear license plate lamps is located on the rear bumper directly below the spare tire on vehicles manufactured for export markets.
- **Rear Fog Lamps (7)** - Rear fog lamp units are mounted on the outboard ends of the rear bumpers on vehicles manufactured for export markets where they are required.
- **Rear Lamp Units (6)** - A standard equipment rear lamp unit is mounted to the rear of each rear body corner panel on either side of the swing gate opening.
- **Underhood Lamp** - Vehicles equipped with this option have a single underhood lamp unit with an integral automatic mechanical (non-mercury) switch. The lamp and switch unit is mounted to the underside of the inner hood reinforcement above the right side of the engine compartment.

These exterior lighting lamp units and their controls are combined to provide the following exterior lighting features:

- **Backup Lamps** - The backup (or reverse) lamps include a clear bulb, reflector and clear lens that are integral to each rear lamp unit.
- **Brake Lamps** - The brake (or stop) lamps include a clear bulb, reflector and red lens that are integral to each rear lamp unit, and the red lens and multiple Light-Emitting Diode (LED) units of the CHMSL.
- **Daytime Running Lamps** - Daytime Running Lamps (DRL) are standard equipment on vehicles manufactured for sale in Canada and optional on vehicles manufactured for the United States. Vehicles with DRL illuminate the high beam filament of each headlamp bulb at a reduced intensity to serve as the DRLs.
- **Exterior Lamp Fail-Safe Operation** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the Totally Integrated Power Module (TIPM) provide a fail-safe feature which will automatically turn ON the low beam headlamps and all park lamps when the ignition switch is in the ON position and there is no detected input from the Steering Control Module (SCM), or when there is no communication over the Local Interface Network (LIN) or Controller Area Network (CAN) data buses.
- **Exterior Lamp Load Shedding** - The TIPM provides a battery saver feature which will automatically turn OFF all exterior lamps that remain ON with the ignition switch in the LOCK position after a timed interval of about eight minutes.
- **Front Fog Lamps** - The standard equipment front fog lamps include the clear bulb, reflector and clear lens of each adjustable front fog lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the bulbs, reflectors and lenses of each lamp in the right and left, front and rear turn signal circuits.
- **Headlamp Delay** - The standard equipment low or high beam headlamps remain illuminated for a customer-programmable delay period of 0 (disabled), 30, 60 or 90 seconds when the headlamps are turned OFF after the ignition switch has been turned to the OFF position.
- **Headlamps** - The headlamps include a single, dual filament halogen bulb, a reflector and a clear lens integral to each headlamp unit. Headlamps for domestic markets are vertically adjustable, while those for export markets are both vertically and horizontally adjustable.
- **Headlamp Leveling** - Headlamp leveling is available only in certain markets where it is required equipment. A headlamp leveling actuator motor attached to each headlamp mounting collar and a headlamp leveling switch integral to the switch pod in the instrument panel center stack allow the

headlamp beam pattern to be adjusted by the vehicle operator from the interior of the vehicle to compensate for variable passenger or cargo loads.

- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the left (lighting) multi-function switch control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.
- **Park Lamps** - The front park lamps include the bulbs, reflectors and amber lenses integral to each front park/turn lamp unit and, if the vehicle is so equipped, the clear position lamp bulb integral to each headlamp unit. The rear park lamps include the clear bulbs, reflectors and red lenses integral to each rear lamp unit as well as the bulbs and lenses of the rear license plate lamp or lamps.
- **Rear Fog Lamps** - Rear fog lamps are available only in certain markets where they are required equipment. The rear fog lamps include a clear bulb and a red lens and reflector that are integral to each rear lamp unit.
- **Turn Signal Lamps** - The front turn signal lamps include a clear bulb, a reflector and an amber lens that are integral to each front park/turn lamp unit. In certain markets where they are required, the repeater lamps on each front fender flare will also be included in the front turn signal circuits. The domestic market rear turn signal lamps include a clear bulb, a reflector and a red lens integral to each rear lamp unit; while the export market rear turn signal lamps include an amber bulb, a reflector and a clear lens that are integral to each rear lamp unit.

Other components of the exterior lighting system for this vehicle include:

- **Backup Lamp Switch** - A plunger-type backup lamp switch is installed through the transmission housing of vehicles equipped with a manual transmission and is actuated by the shifter mechanism within the transmission when REVERSE gear is selected. On vehicles with an optional automatic transmission a stand-alone Transmission Range Sensor (TRS) performs the backup lamp switch function.
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the brake pedal support bracket under the instrument panel and is actuated by the brake pedal arm when the brake pedal is depressed.
- **Clockspring** - The clockspring includes an integral turn signal cancel cam, which provides automatic turn signal cancellation as the steering wheel is rotated back to its centered position following a vehicle turning maneuver. The clockspring is located near the top of the steering column, directly beneath the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - DESCRIPTION).
- **Hazard Switch** - A latching push button-actuated hazard switch is integral to the switch pod located just below the heater and air conditioner controls in the center stack area of the instrument panel.
- **Headlamp Leveling Motor** - A headlamp leveling motor is mounted to the back of the front end module support behind each headlamp of vehicles manufactured for certain markets where the headlamp leveling feature is required.
- **Headlamp Leveling Switch** - A four mode push button-actuated headlamp leveling switch is integral to the switch pod located just below the heater and air conditioner controls in the center stack area of the instrument panel of vehicles manufactured for certain markets where the headlamp leveling feature is required.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DESCRIPTION).
- **Instrument Panel Switch Pod** - The instrument panel switch pod contains the hazard switch and, on vehicles so equipped, the headlamp leveling switch. The switch pod is located just below the heater and air conditioner controls in the center stack area of the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - DESCRIPTION).
- **Left Multi-Function Switch** - The left (lighting) multi-function switch is located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the switch is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn). A control knob on the control stalk is used to select the park lamps, headlamps or fog lamps.
- **Park Brake Switch** - A park brake switch is located on the park brake lever mechanism on the floor panel transmission tunnel between the two front seats.

- **Steering Control Module** - The Steering Control Module (SCM) is located within the left multi-function switch housing on the top of the steering column, just below the steering wheel. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/STEERING COLUMN CONTROL MODULE - DESCRIPTION).
- **Totally Integrated Power Module** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION - DESCRIPTION).
- **Trailer Tow Wiring** - Vehicles equipped with an optional Trailer Tow package have a trailer tow wire harness that is connected between the body wire harness and the left rear lamp unit to provide a take out and a molded four-way trailer tow connector secured to a bracket near the trailer hitch receiver below the rear bumper.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

Following are paragraphs that briefly describe the operation of each of the major exterior lighting systems. The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BACKUP LAMPS

The backup (or reverse) lamps have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment. On vehicles with a manual transmission, the backup lamp switch provides a hard wired input to the Totally Integrated Power Module (TIPM) through a reverse switch signal circuit and the TIPM provides battery voltage to the backup lamps on the backup lamp feed circuit whenever the ignition switch is in the ON position and the REVERSE position is selected with the transmission shift linkage.

On vehicles with an automatic transmission the Transmission Control Module (TCM) monitors a multiplex input from the Transmission Range Sensor (TRS), then sends the proper electronic **transmission gear selector status** messages to other electronic modules over the Controller Area Network (CAN) data bus. Whenever the ignition switch is in the ON position and the TIPM receives an electronic message indicating the status of the transmission gear selector is REVERSE, it provides a battery voltage output through a high side driver to the backup lamps on the backup lamp feed circuit.

BRAKE LAMPS

The brake (or stop) lamps and the Center High Mounted Stop Lamp (CHMSL) each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment. The CHMSL receives battery voltage directly on the brake lamp switch output circuit when the brake lamp switch is closed by the brake pedal arm. The TIPM also receives battery voltage on the brake lamp switch output circuit, which it uses as a signal to energize the brake lamps. The TIPM provides battery voltage to the brake lamps through a high side driver on the tail/stop lamp rear feed circuit when it receives the proper input from the closed brake lamp switch.

DAYTIME RUNNING LAMPS

Vehicles equipped with the Daytime Running Lamps (DRL) feature illuminate the high beam filament of both headlamp bulbs at a reduced intensity when the engine is running, the parking brake is released, the headlamps are turned OFF, and the optional automatic transmission gear selector lever is in any position except PARK. The park lamps may be ON or OFF for DRL to operate. For vehicles with a manual transmission, the DRL will operate in any transmission gear selector lever position. The TIPM must be programmed appropriately for this feature to be enabled.

Once enabled, anytime the TIPM receives electronic messages over the CAN data bus from the Powertrain Control Module (PCM) indicating the engine is running, from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) indicating the status of the left (lighting) multi-function switch is in any position except headlamps ON and the parking brake lever is released, and from the Transmission Control Module (TCM) indicating the automatic transmission gear selector lever is in any position except PARK, the TIPM provides a pulse width modulated voltage output to the headlamp high beam bulb filaments through high side drivers on the right and left high beam feed circuits to produce illumination at a reduced intensity.

