THROTTLE BODY

REMOVAL

CAUTION: Using a diagnostic scan tool, record any previous DTC's (Diagnostic Trouble Codes).

CAUTION: Never have the ignition key in the ON position when/if checking the throttle body shaft for a binding condition. This may set DTC's.

1. Disconnect and isolate negative battery cable at battery.
2. Remove throttle body air intake hose.
3. Disconnect throttle body electrical connector (3).
4. Remove four bolts (4).
5. Remove throttle body (1) from intake manifold (2).

NOTE: Inspect intake manifold to throttle body gasket (2) for damage. Inspect the j-nuts for damage or excessive wear. Replace as necessary.

6. Inspect the four j-nuts (1) for damage or excessive wear, remove if necessary.
7. Inspect intake manifold to throttle body gasket (2) for damage, remove if necessary.

INSTALLATION

1. Install a new intake manifold to throttle body gasket (2), if replacement was necessary.
2. Install four new four j-nuts (1), if replacement was necessary.

CAUTION: The throttle body mounting bolts **MUST** be torqued to specifications. **DO NOT OVER TIGHTEN MOUNTING BOLTS.** Over tightening can cause damage to the throttle body, throttle plate, gaskets, bolts and/or the intake manifold. Proper torque of the mounting bolts is critical to normal operation.

3. Install throttle body (1) to intake manifold (2).
4. Install four bolts (4) and hand tighten.
5. Connect throttle body (1) electrical connector (3).

CAUTION: The throttle body must be torqued in a mandatory torque sequence. Tighten in a criss - cross pattern to specification.

6. Obtain a torque wrench. Tighten mounting bolts (as shown) in a mandatory torque criss-cross pattern sequence to 7.5 N·m (65 in. lbs.).
7. Install clean air hose and tighten clamps to 4 N·m (35 in. lbs.).
8. Connect negative battery cable, tighten nut to 5 N·m (45 in. lbs.).
9. Using the diagnostic scan tool, erase all previous DTC's and perform the ETC Relearn function.

FUEL DELIVERY - 2.8L DIESEL

TANK-FUEL

REMOVAL

GAS POWERED

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel rail, fuel system pressure must be released.

1. Remove fuel tank filler tube cap.
2. Perform Fuel System Pressure Release Procedure.
3. Remove fuel fill cap.
4. Raise and support vehicle.
5. Remove fuel fill hose clamp (2) at rear of tank (3).
6. Remove fuel fill hose (1) from fuel tank.
7. Position a drain hose into the fuel fill hose opening. Note that a small flapper valve is installed into the opening.
8. Drain fuel tank using an approved gasoline fuel draining station.

The fuel tank skid plate and the fuel tank assembly are removed at the same. They share common fasteners.

9. Disconnect quick-connect fitting (2).
10. Disconnect quick-connect fitting (9).
11. Disconnect quick-connect fitting (10).
12. Remove hose clamp (3) and disconnect hose (4) at tank.
13. Support tank with a hydraulic jack.
14. Disconnect quick-connect fittings at front of tank.
15. Remove two tank mounting bolts at rear of fuel tank.
16. Remove three tank mounting bolts at right side of fuel tank.
17. Remove three tank mounting bolts at left side of fuel tank.
18. Partially lower tank to gain access to pump module electrical connector.
19. Disconnect electrical connector at fuel pump module.
20. Continue lowering tank for removal.
21. Lift fuel tank from skid plate.
22. If fuel tank is to be replaced, remove fuel pump module from tank.

DIESEL POWERED

1. Remove fuel fill cap.
2. Raise and support vehicle.
3. Remove fuel fill hose clamp (2) at rear of tank (3).
4. Remove fuel fill hose (1) from fuel tank.
5. Position a drain hose into the fuel fill hose opening. Note that a small flapper valve is installed into the opening.
6. Drain fuel tank using an approved diesel fuel draining station.

The fuel tank skid plate and the fuel tank assembly are removed at the same. They share common fasteners.

7. Locate quick-connect fitting (5).

8. Disconnect quick-connect fitting (5) by squeezing tabs (1).

9.

Disconnect quick-connect fitting (2).

10. Support tank with a hydraulic jack.

11. Disconnect quick-connect fittings (1) and (4) for fuel supply and return lines at front of tank.

12. Remove two tank mounting bolts at rear of fuel tank.

13. Remove three tank mounting bolts at right side of fuel tank.

14. Remove three tank mounting bolts at left side of fuel tank.

- 15. Partially lower tank to gain access to pump module electrical connector (4).
- 16. Disconnect electrical connector (4) at fuel pump module.
- 17. Continue lowering tank for removal.
- 18. Lift fuel tank from skid plate.
- 19. If fuel tank is to be replaced, remove fuel pump module from tank.

INSTALLATION

GAS POWERED

8191165b

The fuel tank skid plate and the fuel tank assembly are installed at the same. They share common fasteners.

1. If fuel pump module had been removed, install module to tank.
2. Position fuel tank into skid plate.
3. Support tank with a hydraulic jack.
4. Partially raise tank to allow connections at top of tank.
5. Connect electrical connector to fuel pump module.
6. Continue raising tank snugly to body.
7. Connect quick-connect fitting (2).
8. Connect quick-connect fitting (9).
9. Connect quick-connect fitting (10).
10. Install hose (4) to tank and install clamp (3).
11. Connect quick-connect fittings at front of tank.
12. Install two tank mounting bolts at rear of fuel tank.
13. Install three tank mounting bolts at right side of fuel tank.
14. Install three tank mounting bolts at left side of fuel tank.

DIESEL POWERED

1. If fuel pump module had been removed, install module to tank.
2. Position fuel tank into skid plate.
3. Support tank with a hydraulic jack.
4. Partially raise tank to gain access to pump module electrical connector (4).
5. Connect electrical connector (4) to fuel pump module.
6. Continue raising tank snugly to body.

7. Connect quick-connect fittings (1) and (4) for fuel supply and return lines at front of tank.
8. Install two tank mounting bolts at rear of fuel tank.
9. Install three tank mounting bolts at right side of fuel tank.
10. Install three tank mounting bolts at left side of fuel tank.

11. Connect quick-connect fitting (2).

12. Connect hose (1) and fuel fill hose clamp (2) at rear of tank (3).

SEPARATOR-FUEL FILTER / WATER

DESCRIPTION

The fuel filter/water separator assembly (8) is mounted to the frame rail near the fuel tank. The assembly includes the fuel filter, fuel heater (3), fuel temperature sensor (2), combination water drain valve/Water-In-Fuel (WIF) sensor (1), and quick-connect fittings attached at the side of the fuel filter canister.

OPERATION

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the filter.

Refer to the maintenance schedules in the owners manual for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to Fuel Filter/Water Separator Removal/Installation section.

A Water-In-Fuel (WIF) sensor is attached to the bottom of fuel filter element.

The fuel heater and fuel temperature sensor are installed into the side of the filter/separator housing.

REMOVAL

Refer to maintenance schedules, or the Owner's Manual for recommended fuel filter replacement intervals.

DRAINING WATER FROM FUEL FILTER CANISTER:

The combination housing drain valve/WIF sensor serves two purposes. One is to **partially** drain the filter housing of excess water. The other is to **partially** drain the housing for fuel temperature sensor, fuel filter or fuel heater element replacement.

The filter housing should be partially drained whenever the water-in-fuel warning lamp remains illuminated. (Note that lamp will be illuminated for approximately two seconds when ignition key is initially placed in ON position for a bulb check).

1. Raise and support vehicle.

2. A nipple is located at the bottom of drain valve (1). Attach a drain hose to this nipple. Place drain pan under drain hose.
 3. **With engine not running**, Disconnect WIF sensor electrical connector (1), then rotate drain valve approximately two revolutions to open it. Leave open until all water and contaminants have been removed and clean fuel exits. Hand tighten drain valve after tightening.
 4. If fuel heater element is being replaced, drain housing completely. Dispose of mixture in drain pan according to applicable regulations.
 5. After draining operation, close and tighten drain valve (1).
 6. **FUEL FILTER REPLACEMENT:**
 7. Clean all dirt and debris from around filter canister and canister head, located at the bottom of the fuel filter/water separator assembly.

8. Open drain valve (1) two complete revolutions. Drain approximately 1 cup of fuel into a waste canister. Dispose of fuel according to environmental regulations.
 9. Remove drain hose from drain valve (1).
 10. Use an oil filter type wrench to loosen filter, located at the bottom of the fuel filter/water separator assembly (8). After loosening, unscrew the filter by hand.
 11. **WATER-IN-FUEL (WIF) SENSOR**

REPLACEMENT: The combination fuel drain valve/WIF sensor is located on the bottom of the fuel filter housing.

The WIF sensor is not a separately serviceable item. If diagnostics have led you to replace this sensor, then the whole fuel filter assembly needs to be changed.

12. FUEL HEATER ELEMENT REPLACEMENT: The fuel heater element is located in the fuel filter housing. To replace heater, the entire housing assembly must be replaced.

13. Drain fuel filter. See previous steps.

14. Disconnect the fuel temperature sensor (2) and fuel heater (3) harness connectors.

15. Disconnect the fuel lines (4) and (5) at the fuel filter/water separator housing (8).

16. Remove the two fuel filter/water separator housing fasteners (6).

17. Remove fuel filter/water separator housing assembly (8).

18. FUEL TEMPERATURE SENSOR

REPLACEMENT: The fuel temperature sensor is located in the fuel filter housing. To replace sensor, the entire housing assembly must be replaced.

19. Drain fuel filter. See previous steps.

20. Disconnect electrical connectors .

21. Disconnect two quick-connect fittings and at housing.

22. Remove three housing mounting nuts.

23. Remove housing assembly.

24. DRAIN VALVE REPLACEMENT: The Drain Valve is located on the bottom of the fuel filter. This is not a separately serviceable item. If replacement is necessary, replace the entire filter/filter canister assembly.

INSTALLATION

Refer to maintenance schedules for recommended fuel filter replacement intervals.

1. FUEL FILTER:

2. Lubricate new fuel filter O-ring with clean engine oil.

3. Position new fuel filter/canister assembly to housing.

4. Rotate fuel filter/canister assembly until it comes to a hard stop.

5. Tighten the filter element an additional half-inch of rotation.

6. Connect WIF sensor electrical connector.

7. Be sure drain valve is tight.
8. Install left front tire/wheel.
9. Install left front wheel splash shield.
10. **FUEL HEATER ELEMENT OR FUEL TEMPERATURE SENSOR:**

Both the fuel heater element and fuel temperature sensor are attached to the fuel filter housing. To replace either of these components, the entire housing assembly must be replaced.

11. Position housing/canister assembly to body.
12. Install three housing mounting nuts.
13. Connect two quick-connect fittings and to housing fittings.
14. Connect electrical connectors.
15. **WATER-IN-FUEL (WIF) SENSOR REPLACEMENT:** The combination fuel drain valve/WIF sensor is located on the bottom of the fuel filter housing.

The WIF sensor is not a separately serviceable item. If diagnostics have led you to replace this sensor, then the whole fuel filter assembly needs to be changed.

SENSOR-WATER IN FUEL

DESCRIPTION

The combination drain valve/Water-In-Fuel (WIF) sensor is located on the bottom of the fuel filter/water separator filter canister.

OPERATION

The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp through CAN bus circuits. This all takes place when the ignition key is initially put in the ON position. The ECM continues to monitor the input while the engine is running.

REMOVAL

The Water-In-Fuel (WIF) sensor is located at the bottom of fuel filter/water separator canister. Refer to Separator–Fuel Filter/Water for removal and installation procedures.

HEATER - FUEL

REMOVAL

The fuel heater is located in the fuel filter/water separator canister housing. Refer to Separator–Fuel Filter/Water for removal and installation procedures.

RELAY - FUEL HEATER

REMOVAL

The fuel heater relay (1) is located in the left/rear of the engine compartment.

1. Disconnect negative battery cable.
2. Disconnect electrical connector (2) from relay.
3. Remove relay mounting bolt and remove relay.
4. Check condition of relay connector pins for corrosion, etc.

INSTALLATION

The fuel heater relay (1) is located in the left/rear of the engine compartment.

1. Check condition of relay connector pins for corrosion, etc.
2. Position relay and install mounting bolt.
3. Connect electrical connector (2) to relay.
4. Connect negative battery cable to battery.

SENSOR - FUEL TEMPERATURE

REMOVAL

The fuel temperature sensor is located in the fuel filter/water separator canister housing. Refer to Separator–Fuel Filter/Water for removal and installation procedures.

RAIL - FUEL

REMOVAL

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire.

Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

1. Disconnect negative battery cable at battery. Isolate end of cable.
2. Remove dress-up cover from top of engine.
3. Disconnect electrical connector at fuel pressure sensor (1).
4. Disconnect electrical connector at fuel pressure solenoid (3).

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINE FITTINGS ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

5. Disconnect fuel line fittings (2) and (4) and remove four fuel lines (3). Note and mark position of each fuel line while removing.
6. Remove fuel line clamp bolt (10).
7. Disconnect rail-to-injection pump high-pressure fuel line fittings (9) and (11) and remove fuel line (12). Note and mark position of fuel line while removing.

81b2ac70

8. Remove three fuel rail mounting nuts (4).

9. Remove rail (2) from cylinder head.

INSTALLATION

NOTE: New High Pressure Fuel Line must be used any time the High Pressure Fuel Lines have been removed.

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

- 5168

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINE FITTINGS ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

3. Install the injectors (8), the injector clamps (7) and washers (6).
4. Install the injector bolts (5). Do not tighten at this time.
5. Position and connect the high pressure line (12) between the high pressure injection pump and the fuel rail. Do not tighten at this time.
6. Torque injector clamp bolts to 32.4 Nm (23 ft. lbs.).
7. Torque the rail side (4) of the high pressure lines between the injectors and the fuel rail to 24.5 Nm (18 ft. lbs.).
8. Torque the injector side (2) of the high pressure lines between the injectors and the fuel rail to 28 Nm (20 ft. lbs.).
9. Torque the rail side (9) of the high pressure fuel line between the high pressure injection pump and the fuel rail to 20 Nm (14 ft. lbs.).
10. Torque the high pressure pump side (11) of the high pressure fuel line between the high pressure injection pump and the fuel rail to 28 Nm (20 ft. lbs.).
11. Install fuel line clamp bolt (10). Tighten bolt to 15 N·m (11 ft. lbs.) torque.

81b2ac70

12. Connect electrical connectors to fuel injectors.
13. Connect electrical connector to fuel pressure solenoid (3).
14. Connect electrical connector to fuel pressure sensor (1).
15. Install the engine cover.
16. Connect negative battery cable to battery.

LINES-FUEL

DESCRIPTION

Low-Pressure Lines Are:

- the fuel supply line from fuel tank to fuel filter housing.
- the fuel return line back to fuel tank.
- the fuel drain line from each fuel injector.
- the fuel supply line from fuel filter to fuel injection pump.
- the fuel injection pump return line.

High-Pressure Lines Are:

- the fuel line from fuel injection pump to fuel rail.

- the four fuel lines from fuel rail up to the fuel injectors

WARNING: High-pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 160,000 kpa (23,206 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect for high-pressure fuel leaks with a sheet of cardboard. High fuel injection pressure can cause personal injury if contact is made with the skin.

OPERATION

High-Pressure Lines

CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel (under pressure) of up to approximately 160,000 kpa (23,206 psi) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

WARNING: Use extreme caution when inspecting for high-pressure fuel leaks. Inspect for high-pressure fuel leaks with a sheet of cardboard. High fuel injection pressure can cause personal injury if contact is made with the skin.

DIAGNOSIS AND TESTING

HIGH-PRESSURE FUEL LINE LEAKS

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: Due to extreme fuel pressures of up to 180,000 kpa (26,107 psi), use extreme caution when inspecting for high-pressure fuel leaks. Do not get your hand or a finger near a suspected leak. Inspect for high-pressure fuel leaks with a sheet of cardboard (2) (typical picture). High fuel injection pressure can cause personal injury if contact is made with the skin.

Start the engine. Move the cardboard (2) over the suspected high-pressure fuel line leak, and check for fuel spray onto the cardboard. If line is leaking, retorque line while engine is shutdown. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines cannot contact

each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

REMOVAL

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

1. Disconnect negative battery cable at battery. Isolate end of cable.
2. Remove dress-up cover from top of engine.

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINE FITTINGS ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

3. Disconnect fuel line fittings (2) and (4) and remove four fuel lines (3). Note and mark position of each fuel line while removing.

4. Remove fuel line clamp bolt (10).
5. Disconnect rail-to-injection pump high-pressure fuel line fittings (9) and (11) and remove fuel line (12). Note and mark position of fuel line while removing.

INSTALLATION

All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINE FITTINGS ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

1. Position and connect rail-to-injection pump high-pressure fuel line (12). Tighten fittings (9) and (11) to 28

N·m (20 ft. lbs.) torque.

2. Install fuel line clamp bolt (10). Tighten bolt to 15 N·m (11 ft. lbs.) torque.

3. Position four fuel lines (3) to engine. Tighten fuel line fittings (2) to 28 N·m (20 ft. lbs.) torque. Tighten fuel line fittings (4) to 20 N·m (15 ft. lbs.) torque.

4. Install dress-up cover to top of engine.

5. Connect negative battery cable to battery.

MOTOR - FUEL PUMP

DESCRIPTION

An engine mounted, low-pressure mechanical fuel pump is **not used** with the 2.8L diesel engine.

An electric fuel pump is mounted to the fuel pump module. The pump supplies a low-pressure fuel supply to the engine.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

The electric fuel pump is not a separate, serviceable component. The entire fuel pump module must be replaced.

MODULE - FUEL PUMP

REMOVAL

1. The 2.8L diesel fuel pump module (2) is located on the top of fuel tank.

2. Drain and remove fuel tank.

3. Note rotational position of module before attempting

removal. An indexing arrow is located on top of module for this purpose.

4. Position special Lockring Remover/Installer tool 9340 (3) into notches on outside edge of lockring (5).

5. Install 1/2 inch drive breaker bar (1) to special Lockring Remover/Installer tool 9340 (3).

6. Rotate breaker bar counter-clockwise to remove lockring.

7. Remove lockring. The module will spring up slightly when lockring is removed.

8. Remove module from fuel tank. Be careful not to bend float arm while removing.

INSTALLATION

CAUTION: Whenever the fuel pump module is serviced, the rubber seal (gasket) must be replaced.

1. Using a new seal (gasket), position fuel pump module into opening in fuel tank.

2. Position lockring (5) over top of fuel pump module.

3. Rotate module until embossed alignment arrow points to center alignment mark. This step must be performed to prevent float from contacting side of fuel tank.

4. Install Lockring Remover/Installer 9340 (3) to lockring.

5. Install 1/2 inch drive breaker (1) into Lockring Remover/Installer 9340 (3).

6. Tighten lockring (clockwise) until all seven notches have engaged.

7. Install fuel tank.

PUMP-FUEL INJECTION

DESCRIPTION

A radial, 3 piston pump (1) mounted to the timing belt cover, is used to deliver fuel under high pressure to the fuel rail.

The pump is driven by the timing belt. Pressure is generated independently of the injection process. The pump is lubricated with diesel fuel and is not responsible for fuel injection timing. However, there is a mark on the high pressure fuel pump sprocket that must be aligned with a mark on the timing belt cover whenever the high pressure pump, sprocket, or timing belt have been removed.

OPERATION

High Pressure Pumping Plungers

The fuel quantity solenoid supplies three high pressure pumping chambers. The pumping chambers have one way inlet valves that allow fuel to flow into the chambers. The valves then close during compression of the fuel and cause the high pressure fuel to overcome a ball and angled seat outlet valve.

All three pumping chambers are tied together in one circuit internal to the pump and provide high pressure fuel up to 1600 bar (23,000 psi) through a steel line, to the fuel rail.

The pump is driven at 1:1 engine speed and is not responsible for injection timing. The pump is only responsible for providing high pressure fuel while the ECM controls the injection timing.

REMOVAL

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

WARNING: High-pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

1. Disconnect negative battery cable.
2. Drain engine coolant. Refer to Cooling section.
3. Raise and support vehicle.
4. Disconnect and reposition engine coolant hose near rear of injection pump.
5. Remove timing belt. Refer to Engine-2.8L Diesel for procedures.

6. Remove injection pump sprocket mounting nut (2). Attach a typical 3-jaw gear/sprocket puller such as special tool 1023 and remove sprocket (1) from pump.

7. Disconnect high-pressure fuel line (4) at rear of pump by removing banjo bolt.
8. Disconnect high-pressure fuel line (2) at rear of pump by removing fitting at end of line.
9. Disconnect electrical connector at high-pressure fuel sensor (1).

10. Remove fuel injection pump mounting nuts (2).
11. Slide pump rearward from mounting studs.

INSTALLATION

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

1. Slip pump (1) over mounting studs.
2. **Be sure pump is fully seated before tightening mounting nuts.** Tighten injection pump mounting nuts (2) to 24 N·m (18 ft. lbs.) torque.

3. Position sprocket (1) to pump shaft and install nut (2) finger tight.

81b3f4a2

4. Install banjo bolt for fuel line (4) at rear of injection pump. Tighten bolt to 28 N·m (20 ft. lbs.) torque.
5. Install fuel line (2) and fitting to rear of injection pump. Tighten fitting to 28 N·m (20 ft. lbs.) torque.
6. Connect electrical connector to high-pressure fuel sensor (1).

81ab675c

7. Tighten injection pump sprocket nut (4) to 88 N·m (65 ft. lbs.) torque.
8. **PUMP ALIGNMENT MARKS:** Rotate pump gear (1) until marks (2) and (3) are aligned.
9. Install timing belt. Refer to Engine-2.8L Diesel for procedures.
10. Connect engine coolant hose near rear of injection pump.
11. Fill engine cooling system. Refer to Cooling section.
12. Lower vehicle.
13. Connect negative battery cable.
14. Start engine and check for fuel leaks.

PUMP-FUEL TRANSFER

DESCRIPTION

The fuel transfer pump (fuel lift pump) is part of the fuel pump module. The fuel pump module is located in the fuel tank. The 12-volt electric pump is operated and controlled by the Engine Control Module (ECM).

REMOVAL

The fuel transfer pump (fuel lift pump) is a part of the fuel tank module. It is not serviced separately. Refer to Fuel Tank Module Removal or Installation for procedures.

SENSOR-FUEL PRESSURE

DESCRIPTION

WARNING: High - pressure fuel line deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

The fuel rail pressure sensor (1) screws into the fuel rail (2) at the top of the engine. The ECM uses this sensor to monitor the fuel rail pressure.

OPERATION

Review the high pressure fuel system warning.

The fuel flows to the fuel pressure sensor through an opening in the rail, the end of which is sealed off by the sensor diaphragm. Pressurized fuel reaches the sensor's diaphragm through a blind hole. The sensor element (semiconductor device) converts the pressure to an electric signal is mounted on this diaphragm. The signal generated by the sensor is monitored by the ECM.

REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover.

WARNING: High pressure fuel spray can cause severe cuts, and is extremely flammable. Before opening any part of the high pressure fuel system, wait for a minimum of 30 seconds after turning off the engine to allow pressure to bleed down from the high pressure side of the fuel system. Otherwise severe personal injury can result when the high pressure fuel system is opened.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

NOTE: Do allow cleaning solvent or debris to enter the fuel pressure sensor harness connector.

3. Clean the area around the fuel pressure sensor with Mopar ® Throttle Body Cleaner P/N 04897156AA or equivalent degreasing solvent and compressed air.
4. Disconnect fuel pressure sensor electrical connector.

WARNING: When working with parts on the high side of the fuel injection system such as the fuel rail and high pressure injector lines, slowly loosen the part to allow any residual pressure to bleed down from the high pressure side of the system.

NOTE: Do not touch the connector terminals of the fuel rail pressure sensor. The internal electronic components of the sensor can be damaged.

5. Remove fuel pressure sensor (1) from fuel rail.
6. If the sensor is to be reused, remove the fuel rail pressure sensor sealing ring. Do not damage or gouge the fuel rail pressure sensor threads. If any gouges or cuts are present in the fuel rail pressure sensor threads, the sensor must be replaced. Otherwise, fuel leaks can occur.

NOTE: Do not allow dirt or debris to enter the fuel rail and fuel rail solenoid threads after the fuel pressure solenoid has been removed from the fuel rail.

7. Clean the thread and fuel pressure sensor sealing surface of the fuel rail.
8. Use a clean plug to close off the fuel rail pressure sensor opening if the fuel pressure solenoid will not be immediately re-installed.