FRONT FOG LAMPS

The front fog lamps have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment wire harness has takeouts with eyelet terminals that are secured by nuts to ground studs on the front end sheet metal within the engine compartment. The Steering Control Module (SCM) monitors a hard wired multiplex input from the left multi-function switch to determine whether the fog lamps are selected, then sends an electronic **front fog lamp switch status** message to the EMIC over the Local Interface Network (LIN) data bus and the EMIC relays an electronic **front fog lamp request** message to the TIPM over the CAN data bus.

When the TIPM receives a **front fog lamp request** message it then controls front fog lamp operation by controlling a battery voltage output through high side drivers on right and left fog lamp feed circuits. The TIPM also sends the appropriate electronic message back to the EMIC to illuminate or extinguish the front fog lamp indicator. In certain markets where required, the TIPM will automatically de-energize the front fog lamps any time the headlamp high beams are selected.

The TIPM also provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position, if there is a charging system failure, or if the electrical system voltage falls below about 11.75 volts for more

than about 30 seconds. The TIPM will return the front fog lamps to normal operation when it detects that system voltage is greater than 13.0 volts for more than about 30 seconds.

Each front fog lamp includes an integral adjustment screw to be used for static aiming of the fog lamp beams.

HAZARD WARNING LAMPS

The hazard warning system includes the EMIC, the TIPM and the hazard switch in the switch pod located in the center stack area of the instrument panel, below the air conditioner and heater controls. The hazard switch provides a hard wired output to the TIPM. The TIPM monitors the hazard switch input through an internal pull-up.

When the TIPM receives an input from the hazard switch it controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left turn signal feed circuits. The TIPM also sends the appropriate electronic messages back to the EMIC over the CAN data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The EMIC then sends messages to the instrument panel switch pod over the LIN data bus to control the illumination of the hazard switch push button.

HEADLAMPS

The headlamp system includes the SCM, the EMIC, the TIPM, and the left (lighting) multi-function switch on the steering column. The headlamp bulbs have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment harness has takeouts with eyelet terminals that are secured by nuts to ground studs on the front end sheet metal within the engine compartment. The TIPM will store a Diagnostic Trouble Code (DTC) for any shorts or opens in the headlamp circuits.

The SCM monitors a hard wired multiplex input to determine the status of the left multi-function switch and whether the headlamp high or low beams are selected. The SCM then sends the appropriate electronic **headlamp switch** and **headlamp beam select switch status** messages to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **headlamp** and **headlamp beam request** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a pulse width modulated voltage output to the headlamps through high side drivers on the right and left low and high beam feed circuits to illuminate the selected headlamp filaments. The TIPM also sends the appropriate electronic messages to the EMIC to control the illumination of the high beam indicator. When the optical horn feature is selected, the low beams will shut OFF about 200 milliseconds after the high beams are activated.

The TIPM also remembers which beams (LOW or HIGH) were selected when the headlamps were last turned OFF, and energizes those beams again the next time the headlamps are turned ON. The TIPM provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The SCM and the EMIC each provide a fail-safe feature for the headlamps, which will cause the TIPM to turn the low beam headlamps ON automatically if there is no input available from the left multi-function switch. The TIPM also provides a fail-safe feature for the headlamps that will turn the headlamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

Each headlamp includes an integral adjustment screw (domestic markets) or screws (export markets) to be used for static aiming of the headlamps.

HEADLAMP DELAY

The headlamp delay feature includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. This feature has customer programmable delay intervals of 0 seconds (disabled), 30 seconds, 60 seconds and 90 seconds. If the left multi-function switch remains in the headlamp ON position until after the ignition switch is turned to the OFF position, then the headlamps will remain illuminated until after the selected delay interval has elapsed. The park lamps will not stay ON during the headlamp delay interval. The default delay interval is zero seconds (disabled), but can be reprogrammed by the customer using the customer programmable features function of the EMIC.

HEADLAMP LEVELING

In certain markets where required, a headlamp leveling system is provided on the vehicle. The headlamp leveling system includes unique front headlamp units each connected to a headlamp leveling actuator motor, and a rocker-actuated headlamp leveling switch integral to the switch pod in the instrument panel center stack. The headlamp leveling system allows the headlamp beams to be adjusted to one of four vertical positions to compensate for changes in inclination caused by the loading of the vehicle suspension. The leveling motors are mechanically connected through an integral pushrod to the adjustable headlamp mounting collar.

Each time the headlamp leveling switch is depressed the circuitry of the switch pod provides an electronic **select status up** or **select status down** message input to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **select request up** or **select request down** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a voltage output to the headlamp leveling motors through high side drivers on the headlamp leveling motor right and left signal circuits to move the headlamp reflectors to the selected position based upon the voltage input received from the TIPM. The TIPM also sends the appropriate electronic messages back to the EMIC and the EMIC relays the message back to the switch to control the illumination of the 1, 2, or 3 Light Emitting Diode (LED) selected position indicator in the leveling switch button. The EMIC and TIPM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

PARK LAMPS

The park lamps system includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. The front park/turn lamp and the position lamp bulbs each have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment wire harness has takeouts with eyelet terminals that are secured by nuts to ground studs on the front end sheet metal within the engine compartment. The rear lamp units and license plate lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment.

The SCM monitors a hard wired multiplex input from the left multi-function switch, then sends the appropriate electronic **headlamp switch status** messages to the EMIC over the LIN data bus. Then the EMIC relays the appropriate electronic message to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a battery voltage output to the appropriate lamp bulbs through high side drivers on the proper park/tail/license/running lamp right and left circuits. The TIPM and the SCM also send the appropriate electronic messages to the EMIC to control the illumination and lighting level of the panel lamps.

The TIPM provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The SCM and the EMIC each provide a fail-safe feature for the park lamps, which will send an electronic message to the TIPM to turn these lamps ON automatically if there is no input available from the left multi-function switch. The TIPM also provides a fail-safe feature for the park lamps that will turn these lamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

REAR FOG LAMPS

Rear fog lamps are installed on vehicles manufactured for all export markets. The rear fog lamp system includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. The rear fog lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment.

The SCM monitors a hard wired multiplex input from the left multi-function switch to determine whether the rear fog lamps are selected, then sends electronic **rear fog lamp switch status** messages to the EMIC over the LIN data bus. Then the EMIC relays an electronic **rear fog lamp request** message to the TIPM over the CAN data bus. The TIPM responds to this message by providing a battery voltage output to the rear fog lamp bulbs through high side drivers on the fog lamp relay control rear circuit. The TIPM also sends the appropriate electronic message back to the EMIC to control the rear fog lamp indicator.

The TIPM will automatically energize and de-energize the front fog lamps in concert with the rear fog lamps. The TIPM also provides a battery saver (load shedding) feature for the rear fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position.

TRAILER TOW WIRING

Domestic market vehicles equipped with an optional trailer tow package include a trailer tow wire harness connected between the body wire harness and the left rear lamp unit. The trailer tow harness includes a molded four-way trailer tow connector and an integral cover that are snapped into a bracket on the trailer hitch receiver platform.

TURN SIGNAL LAMPS

The turn signal lamps system includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. The front turn signal lamp bulbs each have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment wire harness has a takeout with an eyelet terminal that is secured by a nut to a ground stud on the body sheet metal within the engine compartment. The rear turn signal lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment.

The SCM monitors a hard wired multiplex input from the left multi-function switch to determine the status of the turn signal switch, then sends the appropriate electronic **turn signal switch status** messages to the EMIC over the LIN data bus. Then the EMIC relays an electronic **turn signal request** message to the TIPM over the CAN data bus. The TIPM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps through high side drivers on the appropriate right or left turn signal feed circuits. The TIPM also sends the appropriate electronic messages back to the EMIC to control the

illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional turn signal flasher.

The EMIC also provides a **turn signal ON warning** that will generate repetitive chimes to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per-hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers (2.49 miles) for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first.

WARNING

WARNINGS - LAMPS/LIGHTING - EXTERIOR

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SPECIFICATIONS). In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DIAGNOSIS AND TESTING

LAMPS/LIGHTING - EXTERIOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BACKUP LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BACKUP LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace backup lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open backup lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open backup lamp feed circuit if required.
	4. Ineffective switch.	4. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
BACKUP LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted backup lamp feed circuit if required.
	2. Ineffective switch.	2. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

BRAKE LAMPS

NOTE: The Center High Mounted Stop Lamp (CHMSL) is illuminated by several Light-Emitting Diode (LED) units that are soldered to the electronic circuit board within the lamp housing. The CHMSL is hard wired to the output of the brake lamp switch, while the brake lamps are powered by high side drivers within the TIPM based upon an input from the brake lamp switch. If the brake lamps and all of the LED units within the CHMSL fail to operate, diagnose and repair the brake lamps before attempting to repair the CHMSL. If the brake lamps operate but none of the CHMSL LED units illuminate, test and repair the CHMSL ground or feed circuit if required. If some of the CHMSL LED units operate and others do not, the CHMSL assembly must be replaced with a new unit.

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace brake lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open brake lamp ground circuit if required.
	3. Ineffective fuse.	3. Test and replace the fuse in the TIPM if required.
	4. Ineffective feed circuit.	4. Test and repair open brake lamp switch output circuit or stop lamp output circuit if required.
	5. Ineffective switch.	5. Test and replace brake lamp switch if required.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted brake lamp switch output circuit or stop lamp output circuit if required.
	2. Improperly adjusted switch.	2. Adjust the brake lamp switch if required.
	3. Ineffective switch.	3. Test and replace brake lamp switch if required.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

DAYTIME RUNNING LAMPS

NOTE: Before performing the following tests, determine whether the headlamp low and high beams operate. If the headlamp low and high beams are also ineffective, diagnose and repair that problem before attempting to repair the Daytime Running Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. Incorrect TIPM programming.	1. Use a diagnostic scan tool to check and configure TIPM if required.
	2. Automatic transmission in PARK position.	2. Place the transmission gear selector lever in any position except PARK.
	3. Parking brake applied.	3. Release the parking brake.
	4. Engine not running.	4. Start the engine.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

FRONT FOG LAMPS

NOTE: The front fog lamp switch is integral to the left multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Front Fog Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace front fog lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open front fog lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open front fog lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted front fog lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HAZARD WARNING LAMPS

NOTE: The hazard switch is integral to the instrument panel switch bank, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, confirm whether the left and right turn signals operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the turn signals are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the Hazard Warning Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
-----------	-----------------	------------

HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	2. Ineffective TIPM inputs or outputs.	2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	2. Ineffective TIPM inputs or outputs.	2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: As part of the exterior lighting failsafe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the TIPM. Diagnose and repair those problems before attempting to repair the Headlamps. In addition, the TIPM will store a Diagnostic Trouble Code (DTC) for an open or shorted headlamp circuit.

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace headlamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open headlamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open headlamp low beam or high beam feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted headlamp low beam or high beam feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS ILLUMINATE WITH IGNITION ON AND HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)	1. Loss of LIN or CAN data bus communication.	1. Test and repair the LIN or CAN data bus if required. Refer to the appropriate diagnostic information.
HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	2. Ineffective TIPM inputs or outputs.	2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMP LEVELING

NOTE: The headlamp leveling switch is integral to the instrument panel switch bank, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, confirm whether the park lamps operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the park lamps are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the Headlamp Leveling function.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE LEVELING MOTOR IS INEFFECTIVE	1. Ineffective ground circuit.	1. Test and repair open leveling motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair open leveling motor feed circuit if required.
	3. Ineffective signal circuit.	3. Test and repair open headlamp leveling motor signal circuit if required.
	4. Ineffective motor.	4. Test and replace headlamp leveling motor if required.
BOTH LEVELING MOTORS ARE INEFFECTIVE	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	2. Ineffective motor ground circuit.	2. Test and repair open leveling motor ground circuit if required.
	3. Ineffective motor feed circuit.	3. Test and repair open leveling motor feed circuit if required.
	4. Ineffective signal circuit.	4. Test and repair open or shorted headlamp leveling motor signal circuit if required.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective motors.	6. Test and replace leveling motors if required.

PARK LAMPS

NOTE: As part of the exterior lighting failsafe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the TIPM. Diagnose and repair those problems before attempting to repair the Park Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace park lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open park lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open park lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted park lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

REAR FOG LAMPS

NOTE: The rear fog lamp switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Rear Fog Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
REAR FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace rear fog lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open rear fog lamp ground circuit if required.

	3. Ineffective feed circuit.	3. Test and repair open fog lamp relay control rear circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	5. Incorrect TIPM configuration.	5. Use a diagnostic scan tool to check and correct the TIPM configuration settings if required. Refer to the appropriate diagnostic information.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
REAR FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted fog lamp relay control rear circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

TURN SIGNAL LAMPS

NOTE: The turn signal switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Turn Signal Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNAL LAMPS (OR BOTH SIDES) DO NOT FLASH	1. Ineffective feed circuit.	1. Test and repair open right or left turn signal feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic

	outputs.	information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS FLASH TOO RAPIDLY (MORE THAN 100 FLASHES PER MINUTE)	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open bulb ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
TURN SIGNALS DO NOT AUTOMATICALLY CANCEL	1. Ineffective cancel cam.	1. Inspect and replace the turn signal cancel cam (clockspring) if required.
	2. Ineffective cancel actuator.	2. Inspect and replace the turn signal cancel actuator (left multi-function switch) if required.

STANDARD PROCEDURE

FRONT LAMP AIMING

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and correct any burnt out bulbs.
2. If the vehicle is equipped with headlamp leveling, be certain that the headlamp leveling switch is in the **0** position.
3. Repair or replace any ineffective, worn or damaged body or suspension components that could hinder proper lamp alignment.
4. Verify proper tire inflation pressures.
5. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
6. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
7. The fuel tank should be FULL. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
8. Verify correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION

819687cd

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.
8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp

horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

NOTE: Due to the linear nature of the headlamp cutoff, a properly aimed low beam headlamp will project the top edge of the high intensity pattern on the alignment screen from the horizontal line to 50 millimeters (2 inches) below the horizontal line for domestic market vehicles, or to 125 millimeters (5 inches) below the horizontal line for export market vehicles. No horizontal (right/left) adjustment is required for this headlamp beam pattern in domestic market vehicles. Export market vehicles have a second horizontal (right/left) adjustment screw provided. The high beam pattern will be correct when the low beams are properly aimed.

1. Turn the headlamps ON and select the LOW beams for vehicles in all markets.
2. On all vehicles except those with headlamp leveling, use a screwdriver to rotate the headlamp vertical adjustment screw (1) on each headlamp to adjust the beam height as required.
3. For export markets only, use a screwdriver to rotate the headlamp horizontal adjustment screw (2) on each headlamp to adjust the beam right or left as required.

FOG LAMP ALIGNMENT

NOTE: A properly aimed front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp.

1. Turn the fog lamps ON.
2. Insert a screwdriver through the clearance hole in the underside of the front bumper (1) to rotate the vertical adjustment screw (2) on each fog lamp to adjust the beam height as required.

SWITCH-BACK UP LAMP

DESCRIPTION

Vehicles equipped with a manual transmission (1) have a normally open, spring-loaded plunger type backup lamp switch (2). Vehicles with an optional electronic automatic transmission have a Transmission Range Sensor (TRS) that is used to perform several functions, including that of the backup lamp switch. The TRS is described in further detail elsewhere in this service information. Refer to the service and diagnostic information for the automatic transmission type installed in the vehicle.

The backup lamp switch is located in a threaded hole on the side of the manual transmission housing. The switch has a threaded body and a hex formation near the plunger end of the switch. An integral connector receptacle at the end of the switch opposite the plunger connects the switch to the vehicle electrical system through a take out and connector of the engine wire harness. When installed, only the switch connector and the hex formation are visible on the outside of the transmission housing.

The backup lamp switch cannot be adjusted or repaired and, if ineffective or damaged, the entire switch unit must be replaced.

OPERATION

The backup lamp switch controls a path to ground for the Totally Integrated Power Module (TIPM) on the reverse switch signal circuit. The TIPM reads this input through an internal pull-up, then controls an output through a high side driver that regulates the flow of battery voltage to the backup lamp bulbs as appropriate on the backup lamp feed circuit. The switch plunger is mechanically actuated by the gearshift mechanism within the transmission, which will depress the switch plunger and close the switch contacts whenever the REVERSE gear has been selected. The switch receives ground at all times through a take out and eyelet terminal of the engine wire harness that is secured by a nut to a ground stud on the body sheet metal within the engine compartment of the vehicle.

The backup lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

BACKUP LAMP SWITCH

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Locate and disconnect the engine wire harness connector from the backup lamp switch connector receptacle.
4. Check for continuity between the two terminal pins in the backup lamp switch connector receptacle.
 - a. With the gear selector lever in the REVERSE position, there should be continuity.
 - b. With the gear selector lever in any position other than REVERSE, there should be no continuity.
5. If the switch fails either of these two continuity tests, replace the ineffective backup lamp switch.

SWITCH-STOP LAMP

DESCRIPTION

The brake lamp switch (1) is a three circuit, spring-loaded plunger actuated switch that is secured to a stamped metal brake lamp switch bracket on the instrument panel structural support armature near the brake pedal under the instrument panel on the driver side of the vehicle. The molded plastic switch housing has an integral connector receptacle (4) containing six terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the instrument panel wire harness.