INSTALLATION

WARNING: Diesel fuel is under extreme pressure in the high pressure side of the fuel injection system between the fuel injectors and the high pressure fuel pump. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for leaks in the high pressure side of the fuel injection system. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing the high pressure side of the fuel system.

1. If reusing an existing fuel pressure sensor, install a new fuel pressure sensor sealing ring.
2. Lubricate the fuel pressure sensor threads and sealing ring with clean diesel fuel.
3. Install fuel pressure sensor (1) in fuel rail (2). Position the fuel rail pressure sensor so the harness connector is not stretched or under tension. Tighten sensor to 100 N·m (73 ft. lbs.).
4. Connect fuel pressure sensor electrical connector.
5. Install engine cover.
6. Connect negative battery cable.

SOLENOID-FUEL PRESSURE

DESCRIPTION

81b2ac70

The fuel pressure solenoid (3) is attached to the rear of the fuel rail (2). The tip of the fuel pressure solenoid (3) uses a knife edge, for metal to metal sealing. The knife edge actually deforms the metal in the fuel rail in order to seal the surfaces. The solenoid must be replaced when ever it is removed from the rail. The solenoid controls and maintains constant rail pressure with a control current transmitted by the engine control module (ECM) .

OPERATION

High pressure which is present in the fuel rail flows to the ball seat (1) of the pressure solenoid. The specified pressure required by the system is built up in the rail by the fuel pressure solenoid building up a magnetic force which corresponds to this specific pressure by means of a control current from the Electronic Control Module (ECM). This magnetic force equals a certain outlet cross section at the ball seat of the valve. The rail pressure is altered as a result of the quantity of fuel which flows off. The current fuel pressure is signaled by the fuel rail pressure sensor to the engine control module (ECM). The controlled fuel flows back along the return fuel line, into the tank.

In a de-energized state, the fuel pressure solenoid is closed as the spring force (2) presses the ball into the ball seat. When driving, the fuel pressure solenoid is constantly open. When engine is started, the fuel pressure solenoid is held closed by magnetic force. When driving, the pressure of the fluid counteracts the magnetic force of the coil and the slight spring force.

REMOVAL

Review the high pressure fuel system warning before beginning repair.

81b2ac70

WARNING: High pressure fuel spray can cause severe cuts, and is extremely flammable. Before opening any part of the high pressure fuel system, wait for a minimum of 30 seconds after turning off the engine to allow pressure to bleed down from the high pressure side of the fuel system. Otherwise severe personal injury can result when the high pressure fuel system is opened.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

1. Disconnect negative battery cable.

NOTE: Do allow cleaning solvent or debris to enter the fuel pressure solenoid harness connector.

2. Clean the area around the fuel pressure solenoid with Mopar ® Throttle Body Cleaner P/N 04897156AA or equivalent degreasing solvent and compressed air.
3. Disconnect the fuel pressure solenoid harness connector.

WARNING: When working with parts on the high side of the fuel injection system such as the fuel rail and high pressure injector lines, slowly loosen the part to allow any residual pressure to bleed down from the high pressure side of the system.

4. Remove fuel rail (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).
5. Clamp fuel rail (2) securely in vise with protective jaws.

CAUTION: Once removed, the solenoid must always be replaced. Do not re-use a fuel pressure solenoid

CAUTION: Do not reuse an existing fuel pressure solenoid. A new fuel pressure solenoid must be installed any time the existing solenoid has been removed from the fuel rail.

1. Position the fuel rail (2) into a soft jawed vise.
2. Inspect the sealing surfaces of the fuel pressure solenoid opening in the fuel rail. If any cuts or gouges are present in the fuel rail pressure solenoid opening, replace the fuel rail.
3. Lubricate the fuel pressure solenoid sealing rings with clean diesel fuel. Do not allow dirt or debris to come in contact with the fuel rail solenoid or the threads in the fuel rail.
4. Manually thread the fuel pressure solenoid (3) into the fuel rail until hand tight.
5. Position the fuel pressure solenoid electrical socket so the fuel pressure solenoid harness connector is not under stress. Otherwise, the connector or harness can be damaged.
6. Counterhold the fuel rail, and tighten the fuel rail solenoid (3) as follows:
 - a. Tighten the fuel pressure solenoid to 60 N·m (44 ft. lbs.)
 - b. Loosen the fuel pressure solenoid 90 degrees.
 - c. Retighten the fuel pressure solenoid to 85 N·m (62 ft. lbs.).
7. Install fuel rail (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).
8. Connect negative battery cable.
9. Start engine, allow to warm, turn engine off and inspect for leaks.

SOLENOID - FUEL QUANTITY

DESCRIPTION

The fuel quantity solenoid is located in the back of the high pressure pump. The solenoid is pulse width modulated by the ECM and meters the amount of fuel that flows into the high pressure elements inside of the high pressure pump. The solenoid is also inactive during the first 30 seconds to allow maximum fuel pressure to the fuel rail during start up .

OPERATION

The fuel quantity solenoid is a pulse width modulated valve that controls the amount of fuel sent or delayed to the high pressure pump elements inside of the high pressure pump. The ECM determines the fuel pressure set point based on engine sensor inputs. If the actual fuel rail pressure is too low, the ECM commands the solenoid to allow more fuel to flow to the high pressure pump. This minimizes the difference between the actual fuel rail pressure reading and the set point. The ECM will also operate the solenoid, delaying fuel if the fuel rail pressure becomes to high.

The fuel quantity solenoid is commanded open by the ECM to allow the high pressure pump to build maximum pressure (1600 BAR, 23,200 PSI). the solenoid also has fuel tank heat protection function that meters the exact amount of fuel to prevent excess heated fuel from returning to the fuel tank

REMOVAL

1. Disconnect the negative battery cable
2. Remove the charge air inlet hose.
3. Disconnect the fuel quantity solenoid wiring harness connector.
4. Remove the solenoid from the back of the high pressure pump .

NOTE: Inspect the fuel quantity solenoid and high pressure pump passage for contamination or corrosion. If contamination or corrosion is present replace the high pressure pump.

5. Inspect solenoid and pump for corrosion.

INSTALLATION

1. Review the high pressure fuel system warning.
2. Lubricate the fuel quantity solenoid and seal with clean diesel fuel.
3. Install the solenoid into the high pressure pump, hand tighten the fasteners .
4. Torque the solenoid fasteners to 10.8 N·m (96 in. lbs.).
5. Connect the wiring harness connector.
6. Install the charge air inlet hose.
7. Start engine, allow to warm, shut engine off and inspect for leaks.

FUEL INJECTION - 2.8L DIESEL

SENSOR-ACCELERATOR PEDAL POSITION

REMOVAL

The accelerator pedal and APPS (Accelerator Pedal Position Sensor) are serviced as a complete assembly including the bracket.

1. Disconnect electrical connector (3) at APPS.
2. Remove two accelerator pedal mounting bracket nuts (2).
3. Remove accelerator pedal/APPS assembly (1) from vehicle.

INSTALLATION

The accelerator pedal and APPS (Accelerator Pedal Position Sensor) are serviced as a complete assembly including the bracket.

1. Position accelerator pedal/APPS assembly over two mounting studs.
2. Install two accelerator pedal mounting bracket nuts (2).
3. Connect electrical connector (3) at APPS.
4. Before starting engine, operate accelerator pedal to check for any binding.

INJECTOR-FUEL

DESCRIPTION

To control the injection valves, the new Common-Rail injectors use a rapid-action actuator made of piezo crystals, which opens and closes the injection valve. The piezo crystals expand when electrical current is applied to them, and contract when electrical current is turned off. The piezo actuator can switch up to five times faster than a standard solenoid, because the movement of the piezo crystals does not rely on mechanical components to transmit motion to the injection valve. This doubles the piezo injector's switching speed, and enables fuel to be delivered with greater precision, which leads to lower emissions and better engine performance.

STANDARD PROCEDURE

INJECTOR CLASSIFICATION

Each fuel injector has a alphanumeric correction code number. This correction code is printed on the upper part of

the fuel injector (3) and is used to identify injector calibration. When replacing any fuel injectors, this code must be entered into the vehicles Engine Control Module (ECM) using a diagnostic scan tool. In addition, if a new ECM is installed, use a diagnostic scan tool to program all of the injector codes from the original fuel injectors into the new ECM.

The classification of injectors describes the fuel flow quantity characteristic of the injector. This will make it possible in the future to match the engine software to the tolerances of the injector within a more narrowly graduated range. Classification can be clearly recognized, and assigned only by means of a scan tool.

These general conditions equally apply if, as a result of replacing an engine, carrying out repairs to the cylinder head etc., the cylinder selective assignment of the injectors or the engine control module assignment may have changed. If proper attention is not paid to the classification on these vehicles, driveability and smoking concerns could result.

If an injector is replaced, it is then necessary to assign the classification code to the corresponding cylinder in the ECM (Engine Control Module) with the appropriate scan tool.

INJECTOR CLASSIFICATION PROCEDURE

1. Turn ignition switch "ON".
2. Using the diagnostic scan tool, select ENGINE then MISCELLANEOUS.
3. Select LEARN INJECTORS.
4. Using the up and down arrows, scroll to the appropriate injector.
5. Using the right and left arrows, set injector to proper classification code.
6. Once injectors are classified, cycle ignition key to complete.

REMOVAL

CAUTION: Due to the complexity of the fuel injection system used on this engine, refer to the Diesel Engine Diagnostics, and service any fuel system DTCs prior to replacing any fuel injectors. If no DTCs are present, refer to the Diesel Engine Diagnostic Test for Lack of Engine Power, and perform all steps as directed prior to replacing any fuel injectors.

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

1. Disconnect negative battery cable at battery. Isolate end of cable.
2. Remove dress-up cover from top of engine.
3. Remove the high-pressure fuel lines from fuel rail to fuel injectors. Refer to Fuel Line Removal.

4. Locate common fuel return line (1).

5. Disconnect electrical connector at top of injector(s).

NOTE: The injector common fuel return line is connected to the low pressure fuel circuit (5 bar/72 psi).

6. A lock button (1) is used to secure the common fuel return line to each fuel injector. Use your fingers to lift all four lock buttons (1) up. After unlocking all four buttons, lift fuel return line assembly up for removal.

81b2f156

7. Remove injector mounting bolt (2) and washer (3).
8. Remove injector mounting clamp (1).
9. Using compressed air, thoroughly clean surface area in and around injector bore to prevent foreign material from falling into the injector bore after injector removal.
10. Using your hand, pull fuel injector straight up from cylinder head for removal.

81b2f15a

11. If injector can't be removed by hand, install special fuel injector removal tool #9552 (2) to top of fuel injector.

81b2f15e

12. Install special slide hammer tool #8941 (1) onto special tool #9552 (4). Tighten lock nut (2). Remove injector from cylinder head.

NOTE: DO NOT use a wire brush to clean the fuel injector or nozzle. Possible restriction of the injector needle may result.

INSTALLATION

CAUTION: Due to the complexity of the fuel injection system used on this engine, refer to the Diesel Engine Diagnostics, and service any fuel system DTCs prior to replacing any fuel injectors. If no DTCs are present, refer to the Diesel Engine Diagnostic Test for Lack of Engine Power, and perform all steps as directed prior to replacing any fuel injectors.

81b2f163

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

NOTE: DO NOT use a brush to clean around the injector nozzle (2). DO NOT lubricate area around injector

nozzle. The injector may become restricted with debris.

NOTE: Be sure a new copper washer/seal (3) is installed on end of injector and the old seal is removed, before installing in cylinder head.

1. Install fuel injector into cylinder head with new seal.

2. Install fuel injector retainer clamp (1), washer (3) and bolt (2). Tighten clamp bolt (2) to 33 N·m (24 ft. lbs.) torque.
 3. Connect electrical connector to fuel injector.
 4. Install fuel injector high-pressure lines. Refer to Fuel Line Installation.

5. Position female fittings on fuel return line to male fittings at each fuel injector. **Be sure lock buttons (1) are in up position before positioning.**

6. After positioning, push each lock button (1) down to secure fuel return line to each fuel injector.
7. Connect each fuel injector electrical connector.
8. Connect negative battery cable.
9. Perform the injector classification procedure with a diagnostic scan tool.
10. Start the engine and allow to warm. **Turn off the ignition switch** and inspect for fuel leaks.
11. Install engine dress-up cover.

SENSOR-CRANKSHAFT POSITION

REMOVAL

The Crankshaft Position Sensor (CKP) (4) is located between the transmission and the rear of the engine block. It is bolted to the engine block below the crankshaft hub (1).

1. Raise and support vehicle.
2. Remove access cover.
3. Disconnect CKP electrical connector (2).
4. Remove CKP mounting bolt (3).
5. Remove CKP sensor (4).

INSTALLATION

81b31297

The Crankshaft Position Sensor (CKP) (4) is located between the transmission and the rear of the engine block. It is bolted to the engine block below the crankshaft hub (1).

1. Position CKP sensor (4) into mounting hole.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

2. Install CKP mounting bolt (3). Tighten bolt to 11 N·m (8 ft. lbs.) torque.
3. Connect CKP electrical connector (2).
4. Position CKP access cover. Install bolts and tighten to 15 N·m (11 ft. lbs.) torque.
5. Lower vehicle.

SENSOR-INTAKE AIR PRESSURE REMOVAL

81b31297

The Inlet Pressure Sensor (5) is located on the air cleaner

cover (1).

1. Disconnect electrical connector (4) at sensor.
2. Remove mounting screws.
3. Remove sensor from air cleaner cover.

INSTALLATION

1. Check condition of sensor O-ring.
2. Position Inlet Pressure Sensor (5) into top of air cleaner cover with a slight twisting action.
3. Install mounting screw.
4. Install Inlet Pressure Sensor electrical connector (4).

SENSOR-MASS AIR FLOW

REMOVAL

The Mass Airflow Sensor (2) is located on the air cleaner cover (1).

1. Disconnect electrical connector (3) at sensor.
2. Remove mounting screws.
3. Remove sensor from air cleaner cover.

INSTALLATION

1. Check condition of sensor O-ring.
2. Position MAF sensor (2) into top of air cleaner cover with a slight twisting action.
3. Install mounting screw.
4. Install MAF electrical connector (3).

SENSOR- TEMPERATURE/PRESSURE-MAP OPERATION

The combination, dual function Intake Manifold Air Temperature Sensor/MAP Sensor is installed into the top of the intake manifold with the sensor element extending into the air stream.

The IAT portion of the sensor provides an input voltage to the Engine Control Module (ECM) indicating intake manifold air temperature. The MAP portion of the sensor provides an input voltage to the ECM indicating turbocharger boost pressure.

REMOVAL

The combination, dual function Intake Manifold Air Temperature Sensor/MAP (IAT/MAP) sensor (1) is installed into the top of the intake manifold near the fuel rail.

1. Clean area around sensor.
2. Disconnect electrical connector from IAT/MAP sensor.
3. Remove mounting screw.
4. Remove sensor from intake manifold by twisting.
5. Check condition of sensor O-ring.

INSTALLATION

1. Check condition of sensor O-ring.
2. Clean sensor mounting area at intake manifold.
3. Lubricate sensor O-ring and sensor mounting hole in intake manifold cover with clean engine or diesel oil.
4. Position sensor (1) into intake manifold.
5. Install and tighten sensor mounting screw to 1 N·m (9 in. lbs.) torque.
6. Connect electrical connector to sensor.

81ab858c

81ab858c

19 - STEERING

STEERING

DESCRIPTION

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The power steering system has a hydraulic pump. The pump is a droop flow rate and displacement vane-type pump. The pump reservoir is remote located by the air box & headlamp.

The steering gear used is a straight ratio recirculating ball type gear.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which turns the steering linkage.

DIAGNOSIS AND TESTING

STEERING SYSTEM DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES, PERFORMANCE ISSUES, and FLUID ISSUES.

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
OBJECTIONABLE HISS OR WHISTLE WHILE TURNING STEERING WHEEL WHEN STATIONARY OR MOVING SLOWLY*	1. Damaged or mispositioned steering column shaft/coupling dash boot seal.	1. Check to ensure boot is properly installed and seals against sheet metal. Reposition or replace steering column shaft/coupling dash boot seal as necessary.

	2. Mis-routed power steering hose.	2. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.
	3. Restriction in pressure or return hose.	3. Using an electronic listening tool, determine if noise is coming from either pressure or return hose. Replace hose that noise is present within.
	4. Noisy valve in power steering gear.	4. For evaluation and correction, (Refer to 19 - STEERING/LINKAGE/TIE ROD END - DIAGNOSIS AND TESTING).
RATTLE OR EXCESSIVE CLUNK**	1. Power steering gear loose on engine cradle/crossmember.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.
	2. Loose strut assembly mounting fasteners at tower or knuckle.	2. Check fastener torque and tighten to specifications.
	3. Excessive play in outer tie rod.	3. For evaluation and correction, (Refer to 19 - STEERING/LINKAGE/TIE ROD END - DIAGNOSIS AND TESTING).
	4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.	4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.
	5. Wheel Mounting (Lug) nuts loose.	5. Inspect wheel mounting (Lug) nuts and studs and repair as necessary. Tighten nuts to specifications.
	6. Power steering hose touching the body or frame of vehicle.	6. For evaluation and correction, (Refer to 19 - STEERING/PUMP - DIAGNOSIS AND TESTING).
	7. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary).	7. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link.
	8. Loose lower control arm mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary).	8. Check control arm mounting bolts and tighten to specified torque.
	9. Loose intermediate shaft or column.	9. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.
	10. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).	10. Inspect bushings for wear and replace lower control arm as necessary.
	11. Internal power steering gear noise.	11. Drive vehicle on rough road, then steer rapidly back and forth when stopped. Replace power steering gear as necessary.
	12. Loose inner tie rod.	12. For evaluation and correction, (Refer to 19 - STEERING/LINKAGE/TIE ROD END - DIAGNOSIS AND TESTING).

		TESTING).
	13. Damaged engine cradle/crossmember.	13. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE	1. Loose steering gear mounting fasteners.	1. Check fasteners for proper torque and retighten as necessary.
	2. Loose outer tie rod mounting nut or jam nut.	2. Check fastener torque. Replace nuts as necessary and tighten to specifications.
	3. Loose intermediate (steering) shaft coupling at gear input shaft.	3. Make sure coupling is fully seated on gear input shaft. Retighten or re-seat as necessary.
	4. Worn tie rod (outer or inner).	4. For evaluation and correction, (Refer to 19 - STEERING/LINKAGE/TIE ROD END - DIAGNOSIS AND TESTING).
	5. Worn axle half-shaft.	5. For evaluation and correction, (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - 186FBI - DIAGNOSIS AND TESTING).
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Inspect belt. Replace belt if worn or glazed. Tighten/adjust power steering pump drive belt if equipped with a manual tensioner.
	2. Pulley alignment incorrect.	2. Realign accessory drives.
	3. Malfunctioning belt auto-tensioner	3. Verify belt tension. Replace belt auto-tensioner.
	4. Power steering pump noisy (worn bearing/bushing noise).	4. Using an electronic listening tool, determine if noise is coming from pump. Replace power steering pump as required.
	5. Generator or water pump noisy.	5. Using an electronic listening tool, determine if noise is coming from Generator or water pump. Replace faulty component.
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
	2. Air in power steering fluid.	2. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. (Refer to 19 - STEERING - STANDARD PROCEDURE)
	3. Power steering hose touching body or frame of vehicle.	3. For evaluation and correction, (Refer to 19 - STEERING/PUMP - DIAGNOSIS AND TESTING).
	4. Wear of power steering pump internal components.	4. For evaluation and correction, (Refer to 19 - STEERING/PUMP - DIAGNOSIS AND TESTING).
COLD START WHINE OR MOAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).

	2. Extremely low ambient temperature (near 0 F° (-18 C°) or below)	2. Some noise is expected as pump attempts to pull cold, thick fluid. Noise should go away as vehicle warms up. Acceptable levels of excessive noise are one second at 0 F° (-18 C°) and 15 seconds at -20 F° (-29 C°). If noise is excessive, look for poor sealing on the return hose or a possible fluid leak.
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
	2. Clockspring inside steering column noisy.	2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring.
	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
	4. Steering gear outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary.
	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND.	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.
	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.
	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.
	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.
	5. Accessory drive pulley rubbing against another component.	5. Check pulleys for wear. Check for worn engine or transmission mount. Reposition components or replace mounts as necessary.

NOTE: * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: ** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary.

This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This movement may be felt in the steering components during steering wheel reversal.

NOTE: * Power steering pump growl/moan/groan results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.**

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL OR COLUMN HAS FREEPLAY/LASH/LOOSENESS (CLUNKING OR RATTLING)	1. Loose coupling pinch bolt at gear input shaft.	1. Check pinch bolt torque. Replace pinch bolt if equipped with thread locker patch and tighten to specifications.
	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	3. Excessive freeplay or noise from steering column bearings.	3. Replace steering column.
	4. Excessive intermediate (steering) shaft coupling u-joint free-play.	4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace intermediate shaft as necessary.
	5. Loose or worn outer tie rod.	5. For evaluation and correction, (Refer to 19 - STEERING/LINKAGE/TIE ROD END - DIAGNOSIS AND TESTING).
	6. Lack of lubrication in lower ball joint or ball joint is damaged.	6. Lubricate ball joint if equipped with a zerk fitting and check for function . If not equipped with a zerk fitting, test and replace ball joint as necessary.
	7. Excessive lash inside steering gear.	7. Disconnect intermediate shaft and turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.
STEERING WHEEL HAS FORE AND AFT LOOSENESS.	1. Steering wheel retaining bolt loose.	1. Check steering wheel retaining bolt torque and tighten to specifications as necessary.
	2. Loose steering column to instrument panel fasteners.	2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary.
	3. Steering column lower bearing spring retainer slipped on	3. Pull steering wheel fore-and-aft while observing movement. Replace steering column as necessary.

	steering column shaft.	
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL).	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. (Refer to 19 - STEERING - STANDARD PROCEDURE)
	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
	3. Excessive engine vibration.	3. Ensure that the engine is tuned properly.
	4. Loose tie rod end jam nut.	4. Check torque and tighten the inner to outer tie rod jam nut to specifications.
	5. Overcharged air conditioning (A/C) system.	5. Turn A/C off and verify issue goes away. Repair A/C as necessary.
	6. Grounded, damaged or loose engine mount.	6. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace, realign or retighten as necessary.
	7. Loose or worn outer tie rod.	7. For evaluation and correction, (Refer to 19 - STEERING/LINKAGE/TIE ROD END - DIAGNOSIS AND TESTING).
	8. Steering gear noisy.	8. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions and verify that the noise follows the steering input. Check TSB's for any known issues. Replace steering gear as necessary.
STEERING CATCHES, SURGES OR STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN.	1. Low power steering fluid level.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.
	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
	3. Loose or slipping power steering/accessory drive belt.	3. Verify belt tension. Replace belt auto-tensioner and belt as necessary.
	4. Lack of lubrication in lower ball joint or ball joint is damaged.	4. Lubricate ball joint if equipped with a zerk fitting and check for function . If not equipped with a zerk fitting, test and replace ball joint as necessary.
	5. Lack of lubrication in steering gear outer tie rod end(s).	5. For evaluation and correction, (Refer to 19 - STEERING/LINKAGE/TIE ROD END - DIAGNOSIS AND TESTING).
	6. Faulty power	6. Perform Power Steering Flow and Pressure Test (Refer to 19 -

	steering pump.	STEERING - DIAGNOSIS AND TESTING). Look for low or erratic flow or pressure. Replace power steering pump as necessary.
	7. Excessive friction in intermediate shaft/coupler joint.	7. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.
	8. Excessive friction in steering column.	8. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.
	9. Worn or binding seat and bearing in front strut assembly.	9. Disconnect outer tie rod ends from knuckles, then turn tire and wheel assembly checking for smooth operation. Replace front strut assembly seat and bearing.
	10. Faulty steering gear.	10. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION.	1. Tire(s) not properly inflated.	1. Check and inflate tires to the specified pressure.
	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
	3. Lack of lubrication in lower ball joint or ball joint is damaged.	3. Lubricate ball joint if equipped with a zerk fitting and check for function . If not equipped with a zerk fitting, test and replace ball joint as necessary.
	4. Excessive friction in intermediate shaft/coupler joint.	4. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.
	5. Excessive friction in steering column.	5. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.
	6. Worn or binding seat and bearing in front strut assembly.	6. Disconnect steering gear outer tie rod ends at knuckles, then turn tire and wheel assembly in and out checking for smooth operation. Replace seat and bearing as necessary.
	7. Excessive friction in power steering gear.	7. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. (Refer to 19 - STEERING - STANDARD PROCEDURE)
	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.