The switch plunger (3) extends through a mounting collar (2) on one end of the switch housing. The plunger has a telescoping self-adjustment feature that is activated after the switch is installed by pulling the brake pedal upward to its normal at-rest position. The telescoping plunger can be pulled outward from the switch housing to repeat the self-adjustment procedure if necessary.

The brake lamp switch cannot be repaired. If the switch is damaged or ineffective it must be replaced with a new unit.

OPERATION

The brake lamp switch controls three independent circuits. These circuits are described as follows:

- **Brake Lamp Switch Circuit** - A normally open brake lamp switch circuit receives a battery voltage input, and supplies this battery voltage to the brake lamps and the Controller Antilock Brake (CAB) on a brake lamp switch output circuit only when the brake pedal is depressed (brake lamp switch plunger released).

- **Brake Lamp Switch Signal Circuit** - A normally closed brake lamp switch signal circuit receives a direct path to ground, and supplies this ground input to the Powertrain Control Module (PCM) on a brake lamp switch sense circuit only when the brake pedal is released (brake lamp switch plunger is depressed).
- **Speed Control Circuit** - A normally closed speed control circuit receives a battery voltage input from the PCM on a speed control supply circuit, and supplies this battery voltage to the speed control servo solenoids (dump, vacuum, and vent) on a speed control brake switch output circuit only when the speed control system is turned ON and the brake pedal is released (brake lamp switch plunger is depressed).

The brake lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

BRAKE LAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the brake lamp switch.
3. Using an ohmmeter, perform the continuity tests at the terminal pins (1) in the brake lamp switch connector receptacle as shown in the Brake Lamp Switch Tests table.

BRAKE LAMP SWITCH TESTS	
PLUNGER POSITION (2)	CONTINUITY BETWEEN
Released (Extended)	Pins 1 and 2
Compressed (Depressed)	Pins 3 and 4, 5 and 6

4. If the switch fails any of the continuity tests, replace the ineffective brake lamp switch as required.

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the steering column opening cover from the instrument panel (2). (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
3. Depress and hold the brake pedal in the depressed position.
4. Rotate the brake lamp switch housing (4) counterclockwise about 30 degrees to align the tabs on the switch locking collar with the keyed hole in the brake lamp switch mounting bracket (3).
5. Pull the switch straight back from the keyed hole to remove it from the bracket.
6. Release the brake pedal.
7. Disconnect the wire harness connector (1) from the brake lamp switch.

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Be certain that the brake lamp switch (4) plunger is pulled all the way out of the switch housing to its fully extended position.
2. Reconnect the wire harness connector (1) to the connector receptacle on the switch.
3. Depress and hold the brake pedal in the depressed position.
4. Align the tabs on the brake lamp switch locking collar with the keyed hole in the brake lamp switch mounting bracket (3).

5. Insert the tab on the brake lamp switch locking collar through the keyed hole in the mounting bracket until the switch housing is firmly seated against the bracket.
6. Rotate the switch housing clockwise about 30 degrees to engage the tabs on the locking collar with the mounting bracket.

CAUTION: Brake booster damage may occur if the brake pedal pull exceeds about 9 kilograms (20 pounds).

7. Release the brake pedal. Then pull the pedal lightly upward to its normal at-rest position. The pedal will set the plunger to the correct position as the pedal pushes the plunger into the switch housing. The switch plunger will make a light audible ratcheting noise as it self-adjusts.
8. Reinstall the steering column opening cover onto the instrument panel (2). (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).
9. Reconnect the battery negative cable.

ADJUSTMENTS

BRAKE LAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
3. Depress and hold the brake pedal in the depressed position.
4. Pull the brake lamp switch plunger all the way out of the switch housing to its fully extended position.

CAUTION: Brake booster damage may occur if the brake pedal pull exceeds about 9 kilograms (20 pounds).

5. Release the brake pedal. Then pull the pedal lightly upward to its normal at-rest position. The pedal will set the plunger to the correct position as the pedal pushes the plunger into the switch housing. The switch plunger

will make a light audible ratcheting noise as it self-adjusts.

6. Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

7. Reconnect the battery negative cable.

CENTER HIGH MOUNTED STOP LAMP

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Unlatch and open the swing gate (4).
3. Unsnap the inboard side of the louvered plastic access panel and unhook it from the outboard edge of the access hole on the inside of the swing gate near the latch.
4. Reach through the access hole to disconnect the Center High Mounted Stop Lamp (CHMSL) pigtail connector (7) from the swing gate wire harness connector (3).
5. Disengage the grommet (6) for the CHMSL pigtail wire harness from the clearance hole in the outer swing gate panel.
6. Carefully pull the CHMSL pigtail wire harness and connector out through the swing gate clearance hole.
7. Remove the four screws (2) from the forward facing surface of the stanchion on the spare tire carrier (5) that secure the CHMSL (1).

8. Pull the CHMSL away from the vehicle while feeding the CHMSL pigtail wire harness through the spare tire carrier.

INSTALLATION

1. Feed the Center High Mounted Stop Lamp (CHMSL) (1) pigtail wire harness through the spare tire carrier (5) on the outer surface of the swing gate (4).
2. Position the CHMSL to the rearward facing surface of the stanchion on the spare tire carrier
3. Install and tighten the four screws (2) that secure the CHMSL to the stanchion. Tighten the screws to 2 N·m (20 in. lbs.).
4. Feed the CHMSL wiring back into the swing gate through the clearance hole far enough to engage the rubber grommet (6) into the clearance hole.
5. Reach through the access hole on the inside of the swing gate near the latch to access and reconnect the CHMSL pigtail connector (7) to the swing gate wire harness

connector (3).

6. Reinstall the louvered plastic access panel over the access hole by hooking it into the outboard edge of the hole, then pressing firmly and evenly over the two snap clip locations on the inboard side of the panel until it snaps into place.

7. Reconnect the battery negative cable.

FRONT FOG LAMP

REMOVAL

LAMP

1. Disconnect and isolate the battery negative cable.
2. For export market vehicles, turn the front wheels fully in either direction.
3. Raise and support the vehicle.
4. For domestic market vehicles, remove the front bumper lower air dam from the vehicle.
5. Disconnect the engine compartment wire harness connector (4) from the front fog lamp bulb connector receptacle.
6. Remove the four screws (3) that secure the front fog lamp housing (1) to the back of the front bumper cover (2).
7. Remove the lamp from the back of the front bumper cover.

BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Disconnect and isolate the battery negative cable.
2. For export market vehicles, turn the front wheels fully in either direction.
3. Raise and support the vehicle.
4. For domestic market vehicles equipped with the optional electronic sway bar disconnect feature, service of the right fog lamp bulb will also require removal of the front bumper lower air dam from the vehicle.
5. From behind the front bumper (2), disconnect the engine compartment wire harness connector (4) from the front fog lamp bulb (3) connector receptacle.
6. Firmly grasp the bulb on the back of the front fog lamp housing (1) and rotate it counterclockwise about 30 degrees to unlock it.
7. Pull the bulb straight out from the keyed opening in the housing.

INSTALLATION

LAMP

1. Position the front fog lamp housing (1) to the back of the front bumper cover (2). Be certain that the two alignment pins on the back of the front bumper cover are engaged in the alignment holes in the lamp housing.
2. Install and tighten the four screws (3) that secure the lamp to the back of the front bumper cover. Tighten the screws to 2 N·m (18 in. lbs.).
3. Reconnect the engine compartment wire harness connector (4) to the fog lamp bulb connector receptacle.
4. If it was removed during bulb removal, reinstall the front bumper lower air dam onto the vehicle.
5. Lower the vehicle.
6. Reconnect the battery negative cable.
7. Confirm proper front fog lamp alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - STANDARD PROCEDURE - FRONT LAMP AIMING).

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Align the front fog lamp bulb (3) with the keyed opening on the back of the front fog lamp housing (1).
2. Insert the bulb into the housing until it is firmly seated.
3. Rotate the bulb clockwise about 30 degrees to lock it into place. The bulb connector receptacle should be horizontal in orientation.
4. Reconnect the engine compartment wire harness connector (4) to the bulb connector receptacle.
5. If it was removed during bulb removal, reinstall the front bumper lower air dam onto the vehicle.
6. Lower the vehicle.
7. Reconnect the battery negative cable.

FRONT SIDE MARKER OR REPEATER LAMP

REMOVAL

LAMP

NOTE: The following procedure applies to either the front side marker lamps used on vehicles manufactured for the domestic market or to the repeater lamps used on vehicles manufactured for the export market. Although the lamps and bulbs are unique, the service procedures are the same.

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Disconnect the ends of the jumper wire harness (3) from the front side marker/repeater lamp bulb socket and from the engine wire harness.
4. Remove and disassemble the front fender flare (6), reinforcement bracket (5) and wheel liner (2) from the vehicle. Take the proper precautions to protect the fender flare from cosmetic damage during disassembly. (Refer to 23 - BODY/EXTERIOR/WHEEL OPENING FLARE MOLDING - FRONT - REMOVAL).
5. Release the two integral latch features on the back of the lamp housing (4) and unhook the integral hook feature on the lamp housing from the slot in the lamp seat of the front fender flare reinforcement bracket.

BULB

NOTE: The front side marker lamps are used only on vehicles manufactured for domestic markets, while repeater lamps are used only on vehicles manufactured for export markets. The service procedures for the bulbs of these two unique lamps are the same.

1. Disconnect and isolate the battery negative cable.
2. Reach between the front wheel flare (3) and the front tire above the front bumper (2) to access the back of the lamp (1).
3. Firmly grasp the bulb socket (4) and connector on the back of the lamp and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

INSTALLATION

LAMP

NOTE: The following procedure applies to either the front side marker lamps used on vehicles manufactured for the domestic market or to the repeater lamps used on vehicles manufactured for the export market. Although the lamps and bulbs are unique, the service procedures are the same.

1. Position the front side marker/repeater lamp (4) into the

lamp seat in the front fender flare reinforcement bracket (5). Be certain that the integral hook feature on the lamp housing is engaged in the slot on one side of the seat and that the two integral latch features on the lamp housing are fully engaged.

2. Reassemble and reinstall the front fender flare (6), reinforcement bracket, wheel liner (2) and side marker/repeater lamp to the vehicle as a unit. (Refer to 23 - BODY/EXTERIOR/WHEEL OPENING FLARE MOLDING - FRONT - INSTALLATION).
3. Reconnect the ends of the jumper wire harness (3) to the front side marker/repeater lamp bulb socket and to the engine wire harness.
4. Lower the vehicle.
5. Reconnect the battery negative cable.

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The front side marker lamps are used only on vehicles manufactured for domestic markets, while repeater lamps are used only on vehicles manufactured for export markets. The service procedures for the bulbs of these two unique lamps are the same.

1. Reach between the front wheel flare (3) and the front tire above the front bumper (2) to access the back of the lamp (1).
2. Align the base of the bulb with the lamp socket (4).
3. Push the bulb straight into the socket until the base is firmly seated.
4. Align the socket and bulb with the keyed opening on the back of the lamp.
5. Insert the socket and bulb into the housing until the socket is firmly seated.
6. Rotate the socket clockwise about 30 degrees to lock it into place.
7. Reconnect the battery negative cable.

HAZARD SWITCH

DESCRIPTION

The hazard switch (3) is integral to the instrument panel switch pod (1), which is secured to the instrument panel center bezel just below the heater and air conditioner controls. A red, stencil-like International Control and Display Symbol icon for **Hazard Warning** identifies the hazard switch button. The remainder of the hazard switch circuitry is concealed within the instrument panel switch pod.

The hazard switch button has panel lamps dimmer controlled illumination for night visibility. The switch button unlatches to a slightly raised position when the hazard warning system is activated and the icon on the switch button will illuminate at an increased intensity while the turn signals and turn signal indicators are flashing. The switch button latches to a lowered position flush with the other push buttons in the switch pod when the hazard warning is deactivated.

All of the circuitry and components of the hazard switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The hazard switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch pod unit must be replaced. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - REMOVAL).

OPERATION

The status of the hazard switch is continually monitored by the circuitry within the instrument panel switch pod. The switch pod receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The only other inputs to the switch pod consists of electronic communication with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the single wire Local Interface Network (LIN) data bus.

Whenever the hazard switch is in its unlatched and raised position, the hazard warning system is selected and the switch pod circuitry sends a hard wired output to the Totally Integrated Power Module (TIPM) over the CAN data bus. When the TIPM receives a hazard switch input it then controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left turn signal feed circuits. The TIPM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The EMIC then sends messages back to the switch pod to control the illumination of the hazard switch push button.

The hard wired circuits for the instrument panel switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the hazard warning switch or the electronic controls and communication between other modules and devices that provide some features of the hazard warning system. The most reliable, efficient, and accurate means to diagnose the hazard switch or the electronic controls and communication related to hazard warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

HEADLAMP LEVELING MOTOR

DESCRIPTION

The headlamp leveling motor (1) is located on the engine compartment side of the front end module carrier behind each headlamp unit on vehicles equipped with the headlamp leveling system, which is available only in certain markets where it is required equipment. The motor is encased within a molded plastic housing and is secured by an integral wedge-type mounting boss (2) to a keyed flange on the front end module carrier.

The outside of the motor housing features an integral molded connector (4) on its lower rearward surface and a plastic pushrod with a ball formation (3) on its free end extends from the motor mounting boss. Within the motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission. The headlamp leveling motor is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp wire harness.

The motor cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

The controller board and logic circuitry of the headlamp leveling motor control motor operation based upon a voltage signal input received from the Totally Integrated Power Module (TIPM). The TIPM uses electronic messages received over the Controller Area Network (CAN) data bus from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the correct voltage signal to provide the leveling motor, while the EMIC uses electronic messages received over the Local Interface Network (LIN) data bus from the instrument panel switch pod to monitor the headlamp leveling switch selection.

The headlamp leveling motors have a path to ground at all times. The headlamp leveling motors operate on battery voltage received through the headlamp low beam feed circuits so that the system will only operate when the headlamp low beams are turned ON. When the motor is energized it will extend or retract the motor pushrod through an integral screw-drive transmission. The ball on the end of the pushrod is snapped into a socket on one end of a molded plastic spacer. The other end of the spacer snaps into a receptacle in the molded plastic headlamp mounting collar for the headlamp unit on the face of the front end module carrier. The headlamp then moves vertically as the pushrod is extended or retracted, changing the angle at which light is projected from the headlamps.

The hard wired circuits for the headlamp leveling motors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the active electronic elements within the headlamp leveling motors or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling motor or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Disconnect the engine compartment wire harness connector from the headlamp leveling motor (1) connector receptacle.
3. Rotate the headlamp leveling motor on the back of the front end module carrier (2) counterclockwise about 30 degrees.
4. Grasp the motor firmly with one hand and pull sharply and quickly straight rearward to unsnap the ball on the end of the motor pushrod from the socket on the spacer (3).
5. Remove the headlamp leveling motor from the engine compartment.

NOTE: The spacer and the headlamp mounting collar (4) cannot be repaired. If the spacer or collar break or if the spacer becomes disengaged from the collar before the leveling motor pushrod disengages the spacer, both the spacer and the mounting collar will also require replacement.

INSTALLATION

1. Position the headlamp leveling motor (1) and pushrod to the mounting boss on the back of the front end module carrier (2).
2. Align the ball on the end of the leveling motor pushrod with the socket in the spacer (3).
3. While stabilizing the headlamp from the face of the front end module carrier with one hand, firmly and steadily push the headlamp leveling motor pushrod straight into the spacer to snap the ball on the pushrod into the socket end of the spacer.
4. Insert the mounting flange of the headlamp leveling motor into the mounting boss on the front end module carrier until the motor is firmly seated.
5. Rotate the headlamp leveling motor clockwise about 30 degrees to lock it into place.
6. Reconnect the engine compartment wire harness connector to the headlamp leveling motor connector receptacle.
7. Reconnect the battery negative cable.

NOTE: The spacer and the headlamp mounting collar (4) cannot be repaired. If the spacer or collar break or if the spacer becomes disengaged from the collar before the leveling motor pushrod engages the spacer, both the spacer and the mounting collar will also require replacement.

HEADLAMP LEVELING SWITCH

DESCRIPTION

The headlamp leveling switch (2) is used only on vehicles manufactured for certain markets where the headlamp leveling system is required. The headlamp leveling switch is integral to the switch pod (1) on the instrument panel. A stencil-like International Control and Display Symbol icon for **Headlamp Levelling Control** identifies the headlamp leveling switch button. The switch push button is also marked with the numbers **0**, **1**, **2**, and **3**, which indicates each of the four headlamp leveling positions. Each higher number represents a lower aiming position of the headlamp beam relative to the road surface.

The headlamp leveling switch button has panel lamps dimmer controlled illumination for night visibility. The switch button also features a jewel like Light Emitting Diode (LED) indicator adjacent to the numbers **1**, **2**, and **3**. The appropriate LED is illuminated when that headlamp position is currently selected. The momentary switch push button is operated by depressing, then releasing the top or bottom of the button in a rocker manner to enable the selection of a sequentially higher or lower position with each button press.

All of the circuitry and components of the headlamp leveling switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The headlamp leveling switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch pod unit must be replaced. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - REMOVAL).