	3. Steering column, coupling or intermediate shaft worn or loose.	3. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Retighten if loose bolt is found. Replace steering column, coupling or intermediate shaft if necessary.
	4. Power steering pump flow is too low.	4. Perform Power Steering Flow and Pressure Test (Refer to 19 - STEERING - DIAGNOSIS AND TESTING). Look for low or erratic flow or pressure. Replace power steering pump as necessary.

FLUID ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK.	1. Loose power steering hose fittings or connections.	1. Check torque on all tube nuts (at gear and pump). Inspect clamps at all rubber hose connections for correct position, damage and tension. Tighten tube nuts as required. Reposition or replace clamps at hose connections. Clean joints and reinspect for leaks.
	2. Damaged or missing O-ring at power steering hose tube nuts.	2. Remove tube nut and inspect O-ring. If damaged or missing, replace O-ring. Clean joints and reinspect for leaks.
	3. Power steering line or hose failure.	3. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace hoses as necessary.
	4. Power steering component leaking (reservoir, pump, gear).	4. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace power steering component as necessary.
AERATED FLUID.*	1. Low power steering fluid level.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.
	2. Air leak at power steering supply hose, reservoir or pump.	2. Inspect components. Put a hand vacuum pump on the reservoir and verify that the system can keep a vacuum. System should not lose more than 1 psi in 2 minutes (make sure vacuum pump is sealed well to the reservoir).
	3. Air leak at power steering supply hose, reservoir or pump.	3. Inspect components. Place a hand vacuum pump with Adapter 9688 on reservoir and verify that system can sustain vacuum. System should not lose more than 1 psi in 2 minutes (make sure vacuum pump is sealed well to the reservoir). Replace steering component as necessary.
RESERVOIR FLUID OVERFLOW OR FLUID THAT IS MILKY IN COLOR	1. Water contamination of power steering fluid.	1. Inspect fluid for milky appearance. Completely drain power steering fluid. Refill and bleed system. (Refer to 19 - STEERING - STANDARD PROCEDURE)

*** NOTE: Extremely cold temperatures may cause power steering fluid aeration. The air should work its way out of the system as the fluid warms.**

HYDRAULIC FLOW

The following procedures are used to test the operation of the power steering and hydraulic fan systems on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with any maximum relief pressure. Perform test anytime a power steering system problem is present. This test will determine if the power steering pump, hydraulic fan, and power steering gear are not functioning properly. It will also determine if the flow coming out of the hydraulic fan motor is sufficient for the power steering gear. The following pressure and flow test is performed using the Power Steering Analyzer Tool kit 6815 and Adapter kit 8630.

FLOW TEST - FLOW FROM POWER STEERING PUMP

1. Check the power steering belt to ensure it is in good condition and adjusted properly.
2. Connect the pressure gauge hose from the Power Steering Analyzer to Tube 8630-2.
3. Connect Adapter 8630-3 to Power Steering Analyzer test valve end.
4. Disconnect the high pressure hose from the power steering pump.
5. Connect Tube 8630-2 to the pump hose fitting.
6. Connect the power steering hose from the fan motor to Adapter 8630-3.
7. Open the test valve completely.
8. Start engine and let idle long enough to circulate power steering fluid through the flow/pressure test gauge.
9. Shut off the engine and check the fluid level, add fluid as necessary. Start engine again and let idle.
10. The initial pressure reading should be 483 - 690 kPa (70 - 100 psi). If pressure is higher inspect the hoses for restrictions and repair as necessary.
11. Increase the engine speed to 1100 rpm and read the flow meter. The reading should be 2.29GPM minimum, if the reading is below this specification, the pump should be replaced.

FLOW AND PRESSURE TEST - (should be done if necessary after the Pump flow test)

1. Connect the pressure gauge hose from the Power Steering Analyzer to Fitting 8630-1.
2. Connect Adapter 8630-4 to Power Steering Analyzer test valve end.
3. Disconnect the high pressure hose from the power steering gear.
4. Connect Fitting 8630-1 to the high pressure hose.
5. Connect Adapter 8630-4 to the power steering gear.
6. Open the test valve completely.

7. Start engine and let idle long enough to circulate power steering fluid through the flow/pressure test gauge.
8. Shut off the engine and check the fluid level, add fluid as necessary. Start engine again and let idle.
9. The initial pressure reading should be 345-552 kPa (50-80 psi). If pressure is higher inspect the hoses for restrictions and repair as necessary.
10. Increase the engine speed to 1500 RPM and read the flow meter. The reading should be 2.29 - 2.68 GPM if the reading is below this specification the fan should be replaced.

CAUTION: This next step involves testing maximum fan motor steering relief pressure. Do not leave the valve closed for more than three seconds.

11. Close the valve fully three times for three seconds and record highest pressures indicated each time. All three readings must be at fan motor steering relief pressures.
12. Open the test valve and turn the steering wheel to the extreme left and right positions against the stops. Record the highest pressure readings at each position. If pressure readings are not within 50 psi from each other, the gear is leaking internally and must be repaired.

PUMP MOTOR SPECIFICATIONS

ENGINE	RELIEF PRESSURE $\pm$ 50 PSI	FLOW RATE (GPM)
3.8L	9997 kPa (1450 psi)	1100 RPM 2.4-2.8 GPM Minimum @ 200 psi

STANDARD PROCEDURE

POWER STEERING SYSTEM BLEEDING

WARNING: The fluid level should be checked with engine off to prevent injury from moving components.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

CAUTION: If the air is not purged from the power steering system correctly, pump failure could result.

NOTE: Be sure the vacuum tool used in the following procedure is clean and free of any fluids.

1. Check the fluid level. As measured on the side of the reservoir, the level should indicate between MAX and MIN when the fluid is at normal ambient temperature. Adjust the fluid level as necessary. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE)
2. Tightly insert Power Steering Cap Adapter (4), Special Tool 9688, into the mouth of the reservoir (3).

CAUTION: Failure to use a the vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

3. Attach Hand Vacuum Pump (2), Special Tool C-4207 or equivalent, with reservoir (1) attached, to the Power Steering Cap Adapter (4).

CAUTION: Do not run the engine while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: When performing the following step make sure the vacuum level is maintained during the entire time period.

4. Using Hand Vacuum Pump (2), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
5. Slowly release the vacuum and remove the special tools.
6. Adjust the fluid level as necessary. Refer to [STEP 1](#).
7. Repeat [STEP 1](#) through [STEP 6](#) until the fluid no longer drops when vacuum is applied.
8. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: Do not hold the steering wheel at the stops.

9. Stop the engine and check for leaks at all connections.
10. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

SPECIAL TOOLS

STEERING COLUMN

Puller C-3894-A

PULLER L-4407-A

COLUMN

COLUMN

DESCRIPTION

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

The standard tilt steering column has been designed to be serviced as an assembly. The column is connected to the steering gear with an upper and lower intermediate shaft. The upper shaft has a support bearing mounted to a bracket. The bracket mounts to the dash panel wall with two nuts. These shafts and bearing are serviceable. The key cylinder, switches, clock spring, trim shrouds and steering wheel are serviced separately.

OPERATION - SERVICE PRECAUTIONS

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or airbag, refer to Electrical - Restraints and follow all WARNINGS and CAUTIONS.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

REMOVAL

1. Position front wheels **straight ahead**.
2. Remove and isolate the negative ground cable from the battery.
3. Remove the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

NOTE: If equipped with cruise control, disconnect clock spring harness from the cruise switch harness on the steering wheel.

4. Remove the steering wheel (2) with puller C-3894-A (1) or an appropriate puller (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).

5. Remove steering column opening cover, (Refer to 23 -

BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

6. Remove screws from the lower column shroud (2) and remove both the upper and lower shrouds.

7. Turn ignition key to the on position.
 8. If vehicle is equipped with automatic transmission, disconnect shifter interlock cable from the column.
 9. Remove the steering coupler bolt and column mounting nuts (2) then lower column (1) off the mounting studs.

10. Disconnect and remove the wiring harness (1) from the column.
 11. Slide the shifter interlock cable from the tie straps.

12. Remove column (4).
 13. Transfer the necessary parts if needed.
 14. Remove clock spring (3) , switches, (SKREEM if

equipped) (5) (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

INSTALLATION

1. Align and install column (1) into the steering coupler .

2. Install column harness (1) and connect harness to switches .

3. Reroute the shifter interlock cable through the tie straps.

4. Install the column (1) onto the mounting studs (2) .

5. Install the two mounting nuts and the two mounting bolts all finger tight.

CAUTION: Lower nuts must be installed and tightened first then the upper nuts in order to prevent damage to the capsules.

6. Tighten the lower mounting nuts to 17 N·m (150 in. lbs.).
7. Tighten the upper mounting nuts to 17 N·m (150 in. lbs.).

8. Install the steering column coupler bolt and tighten to 49 N·m (36 ft. lbs.).
9. Reconnect the shifter interlock cable.
10. Center the clock spring (3) (if necessary) and install it on the column (4) , (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

11. Snap together the column shrouds (1&2) and install the mounting screws .

12. Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)

NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.

13. Install the steering wheel and tighten bolt to 54 N·m (40 ft. lbs.) (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).

NOTE: If equipped with cruise control, connect clock spring harness to cruise switch harness on the steering wheel.

14. Install the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

15. Install the negative battery terminal.

IGNITION SWITCH

DESCRIPTION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

DIAGNOSIS AND TESTING

IGNITION SWITCH

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, Refer to the appropriate section for the component.

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

Vehicles equipped with an automatic transmission and a floor mounted shifter: a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock system is used to lock the transmission shifter in the PARK position when the key cylinder is rotated to any position. If the ignition key is difficult to rotate to or from any position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE/GEAR SHIFT CABLE - ADJUSTMENTS). The interlock system within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a button is located on the steering column behind the ignition key cylinder. The button must be manually depressed to allow rotation of the ignition key cylinder to any position. If it is difficult to rotate the key to any position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

REMOVAL

1. Remove the steering column shrouds.

NOTE: The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

2. Remove lock cylinder. (Refer to 19 - STEERING/COLUMN/KEY/LOCK CYLINDER - REMOVAL).
3. Remove the multi-function switch.
4. Disconnect the electrical connector at the rear of the ignition switch.
5. Remove the ignition switch mounting screw (1). Use tamper proof torx bit to remove the screw.

NOTE: Tilt arm (3) must be moved to allow removal of the switch.

6. Pull the ignition switch (2) straight out to remove from the locking tabs.

INSTALLATION

1. Before installing ignition switch (1), rotate the slot in the switch to the ON position (2).

NOTE: Tilt arm (3) must be moved to allow installation of the switch.

2. Position the switch (2) to the column and install tamper proof screw (1). Tighten screw to 2 N·m (17 in. lbs.).
3. Connect the electrical connector to rear of ignition switch. Make sure that locking tab is fully seated into wiring connector.

NOTE: The ignition key must be in the key cylinder for cylinder installation. The key cylinder must be aligned with the ignition switch for installation.

4. Install the lock cylinder (Refer to 19 - STEERING/COLUMN/KEY/LOCK CYLINDER - INSTALLATION).
5. Test the operation of the lock cylinder for smooth rotating.
6. Install the multi-function switch.
7. Install steering column lower cover.

KEY CYLINDER

REMOVAL

The ignition key (1) must be in the key cylinder (2) for cylinder removal. The key cylinder must be removed first before removing ignition switch.

1. If equipped with an automatic transmission, place shifter in PARK position.
2. Remove the shroud covers.
3. Remove the remote keyless entry (S.K.R.E.E.M) module.
4. Remove the halo ring around the cylinder.
5. Rotate key to ON position.
6. A release pin is located on the bottom of the key cylinder (5) with the access hole on the top of the lock cylinder housing (3).
7. Position a small screwdriver or pin punch (4) into pin access hole (5).
8. Push the pin punch (5) up while pulling key cylinder (2) from lock cylinder housing (3).

INSTALLATION

The ignition key (1) must be in the key cylinder (2) for cylinder installation.

1. Install the key cylinder (2) into the housing (3) using care to align the end of the key cylinder with the ignition switch.
2. Push the key cylinder (2) in until it clicks.
3. Rotate the key to the insert position.
4. Install the halo ring around the key cylinder housing.
5. Install the (S.K.R.E.E.M) module.
6. Install the shroud covers.

KEY-IN IGNITION SWITCH

DESCRIPTION

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column, opposite the ignition cylinder. It closes a path to ground for the instrument cluster chime warning circuitry when the ignition key is inserted in the ignition cylinder and the driver door jamb switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition cylinder.

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced. (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - REMOVAL).

DIAGNOSIS AND TESTING - KEY-IN IGNITION SWITCH

For circuit descriptions and diagrams, Refer to the appropriate sections on the individual components.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable. Remove the steering column shrouds. Unplug the key-in ignition switch wire harness connector from the ignition switch.
2. Check for continuity between the key-in switch sense circuit and the left front door jamb switch sense circuit terminals of the key-in ignition switch. There should be continuity with the key in the ignition cylinder, and no continuity with the key removed from the ignition cylinder. If OK, go to [STEP 3](#). If not OK, replace the faulty ignition switch assembly.
3. Check for continuity between the left front door jamb switch sense circuit cavity of the key-in ignition switch wire harness connector and a good ground. There should be continuity with the driver door open, and no continuity with the driver door closed. If OK, see the diagnosis for Instrument Cluster in this group. If not OK, repair the circuit to the driver door jamb switch as required.

HOUSING-LOCK CYLINDER

REMOVAL

1. Access and remove the Steering Column Control Module (SCCM) (3) from the steering column (2). (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL). (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

2. Remove the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3).
3. Unhook the SKREEM/WCM (2) retainer fingers from the lock cylinder housing (3) and remove it.

4. Insert the key (2) and turn the key cylinder (3) to the RUN position.

5. Insert an appropriate tool into the slot (1) formed into the lock cylinder housing depressing the key cylinder retaining tab.

6. Pull the key cylinder and key straight out of the lock cylinder housing as one unit.

7. Using a Tamper-Proof Torx® Plus (five point) 30 bit, remove the two screws (1) fastening the lock cylinder housing (2) to the column.

8. Remove the lock cylinder housing from the steering column.

9. Remove the ignition module (2) mounting screw (1).

10. Pull the module (1) straight out and off the retaining tabs (2) located on the lock cylinder housing.

INSTALLATION

NOTE: Ignition module must be installed prior to lock housing installation on column. Otherwise, the tilt lever will obstruct installation of ignition switch.

1. Ensure the ignition module is in the RUN position and the actuator shaft in the lock housing is in the RUN position.
2. Align the ignition module with the pin (3), actuator shaft and retaining tabs (2) located on the lock cylinder housing. Carefully install the module, snapping it into place over the retaining tabs.

3. Install the ignition module (2) mounting screw (1). Tighten the screw to 2 N·m (18 in. lbs.).

NOTE: Ignition module needs to be installed on lock cylinder housing before housing installation to clear tilt lever.

4. Position the lock cylinder housing in the RUN position.
5. Align the lock cylinder housing (2) with the steering column.
6. Install the two screws (1) fastening the lock cylinder housing (2) to the column. Tighten the screws to 12 N·m (110 in. lbs.).

7. Place the actuator in the lock cylinder housing to the RUN position (if not already there).
8. Insert the key into the key cylinder and turn the key cylinder to the RUN position.
9. Align the retaining tab on the key cylinder with the slot in the top of the lock cylinder housing.
10. Slide the key cylinder into the lock cylinder housing until the key cylinder retaining tab locks the cylinder into place.
11. Rotate the key back and forth (OFF to START), then remove and reinstall it, making sure the key cylinder and lock cylinder housing operate properly.

12. Slide the ring of the SKREEM/WCM (2) over the lock cylinder housing (3) and engage the retainer fingers in the recesses formed on the lock cylinder housing.

13. Install the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3). Tighten the screw to 2.5 N·m (22 in. lbs.).

14. Install the Steering Column Control Module (SCCM) (3) and all components removed to access it. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

15. Check operation of all steering column mounted components.

STEERING WHEEL REMOVAL

1. Disable and remove the drivers side airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

2. Disconnect the speed control wiring (3) to allow access for the puller (4).

3. Partially remove the steering wheel bolt (2) and leave the bolt in the column.

4. Install steering wheel puller special tool L-4407A puller with OTC® 7929A jaws or equivalent (4) using the top of the bolt to push on.

NOTE: Ensure the puller jaws are seated in the pockets of the steering wheel armature.

5. Remove the steering wheel (1).

INSTALLATION

NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)

1. Install steering wheel to the column

NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.

2. Install the new steering wheel bolt. Tighten the bolt to 54 N·m (40 ft. lbs.).
3. Reconnect the speed control electrical wiring.
4. Install the drivers side air bag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

INTERMEDIATE SHAFT

DESCRIPTION

The intermediate shaft consists of an upper (1) and lower (2) shaft to connect the steering column to the gear box.

REMOVAL

LOWER INTERMEDIATE SHAFT

1. Disconnect the negative battery cable.
2. Lock the steering wheel with the tires in the straight ahead position.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

3. Move the coolant bottle to the side out of the way.
4. Remove the lower coupling pinch bolt at the steering gear (2).
5. Remove the coupler from the gear (1).

6. Remove the upper pinch bolt (2) at the upper intermediate shaft (1).
7. Remove the upper coupler (3) from the upper intermediate shaft (1).
8. Remove the intermediate shaft from the vehicle.

UPPER INTERMEDIATE SHAFT

1. Disconnect the negative battery cable.
2. Lock the steering wheel with the tires in the straight ahead position.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

3. Remove the upper pinch bolt (2) at the upper intermediate shaft (1).
4. Remove the upper coupler on the lower shaft (3) from the upper intermediate shaft (1).

5. Remove the bolt (4) for the upper coupler (2) at the steering column (1).

6. Remove the two nuts (3) securing the upper intermediate shaft to the cowl and remove the shaft (1) from the studs (2).

7. Remove the upper intermediate shaft from the vehicle.

INSTALLATION

LOWER INTERMEDIATE SHAFT

1. Install the intermediate shaft to the vehicle.
2. Install the lower intermediate shaft (3) to the upper intermediate shaft (1).
3. Install the upper pinch bolt (2) and tighten the bolt to 49 N·m (36 ft. lbs.).

4. Install the coupler (1) at the steering gear (2).
5. Install the lower coupler pinch bolt at the steering gear and tighten the bolt to 49 N·m (36 ft. lbs.).
6. Unlock the steering wheel.
7. Reconnect the negative battery cable.

UPPER INTERMEDIATE SHAFT

1. Install the intermediate shaft (1) to studs (2) at the cowl.
2. Install the two mounting nuts (3). Tighten to 13 N·m (115 in.lbs.).

3. Install the upper shaft coupler (2) to the steering column (1).
4. Install and tighten the pinch bolt (4) to 49 N·m (36 ft. lbs.).

5. Install the lower intermediate shaft coupler (3) to the upper intermediate shaft (1).
6. Install the pinch bolt (2) and tighten the bolt to 49 N·m (36 ft. lbs.).
7. Unlock the steering wheel.
8. Reconnect the negative battery cable.

GEAR

GEAR

DESCRIPTION

The power steering gear is a recirculating ball type gear.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which turns the steering linkage.

REMOVAL

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an

internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

1. Place the front wheels in the straight ahead position with the steering wheel centered and locked.
2. Siphon out as much power steering fluid as possible.
3. Move the coolant bottle to the side out of the way.

4. Remove the lower column pinch bolt at the gear (2).
5. Remove the lower column coupler shaft (1) from the gear (2).

6. Remove power steering hoses/tubes (1&2) from steering gear (3).

7. Raise and support the vehicle.
8. Remove the track bar bolt (2) at the frame and lower the track bar (1).

9. Remove the pitman arm nut (3).

10. Separate the pitman arm (2) from the gear using special tool 9615 puller (1).

11. Remove pitman (2) arm from gear. (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - REMOVAL).

12. Remove the steering gear retaining bolts (1) and remove the gear.

INSTALLATION

1. Install steering gear on the frame rail and tighten bolts (1) to 95 N·m (70 ft. lbs.)

2. Align and install the pitman arm (2) and tighten nut (3) to 251 N·m (185 ft. lbs.).

3. It may be necessary to pry the axle assembly over to install the track bar (1) at the frame rail. Install track bar at the frame rail bracket. Install the nut and bolt (2) at the frame rail bracket.
4. Tighten the bolt (2) at the frame bracket to 169 N·m (125 ft. lbs.).
5. Install the track bar (1) back into position at the frame.
6. Remove the support and lower the vehicle.

7. Align the column coupler shaft (1) to steering gear (2). Install a **new** coupler pinch bolt and tighten to 49 N·m (36 ft. lbs.).

8. Install power steering hoses/tubes (1&2) to steering gear (3) and tighten to 36 N·m (27 ft. lbs.).
9. Reinstall the coolant bottle back into position.
10. Fill power steering system to proper level, (Refer to 19 - STEERING - STANDARD PROCEDURE).
11. Check the toe setting, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

ADJUSTMENTS

STEERING GEAR

NOTE: Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

OVER-CENTER

1. Rotate the stub shaft with Socket 8343 from stop to stop and count the number of turns.
2. Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.
3. Place torque wrench and Socket 8343 in a vertical position on the stub shaft. Rotate the wrench 45 degrees each side of the center and record the highest rotational torque in this range. This is the Over-Center Rotating Torque.

NOTE: The stub shaft must rotate smoothly without sticking or binding.

4. Rotate the stub shaft between 90° and 180° to the left of center and record the left off-center preload. Repeat this to the right of center and record the right off-center preload. The average of these two recorded readings is the Preload Rotating Torque.
5. The Over-Center Rotating Torque should be 0.45-0.80 N·m (4-7 in. lbs.) **higher** than the Preload Rotating Torque.
6. If an adjustment to the Over-Center Rotating Torque is necessary, first loosen the adjuster lock nut. Then turn the pitman shaft adjuster screw back (COUNTERCLOCKWISE) until fully extended, then turn back in (CLOCKWISE) one full turn.
7. Remeasure Over-Center Rotating Torque. If necessary turn the adjuster screw and repeat measurement until correct Over-Center Rotating Torque is reached.

NOTE: To increase the Over-Center Rotating Torque turn the screw CLOCKWISE.

8. Prevent the adjuster screw from turning while tightening adjuster lock nut. Tighten the adjuster lock nut to 37-52 N·m (27-38 ft. lbs.).

SPECIAL TOOLS

STEERING LINKAGE

Puller C-3894-A

DAMPER

REMOVAL

STEERING DAMPER

1. Place the front wheels in a straight ahead position.
2. Raise and support the vehicle.
3. Remove the steering damper retaining nut (1) from the steering damper bracket.
4. Remove the steering damper retaining nut and bolt from the axle bracket (3).
5. Remove the steering damper (2) from the vehicle.

STEERING DAMPER BRACKET

1. Remove the steering damper nut (1) from the bracket.

2. Remove the four nuts (2) for the U-bolts.
3. Remove the U-bolts and bracket (1).

INSTALLATION

STEERING DAMPER

1. Install the steering damper (2) to the axle bracket and steering damper bracket.
2. Install the steering damper bolt (3) in the axle bracket and tighten nut to 68 N·m (50 ft. lbs.).
3. Install the steering damper nut (1) on the steering damper bracket and tighten nut to 68 N·m (50 ft. lbs.).
4. Remove the support and lower the vehicle.

STEERING DAMPER BRACKET

1. Install the bracket loosely to the tie rod tube.
2. The bracket should be oriented such that the stud (1) is on the left (driver) side and pointing rearward in the vehicle, and the U-bolts (4) should assemble on the front.
3. Slide the bracket so that the nearest edge (2) is facing the end of the tube (3) the stud (1) on the bracket should be facing the left side of the vehicle.
4. Measure from the edge of the bracket (2) to the edge of the tube (3) a distance of 402 mm (15.8 in).

NOTE: The vehicle should be parked on a level surface. The tie rod should be level (front to back) prior to aligning the damper bracket.

5. To level the tie rod (1), place a small level on the bottom of the right side tie rod socket (2). Rotate the tie rod until it is level. While maintaining the tie rod at a level position, rotate the damper bracket so that the stud is horizontal and pointed rearward.

6. Hand tighten all four nuts (2) for equal thread engagement. Tighten the nuts for one U-bolt at a time, alternating between the top and bottom nut. The final torques should be 20 N·m (15 ft.lbs.) on all four nuts.

7. Install the steering damper nut (1) on the steering damper bracket and tighten nut to 68 N·m (50 ft. lbs.).

DRAG LINK

REMOVAL

DRAG LINK (KNUCKLE SIDE)

1. Raise and support the vehicle.
2. Remove the right front tire.

3. Remove the right side drag link nut at the knuckle.

4. Separate the drag link using special tool 9360 separator (2).

5. Remove the tie rod nut at the knuckle.

6. Separate the tie rod using special tool 9360 separator (2).

NOTE: Count the number of turns when removing the tie rod end, This will give a good starting point when reassembling and toe adjustment.