OPERATION

The status of the headlamp leveling switch is continually monitored by the circuitry within the instrument panel switch pod. The switch pod receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The only other inputs to and outputs from the switch pod consist of electronic communication with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the single wire Local Interface Network (LIN) data bus.

Whenever the headlamp leveling switch push button is depressed the switch pod circuitry sends an electronic **select status up** or **select status down** message input to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **select request up** or **select request down** message to the TIPM over the CAN data bus.

The TIPM responds to these messages by providing a voltage output to the headlamp leveling motors through high side drivers on the headlamp leveling motor right and left signal circuits to move the headlamp reflectors to the selected position based upon the voltage input received from the TIPM. The TIPM also sends the appropriate electronic messages back to the EMIC and the EMIC relays the messages back to the switch pod to control the illumination of the **1**, **2**, or **3** Light Emitting Diode (LED) selected position indicator in the leveling switch button. The EMIC and TIPM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

The hard wired circuits for the instrument panel switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp leveling switch or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling switch or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

HEADLAMP UNIT

STANDARD PROCEDURE

HEADLAMP UNIT MOISTURE CLEARING

Some moisture accumulation inside a vented headlamp unit is normal. This normal moisture will appear as a fogging on the inside of the lamp lens, similar to the fog that sometimes appears on the inside of a windshield. This moisture may be removed by activating the headlamps on HIGH beam for 15 minutes.

If water droplets larger than 1 millimeter (0.039 inch) in size have accumulated on the inside of the lamp lens, the headlamp unit should be replaced.

REMOVAL

BULB - HEADLAMP - DOMESTIC

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Disconnect and isolate the battery negative cable.
2. Remove the headlamp unit (1) from the mounting collar (3). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - DOMESTIC - REMOVAL).
3. Using the tabs on each side of the headlamp bulb connector receptacle (2), firmly grasp the bulb base and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the bulb and base straight out from the keyed opening in the headlamp unit.

BULB - HEADLAMP - EXPORT

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Disconnect and isolate the battery negative cable.
2. Remove the headlamp unit (1) from the mounting collar (3). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - EXPORT - REMOVAL).

3. Remove the rubber headlamp boot seal (2) from the back of the headlamp housing and the headlamp bulb base (4).
4. Removal of the boot seal from the headlamp unit housing will reveal the wire retainer for the headlamp bulb.
5. Pinch the two ends of the wire retainer together and disengage them from the hooks that secure them against the bulb flange on the headlamp housing.
6. Pivot the wire retainer up off of the flange of the headlamp bulb base and out of the way.
7. Pull the bulb straight out of the keyed opening in the headlamp housing.

LAMP - DOMESTIC

1. Disconnect and isolate the battery negative cable.
2. Remove the grille panel from the front of the vehicle. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
3. Remove the four screws (4) that secure the retainer (3) and the headlamp unit (2) to the mounting collar (1) on the face of the front end module carrier.
4. Pull the retainer and the headlamp unit away from the front of the vehicle far enough to access the wiring connection on the back of the lamp housing.
5. Disconnect the engine compartment wire harness connector from the headlamp bulb connector receptacle.
6. Remove the headlamp unit from the vehicle.

LAMP - EXPORT

1. Disconnect and isolate the battery negative cable.
2. Remove the grille panel from the front of the vehicle. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
3. Remove the four screws (4) that secure the retainer (3) and the headlamp unit (2) to the mounting collar (1) on the face of the front end module carrier.
4. Pull the retainer and the headlamp unit away from the front of the vehicle far enough to access the wiring

- connection on the back of the lamp housing.
5. Disconnect the engine compartment wire harness connectors from the headlamp bulb connector receptacle and from the position lamp bulb pigtail connector (5).
 6. Remove the headlamp unit from the vehicle.

BULB - POSITION LAMP

NOTE: The following procedure applies only to vehicles manufactured for export markets. Vehicles manufactured for domestic markets do not have a position lamp bulb, socket or wiring provided in the headlamp unit.

1. Disconnect and isolate the battery negative cable.
2. Remove the headlamp unit (1) from the mounting collar (3). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - EXPORT - REMOVAL).
3. Firmly grasp the position lamp socket (5) and pull it straight out of the rubber grommet in the headlamp unit housing.
4. Rotate the bulb counterclockwise about 30 degrees to unlock it from the socket.
5. Pull the bulb straight out of the socket.

INSTALLATION

BULB - HEADLAMP - DOMESTIC

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Align the headlamp bulb base (2) with the keyed opening

- on the back of the headlamp unit (1).
2. Insert the bulb and base into the headlamp until the base is firmly seated.
3. Using the tabs on each side of the connector receptacle, rotate the bulb base clockwise about 30 degrees to lock it into place.
4. Reinstall the headlamp unit (1) into the mounting collar (3). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - DOMESTIC - INSTALLATION).
5. Reconnect the battery negative cable.

BULB - HEADLAMP - EXPORT

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Insert the headlamp bulb (4) into the keyed opening in the headlamp unit housing (1).
2. Be certain the bulb is fully seated in the headlamp, then pivot the wire bulb retainer back over the bulb flange.
3. Pinch the two ends of the wire bulb retainer together and engage them under the hooks to secure them against the flange of the headlamp bulb.
4. Position the center openings of the rubber boot seal (2) over the base of the headlamp bulb and engage it fully over the bulb base.
5. Position the outer circumference of the boot seal over the flange on the back of the headlamp unit housing and pull it down around the circumference housing flange until it is fully engaged.
6. Reinstall the headlamp unit into the mounting collar (3). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - EXPORT - INSTALLATION).
7. Reconnect the battery negative cable.

LAMP - DOMESTIC

1. Position the headlamp unit (2) close enough to the front of the vehicle to reconnect the engine compartment wire

harness connector to the headlamp bulb connector receptacle.

2. Position the headlamp unit by aligning and engaging the index tabs on the back of the lamp with the depressions in the mounting collar (1) on the face of the front end module carrier.

3. Install the retainer (3) over the headlamp unit and against the mounting collar with the retainer screw tabs in alignment with the screw holes in the collar.

4. Install and tighten the four screws that secure the retainer to the collar. Tighten the screws until they are fully seated.

5. Reinstall the grille panel onto the front of the vehicle.

(Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

6. Reconnect the battery negative cable.

7. Confirm proper headlamp alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - STANDARD PROCEDURE - FRONT LAMP AIMING).

LAMP - EXPORT

1. Position the headlamp unit (2) close enough to the front of the vehicle to reconnect the engine compartment wire harness connectors to the headlamp bulb connector receptacle and to the position lamp bulb pigtail connector (5).

2. Position the headlamp unit by aligning and engaging the index tabs on the back of the lamp with the depressions in the mounting collar (1) on the face of the front end module carrier.

3. Install the retainer (3) over the headlamp unit and against the mounting collar with the retainer screw tabs in alignment with the screw holes in the collar.

4. Install and tighten the four screws that secure the retainer to the collar. Tighten the screws until they are fully seated.

5. Reinstall the grille panel onto the front of the vehicle.

(Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

6. Reconnect the battery negative cable.

7. Confirm proper headlamp alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - STANDARD PROCEDURE - FRONT LAMP AIMING).

BULB - POSITION LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The following procedure applies only to vehicles manufactured for export markets. Vehicles manufactured for domestic markets do not have a position lamp bulb, socket or wiring provided in the headlamp unit.

1. Align the base of the bulb with the position lamp bulb socket (5).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Rotate the bulb clockwise about 30 degrees to lock it into place.
4. Align the socket and bulb with the opening near the bottom of the headlamp unit housing (1).
5. Push the socket and bulb straight into the rubber grommet in the housing until the socket is firmly seated.
6. Reinstall the headlamp unit into the mounting collar (3). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - EXPORT - INSTALLATION).
7. Reconnect the battery negative cable.

LEFT MULTI-FUNCTION SWITCH

DESCRIPTION

The left (lighting) multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the interior and exterior lighting systems. The only visible components of the switch are the control stalk (2), control knob (1) and control sleeve (3) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connection, and the turn signal cancel actuator are concealed beneath the shrouds.

The switch housing (2) and controls (1) are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. A single screw (7) through a mounting tab integral to the back of the switch housing, and a slide tab integral to the bottom of the switch housing secure the switch to the mounting bracket integral to the clockspring (3).