7. Loosen the nut and bolt (1) for the drag link adjustment sleeve.
8. Unthread the drag link socket from the adjuster.

DRAG LINK TIE ROD (PITMAN ARM SIDE)

1. Raise and support the vehicle.

2. Remove the drag link nut at the pitman arm.
3. Separate the drag link (3) from the pitman arm using special tool 9360 separator (2).

NOTE: Count the number of turns when removing the tie rod end, This will give a good starting point when reassembling and toe adjustment.

4. Loosen the nut and bolt (1) for the drag link adjustment sleeve.
5. Unthread the tie rod end from the tube.

INSTALLATION

DRAG LINK (KNUCKLE SIDE)

1. Thread the drag link socket into the adjuster . Tighten the adjustment sleeve bolt finger tight (1). Do not tighten to specs until after the toe set is complete.

2. Install the drag link to the knuckle and tighten the nut to 85 N·m (63 ft. lbs.)
3. Install the tie rod end to the knuckle and tighten to 85 N·m (63 ft. lbs.).
4. Install the right side tire.
5. Lower the vehicle.
6. Set the toe. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

DRAG LINK TIE ROD (PITMAN ARM SIDE)

1. Thread the tie rod end onto the drag link tube. Tighten the tie rod end adjustment sleeve bolt finger tight (1). Do not tighten to specs until after the toe set is complete.
2. Install the tie rod end and nut to the pitman arm and tighten to 105 N·m (77 ft. lbs.).
3. Lower the vehicle.
4. Set the toe. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

PITMAN ARM

REMOVAL

1. Raise and support the vehicle.
2. Remove the track bar bolt (2) at the frame and lower the track bar (1).

3. Remove the pitman arm nut at the drag link (3).
4. Separate the pitman arm (1) from the drag link (3) using special tool 9360 separator (2).

5. Remove the pitman arm nut (3). **Mark the pitman shaft and pitman arm for installation reference.**

6. Separate the pitman arm (2) from the gear using special tool 9615 puller (1).
7. Remove pitman (2) arm from gear. (Refer to 19 - STEERING/LINKAGE/PITMAN ARM - REMOVAL).

INSTALLATION

1. Align and install the pitman arm (2) on steering gear shaft.
2. Install the washer and nut (3) on the shaft and tighten the nut to 251 N·m (185 ft. lbs.).
3. Install drag link ball stud to pitman arm. Install nut and tighten to 105 N·m (77 ft. lbs.).

4. Install the track bar back into position at the frame.
5. It may be necessary to pry the axle assembly over to install the track bar (1) at the frame rail. Install track bar at the frame rail bracket. Install the nut and bolt (2) at the frame rail bracket.
6. Tighten the bolt (2) at the frame bracket to 169 N·m (125 ft. lbs.).
7. Remove the support and lower the vehicle.
8. Fill power steering system to proper level, (Refer to 19 - STEERING - STANDARD PROCEDURE).
9. Check the toe setting, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

TIE ROD END

DIAGNOSIS AND TESTING

TIE ROD

Tie rod free-play can be measured using the following hand methods:

NOTE: When checking free-play, DO NOT rotate the tie rod. Just because a tie rod rotates easily, it is not necessarily faulty.

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down. If any free-play is felt, replace the outer tie rod (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL). If no free-play is felt at the outer tie rod, attempt to move the inner tie rod in the same manner. Refer to the following procedure.

STANDARD PROCEDURE

CHECKING TIE ROD ENDS

Tie rod free-play can be measured using the following hand methods:

NOTE: When checking free-play, DO NOT rotate the tie rod. Just because a tie rod rotates easily, it is not necessarily faulty.

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down. If any free-play is felt, replace the outer tie rod (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL). If no free-play is felt at the outer tie rod, attempt to move the inner tie rod in the same manner. Refer to the following procedure.

REMOVAL

TIE ROD TUBE

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. loosen the end clamp bolt (2).

4. Remove the nut (3) at the steering knuckle.

5. Separate the tie rod (3) from the knuckle (1) using special tool 9360 separator (2).

NOTE: Count the number of turns when removing the tie rod tube, This will give a good starting point when reassembling and toe adjustment.

6. Unthread the tie rod tube from the adjuster.

TIE ROD END

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. loosen the end clamp bolt (2).
4. Remove the nut (3) at the steering knuckle.
5. Separate the tie rod from the knuckle using special tool 9360 separator.

NOTE: Count the number of turns when removing the tie rod end, This will give a good starting point when reassembling and toe adjustment.

6. Unthread the tie rod end from the tube.

INSTALLATION

TIE ROD TUBE

1. Thread the tie rod tube onto the adjuster.

2. Install the tie rod in the steering knuckle.
3. Tighten the ball stud nut (3) on the steering knuckle to 85 N·m (63 ft. lbs.).

4. Position the tie rod clamp (2) and tighten to 61 N·m (45 ft. lbs.).
5. Install the tire and wheel assembly.
6. Lower the vehicle.
7. Set wheel toe, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE) .

TIE ROD END

1. Thread the tie rod end in the tube.
2. Install the tie rod in the steering knuckle.
3. Tighten the ball stud nut (3) on the steering knuckle to 85 N·m (63 ft. lbs.).
4. Position the tie rod clamp (2) and tighten to 61 N·m (45 ft. lbs.).
5. Install the tire and wheel assembly.
6. Lower the vehicle.
7. Set wheel toe, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE) .

PUMP

PUMP

DESCRIPTION

GAS ENGINE

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump. The pump shaft has a pressed-on high strength plastic drive pulley that is belt driven by the crankshaft pulley. The reservoir is a remote reservoir located by the battery. The power steering pump is connected to the steering gear by the pressure and return hoses.

DIESEL ENGINE

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump. The pump shaft has a bolt on steel drive pulley that is belt driven by the crankshaft pulley. The reservoir is a remote reservoir located by the battery. The power steering pump is connected to the steering

gear by the pressure and return hoses.

OPERATION

The power steering pump is a droop flow rate and displacement, vane-type pump. The pump internal parts operate submerged in fluid. The flow control orifice is part of the high pressure line fitting. The pressure relief valve inside the flow control valve limits the pump pressure.

NOTE: Power steering pumps have different pressure rates and are not interchangeable with other pumps.

DIAGNOSIS AND TESTING

POWER STEERING PUMP AND HOSES

NOTE: This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering section. (Refer to 19 - STEERING - DIAGNOSIS AND TESTING)

CHECKING FOR WEAR OF POWER STEERING PUMP INTERNAL COMPONENTS

1. Place gear selector in PARK (or NEUTRAL) with wheels chalked.
2. With the engine idling, have a helper turn the steering wheel.
3. Using an electronic listening tool, determine if noise is coming from the pump.
4. Increase the engine speed and have a helper turn the steering wheel. Does the noise change with load?
5. Replace the power steering pump if excessive noise is present. (Refer to 19 - STEERING/PUMP - REMOVAL)

CHECKING FOR POWER STEERING HOSES TOUCHING BODY OR FRAME OF VEHICLE

Check hoses and hose tubes as following:

- Inspect hoses and hose tubes for witness marks. If witness marks are present, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque (Refer to 19 - STEERING/PUMP - SPECIFICATIONS). **Do not bend tubing to adjust.** Replace the hose assembly if damaged.
- Check fastener torque of hose mounting brackets and tube nuts. (Refer to 19 - STEERING/PUMP - SPECIFICATIONS)
- Have a helper bump the steering gear off of the stops to induce pressure fluctuations which may move the hose. If hose contact is made, adjust hose(s) to the proper position by loosening, repositioning and

tightening attachments to the specified torque (Refer to 19 - STEERING/PUMP - SPECIFICATIONS). **Do not bend tubing to adjust.** Replace the hose assembly if damaged.

REMOVAL

3.8L

1. Remove cap from power steering fluid reservoir.
2. Siphon as much fluid as possible from the power steering fluid reservoir.
3. Remove the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)..
4. Remove the pressure hose at the pump.
5. Remove the supply hose from the pump.

6. Remove the drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
7. Remove the three front mounting bolts through the pulley (2).
8. Remove the pump (with pulley).
9. If the pulley (1) needs removal, (Refer to 19 - STEERING/PUMP/PULLEY - REMOVAL).

2.8L- DIESEL

1. Siphon out as much power steering fluid as possible.
2. Remove the air cleaner box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Remove the turbo air inlet tube (1).

4. Remove the serpentine drive belt.
5. Remove the three bolts (4) securing the pulley (3) to the pump (2).
6. Remove the power steering hoses (1&6).

7. Remove the three bolts (2) securing the pump (1) to the engine.
8. Remove the pump (1) from the vehicle.

INSTALLATION

3.8L

1. Install pulley (1) on pump (if removed). (Refer to 19 - STEERING/PUMP/PULLEY - INSTALLATION).
2. Install pump on the engine.
3. Install 3 pump mounting bolts (2) and tighten to 26 N·m (19 ft. lbs.).

4. Install the pressure line on the pump and tighten to 31 N·m (23 ft. lbs.).
5. Install supply hose on pump.
6. Install drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
7. Fill and bleed the power steering system (Refer to 19 - STEERING - STANDARD PROCEDURE).
8. Check for leaks.
9. Install the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

2.8L-DIESEL

1. Install the pump to the vehicle.
2. Install the three bolts (2) securing the pump (1) to the engine and tighten to 47 N·m (35 ft. lbs.).

3. Install the power steering hoses (1&6). Tighten to 28 N·m (21 ft. lbs.).
4. Install the power steering pulley to the pump.
5. Install the three bolts (4) securing the pulley (3) to the pump (2).
6. Install the serpentine belt.

7. Install the air inlet tube (1).
8. Install the air cleaner box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
9. Refill the power steering fluid and bleed the system (Refer to 19 - STEERING - STANDARD PROCEDURE).

SPECIFICATIONS

TORQUE CHART

TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.

Diesel Power Steering Pump Pulley	28	21	—
Power Steering Pump Pressure Line	31	23	—

SPECIAL TOOLS

POWER STEERING PUMP

HOSES

DESCRIPTION

PRESSURE LINE

The pressure hose (4) consists of two metal ends two rubber sections and one center metal section. The hose connects to the gear box (6) and to the power steering pump (1).

RETURN LINE

Power steering return line (2) is a hose which is clamped at the reservoir and torqued at the gear mounted under the grille.

DESCRIPTION

The supply hose (3) consists of a rubber section that is clamped at the reservoir and pump (2).

OPERATION

PRESSURE LINE

Power steering pressure line is used to transfer high pressure power steering fluid from the power steering pump to the power steering gear.

RETURN LINE

Power steering return line is used to transfer low pressure power steering fluid from the power steering gear to the power steering reservoir.

OPERATION

The supply hose is used to transfer low pressure P/S fluid from the reservoir to the pump.

REMOVAL

PRESSURE HOSE

1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Remove the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING -

REMOVAL)..

3. Remove the pressure hose (2) at the pump.

4. Move the coolant bottle to the side out of the way.

5. Remove the pressure hose (2) at the gear.

6. Remove the pressure hose from the routing clips (1).

7. Remove the pressure hose (2) from the vehicle.

RETURN HOSE

1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Remove the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Remove the clamp (3) for the return hose (4) at the reservoir (1) and then remove the hose.

4. Move the coolant bottle to the side out of the way.
5. Remove the return hose (1) at the gear.

6. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
7. Remove the panel in between the grille and the bumper (3).
8. Remove the return hose routing clips (1) at the body.
9. Remove the return hose (2) from the vehicle.

SUPPLY HOSE

1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Remove the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)..
3. Remove the supply hose (3) at the reservoir (1).
4. Remove the supply hose (3) at the pump.
5. Remove the supply hose (3) from the vehicle.

INSTALLATION

PRESSURE HOSE

1. Install the pressure hose to the vehicle.
2. Install and secure the pressure hose at the routing clips (1).

3. Install the Pressure hose (2) at the gear. Tighten the tube nut to 36 N·m (27 ft. lbs.).

4. Install the pressure hose (2) at the pump pressure port. Tighten the tube nut to 31 N·m (23 ft. lbs.).
5. Reinstall the coolant bottle back into position.
6. Fill and bleed the power steering system (Refer to 19 - STEERING - STANDARD PROCEDURE).
7. Check for leaks.
8. Install the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

RETURN HOSE

1. Install the return hose (2) to the vehicle.
2. Install and secure the return hose at the routing clips (1).
3. Install the bumper to grille panel (3).

4. Install the return hose (1) at the gear. Tighten the tube nut to 32 N·m (24 ft. lbs.).

5. Install the return hose (4) at the reservoir (1) and reclamp (3).
6. Reinstall the coolant bottle back into position.
7. Fill and bleed the power steering system (Refer to 19 - STEERING - STANDARD PROCEDURE).
8. Check for leaks.
9. Install the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
10. Install the front grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

SUPPLY HOSE

1. Install the supply hose (3) to the vehicle.
2. Install the supply hose at the pump (2).
3. Install the supply hose to the reservoir (2).
4. Fill and bleed the power steering system (Refer to 19 - STEERING - STANDARD PROCEDURE).
5. Check for leaks.
6. Install the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

FLUID

DESCRIPTION

The recommended fluid for the power steering system is Mopar® ATF +4.

Mopar® ATF+4, when new is red in color. The ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

STANDARD PROCEDURE

POWER STEERING FLUID LEVEL CHECKING

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT PERSONAL INJURY FROM MOVING PARTS.

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two ranges listed on the dipstick, COLD and HOT. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the minimum and maximum area of the cold range. When the fluid is hot, fluid level is allowed to read up to the highest end of the HOT range. Only add fluid when the vehicle is cold.

Use only **Mopar® ATF+4**. Do not overfill the power steering system.

PULLEY

REMOVAL

GAS

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

1. Remove the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)..
2. Remove the pulley (2) from the pump using (OTC® 7185) power steering pulley removal tool or equivalent (3).

DIESEL

1. Remove the air cleaner box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
2. Remove the air inlet tube (1).

3. Remove the serpentine drive belt.
4. Remove the three bolts (4) securing the pulley (3) to the pump (2).

INSTALLATION

GAS

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

1. Replace the pulley (2) if it's bent, cracked, or loose.
2. Install the pulley (2) on the pump (1) using (OTC® 7771) power steering pulley installation tool or equivalent (3) making sure it is flush with the end of the shaft. Ensure the tool and pulley remain aligned with the pump shaft.
3. Install the air box assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
4. Run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

DIESEL

1. Install the pulley (3) to the pump shaft.
2. Install the three bolts (4) securing the pulley (3) to the pump (2). Tighten to 47 N·m (35 ft. lbs.).

3. Install the serpentine belt.
4. Install the air inlet tube (1).
5. Install the air cleaner box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

RESERVOIR

REMOVAL

1. Siphon the power steering reservoir (1).
2. Loosen and move the hose clamps (3&5) backwards on the power steering hoses at the reservoir (1).
3. Remove the return hose (4) from the reservoir.
4. Remove the supply hose (6) from the reservoir.
5. Remove the reservoir mounting bolt (2).
6. Remove the reservoir (1).

INSTALLATION

1. Install the reservoir (1) onto the mounting bracket.
2. Install the mounting bolt (2).
3. Install the supply hose (6) to the reservoir (1).
4. Install the return hose (4) to the reservoir (1).
5. Reconnect the hose clamps (3&5) on the hoses at the reservoir (1).
6. Add power steering fluid, (Refer to 19 - STEERING - STANDARD PROCEDURE).

21 - TRANSMISSION AND TRANSFER CASE

MANUAL TRANSMISSION - NSG370

MANUAL TRANSMISSION - NSG370

DIAGNOSIS AND TESTING

MANUAL TRANSMISSION - NSG370

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or incorrect lubricant level check.

Rear transmission leaks will be from the oil seals or component mating surfaces.

Front transmission leaks will be from the front input shaft retainer seal. Lubricant may drip from the clutch housing after extended operation. If leak is severe, it may contaminate the clutch disc.

Lubricant level check can only be made when the vehicle is level and allowing the lubricant to settle for a minute before checking. This will ensure an accurate check and avoid an under filled or over filled condition.

HARD SHIFTING

Hard shifting is usually caused by low lubricant level, improper or contaminated lubricants. This will cause noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. The first indications of component damage is usually hard shifting and noise.

Shift component damage, clutch adjustment, worn pressure plate or disc are also causes of increased shift effort. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchronizer rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchronizers, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

STANDARD PROCEDURE

DRAIN AND FILL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove drain plug (1) and drain fluid.

3. Install drain plug and remove fill plug (1).
4. Fill transmission with 1.5 L (3.17 pts.) of Mopar® Manual Transmission Lubricant MS-9224 or to the bottom of the fill plug (1) hole.

REMOVAL

1. Disconnect negative battery cable.
2. With vehicle in neutral, position vehicle on hoist.
3. Slide shift lever boot (1) up and remove shift lever bolt and lever (2).

4. Remove drain plug (1) and drain fluid.
5. Remove transfer case skid plate.
6. Remove 3.8L catalyst assembly.
7. Mark installation reference marks on propeller shaft/shafts and remove shafts.
8. Remove transfer case shift linkage, wiring connector, and vent hose, if equipped.
9. Remove transfer case, if equipped.

10. Remove clutch slave cylinder (1) nuts (2) and remove cylinder.

11. Remove backup lamp switch (2) wiring connector (1).

12. Remove starter (1) bolts (2) and remove starter.

13. Support transmission with jack.
14. Remove transmission mount, crossmember (1) and skid plate (2) bolts. Lower and slid crossmember out left side of the vehicle.

15. Remove transmission bolts from engine (1) and structural cover (2).

NOTE: Do not remove the structural cover from the engine. If cover is removed clutch housing and structural dust cover must be aligned with the engine.

DISASSEMBLY

1. Remove shift tower (1) bolts (2) and remove tower.

2. Through shift tower opening (1) shift two shift rails (2) forward to engage two gears.

3. Remove back-up lamp switch (1) bolt (2) and remove switch.

4. Remove countershaft plug (1) from the front housing (2) with a seal pick.

5. Remove countershaft bolt (1) from the front housing (2).

6. Remove output shaft (1) seal (2) from rear housing (3) with a seal pick.

7. Remove output shaft (1) snap ring (2) 4x4 only.

8. Stand transmission on the rear housing and remove the housing bolts.

9. Remove front housing (1) from the rear housing (2).

10. Remove shift rails (1) support plate (2) bolts.

11. Remove input shaft (1) roller bearing (2).

12. Remove fifth gear synchronizer blocker ring (1) from 5-6 synchronizer hub (2).

13. Remove fifth gear synchronizer friction ring (1) from 5-6 synchronizer hub (2).

14. Set geartrain and shift rails with rear housing into Build Fixture 9633.

15. Remove mainshaft shaft (1) from rear housing bearing with Remover 9636 (2).

16. Remove mainshaft (1), countershaft (2) and shift rails/forks (3) from fixture.

MAINSHAFT

1. Place mainshaft with 5-6 synchronizer facing up in build Fixture 9648 and place in a vise.
2. Push 5-6 synchronizer sleeve (1) down on hub and remove detents (2) springs and balls.

3. Remove 5-6 synchronizer sleeve (1) from hub (2).

4. Remove 5-6 synchronizer hub (1) snap ring (2).

NOTE: All snap rings are select fit from the factory, and must be installed in their original location.

5. Remove 5-6 synchronizer hub (1) and sixth gear synchronizer rings (2) with a three jaw puller. Place puller jaws under sixth gear synchronizer rings (2).

6. Remove sixth gear (1) and bearing (2).

7. Third gear (1) and fourth gear (2) are serviced with the mainshaft only.

8. Remove mainshaft from Fixture 9648. Turn fixture over in vise and set opposite end of mainshaft in the fixture.

9. Remove reverse gear (1) synchronizer sleeve (2) off synchronizer hub.

10. Remove reverse synchronizer hub (1) detents (2).

11. Remove reverse synchronizer hub (1) with three jaw puller (2). Place puller jaws in hub detent openings.

12. Remove reverse gear (1) synchronizer ring (2).

13. Remove reverse gear (1) and bearing (2).

14. Remove reverse gear bearing race (1), thrust washer (2) and first gear (3) with puller (4). Place puller jaws under first gear (3).

15. Remove first gear bearing.

16. Remove first gear synchronizer rings.

17. Push 1-2 synchronizer sleeve down on hub. Remove 1-2 synchronizer hub (1) detents (2), balls and springs.

18. Remove 1-2 synchronizer sleeve (1) from synchronizer hub (2).

19. Remove 1-2 synchronizer hub (1) snap ring (2).

NOTE: All snap rings are select fit from the factory, and must be installed in their original location.

20. Remove 1-2 synchronizer hub (1), synchronizer rings and second gear (2) off shaft with a press. Place second gear (2) on press plates and press shaft through 1-2 synchronizer hub (1), synchronizer rings and second gear (2)

COUNTERSHAFT

The countershaft (1) and 3-4 synchronizer (2) are serviced as an assembly only .

FRONT HOUSING

1. Remove input shaft retainer (1) bolts (2) and remove retainer.

2. Remove countershaft bearing (1) retainer (2) bolts and remove retainers.

3. Remove countershaft bearing (1) from housing (2) with a hammer and driver.

4. Remove input shaft (1) bearing retainer (2, 3) bolts and remove retainers.
 5. Remove input shaft and bearing from housing with a dead blow hammer.

6. Remove input shaft seal (1) from housing (2) with a hammer and driver.

INPUT SHAFT

1. Remove input shaft bearing (1) snap ring (2).

NOTE: All snap rings are select fit from the factory, and must be installed in their original location.

2. Remove input shaft bearing (1) with Splitter 1130 (2) and press. Place splitter around bearing retainer lip.

REAR HOUSING

1. Remove reverse idler gear shaft bolt (1) from housing (2).

2. Thread idler gear shaft bolt (1) into the shaft (2). Then work shaft (2) out of the idler gear.

3. Remove reverse idler gear (1) shaft support (2).

4. Remove reverse idler gear (1) thrust washer (2).

5. Remove reverse idler gear (1) and bearing (2).

6. Break plastic countershaft roller bearing cage (1) with a screw driver (2). Then remove cage and roller bearing.

7. Remove countershaft roller bearing shell (1) from the rear housing with Remover 7794-A (2) and Slide Hammer C-637.

8.
Remove

mainshaft bearing (1) retainer (2) bolts and remove retainers.
9. Remove bearing from housing with a hammer and driver.

CLEANING

Clean gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean shaft bearings with a mild solvent such as Mopar™ degreasing solvent or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

NOTE: Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.

Bearings: Inspect for worn, cracked, flat-spotted or brinnelled.

Gears: Inspect for worn, chipped or cracked teeth. Inspect bearing surfaces for ware or flat-spotted.

Mainshaft: Inspect for worn splines, snap ring grooves and threads. Inspect bearing surfaces for ware or flat-spotted. **Third gear (1) and fourth gear (2) are serviced with mainshaft only.**

Countershaft: Inspect for worn, chipped or cracked teeth. Inspect bearing surfaces (1) for wear or flat-spots. Inspect 3-4 synchronizer assembly (2). **The countershaft is serviced as**

an assembly.

Input Shaft: Inspect for worn, chipped or cracked teeth (1). Inspect bearing surface (2) for wear or flat-spots. Inspect for worn splines (3).

Synchronizer components: Inspect for worn, chipped or cracked teeth (1) and burned friction surface (2) or flaking off friction material (3). **Synchronizers are serviced as an assembly. 3-4 synchronizer assembly is serviced with countershaft.**

Shift forks: Inspect shift forks and shoes (1) for wear and

distortion. Check fit of fork shoes in synchronizer sleeve to ensure parts fit and work smoothly, replace if necessary. If shift fork pads (2) are worn, the shift fork must be replaced.

Housing/Tail housing: Inspect sealing and mating surfaces are free of burrs and nicks. Inspect alignment dowels are tight and in good condition.

Input Shaft Retainer: Inspect retainer (1) release bearing slide surface (2).

ASSEMBLY

MAINSHAFT

1. Place mainshaft in Fixture 9648 mounted in a vise.
2. Install second gear bearing (1) on mainshaft (2).

3. Install second gear (1) on bearing (2).

4. Install inner synchronizer friction ring (1) on second gear (2).

5. Install outer synchronizer friction ring (1) on second gear (2).

6. Install synchronizer blocker ring (1) on second gear (2).

7. Install 1-2 synchronizer hub (1) with Installer 8228 (2) and a press. Align hub detent openings with synchronizer rings.

8. Install 1-2 synchronizer hub (1) snap ring (2).

NOTE: Reuse original snap ring or thickest snap ring that will fit.

9. Install 1-2 synchronizer sleeve (1) and push to the bottom of the synchronizer hub (2).

10. Install 1-2 synchronizer detents, springs, and balls (2).

11. Install first gear blocker ring (1) into synchronizer hub (2).

12. Install first gear outer friction ring (1) into synchronizer hub (2).

13. Install first gear inner friction ring (1) into synchronizer hub (2).

14. Install first gear (1) and bearing (2). Then center 1-2 synchronizer sleeve on synchronizer hub.

WARNING: Use welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: A bearing heater is used to assemble first gear thrust washer (1) and reverse gear bearing race (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 177 Celsius (212° Min - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

15. Heat first gear thrust washer (1) and reverse gear bearing race (2) with bearing heater.

16. Using welding gloves or tongs, install first gear thrust washer (1) then reverse gear bearing race (2).

17. Install reverse gear (1) and bearing (2).

18. Install reverse gear (1) synchronizer friction ring (2).

19. Install reverse gear synchronizer hub (1) on mainshaft with Installer W-262 (2) and a press. Align hub detent opening (3) with friction ring (4) lug.

20. Install reverse gear synchronizer hub (1) detents (2).

21. Install reverse gear (1) synchronizer sleeve (2) with tooth points pointing down and center sleeve on synchronizer hub.
 22. Remove mainshaft from Fixture 9648. Turn fixture over in the vise, then install opposite end of mainshaft in the fixture.

23. Install sixth gear (1) and bearing (2).

24. Install sixth gear synchronizer blocker ring (1) on sixth gear (2).

25. Install sixth gear synchronizer friction ring (1) on sixth gear (2).

26. Install 5-6 synchronizer hub (1) with Installer W-262 (2). Align hub detent opening (3) with friction ring lugs (4) and press hub on mainshaft.

NOTE: 5-6 synchronizer hub center, is offset and must be install large offset down.

27. Install 5-6 synchronizer hub (1) snap ring (2).

NOTE: Reuse original snap ring or thickest snap ring that will fit.

28. Install 5-6 synchronizer sleeve on hub (1).

REAR HOUSING

1. Install countershaft bearing into rear housing with Installer 9643 (1) and Handle C-4171.

2. Install mainshaft bearing (1) into housing (2).
 3. Install bearing retainer and tighten bolts to 10 N·m (88 in. lbs.).

4. Install reverse idler gear (1) into housing (2).

5. Install idler gear (1) bearing (2) into gear.

6. Install idler gear (1) thrust washer (2) on idler gear.

7. Install idler gear (1) shaft support (2) into housing.

8. Install idler gear (1) shaft (2) with shaft bolt hole aligned with shaft support hole (3).

9. Install idler gear shaft bolt (1) into the housing (2) and tighten to 20 N.m (15 ft. lbs.).

10. Install 4x4 output shaft seal into rear housing (1) with Installer 9638 (2). Install 4x2 output shaft seal into rear housing with Installer 9635 and Installer 6448A.

INPUT SHAFT

1. Install input shaft bearing (1) on input shaft with the bearing retainer lip (2) facing fifth gear.

2. Install input shaft bearing (1) with Installer 6448A (2) and a press.

3. Install input shaft bearing (1) snap-ring (2).

NOTE: Reuse original snap ring or thickest snap ring that will fit.

FRONT HOUSING

1. Install input shaft seal with Installer 9635 (1) and Installer 6448A (2).

2. Install input shaft (1) with bearing (2) into housing.

3. Install input shaft (1) bearing retainers (2, 3) and tighten bolts to 10 N·m (88 in. lbs.).

4. Install input shaft retainer (1) and tighten bolts (2) to 9 N·m (80 in. lbs.).

5. Install countershaft bearing (1) into housing with bearing retainer lip (2) facing up.

6. Install countershaft bearing (1) retainers (2) and tighten bolts to 10 N·m (88 in. lbs.).

FINAL ASSEMBLY

1. Install mainshaft (1) onto Build Fixture 9633 (2).

2. Install countershaft (1) onto Build Fixture 9633 (2).

3. Install oil slinger (3) on countershaft (2) between reverse (1) and first gear (4).

4. Install shift rails and forks (1) onto Fixture 9633 (2) and countershaft/mainshaft .

5. Install rear housing on mainshaft (1) with Installer 9636 (2).

6. Remove rear housing with mainshaft, countershaft and shift rails from fixture. Set assembly on rear housing with shafts pointing up.
7. Install 5-6 synchronizer hub (1) detents, springs, and balls (2).

8. Install fifth gear synchronizer friction ring (1) on 5-6 synchronizer hub (2).

9. Install fifth gear blocker ring (1) on 5-6 synchronizer hub (2). Then hold blocker ring and center synchronizer sleeve.

10. Install input shaft roller bearing (1) on mainshaft (2).

11. Install shift rail (1) support plate (2) bolts and tighten to 8 N·m (71 in. lbs.).

12. Apply MOPAR® Gasket Maker to front housing.
13. Install front housing (1) on rear housing (2) and tighten bolts to 28 N·m (20 ft. lbs.).

14. Install output shaft (1) snap ring (2) 4x4 only.

15. Install output shaft (1) seal (2) in rear housing with Installer 9638.

16. Through the shift tower opening (1) move two shift rails (2) forward to lock the transmission in two gear.

17. Install countershaft bolt (1) into the front housing (2) and tighten to 100 N·m (74 ft. lbs.).

18. Install countershaft plug (1) in front housing (2) with Installer 7828-A and Handle C-4171.

19. Move shift rails to neutral.

20. To prevent plugging the transmission vent, apply just a thin film of MOPAR® Gasket Maker to shift tower mating surface.

21. Install shift tower (1) and tighten bolts (2) to 14 N·m (10 ft. lbs.).

22. Install back up lamp switch (1) and bolt (2).

INSTALLATION

1. Install transmission on engine.
2. Tighten top transmission bolts to 40 N·m (30 ft. lbs.).
3. Tighten two side bolts (1) to 68 N·m (50 ft. lbs.).
4. Tighten four bottom bolts (2) to 54 N·m (40 ft. lbs.).

5. Install backup lamp (2) wiring connector (1).

6. Install clutch slave cylinder (2) and tighten mounting nuts (1) to 23 N·m (17 ft. lbs.).

7. Install transmission crossmember (1) and tighten bolts to 47 N·m (35 ft. lbs.). Install transmission mount bolts and tighten to 47 N·m (35 ft. lbs.). Install and tighten skid plate bolts.

8. Install transfer case, if equipped.

9. Install propeller shaft/shafts with reference marks aligned.

10. Remove fill plug (1) and fill transmission with lubricant.

11. Install shift lever (2) and tighten bolt to 4 N·m (33 in. lbs.).

AUTOMATIC TRANSMISSION 42RLE - ELECTRICAL DIAGNOSTICS

AUTOMATIC TRANSMISSION 42RLE - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

P0122-TPS/APP CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored TPS voltage drops below .078 volts for the period of 0.48 seconds.

Possible Causes
RELATED TPS ENGINE DTCS PRESENT
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT

With the scan tool, check Engine DTCS, including pending DTCS and one trip failures.

Are there any Engine TPS DTCS present?

Yes

- Refer to the Driveability category and perform the appropriate diagnostic procedure.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
With the scan tool, erase Transmission DTCS.

NOTE: Clearing DTCS does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults

and may cause poor shift quality until those values are relearned.

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the Event Data. With the scan tool, read Transmission DTCs.

Does this DTC reset?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0123-TPS/APP CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of

range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored TPS voltage rises above 4.94 volts for the period of 0.48 seconds.

Possible Causes
RELATED TPS ENGINE DTCS PRESENT
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT

With the scan tool, check Engine DTCs, including pending DTCs and one trip failures.

Are there any Engine TPS DTCs present?

Yes

- Refer to the Driveability category and perform the appropriate diagnostic procedure.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [2](#)

2. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
 With the scan tool, erase Transmission DTCs.

NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the Event Data.
 With the scan tool, read Transmission DTCs.

Does this DTC reset?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
 Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
 Wiggle the wires while checking for shorted and open circuits.
 Pay particular attention to the TPS signal and sensor ground circuits.
 With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
 Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0124-TPS/APP INTERMITTENT

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored TPS throttle angle between the angles of 6° and 120° and the degree change is greater than 5° within a period of less than 7.0 ms.

Possible Causes
RELATED TPS ENGINE DTCS PRESENT
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED ENGINE TPS DTCS ARE PRESENT

With the scan tool, check Engine DTCS, including pending DTCS and one trip failures.

Are there any Engine TPS DTCS present?

Yes

- Refer to the Driveability category and perform the appropriate diagnostic procedure.

- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
With the scan tool, erase Transmission DTCs.

NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the Event Data.
With the scan tool, read Transmission DTCs.

Does this DTC reset?

Yes

- Go to [3](#)

No

- Go to [4](#)

3. CHECK THE THROTTLE POSITION SENSOR OPERATION

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the TPS voltage in the following step.
Slowly open and close the throttle while checking for erratic voltage changes.

Did the TPS voltage change smooth and consistent?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Replace the Throttle Position Sensor per the Service Information.

- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The DTC is an informational code only and is being set to aid the technician in determining root cause of a customer driveability issue. The code is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler should be added to the vehicle if the customer regularly drives in a manner that overheats the transmission.

- **When Monitored:**

Whenever the engine is running.

- **Set Condition:**

Immediately when an Overheat shift schedule is activated when the Transmission Oil Temperature reaches 115° C (240° F).

Possible Causes
ENGINE COOLING SYSTEM OPERATION
TRANSMISSION OIL COOLER PLUGGED

HIGH TEMPERATURE OPERATIONS ACTIVATED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK ENGINE COOLING SYSTEM

Perform Engine Cooling System diagnostics per the Service Information.

Is the Engine Cooling System functioning properly?

Yes

- Go to [2](#)

No

- Repair the cause of the engine overheating. Refer to the Service Information for the related diagnostic or repair procedures.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

2. TRANSMISSION OIL COOLER RESTRICTED

Check the Transmission Oil Cooler Flow in accordance with the Service Information.

Is the transmission oil cooler restricted or plugged?

Yes

- Repair the cause of the plugged Transmission Oil Cooler as necessary and repair or replace the Transmission Oil Cooler per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. HIGH TEMPERATURE OPERATION

This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints. This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint.

The customer driving patterns may indicate the need for an additional transmission oil cooler.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

If there are no possible causes remaining, view repair.

Repair

- Repair the cause of transmission overheating per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0562-BATTERY VOLTAGE LOW

RELAY-TRANSMISSION CONTROL (EATX) (IN TIPM)

0199cd03

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Transmission damage may occur if there is insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

- **When Monitored:**

With the engine running and the PCM has closed the Transmission Control Relay.

- **Set Condition:**

If the battery voltage of the Transmission Control Relay Output Sense circuit(s) to the PCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5 volts for 200ms or when Transmission Control Relay Output circuits are less than 7.2 volts for 200ms.

Possible Causes
RELATED CHARGING SYSTEM DTCS
TRANSMISSION CONTROL RELAY
(Z903) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(T16) TRANSMISSION CONTROL OUTPUT TO TCM OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Theory of Operation

Transmission damage may occur if there is insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

Diagnostic Test

1. CHECK FOR RELATED CHARGING SYSTEM DTCS

With the scan tool, read the Engine DTCS.

Are there any Charging System related DTCS present?

Yes

- Refer to the Charging System category and repair any Charging System DTCS before proceeding. After repairing the Charging System DTCS, perform the Transmission Verification test to verify the transmission and or controller was not damaged.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [2](#)

2. CHECK FOR TIPM DTCS

NOTE: Generator, battery, and charging system must be fully functional before performing this test.

With the scan tool, read TIPM DTCS.

Are there any TIPM TCM Power Control Circuit DTCS present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [3](#)

3. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCS.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

- Go to [4](#)

No

- Go to [6](#)

4. CHECK THE (Z903) GROUND CIRCUITS FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Using a 12-volt test light connected to 12-volts, check the (Z903) Ground circuits in the appropriate terminals of Miller tool #8815.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for all the Ground circuits?

Yes

- Go to [5](#)

No

- Repair the (Z903) Ground circuit for an open circuit or high resistance.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.
Disconnect the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector (if equipped).
Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission. Using a 12-volt test light connected to ground, check all (T16) Transmission Control Output circuits.

NOTE: The (T16) Transmission Control Output circuit branches off to both Transmission Solenoid/Pressure Switch Assembly, PCM and (if equipped) the Line Pressure Sensor/Variable Force Solenoid Assembly.

Does the test light illuminate brightly while cycling on and off on all (T16) Transmission Control Output circuits?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair the (T16) Transmission Control Relay Output circuit(s) for an open or high resistance.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorts and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The controller is programmed during manufacturing with generic software to facilitate testing. This software does not have the proper calibrations to control a transmission in a vehicle. The check for generic software is made at power-up. If generic software is found, the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

- **When Monitored:**

Check for generic software is made at power-up.

- **Set Condition:**

If generic software is found, the MIL will light immediately. This DTC is designed to signal the technician that the controller still has generic software installed.

Possible Causes
PCM - PROGRAMMING ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CONTROL MODULE PROGRAMMING ERROR

NOTE: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.

Record the controller part number.

Update the controller with the correct software in accordance with the Service Information.

Verify that the controller updated successfully.

Test Complete

- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

After the controller is reset, the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be the same as the written value. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

- **When Monitored:**

One time after the ignition key is turned to the run position.

- **Set Condition:**

The read value does not match the written value in any RAM location.

Possible Causes
PCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. PCM - INTERNAL ERROR

If there are no possible causes remaining, view repair.

Repair

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service

Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

After the controller is reset, the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in memory. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

- **When Monitored:**

One time after the ignition key is turned to the run position.

- **Set Condition:**

If the ROM checksum does not match a known constant.

Possible Causes
PCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. PCM - INTERNAL ERROR

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

If there are no possible causes remaining, view repair.

Repair

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0613-INTERNAL TRANSMISSION PROCESSOR

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The internal watchdog is a separate hardware circuit which continuously monitors the microprocessor. To make sure the transmission is operating properly, the watchdog must receive a signal from the microprocessor within a specific time window. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

- When Monitored:**

After the ignition key is turned to the run position and 60 seconds thereafter.

- Set Condition:**

Either of the following conditions occur 3 times in less than 590 milliseconds: The watchdog line remains high after the watchdog test or the transmission relay coil is energized and remains on after the watchdog delay expires.

Possible Causes
PCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. PCM - INTERNAL ERROR

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention

to all power and ground circuits.

If there are no possible causes remaining, view repair.

Repair

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0706-TRANSMISSION RANGE SENSOR RATIONALITY

01004164

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The C1 through C4 (T41, T42, T3, and T1) Signal circuits communicate the shift lever position to the PCM. Each circuit is terminated at the transmission with a switch. Each switch can be either open or closed, depending on the shift lever position. The PCM can decode this information and determine the shift lever position. Each shift lever position has a certain combination of switches, which will be open and closed, this is called a PRNDL code. There are 4 switches, therefore: there are many possible combinations of open and closed switches (codes). However, there are only 9 valid codes (8 for AutoStick), one for each gear position and three recognized between gear codes. The remainder of the codes should never occur, these are called invalid codes. The following chart shows the normal switch states for each shift lever position.

- **When Monitored:**

Continuously with the ignition on.

- **Set Condition:**

The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 seconds.

Possible Causes
SHIFTER OUT OF ADJUSTMENT
TRS SIGNAL CIRCUIT OPEN
TRS SIGNAL CIRCUIT SHORT TO GROUND
TRS SIGNAL CIRCUIT SHORT TO VOLTAGE
METAL DEBRIS IN OIL PAN
TRANSMISSION RANGE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

TRS SWITCH STATES

SLP	T41 (C1)	T42 (C2)	T3 (C3)	T1 (C4)
P	CLOSED	CLOSED	CLOSED	OPEN
R	OPEN	CLOSED	OPEN	OPEN

N	CLOSED	CLOSED	OPEN	CLOSED
OD	OPEN	OPEN	OPEN	CLOSED
3 or AutoStick if equipped	OPEN	OPEN	CLOSED	OPEN
L	OPEN	CLOSED	CLOSED	CLOSED

SHIFT LEVER ERROR CODES REPORTED BY SCAN TOOL

ERROR CODE	SWITCH CIRCUIT STUCK	SWITCH POSITION
1	T1 (C4)	OPEN
2	T1 (C4)	CLOSED
3	T3 (C3)	OPEN
4	T3 (C3)	CLOSED
5	T42 (C2)	OPEN
6	T42 (C2)	CLOSED
7	T41 (C1)	OPEN
8	T41 (C1)	CLOSED

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the Shift Lever Position Test.

Select the test outcome from the following:

Test passes:

- Go to [6](#)

Test fails with Error Code:

- Go to [2](#)

Test fails without Error Code:

- Perform the Gearshift Adjustment Procedure per the Service Information.
- Perform the PRNDL Fault Clearing Procedure (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

2. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.
Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, perform the Shift Lever Position Test.

When the scan tool instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator.

The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing "ENTER" on the scan tool.

NOTE: When the scan tool requests the O/D off button be depressed, you must use the O/D OFF button in the vehicle or you will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.

NOTE: If the Shift Lever Position test fails, make sure to note the identification of the TRS Signal circuit for future reference.

Did the Shift Lever Position test pass?**Yes**

- Remove the Oil Pan and Main Valve Body Assembly per the Service Information. Check for metal debris on top of the TRS Assembly. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission TRS Assembly per the Service Information.
- Perform the PRNDL Fault Clearing Procedure (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. TRS SIGNAL CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM harness connectors and install Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the identified (T41, T42, T3, and T1) TRS Signal circuit, from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the identified (T41, T42, T3, and T1) TRS Signal circuit for an open.
- Perform the PRNDL Fault Clearing Procedure (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. TRS SIGNAL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the identified (T41, T42, T3, and T1) TRS Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the identified (T41, T42, T3, and T1) TRS Signal circuit for a short to ground.
- Perform the PRNDL Fault Clearing Procedure (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. TRS SIGNAL CIRCUIT SHORT TO OTHER CIRCUITS

Measure the resistance between the identified (T41, T42, T3, and T1) TRS Signal circuit and all other circuits in

the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 100k ohms between the identified (T41, T42, T3, and T1) TRS Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the identified (T41, T42, T3, and T1) TRS Signal circuit for a short to other circuit(s).
- Perform the PRNDL Fault Clearing Procedure (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform the PRNDL Fault Clearing Procedure (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the PRNDL Fault Clearing Procedure (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE

01004164

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

DTC will set when the transmission temperature does not reach a normal operating temperature within a given time frame. Time is variable due to ambient temperature. Approximate DTC set time is 10 to 35 minutes. The following are starting temperature to warm up times to set this DTC: starting temperature - 40° C (-40° F) warm up time 35 minutes, starting temperature -28° C (-20° F) 25 minutes, starting temperature -6.6° C (20° F) 20 minutes, starting temperature 15.5 ° C (60° F) 10 minutes. When the fault is set, calculated temperature is substituted for measured temperature, however the DTC is stored only after three consecutive occurrences.

Possible Causes
RELATED TRANSMISSION TEMPERATURE DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED TRANSMISSION TEMPERATURE DTCS

With the scan tool, read DTCs.

Are there any other Transmission Temperature Sensor DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [3](#)

No

- Go to [4](#)

3. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings (± 0.2 volts)?

Yes

- Replace Transmission Range Sensor (TRS) Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins and for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0712-TRANSMISSION TEMPERATURE SENSOR LOW

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 volts for the period of 1.45 seconds. When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT SHORT TO GROUND
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, read DTCs.

Are there any Speed Sensor DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [3](#)

No

- Go to [5](#)

3. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings $\pm$ 0.2 volts?

Yes

- Replace Transmission Range Sensor (TRS) Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.
 Disconnect the PCM C4 harness connector.
 Disconnect the TRS Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T54) Transmission Temperature Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T54) Transmission Temperature Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
 Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
 Wiggle the wires while checking for shorted and open circuits.
 With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.
 Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

01004164

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 1.45 seconds. When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible Causes
(K900) SENSOR GROUND OPEN
(T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT OPEN
(T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

1. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [2](#)

No

- Go to [6](#)

2. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.
Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings (± 0.2 volts)?

Yes

- Replace Transmission Range Sensor (TRS) Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.
Disconnect the TRS harness connector

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the Transmission Temperature Signal circuit between the TRS harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the Transmission Temperature Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN

Disconnect the PCM C2 harness connector. Measure the resistance of the (K900) Sensor Ground circuit between the TRS harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (K900) Sensor Ground circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T54) Transmission Temperature Sensor Signal circuit in the appropriate terminal of Miller tool #8815.

Is the voltage above 0.5 volts?

Yes

- Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are

found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT

01004164

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

Possible Causes
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

1. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [2](#)

No

- Go to [3](#)

2. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being

started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading (± 0.2 volts)?

Yes

- Replace Transmission Range Sensor (TRS) Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE

81994529

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission control system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through system checks.

- **When Monitored:**

The transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If there is an excessive change in the Input rpm in any valid gear (R, 1st, 2nd, 3rd, or 4th).

Possible Causes
(T52) INPUT SPEED SIGNAL CIRCUIT OPEN
(T13) SENSOR GROUND CIRCUIT OPEN
(T52) INPUT SPEED SIGNAL CIRCUIT SHORT TO GROUND
(T52) INPUT SPEED SIGNAL CIRCUIT SHORT TO VOLTAGE
(T13) SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
INPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

Start the engine.
Place the shifter in Park.

With the scan tool, read the Input Speed Sensor rpm.

Is the Input Speed Sensor reading below 400 rpm?

Yes

- Go to [2](#)

No

- Go to [8](#)

2. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, set the "Input/Output Speed" switch to "ON" and the rotary switch to the "3000/1250" position.

With the scan tool, read the Input and Output rpm.

Does the Input speed read 3000 rpm and the Output speed read 1250 rpm ($\pm$ 50 rpm)?

Yes

- Replace the Input Speed Sensor per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK THE (T52) INPUT SPEED SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Input Speed Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T52) Input Speed Signal circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T52) Input Speed Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (T13) Sensor Ground circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T13) Sensor Ground circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE (T52) INPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T52) Input Speed Signal circuit.

Is the resistance Below 5.0 ohms?

Yes

- Repair the (T52) Input Speed Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T52) INPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Output Speed Sensor harness connector.
 Ignition on, engine not running.
 With the scan tool under TIPM, actuate the Transmission.
 Measure the voltage of the (T52) Input Speed Signal circuit.

Is the voltage above 0.5 volt?

Yes

- Repair the (T52) Input Speed Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

With the scan tool under TIPM, actuate the Transmission.
 Measure the voltage of the (T13) Sensor Ground circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service

Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0721-OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE

01094520

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through system checks.

- **When Monitored:**

The transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If there is an excessive change in the Output rpm in any gear.

Possible Causes
(T14) OUTPUT SPEED SIGNAL CIRCUIT OPEN
(T13) SENSOR GROUND CIRCUIT OPEN
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORT TO GROUND
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORT TO VOLTAGE
(T13) SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
OUTPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

Start the engine in Park.

Raise the drive wheels off of the ground.

WARNING: Properly support the vehicle.

Firmly apply the brakes and place the transmission selector in Drive.

WARNING: Be sure to keep hands and feet clear of rotating wheels.

Release the brakes and allow the drive wheels to spin freely.

NOTE: The drive wheels must be turning at this point.

With the scan tool, read the Output rpm

Is the Output rpm below 100?

Yes

- Go to [2](#)

No

- Go to [8](#)

2. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, set the "Input/Output Speed" switch to "ON" and the rotary switch to the "3000/1250" position.

With the scan tool, read the Input and Output rpm.

Does the Input rpm read 3000 and the Output rpm read 1250 (within 50 rpm)?

Yes

- Replace the Output Speed per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

CHECK THE (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR AN OPEN

3.

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.
Disconnect the Output Speed harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T14) Output Speed Signal circuit between the Output Speed harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T14) Output Speed Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the Sensor Ground circuit between the Output Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T13) Sensor Ground circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T14) Output Speed Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T14) Output Speed Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T14) Output Speed Signal circuit.

Is the voltage above 0.5 volt?