The Steering Control Module (SCM) is internal to the switch housing. The switch outputs are internally connected directly to the SCM. A single connector receptacle containing seven terminal pins is integral to the inboard end of the switch housing and connects the right multi-function switch (6) through a jumper wire harness (5) directly to the SCM. An integral connector receptacle on the back of the switch housing connects the SCM to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The left multi-function switch provides the vehicle operator with a control interface for the following exterior lighting system functions:

- **Front Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional front fog lamps.
- **Headlamps** - The left multi-function switch control knob provides detent switching for the headlamps.
- **Headlamp Beam Selection** - The left multi-function switch control stalk provides detent switching for selection of the headlamp high or low beams.
- **Headlamp Optical Horn** - The left multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Park Lamps** - The left multi-function switch control knob provides detent switching for the park lamps.
- **Rear Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional rear fog lamps. Rear fog lamps are optional only for vehicles manufactured for certain markets, where they are required.
- **Turn Signal Control** - The left multi-function switch control stalk provides both momentary non-detent switching and detent switching with automatic cancellation for both the left and right turn signal lamps.

The left multi-function switch also provides the vehicle operator with a control interface for the following

interior lighting functions:

- **Interior Lamps Defeat** - The left multi-function switch control ring provides detent switching to DEFEAT the illumination of all interior courtesy lamps when a door, the rear flip-up glass, or the liftgate are opened.
- **Interior Lamps On** - The left multi-function switch control ring provides detent switching to simultaneously illuminate all interior courtesy lamps.
- **Panel Lamps Dimming** - The left multi-function switch control ring provides simultaneous adjustable control of the illumination intensity of all instrument panel lighting at one of five available illumination intensity levels.
- **Parade Mode** - The left multi-function switch control ring provides detent switching for a PARADE mode that maximizes the illumination intensity of all instrument panel lighting for visibility when driving in daylight with the exterior lamps turned ON.

The left multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire switch unit must be replaced. The clockspring (with the multi-function switch mounting bracket), the left multi-function switch (with the SCM), the right multi-function switch and the jumper wire harness are each available for separate service replacement.

OPERATION

The left (lighting) multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over a Local Interface Network (LIN) data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), and the EMIC relays electronic **switch request** messages over the Controller Area Network (CAN) data bus to other electronic modules in the vehicle.

If the SCM detects no inputs from the left multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the LIN data bus. The SNA status signals the EMIC to request other electronic modules to implement a failsafe mode of operation for the exterior lighting systems. The failsafe mode automatically turns the exterior lighting ON when the ignition switch is in the ON position, and OFF when the ignition switch is in the OFF position.

The hard wired inputs and outputs of the left multi-function switch and SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

EXTERIOR LIGHTING

Following are descriptions of how the left multi-function switch is operated to control the many exterior lighting functions and features it provides:

- **Front Fog Lamps** - The optional front fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the front fog lamps to be selected while

the headlamp ON position is also selected, and will automatically move the control knob to the front fog lamps OFF position when the control knob is rotated to deselect the headlamps.

- **Headlamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the headlamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the left multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **beam select switch status** message over the LIN data bus to the EMIC, which relays an electronic **beam select switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the left multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp high beams will remain illuminated for as long as the control stalk is held in this momentary position and the low beams will be restored when the control stalk is released. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **beam select switch status** message over the LIN data bus to the EMIC, which relays an electronic **beam select switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Park Lamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the park lamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Fog Lamps** - The optional rear fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position and then rotated to the rear fog lamps detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the rear fog lamps to be selected while the front fog lamps ON position is also selected, and will automatically move the control knob to the rear fog lamp OFF position when the control knob is pushed in to deselect the front fog lamps.
- **Turn Signal Control** - The turn signals are requested when the left multi-function switch control stalk is moved downward (left signal) or upward (right signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends through an opening in the side of the clockspring case toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the left multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.

INTERIOR LIGHTING

Following are descriptions of the how the left multi-function switch is operated to control the many interior lighting functions and features it provides:

- **Interior Lamps Defeat** - The interior lamps defeat feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps DEFEAT detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Interior Lamps On** - The interior lamps ON feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Panel Lamps Dimming** - The panel lamps dimming function is active only when the left multi-function switch control knob is in any exterior lighting ON position. With the exterior lighting ON, the panel lamps dimming level is requested when the left multi-function switch control sleeve is rotated to any one of five minor detent positions. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Parade Mode** - The PARADE (or funeral) mode is active only when the left multi-function switch control knob is in any exterior lighting ON position. With the exterior lighting ON, the PARADE mode is requested when the left multi-function switch control sleeve is rotated to the PARADE mode detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove both the upper and lower shrouds from the steering column. (Refer to 19 - STEERING/COLUMN - REMOVAL).
3. Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the left multi-function switch.
4. Remove the screw (2) that secures the left multi-function switch (1) to the mounting bracket integral to the left side of

the clockspring (3) on the steering column.

5. Slide the switch away from the clockspring far enough to disengage the slide tabs on the switch housing from the channel formations in the mounting bracket.

6. Disconnect the jumper wire harness connector from the connector receptacle on the inboard end of the left multi-function switch.

7. Remove the switch from the clockspring.

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Position the left multi-function switch (1) close enough to the mounting bracket (3) integral to the left side of the clockspring to reconnect the jumper wire harness connector to the connector receptacle on the inboard side of the switch housing.

2. Align the slide tabs on the switch housing with the channel formations integral to the clockspring mounting bracket, then slide the switch into the bracket until it is firmly seated.

3. Install and tighten the screw (2) that secures the mounting tab on the front of the left multi-function switch to the mounting bracket on the clockspring. Tighten the screw to 1 N·m (10 in. lbs.).

4. Reconnect the instrument panel wire harness connector to the connector receptacle on the back of the switch housing.

5. Reinstall the upper and lower shrouds onto the steering column. (Refer to 19 - STEERING/COLUMN - INSTALLATION).

6. Reconnect the battery negative cable.

LICENSE PLATE LAMP

REMOVAL

BULB

1. Disconnect and isolate the battery negative cable.
2. Reach under the license plate lamp hood (1) to access and squeeze together the two latch tabs (4) integral to license plate lamp lens (3).
3. Pull the lens downward and back out of the hood far enough to access the bulb socket (2).
4. Firmly grasp the bulb socket on the back of the lens and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the socket and bulb straight out from the keyed opening in the lens.
6. Firmly grasp and pull the bulb straight out of the socket.

LAMP - DOMESTIC

1. Disconnect and isolate the battery negative cable.
2. Remove the license plate from the rear license plate bracket.
3. Remove the four screws (4) that secure the rear license plate bracket and lamp unit (3) to the four spring nuts (2) in the rear body sheet metal (5).
4. Pull the bracket and lamp unit away from the rear body sheet metal far enough to access and disconnect the body wire harness connector (1) from the connector on the back of the bracket and lamp unit housing.
5. Remove the bracket and lamp unit from the vehicle.

LAMP - EXPORT

1. Disconnect and isolate the battery negative cable.
2. Remove the license plate from the rear bumper cover (1).
3. Reach under and behind the rear bumper to access and disconnect the license plate lamp pigtail wire harness connector (2) from the body wire harness.
4. Remove the two screws (3) that secure the rear license plate lamp unit (4) to the rear bumper cover.

5. Pull the license plate lamp unit away from the rear bumper cover far enough to disengage the pigtail wire harness from the clearance hole.
6. Remove the bracket and lamp unit from the rear bumper cover.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

1. Align the base of the bulb with the license plate lamp socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the license plate lamp lens (3).
4. Insert the socket and bulb into the lens until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Push the lens upward into the license plate lamp hood (1) until the two latch tabs (4) integral to the lens snap into place.
7. Reconnect the battery negative cable.

LAMP - DOMESTIC

1. Check to be certain that the four spring nuts (2) are in good condition and properly installed in the rear body sheet metal (5).
2. Position the rear license plate bracket and lamp unit (3) to the rear body sheet metal.
3. Reconnect the body wire harness connector (1) to the

- connector on the back of the bracket and lamp unit housing.
4. Align the mounting holes of the bracket and lamp unit to the four spring nuts.
 5. Install and tighten the four screws (4) that secure the bracket and lamp unit to the rear body sheet metal. Tighten the screws to 1.5 N·m (15 in. lbs.).
 6. Reinstall the license plate onto the bracket.
 7. Reconnect the battery negative cable.

LAMP - EXPORT

1. Position the rear license plate lamp unit (4) to the rear bumper cover (1).
2. Insert the license plate lamp pigtail wire harness and connector (2) through the clearance hole in the rear bumper cover.
3. Align the mounting holes of the license plate lamp unit to the two mounting holes in the rear bumper cover.
4. Install and tighten the two screws (3) that secure the lamp unit to the rear bumper cover. Tighten the screws to 1.5 N·m (15 in. lbs.).
5. Reach under and behind the rear bumper to reconnect the license plate lamp pigtail wire harness connector to the body wire harness.
6. Reinstall the license plate onto the rear bumper cover.
7. Reconnect the battery negative cable.