Yes

- Repair the (T14) Output Speed Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T13) Speed Sensor Ground circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T13) Sensor Ground circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are

found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0726-ENGINE SPEED INPUT CIRCUIT RANGE/PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The PCM uses a dual port RAM internal to the controller to send the engine speed signal to the Transmission Control System. The calculated engine RPM is compared to a minimum and maximum value. If the PCM interprets this signal to be out of range when the engine is running the code is set. The MIL illuminates after 10 seconds of vehicle operation and the transmission system defaults to limp-in mode.

- **When Monitored:**

Whenever the engine is running.

- **Set Condition:**

The Engine rpm is less than 390 or greater than 8000 for more than 2 seconds while the engine is running.

Possible Causes
ENGINE DTCS PRESENT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

Start the engine.

NOTE: This DTC is not a Transmission Input Speed Sensor DTC.

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter set at 0 for this DTC ?

Yes

- Go to [2](#)

No

- Go to [3](#)

2. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes

- Refer to Section 9 – Engine Electrical Diagnosis and Testing and perform the appropriate diagnostic procedure.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0731-GEAR RATIO ERROR IN 1ST

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

- **When Monitored:**

The Transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes
RELATED TRANSMISSION DTCS PRESENT

INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED TRANSMISSION DTCS

With the scan tool, read Transmission DTCS.

If any of these DTCS are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCS present?

Yes

- Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCS are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

- Go to [2](#)

2. CHECK TO SEE IF P0731 IS CURRENT

With the scan tool, perform the 1st gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

- Go to [3](#)

No

- Repair internal Transmission as necessary. Check all of the components related to the UD and LR clutches. Inspect the Oil Pump and repair or replace as necessary. Refer to the Service Information for the proper repair procedures.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0732-GEAR RATIO ERROR IN 2ND

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm.

These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

- **When Monitored:**

The Transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCS.

If any of these DTCS are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCS present?

Yes

- Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCS are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the 2nd gear clutch test. Follow the instructions on the scan tool. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

- Go to [3](#)

No

- Go to [4](#)

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors to the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTCS.

Are the DTCS P0845 and/or P0846 present also?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair internal Transmission per the Service Information. Check all of the components related to the UD and 2/4 clutches. Inspect the Oil Pump and repair or replace as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0733-GEAR RATIO ERROR IN 3RD

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

- **When Monitored:**

The Transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
INTERMITTENT GEAR RATIO ERRORS
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?

Yes

- Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the 3rd gear clutch test. Follow the instructions on the scan tool. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

- Go To [3](#)

No

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTCs.

Are the DTCs P0870 and/or P0871 present also?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST.

No

- Repair internal Transmission per the Service Information. Check all of the components related to the UD and O/D clutches. Inspect the Oil Pump and repair or replace as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0734-GEAR RATIO ERROR IN 4TH

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

- **When Monitored:**

The Transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
INTERMITTENT GEAR RATIO ERRORS
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
INTERNAL TRANSMISSION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCS.

If any of these DTCS are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?**Yes**

- Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the 4th gear clutch test. Follow the instructions on the scan tool. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?**Yes**

- Go to [3](#)

No

- Go to [4](#)

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets a Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTCS.

Are the DTCS P0870 and/or P0871 present also?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair internal Transmission per the Service Information. Check all of the components related to the O/D and 2/4 clutches. Inspect the Oil Pump and repair or replace as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0736-GEAR RATIO ERROR IN REVERSE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

◦ When Monitored:

The Transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCS.

If any of these DTCS are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCS present?

Yes

- Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCS are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

- Go to [2](#)

2. CHECK TO SEE IF P0731 IS CURRENT

With the scan tool, perform the Reverse gear clutch test. Follow the instructions on the scan tool. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

- Go to [3](#)

No

- Repair internal Transmission per the Service Information. Check all of the components related to the Reverse and L/R clutches. Inspect the Oil Pump and repair or replace as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors related to the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0740-TCC OUT OF RANGE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

When in 2nd, 3rd, or 4th gear, the Torque Converter Clutch (TCC) can be locked or partially locked when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the LR/TCC solenoid until the torque converter slip difference (difference between engine and turbine speed) is within 60 rpm. Then the LR/TCC solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity. The transmission will attempt normal EMCC operation (not in limp-in) even after the MIL is illuminated. MIL will illuminate after 5 minutes of accumulated slip in FEMCC.

- **When Monitored:**

The Torque Converter Clutch (TCC) is in FEMCC or PEMCC, Transmission temperature is hot, Engine temperature is greater than 38° C or 100° F, Transmission Input Speed greater than engine speed, TPS less than 30°, and brake not applied.

- **Set Condition:**

The TCC is modulated by controlling the duty cycle of the L/R Solenoid until the difference between the Engine rpm and the Transmission Input Speed rpm or duty cycle is within a desired range. The DTC is set after the period of 10 seconds and 3 occurrences of either: FEMCC - with slip greater than 100 rpm or PEMCC - duty cycle greater than 85%.

Possible Causes
RELATED L/R SOLENOID OR PRESSURE SWITCH DTCS PRESENT
INTERNAL TRANSMISSION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read DTCS.

Are the DTCS P0750 and/or P0841 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

Ignition on, engine not running.

With the scan tool, record and erase DTCs.

Drive the vehicle until it is fully warmed up to at least 43° C (110° F).

Perform the following step 3 times.

Drive the vehicle at 80 km/h (50 mph) and allow 4th gear to engage for at least 10 seconds. Close the throttle, then tip back in until the throttle angle is between 25 and 29 degrees. Note that if you go over 30 degrees, you must back off of the throttle and retry.

Did the TCC engage during any of the attempts?

Yes

- Go to [3](#)

No

- Perform the Hydraulic Pressure test per the Service Information and repair the internal transmission components and Torque convertor as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem.

Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0750-LR SOLENOID CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into Neutral, if the DTC is set above 35 Km/h (22 mph), limp-in mode when vehicle speed is below 35 Km/h (22 mph).

- **When Monitored:**

Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.

- **Set Condition:**

Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

Possible Causes
RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT
(T20) L/R CONTROL CIRCUIT OPEN
(T20) L/R CONTROL CIRCUIT SHORT TO GROUND
(T20) L/R CONTROL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

- Go to [3](#)

No

- Go to [8](#)

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the L/R Solenoid.

Monitor the L/R Solenoid LED on the Transmission Simulator.

Did the L/R Solenoid LED on the Transmission Simulator blink on and off during actuation?

Yes

- Go to [4](#)

No

- Go to [5](#)

4. CHECK WIRING USING THE TRANSMISSION SIMULATOR

With the scan tool, continue to actuate the L/R Solenoid.

While monitoring the L/R Solenoid LED on the Transmission Simulator, wiggle the related wiring harness and connectors.

Did the L/R Solenoid LED on the Transmission Simulator continue to blink on and off during the wiggle test?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair wiring or connectors as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE (T20) L/R CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T20) L/R Control circuit between the Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T20) L/R Control circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T20) L/R CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T20) L/R Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T20) L/R Control circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (T20) L/R CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T20) L/R Control circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T20) L/R Control circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0755-2/4 SOLENOID CIRCUIT

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into Neutral, if the DTC is set above 35 Km/h (22 mph), limp-in mode when vehicle speed is below 35 Km/h (22 mph).

- **When Monitored:**

Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.

- **Set Condition:**

Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

Possible Causes
RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT
(T19) 2/4 CONTROL CIRCUIT OPEN
(T19) 2/4 CONTROL CIRCUIT SHORT TO GROUND
(T19) 2/4 CONTROL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

- Go to [3](#)

No

- Go to [8](#)

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the 2/4 Solenoid.

Monitor the 2/4 Solenoid LED on the Transmission Simulator.

Did the 2/4 Solenoid LED on the Transmission Simulator blink on and off during actuation?

Yes

- Go to [4](#)

No

- Go to [5](#)

4. CHECK WIRING USING THE TRANSMISSION SIMULATOR

With the scan tool, continue to actuate the 2/4 Solenoid.

While monitoring the 2/4 Solenoid LED on the Transmission Simulator, wiggle the related wiring harness and connectors.

Did the 2/4 Solenoid LED on the Transmission Simulator continue to blink on and off during the wiggle test?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair wiring or connectors as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE (T19) 2/4 CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T19) 2/4 Control circuit between the Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T19) 2/4 Control circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T19) 2/4 CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T19) 2/4 Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T19) 2/4 Control circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (T19) 2/4 CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T19) 2/4 Control circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T19) 2/4 Control circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC -

42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoid circuits is periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into Neutral, if the DTC is set above 35 Km/h (22 mph), limp-in mode when vehicle speed is below 35 Km/h (22 mph).

- **When Monitored:**

Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.

- **Set Condition:**

Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

Possible Causes
RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT
(T60) OD CONTROL CIRCUIT OPEN
(T60) OD CONTROL CIRCUIT SHORT TO GROUND
(T60) OD CONTROL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

- Go to [3](#)

No

- Go to [8](#)

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the OD Solenoid.

Monitor the OD Solenoid LED on the Transmission Simulator.

Did the OD Solenoid LED on the Transmission Simulator blink on and off during actuation?

Yes

- Go to [4](#)

No

- Go to [5](#)

4. CHECK WIRING USING THE TRANSMISSION SIMULATOR

With the scan tool, continue to actuate the OD Solenoid.

While monitoring the OD Solenoid LED on the Transmission Simulator, wiggle the related wiring harness and connectors.

Did the OD Solenoid LED on the Transmission Simulator continue to blink on and off during the wiggle test?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair wiring or connectors as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE (T60) OD CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T60) OD Control circuit between the Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T60) OD Control circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T60) OD CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T60) OD Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T60) OD Control circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (T60) OD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T60) OD Control circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T60) OD Control circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC -

42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0765-UD SOLENOID CIRCUIT

**ASSEMBLY-
TRANSMISSION
SOLENOID/
PRESSURE
SWITCH
(RLE)**

**MODULE-
POWERTRAIN
CONTROL C4
(RLE)**

019a117a

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoid circuits is periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into Neutral, if the DTC is set above 35 Km/h (22 mph), limp-in mode when vehicle speed is below 35 Km/h (22 mph).

- **When Monitored:**

Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.

- **Set Condition:**

Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

Possible Causes
RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT
(T59) UD CONTROL CIRCUIT OPEN
(T59) UD CONTROL CIRCUIT SHORT TO GROUND
(T59) UD CONTROL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

- Go to [3](#)

No

- Go to [8](#)

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the UD Solenoid.

Monitor the UD Solenoid LED on the Transmission Simulator.

Did the UD Solenoid LED on the Transmission Simulator blink on and off during actuation?

Yes

- Go to [4](#)

No

- Go to [5](#)

4. CHECK WIRING USING THE TRANSMISSION SIMULATOR

With the scan tool, continue to actuate the UD Solenoid.

While monitoring the UD Solenoid LED on the Transmission Simulator, wiggle the related wiring harness and connectors.

Did the UD Solenoid LED on the Transmission Simulator continue to blink on and off during the wiggle test?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair wiring or connectors as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE (T59) UD CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T59) UD Control circuit between the Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T59) UD Control circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T59) UD CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T59) UD Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T59) UD Control circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (T59) UD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T59) UD Control circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T59) UD Control circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC -

42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0841-LR PRESSURE SWITCH RATIONALITY

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. If a set condition is identified, 1st gear and torque converter lock-up (EMCC) will be inhibited. The vehicle will launch in 2nd gear and shift normally through the gears without allowing EMCC. If during the same key start, the set condition is no longer valid, the transmission will return to normal operation (1st and EMCC available). Limp-in will not occur unless DTC P0841 is accompanied by a code P0706 and the MIL will illuminate after 5 minutes of substituted operation.

- **When Monitored:**

Whenever the engine is running.

- **Set Condition:**

The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

Possible Causes
RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT
LOSS OF PRIME DTC PRESENT
(T50) L/R PRESSURE SIGNAL CIRCUIT OPEN
(T50) L/R PRESSURE SIGNAL CIRCUIT SHORT TO GROUND
(T50) L/R PRESSURE SIGNAL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

PRESSURE SWITCH STATES

R	OPEN	OPEN	OPEN
P/N	CLOSED	OPEN	OPEN

1st	CLOSED	OPEN	OPEN
2nd	OPEN	CLOSED	OPEN
D	OPEN	OPEN	CLOSED
OD	OPEN	CLOSED	CLOSED

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK FOR LOSS OF PRIME DTC

With the scan tool, check for other Transmission DTCs.

Is the DTC P0944 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [3](#)

3. CHECK TO SEE IF P0841 IS CURRENT

With the scan tool, view DTCs.

Is the status active for this DTC or is the Starts Since Set counter 2 or less?

Yes

- Go to [4](#)

No

- Go to [8](#)

4. PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector to L/R.

With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the L/R Pressure Switch state change?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (T50) L/R PRESSURE SIGNAL CIRCUIT OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors.

Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T50) L/R Pressure Signal circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (T50) L/R PRESSURE SIGNAL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. (T50) L/R PRESSURE SIGNAL CIRCUIT SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T50) L/R Pressure Signal circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T50) L/R Pressure Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are

- found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorted and open circuits. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0845-2/4 HYDRAULIC PRESSURE TEST

**ASSEMBLY-
TRANSMISSION
SOLENOID/
PRESSURE
SWITCH
(RLE)**

**MODULE-
POWERTRAIN
CONTROL C4
(RLE)**

019a117a

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to limp-in mode.

- **When Monitored:**

In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed greater than 1000 rpm the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to verify that the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets

Possible Causes
LOSS OF PRIME P0944 PRESENT
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(T47) 2/4 PRESSURE SIGNAL CIRCUIT OPEN
(T47) 2/4 PRESSURE SWITCH CIRCUIT SHORT TO GROUND

POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECKING FOR LOSS OF PRIME DTC

With the scan tool, read DTCs.

Is the DTC P0944 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK FOR RELATED TRANSMISSION DTCS

With the scan tool, read DTCs.

Are any of the DTCs P0732, P0734 and/or P0846 present also?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [4](#)

No

- Go to [9](#)

4. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to 2/4.

With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Wiggle the wires leading to the PCM while pressing and holding the Pressure Switch Test button.

Did the 2/4 Pressure Switch state change to closed and remain closed while wiggling the wires?

Yes

- Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/Pressure Switch Assembly.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (T47) 2/4 PRESSURE SIGNAL CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T47) 2/4 Pressure Signal circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T47) 2/4 Pressure Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION

TEST (Refer to 21 -
TRANSMISSION/TRANSAXLE/AUTOMATIC -
42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. (T47) 2/4 PRESSURE SIGNAL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T47) 2/4 Pressure Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T47) 2/4 Pressure Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. (T47) 2/4 PRESSURE SIGNAL CIRCUIT SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T47) 2/4 Pressure Signal circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T47) 2/4 Pressure Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN

With the scan tool under TIPM, actuate the Transmission. Using a 12-volt test light connected to ground, check (T16) Transmission Control Relay Output circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

9. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0846-2/4 PRESSURE SWITCH RATIONALITY

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. The 2/4 pressure switch monitors the fluid pressure to the 2/4 clutch to confirm proper operation of the 2/4 solenoid. If the 2/4 pressure switch is identified as closed in P or N, the code will immediately be set and normal operation will be allowed for that given key start. If the problem is identified for 3 successive ignition cycles, the transmission will go into limp-in mode.

- **When Monitored:**

Whenever the engine is running.

- **Set Condition:**

The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK FOR LOSS OF PRIME DTC

With the scan tool, read DTCs.

Is the DTC P0944 present also?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [3](#)

3. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [4](#)

No

- Go to [8](#)

4. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector to 2/4.

With the scan tool, monitor the 2/4 Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the 2/4 Pressure Switch state change?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE (T47) 2/4 PRESSURE SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch

Assembly harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T47) 2/4 Pressure Signal circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T47) 2/4 Pressure Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T47) 2/4 PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T47) 2/4 Pressure Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T47) 2/4 Pressure Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [Z](#)

7. CHECK THE (T47) 2/4 PRESSURE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T47) 2/4 Pressure Signal circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T47) 2/4 Pressure Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service

- Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wires while checking for shorted and open circuits.
With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0868-LINE PRESSURE LOW

019a2008

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

- **When Monitored:**

Continuously while driving in a forward gear.

- **Set Condition:**

The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure is more than 10 psi below Desired Line Pressure, this DTC will set.

Possible Causes
CHECK FOR RELATED DTCS
LOW FLUID LEVEL
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
(T118) LP VFS CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT
INTERNAL TRANSMISSION
LINE PRESSURE SENSOR
CRACKED, PLUGGED, OR MIS-INSTALLED OIL FILTER
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read DTCs

Is the DTC P0932 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [3](#)

No

- Go to [10](#)

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.
Remove the from the TIPM.

CAUTION: Removal of the from the TIPM will prevent the vehicle from being started in gear.

WARNING: The must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.
On the Transmission Simulator select the "OFF" position of the "Input/Output Speed" switch.
Ignition on, engine not running.
With the scan tool, monitor the Line Pressure during the following steps.

Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

- Go to [4](#)

No

- Go to [6](#)

4. CHECK THE LINE PRESSURE SENSOR

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors.

Install a Pressure Gauge, 0 to 2000 kPa or 0 to 300 psi to the L/R test port.

Start the engine in Park.

Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

Is the line pressure gauge reading within 34 kPa or 5 psi of the scan tool reading?

Yes

- Go to [5](#)

No

- Replace the Line Pressure Sensor per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK FOR A PLUGGED TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Transmission Oil Filter per the Service Information.

Does the Oil Pan contain excessive debris and/or is the Transmission Oil Filter plugged?

Yes

- Repair as necessary. If the Transmission Oil Filter is plugged or there is excessive debris, refer to the Service Information for the proper Hydraulic repair procedure.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.
Reconnect all previously disconnected connectors except the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (F856) 5-volt Supply circuit.

Is the voltage above 5.5 volts?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor/Variable Force Solenoid

Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [9](#)

9. CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
 Disconnect the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.
 Disconnect all PCM harness connectors.
 Measure the resistance between the (T118) LP VFS Control circuit and all other circuits in the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.

Is the resistance below 5.0 ohms between the (T118) LP VFS Control circuit and any other circuit(s) in the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector?

Yes

- Repair the (T118) LP VFS Control circuit for a short to another circuit(s).
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

10. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0869-LINE PRESSURE HIGH

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently higher than the highest desired line pressure ever used in the current gear, the line pressure high DTC P0869 will set.

- **When Monitored:**

Continuously while driving in a forward gear.

- **Set Condition:**

The PCM continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the highest Desired Line Pressure ever used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure), the DTC will set.

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
LINE PRESSURE SENSOR CONNECTION
(T118) LP VFS CONTROL CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T118) LP VFS CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION CONTROL OUTPUT CIRCUIT
LINE PRESSURE SENSOR
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read DTCs.

Are there any line pressure sensor or transmission relay output DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [3](#)

No

- Go to [9](#)

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following step.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi (0.2 volts) of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi (0.2 volts) in all three positions?

Yes

- Go to [4](#)

No

- Go to [5](#)

4. CHECK THE LINE PRESSURE SENSOR CALIBRATION

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit and reconnect all previously disconnected connectors.

Install the Line Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa or 0 to 300 psi in the L/R pressure port. Start the engine in Park.

Monitor the Line Pressure readings on the scan tool and the pressure gauge.

Compare the Line Pressure readings between the scan tool and the pressure gauge.

Is the pressure gauge reading within 34 kPa or 5 psi of the scan tool reading?

Yes

- Repair the internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary. If no problem is found, replace the Pressure Control Solenoid.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Replace the Line Pressure Sensor per the Service information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the Powertrain Control Module C4 harness connector.

CAUTION: Do not probe the PCM harness connectors.

Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T118) LP VFS Control circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T118) LP VFS Control circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T118) LP VFS Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T118) LP VFS Control circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Disconnect the PCM C1 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service

- Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

9. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorted and open circuits. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0870-OD HYDRAULIC PRESSURE TEST

**ASSEMBLY-
TRANSMISSION
SOLENOID/
PRESSURE
SWITCH
(RLE)**

**MODULE-
POWERTRAIN
CONTROL C4
(RLE)**

019a117a

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to limp-in mode.

- **When Monitored:**

In any forward gear with engine speed above 1000 rpm, shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed greater than 1000 rpm, the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to identify the correct pressure switch closes. If the pressure switch does not close 2 times, the DTC sets.

Possible Causes
LOSS OF PRIME P0944 PRESENT
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(T9) OD PRESSURE SIGNAL CIRCUIT OPEN
(T9) OD PRESSURE SIGNAL CIRCUIT SHORT TO GROUND
(T9) OD PRESSURE SIGNAL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECKING FOR LOSS OF PRIME DTC

With the scan tool, read DTCs.

Is the DTC P0944 present also?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [2](#)

2. CHECK FOR RELATED DTCS

With the scan tool, read DTCs.

Are any of the DTCs P0732, P0734 and/or P0846 present also?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [4](#)

No

- Go to [9](#)

4. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to OD.

With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Wiggle the wires leading to the PCM while pressing and holding the Pressure Switch Test button.

Did the OD Pressure Switch state change to closed and remain closed while wiggling the wires?

Yes

- Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/Pressure Switch Assembly.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T9) OD Pressure Signal circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T9) OD Pressure Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T9) OD Pressure Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [7](#)

7. CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T9) OD Pressure Signal circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

With the scan tool under TIPM, actuate the Transmission. Using a 12-volt test light connected to ground, check (T16) Transmission Control Output circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION

TEST (Refer to 21 -
TRANSMISSION/TRANSAXLE/AUTOMATIC -
42RLE - STANDARD PROCEDURE)

No

- Repair the (T16) Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

9. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0871-OD PRESSURE SWITCH RATIONALITY

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission system uses three pressure switches to monitor the fluid pressure in the L/R, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. Normal operation will be experienced if no other codes are present. Transmission Control System will ignore the code. Limp-in condition will only occur if DTC P0871 is present with a DTC P0706.

- **When Monitored:**

Whenever the engine is running.

- **Set Condition:**

The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

Possible Causes
RELATED TIPM DTCS PRESENT
LOSS OF PRIME DTC PRESENT
(T9) OD PRESSURE SIGNAL CIRCUIT OPEN
(T9) OD PRESSURE SIGNAL CIRCUIT SHORT TO GROUND
(T9) OD PRESSURE SIGNAL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OPEN	OPEN	OPEN

P/N	CLOSED	OPEN	OPEN
1st	CLOSED	OPEN	OPEN
2nd	OPEN	CLOSED	OPEN
D	OPEN	OPEN	CLOSED
OD	OPEN	CLOSED	CLOSED

Diagnostic Test

1. CHECK FOR TIPM TCM POWER INPUT DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [2](#)

2. CHECK FOR LOSS OF PRIME DTC

With the scan tool, read DTCs.

Is the DTC P0944 present also?

Yes

- Refer to the Transmission category and perform the appropriate diagnostic procedure.

No

- Go to [3](#)

3. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [4](#)

No

- Go to [8](#)

4. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.
Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector to OD.

With the scan tool, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the OD Pressure Switch state change?

Yes

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Tool #8815 to perform diagnosis.

Measure the resistance of the (T9) OD Pressure Signal circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T9) OD Pressure Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T9) OD Pressure Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [Z](#)

7. CHECK THE (T9) OD PRESSURE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T9) OD Pressure Signal circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T9) OD Pressure Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service

- Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wires while checking for shorted and open circuits.
With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0882-TCM POWER INPUT LOW

Theory of Operation

The Transmission Control Output circuit is used to supply power to the Powertrain Control Module, Transmission Solenoid/pressure Switch Assembly and the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into limp-in mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System requests for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If the Transmission Control System detects less than 3.0 volts when the output is commanded on, the DTC will set. **Note: Inadequate Transmission Control Output voltage can also cause DTCs P0846, P0869, or P0871 to set. Repairing the P0882 fault should also eliminate the related DTCs.**

- **When Monitored:**

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

- **Set Condition:**

This DTC is set when there is less than 3.0 volts present at the transmission control output circuits located in the Powertrain Control Module (PCM) when the Transmission Control System request the power up of those circuits. .

Possible Causes
RELATED TIPM DTCS
(T15) TRANSMISSION CONTROL CIRCUIT SHORT TO GROUND
(T15) TRANSMISSION CONTROL CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

- Go to [2](#)

No

- Go to [6](#)

2. CHECK FOR TIPM RELATED DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control circuit DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [3](#)

3. CHECK THE TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.
Remove the Transmission Control Relay.

NOTE: Check connectors - Clean/repair as necessary.

Install a substitute Relay in place of the Transmission Control Relay.
Ignition on, engine not running.
With the scan tool, monitor the Switched Battery voltage in the next step.

NOTE: The switched battery voltage should remain steady and around 12-volts

Does the Switched Battery voltage remain a steady voltage (12-volts) and the DTC not reset?

Yes

- Replace the Transmission Control Relay.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Disconnect the TIPM C1 harness connector.
Measure the resistance between ground and the (T15) Transmission Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T15) Transmission Control circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (T15) Transmission Control circuit between the TIPM C1 harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T15) Transmission Control circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0883-TCM POWER INPUT HIGH

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/Pressure Switch Assembly, Powertrain Control Module (PCM) and the LP VFS Solenoid when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/pressure Switch Assembly in the event that the transmission should need to be placed into limp-in mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If voltage is detected on the Transmission Output circuits before the request is sent, the DTC will set.

- **When Monitored:**

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

- **Set Condition:**

This DTC is set if the Powertrain Control Module senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the PCM to TIPM to energize the Transmission Output circuits.

Possible Causes
TIPM DTCS PRESENT
(T15) TRANSMISSION CONTROL CIRCUIT SHORT TO VOLTAGE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT VOLTAGE
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR TCM TIPM DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control circuit DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

- Go to [3](#)

No

- Go to [7](#)

3. CHECK THE TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.
Remove the Transmission Control Relay.

NOTE: Check connectors - Clean/repair as necessary.

Install a substitute Relay in place of the Transmission Control Relay.
Ignition on, engine not running.

Does the DTC reset?

Yes

- Go to [4](#)

No

- Replace the Transmission Control Relay.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. CHECK THE (T16) TRANSMISSION OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.
 Disconnect the PCM C4 harness connector and connect Miller tool #8815.
 Disconnect the TIPM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.
 Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts on any (T16) Transmission Control Output circuit?

Yes

- Go to [5](#)

No

- Go to [6](#)

5. CHECK THE TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY

Turn the ignition off to the lock position.
 Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.
 Ignition on, engine not running.
 Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage of the (T15) Transmission Control circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T15) Transmission Control circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No**

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

7. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0884-POWER UP AT SPEED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

If a vehicle loses power to the PCM, the vehicle will go to the 2nd gear mode since there is no power available to control the transmission solenoids. However if power is restored, the PCM will power-up and normal operation will be restored. This DTC identifies that power to the PCM was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 km/h (20 mph). If a customer shifts to Neutral and cycles the ignition key and quickly shifts to "Drive" while moving before the PCM comes out of its START ROUTINE, the DTC can be set. Therefore it is critical that this DTC diagnosis repair procedure should only be used if the vehicle is experiencing intermittent 2nd gear operation and subsequently a return to normal operation during normal driving. The transmission will not be placed in limp-in. This is an informational DTC to be used when attempting to diagnose an intermittent 2nd gear operation and subsequent return to normal transmission operation.

- **When Monitored:**

One time after each controller reset. Note: the Transmission Control Module is integrated with Powertrain Control Module. The Transmission Control Module has separate powers and grounds specifically to its portion of the PCM.

- **Set Condition:**

This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear (no PRNDL DTCs) with an output speed above 800 rpm, approximately 32 km/h or 20 mph.

Possible Causes
INTERMITTENT POWER AND GROUND CIRCUITS

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK THE POWER AND GROUND CIRCUITS

This DTC is set when the PCM is initialized while the vehicle is moving in a valid forward gear. This is usually caused by a momentary loss of power to the Transmission portion of the PCM.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Check all of the Fused B(+), Fused Ignition Switch Output, and Ground circuits related to the PCM for an intermittent open or short to ground.

Perform a wiggle test on all wiring and connectors pertaining to the PCM while looking for shorted or open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0888-TRANSMISSION RELAY ALWAYS OFF

Theory of Operation

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/TRS Assembly and to the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in the event that the transmission should need to be placed into limp-in mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System requests for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If the Transmission Control System detects less than 3.0 volts when the output is commanded on, the DTC will set. **Note: Inadequate Transmission Control Output voltage can also cause DTCs P0846, P0869, or P0871 to set. Repairing the P0882 fault should also eliminate the related DTCs.**

- **When Monitored:**

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

- **Set Condition:**

This DTC is set when there is less than 3.0 volts present at the transmission control output circuits located in the Powertrain Control Module (PCM) when the Transmission Control System request the power up of those circuits. **Note: Due to the integration of the Transmission Control Module and the Powertrain Control Module, both systems have their own power and ground circuits..**

Possible Causes
RELATED TIPM DTCS
(T15) TRANSMISSION CONTROL CIRCUIT SHORT TO GROUND
(T15) TRANSMISSION CONTROL CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC P0888 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0888.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter equal to 0?

Yes

- Go To [2](#)

No

- Go To [6](#)

2. CHECK FOR TIPM RELATED DTCS

With the scan tool, check TIPM DTCS.

Are there any TIPM TCM Power Control circuit DTCS present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [3](#)

3. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.
Remove the Transmission Control Relay.

NOTE: Check connectors - Clean/repair as necessary.

Install a substitute Relay in place of the Transmission Control Relay.
Ignition on, engine not running.
With the scan tool, monitor the Switched Battery voltage in the next step.

NOTE: The switched battery voltage should remain steady and around 12-volts.

Does the Switched Battery voltage remain a steady voltage (12-volts) and the DTC not reset?

Yes

- Replace the Transmission Control Relay.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Disconnect the TIPM C1 harness connector.
Measure the resistance between ground and the (T15) Transmission Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T15) Transmission Control circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (T15) Transmission Control circuit between the TIPM C1 harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T15) Transmission Control circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0890-SWITCHED BATTERY

019a117a

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission relay is used to supply power to the solenoid pack when in normal operating mode and to turn off power to produce transmission limp-in mode. The relay output (which supplies power to the solenoid pack) is fed back to the controller. It is referred to as SWITCHED BATTERY. After a controller reset (ignition key turned to the RUN position or after cranking engine), the controller verifies that the relay contacts are open by checking for no voltage on Switched battery line (transmission control relay output) before the relay is energized. After switched battery is verified for no voltage, the voltage of each of the solenoid pack pressure switches is also checked. Since the solenoid pack is not powered up, there should be no voltage on any of the pressure switches.

- **When Monitored:**

One time after a reset (ignition key turned to the RUN position or after cranking engine).

- **Set Condition:**

A fault is set if voltage greater than 4.5 volts is detected for 7 ms on any of the pressure switch circuits before the relay is energized. The transmission is placed in limp-In. The MIL is on after 10 seconds. of vehicle operation.

Possible Causes
(T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
(T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF DTC P0890 IS PRESENT

With the scan tool, view DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter set at 0?

Yes

- Go To [2](#)

No

- Go To [5](#)

2. (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.
 Disconnect the PCM C4 harness connector.
 Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.
 Ignition on, engine not running.
 With the scan tool under TIPM, actuate the Transmission.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the voltage of the (T9) OD Pressure Switch Sense circuit.

Is the voltage above 0.5 volt?

Yes

- Repair the (T9) OD Pressure Switch Sense circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

With the scan tool under TIPM, actuate the Transmission.
 Measure the voltage of the (T47) 2/4 Pressure Switch Sense circuit.

Is the voltage above 0.5 volt?

Yes

- Repair the (T47) 2/4 Pressure Switch Sense circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

With the scan tool under TIPM, actuate the Transmission. Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service

Information. With the scan tool, perform QUICK LEARN.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0891-TRANSMISSION RELAY ALWAYS ON

0109ced3

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/Pressure Switch Assembly and to the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in the event that the transmission should need to be placed into limp-in mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If voltage is detected on the Transmission Output circuits before the request is sent, the DTC will set.

- **When Monitored:**

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

- **Set Condition:**

This DTC is set if the Powertrain Control Module senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the PCM to TIPM to energize the Transmission Output circuits.

Possible Causes
TIPM DTCS PRESENT
(T15) TRANSMISSION CONTROL CIRCUIT SHORT TO VOLTAGE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR TCM TIPM DTCS

With the scan tool under TIPM, check for TCM Power Control circuit DTCs.

Are there any TIPM TCM Power Control circuit DTCS present?**Yes**

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF DTC P0891 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter set to 0?**Yes**

- Go To [3](#)

No

- Go To [7](#)

3. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.
Remove the Transmission Control Relay.

NOTE: Check connectors - Clean/repair as necessary.

Install a substitute Relay in place of the Transmission Control Relay.
Ignition on, engine not running.

Does the DTC reset?**Yes**

- Go To [4](#)

No

- Replace the Transmission Control Relay.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. (T16) TRANSMISSION OUTPUT CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.
Disconnect the TIPM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.
Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts on any (T16) Transmission Control Output circuit?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. CHECK THE TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY

Turn the ignition off to the lock position.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.
Ignition on, engine not running.
Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC -

42RLE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage of the (T15) Transmission Control circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T15) Transmission Control circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

7. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0897-TRANSMISSION FLUID DETERIORATED

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

To prevent a bump due to A/C clutch engagement, a temporary torque converter partial EMCC condition is established prior to A/C clutch engagement. A message is received over the bus indicating that A/C clutch engagement is imminent. Partial EMCC is then established and a reply message, "OK to engage A/C clutch" is sent via the bus. Partial EMCC will be held for 450 ms before returning to full EMCC. During the transition from full to partial EMCC, a turbine acceleration sum is calculated, if this value exceeds a threshold value for several transitions, degraded transmission fluid is indicated.

◦ When Monitored:

Each transition from full EMCC to partial EMCC for A/C bump prevention.

◦ Set Condition:

DTC set if 20 occurrences of a turbine acceleration sum. Fault Set Time: 20 transitions from full EMCC to partial EMCC. Transmission will not use partial EMCC. Established for A/C bump prevention.

Possible Causes
WORN OUT/ BURNT TRANSAXLE FLUID

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. WORN OUT/ BURNT TRANSMISSION FLUID

Turn the ignition off to the lock position.

Flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

NOTE: The Transmission Cooler must be flushed before proceeding.

Allow the engine to idle for 10 minutes, in Park.

Turn the ignition off to the lock position.

Again, flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

With the scan tool, perform a Battery Disconnect.

NOTE: The Battery Disconnect must be done to re-enable EMCC during an A/C Clutch engagement.

NOTE: The vehicle may exhibit intermittent shudder during the first few hundred miles. The new Transmission Fluid will gradually penetrate the Torque Converter Clutch friction material and the shudder should disappear.

Erase the DTC and return the vehicle to the customer.

Did the DTC reset and/or does the vehicle still shudder after a few thousand miles?

Yes

- Replace the Torque Converter per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0933-LINE PRESSURE SENSOR CIRCUIT PERFORMANCE

019a2008

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

- **When Monitored:**

Continuously with the ignition on, engine running, with the transmission in gear.

- **Set Condition:**

The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure reading is more than 172.4 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure ever used in the current gear, the DTC sets.

Possible Causes
RELATED DTC'S PRESENT
LINE PRESSURE CONNECTOR AND WIRING
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check for other transmission DTCs.

Are there any other line pressure related DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. Perform the test for P0934 and/or P0935 first if present.

No

- Go To [2](#)

2. COMPARE ACTUAL LINE PRESSURE TO DESIRED LINE PRESSURE

CAUTION: Apply Parking Brake

Start the engine.

CAUTION: Firmly apply the brakes.

With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees. While firmly applying the brakes, place the shifter in Reverse, then slowly press the accelerator pedal to a TPS degree of 15°. Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

Does the Line Pressure stay within ± 34 kPa or 5 psi of the Desired Line Pressure?

No

- Go To [3](#)

Yes

- Go To [5](#)

3. CHECK LINE PRESSURE CONNECTOR AND WIRING

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor/Variable Force Solenoid Assembly.

Did the voltage remain steady while wiggling the wiring harness and connectors?

Yes

- Go To [4](#)

No

- Disconnect and properly reconnect the Line Pressure Sensor/Variable Force Solenoid Assembly connector. Inspect terminals and repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. CHECK PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.
With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
Ignition on, engine not running.
With the scan tool, monitor the Line Pressure during the following step.
With the Transmission Simulator, turn the selector switch to each of the 3 Line Pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Repair internal transmission and inspect the oil pump per the Service information and replace if necessary. If no problems are found, replace the Line Pressure Sensor/Variable Force Solenoid Assembly — possible cause is the Pressure Control Solenoid is stuck.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wires while checking for shorted and open circuits.
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?**Yes**

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0934-LINE PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate a Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 volts for 0.18 seconds.

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0934.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [2](#)

No

- Go To [6](#)

2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the from the TIPM.

CAUTION: Removal of the from the TIPM will prevent the vehicle from being started in gear.

WARNING: The must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.
 Disconnect the PCM C4 harness connector and connect Miller tool #8815.
 Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Disconnect the PCM C1 harness connector and connect Miller tool #8815.
 Measure the resistance of the (F856) 5-volt Supply circuit between Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Go To [5](#)

No

- Repair the (F856) 5-volt Supply circuit for an open.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are

found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0935-LINE PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate a Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

- **When Monitored:**

Continuously with ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for the period of 0.18 seconds

Possible Causes
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(K900) SENSOR GROUND CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0935.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [2](#)

No

- Go To [6](#)

2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

Remove the from the TIPM.

CAUTION: Removal of the from the TIPM will prevent the vehicle from being started in gear.

WARNING: The must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.
 Disconnect the PCM C2 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (K900) Sensor Ground circuit from the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (K900) Sensor Ground circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Measure the resistance of the (T38) Line Pressure Sensor Signal circuit from the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION

TEST (Refer to 21 -
TRANSMISSION/TRANSAXLE/AUTOMATIC -
42RLE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T38) Line Pressure Sensor
Signal circuit.

Is the voltage above 5.5 volts?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention

to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P0944-LOSS OF HYDRAULIC PUMP PRIME

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The Loss of Prime Test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or ruptured oil filter. The Loss of Prime fault is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

- **When Monitored:**

Every 350 ms

- **Set Condition:**

If the transmission begins to slip in any forward gear, and the pressure switch or switches that should be closed for a given gear are open, a loss of prime test begins. All available elements (in 1st gear LR, 2/4 and OD, in 2nd, 3rd, and 4th gear 2/4 and OD) are turned on by the PCM to see if pump prime exists. The code is set if none of the pressure switches respond. The PCM will continue to run the loss of prime test until pump pressure returns. The vehicle will not move or the transmission will slip. Normal operation will continue if pump prime returns.

Possible Causes
LOW TRANSMISSION FLUID LEVEL
SHIFT LEVER POSITION
PLUGGED TRANSMISSION FILTER
TRANSMISSION OIL PUMP

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

Place the gear selector in Park.
Start the engine.

NOTE: The Transmission Temperature must be at least 43° C (110° F) before performing the following

steps.

The Transmission must be at operating temperature prior to checking pressure. Cold transmission fluid will result in higher pressure readings.

Place the Transmission in Reverse.

With the scan tool, observe the Transmission Pressure Switch states.

Are any of the Pressure Switches closed?**Yes**

- Go to [2](#)

No

- Go to [4](#)

2. INTERMITTENT OPERATION

The conditions necessary to set this DTC are not present at this time.

Test drive the vehicle. Allow the Transmission to shift through all gears and ranges.

Was a delayed engagement and/or a no drive condition present during the test drive?**Yes**

- Go to [4](#)

No

- Go to [3](#)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?**Yes**

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

4. SHIFT LEVER POSITION TEST

With the scan tool, perform a Shift Lever Position test. Follow the instructions on the screen.

Did the Shift Lever Position Test pass?

Yes

- Go to [5](#)

No

- Perform the diagnostic procedure for P0706-TRANSMISSION RANGE SENSOR RATIONALITY.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. CHECK FOR PLUGGED TRANSMISSION FILTER

Remove the Transmission Pan and inspect the Transmission Fluid and Transmission Filter per the Service Information.

Does the Transmission Oil Pan contain excessive debris and/or is the Oil Filter plugged?

Yes

- Repair the cause of the plugged Transmission Filter. Refer to the Service Information for the proper repair procedure.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Replace the Transmission Oil Pump per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P0992-2/4/OD HYDRAULIC PRESSURE TEST

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to limp-in

mode.

- **When Monitored:**

In any forward gear with engine speed above 1000 rpm, shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed greater than 1000 rpm, the PCM momentarily turns on element pressure to the clutch circuits that do not have pressure to identify that the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets.

Possible Causes
CONDITION P0992 PRESENT

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

1. CHECK IF THE DTC IS CURRENT

NOTE: The vehicle must be driven to set this DTC. The transmission must be at operating temperature with the Engine rpm above 1000 rpm.

This DTC is an indication of both the 2/4 and the O/D Hydraulic Pressure Switch DTCs being present. Perform the diagnostic procedures for both P0845 and P0870. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

- Refer to the Transmission category and perform the diagnostic procedures for P0845 and P0870.

P128B-TCM POWER CONTROL CIRCUIT 2 LOW - TIPM

0109ced3

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

- **Set Condition:**

A shorted condition is detected in the Transmission Control Output circuit.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, check TIPM DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Go To [5](#)

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the TIPM C2 harness connector.
Disconnect the PCM C4 harness connector and install Miller tool #8815.

**CAUTION: Do not probe the PCM harness connectors.
Probing the PCM harness connectors will damage the
PCM terminals resulting in poor terminal to pin**

connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T16) Transmission Control Output circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go to [3](#)
-

3. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Reconnect the TIPM C2 harness connector.
 Disconnect the Transmission Solenoid/Pressure Switch harness connector.
 Disconnect the Line Pressure Sensor/Variable Force Solenoid harness connector (if equipped).
 Ignition on, engine not running.
 Using the scan tool under the TIPM Actuators, actuate the Transmission.
 Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at all the (T16) Transmission Control Output circuits?

Yes

- Go To [4](#)

No

- Repair the (T16) Transmission Control Output circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors. Check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test complete.

P128C-TCM POWER CONTROL CIRCUIT 2 HIGH - TIPM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

A shorted condition is detected in the TIPM TCM Power control circuit.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Go To [4](#)

2. (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.
Disconnect the TIPM C10 harness connector.
Disconnect the PCM C4 harness connector.
Measure the voltage of the (T16) Transmission Control Output circuit.

Is the voltage above 10.0 v?

Yes

- Repair the (T16) Transmission Control Output circuit

for a short to voltage.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [3](#)
-

3. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test complete.

P128D-TCM POWER CONTROL CIRCUIT 2 OPEN - TIPM

0100c03

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

An open condition of the Transmission Control Output circuit is detected by the Totally Integrated Power Module (TIPM).

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To [2](#)

No

- Go To [4](#)

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and install Miller tool #8815.
Disconnect the Transmission Solenoid harness connector.
Disconnect the Line Pressure Sensor/Variable Force Solenoid harness connector (if equipped).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the

PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To [3](#)

No

- Repair the (T16) Transmission Control Output circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test complete.

P128E-TCM POWER CONTROL CIRCUIT 2 OVERCURRENT - TIPM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

An overcurrent condition is detected in the TCM Power Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
LINE PRESSURE SENSOR VARIABLE FORCE SOLENOID
SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With a scan tool, read TIPM DTCs.

Is the DTC active at this time?

Yes

- Go To [2](#)

No

- Go To [5](#)

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT

Turn the ignition off.
Disconnect the TIPM C2 harness connector.
Connect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector.

Read the amperage on the ammeter.

Does the amperage read below 2.0 amps?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. CHECK THE PCM

Disconnect the ammeter from the TIPM C2 harness connector and battery positive.
 Disconnect the PCM C4 harness connector.
 Reconnect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector.
 Read the amperage on the ammeter.

Does the amperage read below 2.0 amps?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE TRANSMISSION SOLENOIDS

Disconnect the ammeter from the TIPM C2 harness connector.

Disconnect the PCM C4 harness connector and install Miller tool #8815.

Connect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector. While monitoring the amperage reading of the ammeter and using a jumper wire, jump each solenoid control circuit to ground one at a time in the appropriate terminals of Miller tool #8815.

NOTE: The amperage draw should be approximately .02 milliamperes on each solenoid circuit with the PCM C4 harness connector disconnected.

Does the amperage read between .05 and .015 milliamperes $\pm$.005 milliamperes on each solenoid tested?

Yes

- Replace the Totally Integrated Control Module per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Depending on the identified circuit in the test, replace either Transmission Solenoid/Pressure Switch Assembly or the Line Pressure Solenoid (if equipped) per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

819bb7f8

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P1684-BATTERY WAS DISCONNECTED

Theory of Operation

Note: This is not a fault code. It exists to provide reference information only. A battery backed RAM is used to maintain some learned values. When the battery is disconnected, this memory is lost. When the battery is reconnected, the loss of learned values will be detected by the controller. The code will be set and the learned values will be initialized to known constants and the learning process will continue. Setting the code has no effect except for re-initialization of learned values.

- **When Monitored:**

After a reset (ignition key turned to the RUN position).

- **Set Condition:**

The checksum of the battery backed RAM does not match the stored checksum. Set Time: Less than 7 ms.

Possible Causes
BATTERY WAS DISCONNECTED
PCM WAS REPLACED OR DISCONNECTED
QUICK LEARN WAS PERFORMED
(A919) FUSED B+ CIRCUIT TO PCM OPEN
(Z908 and Z977) GROUND CIRCUIT OPEN

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. BATTERY WAS DISCONNECTED

Has the battery been disconnected, lost its charge, or been replaced recently?

Yes

- Disconnecting or replacing the battery will set this DTC. Erase the DTC.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CHECK IF THE QUICK LEARN WAS PERFORMED

Has a Quick Learn procedure been performed?

Yes

- Performing Quick Learn will set this DTC. Erase the DTC.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. PCM REPLACED OR DISCONNECTED

Has the PCM been replaced or disconnected?

Yes

- Replacing or disconnecting the PCM will set this DTC. Erase the DTC.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (A919) FUSED B(+) CIRCUIT

Turn the ignition off to the lock position.
Disconnect the PCM C1 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (A919) Fused B(+) circuit.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To [5](#)

No

- Repair the Fused B+ circuit for an open. If the fuse is open make sure to check for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. (Z908) AND (Z977) GROUND CIRCUITS

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

Using a 12-volt test light connected to 12-volts, check the (Z908) and (Z977) Ground circuits in the appropriate terminal of Miller tool #8815.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for all of the ground circuits?

Yes

- Go To [6](#)

No

- Repair the Ground circuits for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P1713-RESTRICTED MANUAL VALVE IN T2 RANGE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Ignition on, engine running with the gear shift selector in a valid forward gear.

- **Set Condition:**

This DTC sets whenever Transmission control system detects the manual valve is in the T2 range when it should be in OD. This is mainly an informational DTC.

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
CUSTOMER DRIVING HABITS
MIS-ADJUSTED SHIFTER CABLE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check for other transmission DTCS.

Are there any speed sensor or gear ratio DTCS present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK THE GEAR SHIFT CABLE FOR PROPER ADJUSTMENT

Check the Gear shift cable adjustment per the Service Information.
Also check the cable for possible binding or improperly routed.

Is the Gear shift cable properly adjusted and not binding or improperly routed?

Yes

- Go to [3](#)

No

- Adjust the Shifter Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. CHECK CUSTOMER DRIVING HABIT

This DTC can be set if the customer does not move the shift lever completely into the OD position (in between gears) causing the manual valve to be in the T2 position.

When this occurs, the feed port to the clutch is restricted, the transmission will declare Neutral, and this DTC will set.

This DTC can also be set by simply bumping the shift lever toward Neutral while accelerating.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

- This DTC can be set by the shift lever in the wrong position or not completely in the OD position. Make sure the customer is properly informed.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P1745-TRANSMISSION LINE PRESSURE TOO HIGH FOR TOO LONG

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

This DTC is an informational DTC to inform the technician that transmission has been operating in an open-loop line pressure control for 3220 kilometers (2000 miles) or 1000 2-3 upshifts resulting from a Line Pressure DTC. The 42RLE Transmission is not designed to operate in open-loop line pressure control for an extended period time. This DTC is intended to protect the transmission. If the DTC sets, the transmission controller will place the transmission into limp-in mode.

- **When Monitored:**

Continuously with ignition on.

- **Set Condition:**

If the transmission has been operating in an open-loop line pressure control for 3220 kilometers (2000 miles) or 1000 2-3 upshifts.

Possible Causes
LINE PRESSURE DTCS PRESENT

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, check for Transmission Line Pressure DTCS.

NOTE: In order to erase this DTC you must reset (erase) the VLP Shift Counter and the Output tooth counter which is a single procedure under Miscellaneous functions in the scan tool called “Clear Variable Line Pressure (VLP) counters”.