PARK BRAKE SWITCH

DESCRIPTION

The park brake switch (1) is located on the park brake lever mechanism on the floor panel transmission tunnel below the center floor console. This switch includes a spade-type output terminal (2) that connects the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. The output terminal is integral to the stationary contact within a molded plastic

insulator. A locating tab (4) on the insulator engages a slot in the park brake lever mechanism for positive switch location. External to the insulator is a movable leaf contact (3) with an integral grounding lug on one end and an integral actuating lever and follower on the opposite end. The switch is secured to and grounded by a single screw to the park brake lever mechanism.

The park brake switch cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

The park brake switch is a normally closed, mechanically actuated leaf contact switch that is operated by the park brake lever mechanism. The switch is grounded through its mounting to the park brake lever mechanism and provides a ground input to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) on a park brake switch sense circuit whenever the park brake is applied, and opens this circuit whenever the park brake is released. The park brake switch sense input to the EMIC is used for control of the brake indicator and may also be used as a logic input for other electronic features in the vehicle.

The park brake switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

PARK BRAKE SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: If the brake indicator stays ON with the ignition switch in the ON position and the park brake released, or comes ON while driving, the brake system must be diagnosed and repaired prior to performing the following tests. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). If no brake system problem is found, the following procedures will help to locate a shorted or open park brake switch sense circuit, or an ineffective park brake switch.

INDICATOR ILLUMINATES DURING BULB TEST, BUT DOES NOT WHEN PARK BRAKE APPLIED

1. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector for the park brake switch from the switch terminal. Apply the parking brake. Check for continuity between the park brake switch terminal and a good ground. There should be continuity. If OK, go to [STEP 2](#). If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavities of the instrument panel wire harness connectors for the park brake switch and the instrument cluster. There should be continuity. If not OK, repair the open park brake switch sense circuit between the park brake switch and the instrument cluster as required.

INDICATOR REMAINS ILLUMINATED - BRAKE SYSTEM CHECKS OK

1. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector for the park brake switch from the switch terminal. Check for continuity between the terminal of the park brake switch and a good ground. There should be no continuity with the park brake released, and continuity with the park brake applied. If OK, go to [STEP 2](#). If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavity of the connector for the park brake switch and a good ground. There should be no continuity. If not OK, repair the shorted park brake switch sense circuit between the park brake switch and the instrument cluster as required.

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the console from the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).
3. Pull the parking brake lever upward to apply the parking brake.
4. Disconnect the instrument panel wire harness connector (1) from the terminal of the park brake switch (2) located on the outboard side of the park brake lever mechanism.
5. Remove the screw (4) that secures the switch to the park brake lever bracket (3).
6. Remove the switch from the park brake lever bracket.

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental

Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Position park brake switch (2) onto the inboard side of the park brake lever bracket (3). Be certain to engage the locating pin on the side of the switch insulator into the locating slot in the lever bracket.
2. Install and tighten the screw (4) that secures the switch to the lever bracket. Tighten the screw to 2.5 N·m (24 in. lbs.).
3. Reconnect the instrument panel wire harness connector (1) to the terminal of the switch.
4. Reinstall the console onto the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).
5. Reconnect the battery negative cable.
6. Turn the ignition switch to the ON position and check for proper brake indicator operation with the parking brake applied, then release the parking brake and check that the brake indicator extinguishes.

PARK/TURN SIGNAL LAMP

REMOVAL

BULB

1. Disconnect and isolate the battery negative cable.
2. Reach behind the lower outboard corner of the grille panel (1) to access and disconnect the wire harness connector from the bulb socket connector receptacle (3) on the back of the park/turn signal lamp (2).
3. Firmly grasp the bulb socket on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

LAMP

1. Disconnect and isolate the battery negative cable.
2. Reach behind the lower outboard corner of the grille panel (1) to access and release the two integral park/turn signal lamp (2) latch features (3) and push the lamp out through the face of the grille panel.
3. From the face of the grille panel, pull the lamp out far enough to access and disconnect the wire harness connector from the bulb socket connector receptacle (4) on the back of the lamp.
4. Remove the lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

1. Align the base of the bulb with the park/turn signal lamp socket (3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Reach behind the lower outboard corner of the grille panel (1) to access and align the socket and bulb with the keyed opening on the back of the lamp housing (2).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reconnect the wire harness connector to the bulb socket connector receptacle.
7. Reconnect the battery negative cable.

LAMP

1. Position the park/turn signal lamp (2) to the seat in the face of the grille panel (1).
2. Reconnect the wire harness connector to the lamp bulb socket connector receptacle (4).
3. Be certain that the two integral latch features (3) on the

back of the lamp housing are aligned with the slots in the seat.

4. Push the lamp into the seat until the two latches are fully engaged in the slots.

5. Reconnect the battery negative cable.

REAR FOG LAMP

REMOVAL

LAMP

NOTE: The following procedure applies only to vehicles manufactured for export markets. Rear fog lamps are not available in vehicles manufactured for domestic markets.

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. From behind the outboard end of the rear bumper (1) disconnect the take out and connector (4) of the rear bumper wire harness from the rear fog lamp bulb socket.
4. Remove the two nuts (2) that secure the two mounting studs on the lamp housing to the retainer cap (3) on the back of the rear bumper cover.
5. Remove the lamp from the face of the rear bumper cover.

BULB

NOTE: The following procedure applies only to vehicles manufactured for export markets. Rear fog lamps are not available in vehicles manufactured for domestic markets.

1. Disconnect and isolate the battery negative cable.
2. Reach under and behind the outboard end of the rear bumper cover (1) to access the take out and connector (4) of the rear bumper wire harness on the back of the rear fog lamp housing.

3. Firmly grasp the connector and socket on the back of the housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the lamp housing.
5. Pull the base of the bulb straight out of the socket.

INSTALLATION

LAMP

NOTE: The following procedure applies only to vehicles manufactured for export markets. Rear fog lamps are not available in vehicles manufactured for domestic markets.

1. From the face of the rear bumper, position the rear fog lamp into the receptacle on the outboard end of the rear bumper cover (1).
2. Engage the two mounting studs on the back of the lamp housing through the holes in the retainer cap (3) on the back of the rear bumper cover.
3. Install and tighten the two nuts (2) that secure the lamp to the retainer cap. Tighten the nut to 1.5 N·m (14 in. lbs.).
4. Reconnect the take out and connector (4) of the rear bumper wire harness to the bulb socket on the back of the lamp.
5. Lower the vehicle.
6. Reconnect the battery negative cable.

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The following procedure applies only to vehicles

manufactured for export markets. Rear fog lamps are not available in vehicles manufactured for domestic markets.

1. Reach under and behind the outboard end of the rear bumper cover (1) to access the take out and connector (4) of the rear bumper wire harness connected to the rear fog lamp bulb socket near the back of the lamp housing.
2. Align the base of the bulb with the lamp socket.
3. Push the bulb straight into the socket until the base is firmly seated.
4. Align the socket and bulb with the keyed opening on the back of the rear fog lamp housing.
5. Insert the socket and bulb into the housing until the socket is firmly seated.
6. Rotate the socket clockwise about 30 degrees to lock it into place.
7. Reconnect the battery negative cable.

REAR LAMP UNIT

REMOVAL

BULB - DOMESTIC

NOTE: The domestic rear lamp unit (1) contains two bulbs. They are: backup (3) and park/stop/turn signal/rear side marker (2). The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate the battery negative cable.
2. Remove the rear lamp unit (1) from the rear body sheet metal. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/REAR LAMP UNIT - REMOVAL).
3. Firmly grasp the appropriate bulb socket (2 or 3) on the back of the rear lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

BULB - EXPORT

NOTE: The export rear lamp unit (1) contains three bulbs. They are: park/stop (2), backup (4), and turn signal (3). The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate the battery negative cable.
2. Remove the rear lamp unit (1) from the rear body sheet metal. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/REAR LAMP UNIT - REMOVAL).
3. Firmly grasp the appropriate bulb socket (2, 3 or 4) on the back of the rear lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

LAMP

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (3) from the inboard side of the lamp lens that secure the rear lamp unit (4) to the two spring nuts (2) in the rear body sheet metal.
3. Pull the outboard side of the rear lamp unit inboard far enough to disengage the two tabs on the back of the lamp housing from the edge of the lamp opening in the rear body sheet metal.
4. Pull the lamp away from the vehicle far enough to access and disconnect the body wire harness connectors (1) from the bulb socket pigtail wire connector on the back of the lamp housing.
5. Remove the lamp from the vehicle.

INSTALLATION

BULB - DOMESTIC

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The domestic rear lamp unit (1) contains two bulbs. They are: backup (3) and park/stop/turn signal/rear side marker (2). The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Align the base of the bulb with the appropriate lamp socket (2 or 3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the rear lamp unit (1) housing.
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the rear lamp unit onto the rear body sheet metal. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/REAR LAMP UNIT - INSTALLATION).
7. Reconnect the battery negative cable.

BULB - EXPORT

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.