View repair

Repair

- Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING)

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

**ASSEMBLY-
TRANSMISSION
SOLENOID/
PRESSURE
SWITCH
(RLE)**

**MODULE-
POWERTRAIN
CONTROL C4
(RLE)**

019a117a

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Solenoid Switch Valve, an internal, hydraulically operated valve, controls the direction of the transmission fluid when the LR solenoid is energized. When the solenoid switch valve is in the downshifted position and the LR solenoid is energized, fluid is directed to the LR element for 1st gear. When the solenoid switch valve is in the up-shifted position (2nd, 3rd, and 4th gear) and the LR solenoid is energized, fluid is directed into the Lockup Switch Valve which controls the Torque Converter Clutch. When shifting into 1st gear, a special sequence is followed to insure solenoid switch valve movement into the downshifted position. The LR pressure switch is monitored to confirm switch valve movement. If the solenoid switch valve movement is not confirmed (i.e. no LR pressure when the LR solenoid is energized), 2nd gear is substituted for 1st. No 1st gear (2nd gear is substituted). The transmission Torque converter FEMCC operation is inhibited. MIL on after 5 min. of substituted operation.

- **When Monitored:**

Prior to a shift into 1st gear.

- **Set Condition:**

Transmission temperature must be hot. DTC is set after six unsuccessful attempts to shift into 1st gear.

Possible Causes
RELATED DTC P0841 PRESENT
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check for other Transmission DTCs.

Is the DTC P0841 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF DTC P1775 IS CURRENT

With the scan tool, view DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [3](#)

No

- Go To [8](#)

3. PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.
Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.

With the scan tool, monitor the L/R Pressure Switch State while pressing the Pressure Switch Test button.

Did the Pressure Switch state change from open to closed when the test button was pressed?

Yes

- Repair internal transmission as necessary per the Service Information. Inspect the Solenoid Switch Valve per the Service Information and repair or replace as necessary. If no problems are found, replace the Transmission Solenoid/Pressure Switch Assembly.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN

Turn the ignition off to the lock position.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.
Disconnect the PCM C4 harness connector.
With the scan tool under TIPM, actuate the Transmission.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check all (T16) Transmission Control Relay Output circuits in the appropriate terminals of Miller tool #8815.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly on all (T16) Transmission Control Output circuits?

Yes

- Go To [5](#)

No

- Repair the (T16) Transmission Control Relay Output circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

5. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN

With the scan tool under TIPM, stop the Transmission actuation.

Turn the ignition off to the lock position.

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK

LEARN.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Test drive and verify if the transmission is launching in 2nd gear and/or no TCC engagement.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Are there 2nd gear launches and/or no TCC engagement?

Yes

- Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid Pressure Switch Assembly.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

**ASSEMBLY-
TRANSMISSION
SOLENOID/
PRESSURE
SWITCH
(RLE)**

**MODULE-
POWERTRAIN
CONTROL C4
(RLE)**

019a117a

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Solenoid Switch Valve, an internal, hydraulically operated valve, controls the direction of the transmission fluid when the L/R solenoid is energized. When the solenoid switch valve is in the downshifted position and the L/R solenoid is energized, fluid is directed to the L/R element for 1st gear. When the solenoid switch valve is in the up-shifted position (2nd, 3rd, and 4th gear) and the L/R solenoid is energized, fluid is directed into the Lockup Switch Valve which controls the Torque Converter Clutch. When doing PEMCC or FEMCC, the L/R pressure switch should indicate no pressure if the solenoid switch valve is in the L/R position. If the L/R pressure switch indicates pressure for some time while in partial or full EMCC, the EMCC operation is aborted and momentarily inhibited to avoid accidental application of the L/R clutch. EMCC is attempted again when there is no L/R pressure. The fourth detection of L/R pressure while in PEMCC or FEMCC will result in setting the DTC. Torque converter EMCC operation inhibited. MIL on after 5 min. of substituted operation.

- **When Monitored:**

Every 7 ms when doing PEMCC or FEMCC.

- **Set Condition:**

Must be in partial or full EMCC. The DTC is set if L/R pressure is detected high for the fourth time.

Possible Causes
RELATED DTC P0841 PRESENT
DTC EVENT DATA SHOWS TRS CODE TR2 - SHIFT LEVER OR MANUAL CONTROL VALVE IN A INVALID POSITION
SHIFTER CABLE OUT OF ADJUSTMENT
SOLENOID SWITCH VALVE STICKING IN ITS BORE
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
VALVE BODY
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other Transmission DTCs.

Is the DTC P0841 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK THE DTC EVENT DATA FOR TRS CODE TR2

With the scan tool, check the DTC EVENT DATA for P1776.

Does the DTC EVENT DATA show a TRS Code of TR2?

Yes

- This indicates the shift lever and the manual control valve were in an invalid position between Neutral and OD. Check the shifter cable for: proper adjustment, binding, friction, improper routing, or the shifter was moved in transit. Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK TO SEE IF DTC P1776 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P1776.

NOTE: This counter only applies to the last DTC set.

Is the status Active or is the STARTS SINCE SET counter 2 or less for this DTC?

Yes

- Go To [4](#)

No

- Go To [9](#)

4. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.
Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.

With the scan tool, monitor the L/R Pressure Switch State while pressing the Pressure Switch Test button.

Did the Pressure Switch state change from open to closed when the test button was pressed?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. CHECK THE SOLENOID SWITCH VALVE FOR STICKING

Remove the transmission oil pan and Valve body and inspect the Solenoid Switch Valve for sticking in its bore, repair or replace as necessary.

NOTE: This DTC may be caused by debris lodged in the Transmission Solenoid Switch Valve bore. If debris is found, clean the valve body and reassemble the transmission per the Service Information.

With the scan tool, record the DTC EVENT DATA for P1776 and erase DTCs.

Reassemble the transmission and test drive the vehicle. Try to duplicate the original set conditions using the DTC EVENT DATA recorded earlier.

With the scan tool, check Transmission DTCs.

Did the DTC P1776 reset?

Yes

- Replace the Transmission Solenoid Assembly per the Service Information.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

6. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service

Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Test drive the vehicle and verify if the transmission is launching in 2nd gear and/or there is no TCC engagement.

With the scan tool, check the EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for possible causes that may apply.

Are there 2nd gear launches and/or no TCC engagement?

Yes

- Disassemble and inspect the Valve Body per the Service Information Inspect the Solenoid Switch Valve for sticking in its bore and repair or replace as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P1790-FAULT IMMEDIATELY AFTER SHIFT

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

This DTC is not stored alone. It is stored if a Gear Ratio DTC is detected immediately after shift. The existence of DTC P1790 indicates a mechanical or hydraulic (not electrical) related problems. It should be noted, however, that all mechanical problems don't necessarily result in DTC P1790. When this DTC exists, diagnosing the system should be based on the associated DTC and only mechanical causes should be considered.

- **When Monitored:**

After a Gear Ratio Error code is stored.

- **Set Condition:**

After a Gear Ratio Error DTC has already been set. The DTC is set if the fault happened within 1.3 seconds of a shift. The DTC set time will vary from 1.214 seconds to 15 seconds.

Possible Causes
FAULT AFTER SHIFT

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. FAULT AFTER SHIFT

This DTC is set along with a Gear Ratio DTC. Perform the appropriate test for the Gear Ratio DTC stored.

NOTE: Check Pending DTCs or 1 trip failures if there are no Active or Stored Gear Ratio DTCs.

If there are no possible causes remaining, view repair.

Repair

- Refer to the Transmission category and perform the appropriate symptom.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

P1794-SPEED SENSOR GROUND ERROR

91004529

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The input and output speed sensors use a common ground circuit. The loss of this common ground results in the input signal being sensed for both. After a reset in Neutral, and after observing a specific ratio, the Speed Check Fault Counter will increment. Because the speed sensors and the thermistor share the same ground circuit, this DTC may indicate a loss of the common speed sensor ground. In some cases this fault will cause a Gear Ratio Error DTC to be set.

- **When Monitored:**

Every 7 ms after a controller reset with transmission in Neutral.

- **Set Condition:**

After a PCM reset in Neutral and Input and Output sensor ratio equals 2.50 to 1.0 $\pm$ 50.0 RPM.

Possible Causes
SPEED SENSOR GROUND CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. PCM AND WIRING

Turn the ignition off to the lock position.
Remove the from the TIPM.

CAUTION: Removal of the from the TIPM will prevent the vehicle from being started in gear.

WARNING: The must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A. Ignition on, engine not running.

With the Transmission Simulator, set the "Input/Output Speed" switch to "ON" and the rotary switch to the "3000/1250" position.

With the scan tool, monitor the Input and Output Speed Sensor readings.

Does the Input Speed read 3000 RPM and the Output Speed read 1250 RPM, $\pm$ 50 RPM?

Yes

- Go To [2](#)

No

- Go To [3](#)

2. (T13) SPEED SENSOR GROUND CIRCUIT OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector.
Disconnect the Input and Output Speed Sensor harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of both of the (T13) Speed Sensor Ground circuits from the appropriate terminal of special tool #8815 to the Input and Output Speed Sensor harness connectors.

Is the resistance above 5.0 ohms on either circuit?

Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 -

819b6b85

TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Test Complete.

P1797-MANUAL SHIFT OVERHEAT

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The major cause of heat build up in the transmission is torque converter slip. With the transmission in the AutoStick® mode, the torque converter can slip during aggressive driving or heavy loading conditions such as trailer towing or driving up steep grades. In the non AutoStick® mode, internal controller logic prevents the transmission from overheating by managing the shift and EMCC schedule. In the AutoStick® mode, when the transmission or engine temperature approaches an overheat condition, the manual shift overheat DTC sets and the AutoStick® mode is temporarily suspended until the temperature returns to normal.

◦ **When Monitored:**

Continuously with engine running.

◦ **Set Condition:**

If the Engine Temperature exceeds 123° C (255° F) or the Transmission Temperature exceeds 135° C (275° F) while in AutoStick® mode. Note: Aggressive driving or driving in Low for extended periods of time will set this DTC.

Possible Causes
MANUAL SHIFT OVERHEAT

Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

Diagnostic Test

1. MANUAL SHIFT OVERHEAT

This is an informational DTC only.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check the engine and transmission cooling system for proper operation.

Check the Radiator Cooling Fan operation.

Check the Transmission Cooling operation.

Check the Transmission Fluid Level per the Service Information to verify that it is not overfilled.

NOTE: Aggressive driving or driving in Low for extended periods of time will set this DTC.

If there are no possible causes remaining, view repair.

Repair

- If the Transmission Fluid is low, repair any Transmission Fluid leak as necessary and adjust the Transmission Fluid Level per the Service Information. Refer to Service Information for the related symptoms and repair as necessary.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

U0100 LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

- **When Monitored:**

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0002 CAN C BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

- **When Monitored:**

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Diagnose the U0002 CAN C BUS OFF PERFORMANCE as the U0001 CAN C BUS CIRCUIT test in 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0121 LOST COMMUNICATION WITH ABS

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If

the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

- **When Monitored:**

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0141 LOST COMMUNICATION WITH FCM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

- **When Monitored:**

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

STANDARD PROCEDURE

42RLE - PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W.**

Perform the following steps prior to any diagnostic procedure(s).

NOTE: Due to different power control configurations, the Transmission Control Relay (if equipped) may be referred to as a PCM relay.

1. Many transmission symptoms can be caused by a low fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper fluid level. Refer to the Service Information for the proper repair and fluid fill procedures.
2. Testing should only be performed with the battery fully charged to avoid false diagnosis.
3. With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
4. With the scan tool, read Engine (PCM) DTCs. If Engine DTCs are present, refer to the Driveability Category and perform to the appropriate diagnostic procedure(s) before proceeding.
5. With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
6. With the scan tool, read Event Data. Use this data to identify the conditions in which the DTC was set.

NOTE: Event Data may exist even if no DTCs are stored. Event Data is only erased by a Battery Disconnect, reflash, or QuickLearn procedure. Clearing DTCs does NOT erase the Event Data. Some DTCs require two "bad trips" before they are stored (and the MIL illuminates). The transmission may enter "limp-in" mode during the first "bad trip," but if the fault condition is not present after the vehicle is restarted, the pending DTC may be cleared without lighting the MIL. Nevertheless, the Event Data for the pending DTC will remain stored and can still be retrieved with the scan tool. If the customer reports a "limp-in" event but no DTCs are present, check the Event Data.

NOTE: Performing a Battery Disconnect will clear all Event Data and reset all learned Transmission values to the controllers default values which may temporarily result in erratic shift schedules.

7. With the scan tool, perform the Shift Lever Position Test. If the test does not pass, refer to the diagnostic procedure for P0706-TRANSMISSION RANGE SENSOR RATIONALITY.
8. For Gear Ratio Error DTCs, use the scan tool to read and record the Clutch Volume Index (CVI) information.
9. Use the wiring diagram as a guide, inspect the wiring and connectors related to this circuit and repair as necessary.
10. Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, driving under specific conditions, and after controller diagnostic monitors have run.
11. Refer to applicable Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) or Transmission (TCM) controller software.
12. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Did any of the above procedures repair the vehicle?

Yes

- Testing is complete.
- Perform 42RLE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

No

- Refer to the transmission category and perform the appropriate diagnostic procedure(s).

- (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING)

42RLE TRANSMISSION VERIFICATION TEST

Perform the following after completion of a diagnostic repair:

NOTE: After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed. Refer to the Engine Category.

1. Reconnect any disconnected components.
2. With the scan tool, erase all Transmission and Engine DTCs.
3. With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
4. Erase DTC P0700 under engine to turn the MIL off after completion of transmission repairs.
5. Perform a PRNDL FAULT CLEARING PROCEDURE after completion of repairs for P0706-TRANSMISSION RANGE SENSOR RATIONALITY (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE).
6. If the Powertrain Control Module or the Transmission has been repaired or replaced, it is necessary to perform the scan tool Quick Learn Procedure.
7. If the Torque converter has been replaced, with the scan tool perform TCC BREAK-IN.
8. If the Powertrain Control Module or Front Control Module has been replaced you must reset the Pinion Factor in the Front Control Module.
9. With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C or 110° F.
10. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure.
11. Road test the vehicle. With the scan tool, monitor the engine rpm. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 72 km/h (45 mph) with a constant throttle opening of 20 to 25 degrees.
12. With speeds below 40 km/h (25 mph), make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
13. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC is repaired.
14. If equipped with AutoStick®, upshift and downshift several times using the AutoStick® feature during the road test.

NOTE: Use the OBDII task manager to run a Good Trip in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.

15. Check for any Diagnostic Trouble Codes (DTCs) during and after the road test.

Did any Diagnostic Trouble Codes set during the road test?

Yes

- Repair is not complete. Refer to the Transmission category and perform the appropriate symptom(s).

No

- Repair is complete.

PRNDL FAULT CLEARING PROCEDURE

1. With the scan tool, erase Transmission DTCs.
2. Cycle the ignition off, then start the vehicle.
3. Firmly apply the brakes and shift into Overdrive.

NOTE: Vehicle must remain in Overdrive for at least 3.0 seconds.

4. With the brakes firmly applied, shift slowly through all gears (PRNDL) as least three times, pausing momentarily in each gear.

NOTE: If all the PRNDL lights box individually then the error was cleared.

5. Shift into park and turn the ignition off to the lock position.
6. With the ignition on, engine not running, using the scan tool, read DTCs.

Does the DTC P0706 reset, or do all the PRNDL indicators remain boxed in park or neutral?

Yes

- Return to the symptom list and perform diagnostics for P0706-TRANSMISSION RANGE SENSOR RATIONALITY.

No

- Test Complete.
- Perform 42RLE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

AUTOMATIC TRANSMISSION - 42RLE

AUTOMATIC TRANSMISSION - 42RLE

DESCRIPTION

The 42RLE is a four-speed transmission that is a conventional hydraulic/mechanical assembly controlled with adaptive electronic controls and monitors. The hydraulic system of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly

Control of the transmission is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Transmission Control Module (TCM) portion of the Powertrain Control Module (PCM).

The TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data,

DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB® scan tool.

TRANSMISSION IDENTIFICATION

The 42RLE transmission can be identified by a barcode label that is affixed to the upper left area of the bellhousing.

The label contains a series of digits that can be translated into useful information such as transmission part number (10), date of manufacture (4, 5), manufacturing origin (2), assembly line identifier (6), build sequence number (7), etc..

If the tag is not legible or is missing, the “PK” number, which is stamped into the left rear flange of the transmission case, can be referred to for identification. The entire part number, build code, and sequence number are stamped into the flange.

OPERATION

The 42RLE transmission ratios are:

First	2.84 : 1
Second	1.57 : 1
Third	1.00 : 1
Overdrive	0.69 : 1
Reverse	2.21 : 1

FIRST GEAR POWERFLOW

80f79c31

In first gear range, torque input is through the underdrive clutch (1) to the underdrive hub assembly. The underdrive hub is splined to the rear sun gear. When the underdrive clutch is applied, it rotates the underdrive hub and rear sun gear. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly. The rear sun gear drives the rear planetary pinion gears. The rear planetary pinion gears are forced to walk around the inside of the stationary rear annulus gear. The pinions are pinned to the rear carrier and cause the rear carrier assembly to rotate as they walk around the annulus gear. This provides the torque output for first gear. The other planetary gearset components are freewheeling. The first gear ratio is 2.84:1.

SECOND GEAR POWERFLOW

80779edd

Second gear is achieved by having both planetary gear sets contribute to torque multiplication. As in first gear, torque input is through the underdrive clutch (1) to the rear sun gear. The 2/4 clutch (2) is applied to hold the front sun gear stationary. The rotating rear sun gear turns the rear planetary pinions. The rear pinions rotate the rear annulus/front carrier assembly. The pinions of the front carrier walk around the stationary front sun gear. This transmits torque to the front annulus/rear carrier assembly, which provides output torque and a gear ratio of 1.57:1.

THIRD GEAR POWERFLOW

In third gear, two input clutches are applied to provide torque input: the underdrive clutch (1) and overdrive clutch (2). The underdrive clutch rotates the rear sun gear, while the overdrive clutch rotates the front carrier/rear annulus assembly. The result is two components (rear sun gear and rear annulus gear) rotating at the same speed and in the same direction. This effectively locks the entire planetary gearset together and is rotated as one unit. The gear ratio in third is 1:1.

FOURTH GEAR POWERFLOW

80f7a049

In fourth gear input torque is through the overdrive clutch (1) which drives the front carrier. The 2/4 clutch (2) is applied to hold the front sun gear. As the overdrive clutch rotates the front carrier, it causes the pinions of the front carrier to walk around the stationary front sun gear. This causes the front carrier pinions to turn the front annulus/rear carrier assembly which provides output torque. In fourth gear, transmission output speed is more than engine input speed. This situation is called overdrive and the gear ratio is 0.69:1.

REVERSE GEAR POWERFLOW

In reverse, input power is through the reverse clutch (1). When applied, the reverse clutch drives the front sun gear through the overdrive hub and shaft. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly stationary. The front carrier is being held by the L/R clutch so the pinions are forced to rotate the front annulus/rear carrier assembly in the reverse direction. Output torque is provided, in reverse, with a gear ratio of 2.21:1.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

CAUTION: Before attempting any repair on the 42RLE Four Speed Automatic Transmission, always check for proper shift cable adjustment. Also check for diagnostic trouble codes with the DRB® scan tool and the 42RLE Transmission Diagnostic Procedure Manual.

42RLE automatic transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

When diagnosing a problem always begin with recording the complaint. The complaint should be defined as specific as possible. Include the following checks:

- Temperature at occurrence (cold, hot, both)
- Dynamic conditions (acceleration, deceleration, upshift, cornering)
- Elements in use when condition occurs (what gear is transmission in during condition)

- Road and weather conditions
- Any other useful diagnostic information.

After noting all conditions, check the easily accessible variables:

- Fluid level and condition
- Shift cable adjustment
- Diagnostic trouble code inspection

Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem exists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transmission should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transmission cleaning.

Slipping clutches can be isolated by comparing the “Elements in Use” chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transmission in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse
P - PARK					X
R - REVERSE			X		X
N - NEUTRAL					X
OD - OVERDRIVE					
First	X				X
Second	X			X	
Direct	X	X			

Overdrive		X		X	
D - DRIVE*					
First	X				X
Second	X			X	
Direct	X	X			
L - LOW*					
First	X				X
Second	X			X	
Direct	X	X			
* Vehicle upshift and downshift speeds are increased when in these selector positions.					

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Record all DTCs and the accompanying DTC Event Data.
2. Check for an appropriate Technical Service Bulletin that applies to the customer complaint.
3. Check fluid level and condition.
4. Road test and note how transmission upshifts, downshifts, and engages.
5. If the complaint was related to shift quality, perform the Quick Learn procedure, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE), and the Drive Learn Procedure, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).
6. If the shift complaint still exists, compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off.
7. Perform air-pressure test to check clutch operation. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING)
8. Replace the Transmission Solenoid/TRS Assembly and perform the Quick Learn and Drive Learn procedures

again.

9. If the complaint still exists, remove, inspect, and repair the transmission as necessary.

VEHICLE IS DISABLED

1. Record all DTCs and the accompanying DTC Event Data.
2. With engine running, place transmission in gear and verify correct PRNDL reading. Observe the Input and Output speeds using the scan tool. If output RPM is greater than zero but vehicle does not move, check for transfer case in Neutral (or failed internally), failed propshaft, or failed / disconnected drive axle. If output RPM is zero and input RPM is greater than zero, internal transmission slippage is indicated. Run clutch slip tests using the scan tool, check oil pan for debris, and air check the various clutch circuits.
3. Shift the transmission into neutral, if both input and output speeds are zero, check flexplate bolts, torque converter, and transmission input shaft.
4. Compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off. If line pressure is incorrect, check fluid level and condition.
5. Remove, inspect, and repair the transmission as necessary.

HYDRAULIC PRESSURE TESTS

NOTE: Before performing the hydraulic pressure tests be certain to disconnect the Variable Line Pressure (VLP) electrical connector at the transmission. Check for and clear any codes that may have been set after performing any hydraulic pressure test and connecting the Variable Line Pressure (VLP) electrical connector.

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most transmission problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows the wheels to turn, and position tachometer so it can be read.

Using special adapters L-4559, attach 300 psi gauge(s) C-3293SP to the port(s) required for test being conducted.

Test port locations are shown in the Pressure Taps graphic.

TEST ONE - SELECTOR IN MANUAL 1 (1st Gear)

NOTE: This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

1. Attach pressure gauge to the low/reverse clutch tap.
2. Move selector lever to the MANUAL 1 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.
4. Low/reverse clutch pressure should read 115 to 145 psi.

TEST TWO - SELECTOR IN MANUAL 2 (Second Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the MANUAL 2 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.
4. In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A - SELECTOR IN DRIVE (OD ON - Fourth Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the DRIVE position. Verify that the OD switch is ON.
3. Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.
4. Underdrive clutch pressure should read below 5 psi. If not, than either the solenoid assembly or controller is at fault.

TEST THREE - SELECTOR IN DRIVE (OD OFF - Third and Second Gear)

NOTE: This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the overdrive clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph.
4. Overdrive clutch pressure should read 74 to 95 psi.
5. Move selector lever to the DRIVE position and increase indicated vehicle speed to 30 mph.
6. The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

TEST FOUR - SELECTOR IN DRIVE (OD ON - Fourth Gear)

NOTE: This test checks the 2/4 clutch hydraulic circuit.

1. Attach gauge to the 2/4 clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in fourth gear.
4. The 2/4 clutch pressure should read 75 to 95 psi.

TEST FIVE-SELECTOR IN DRIVE (OD ON - Fourth Gear, CC on)

NOTE: These tests check the torque converter clutch hydraulic circuit.

1. Attach gauge to the torque converter clutch off pressure tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

4. Torque converter clutch off pressure should be less than 5 psi.
5. Now attach the gauge to the torque converter clutch on pressure tap.
6. Move selector to the OD position.
7. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph.
8. Verify the torque converter clutch is applied mode using the RPM display of the scan tool.
9. Torque converter clutch on pressure should be 60-90 psi.

TEST SIX-SELECTOR IN REVERSE

NOTE: This test checks the reverse clutch hydraulic circuit.

1. Attach gauge to the reverse and low/reverse clutch tap.
2. Move selector lever to the REVERSE position.
3. Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.
4. Reverse and low/reverse clutch pressure should read 165 to 235 psi.

TEST RESULT INDICATIONS

1. If proper line pressure is found in any one test, the pump and pressure regulator are working properly.
2. Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.
3. Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.
4. If the overdrive clutch pressure is greater than 5 psi in [STEP 6](#) of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.
5. If the underdrive clutch pressure is greater than 5 psi in [STEP 4](#) of Test Two-A, a defective solenoid/pressure switch assembly or controller is the cause.

ALL PRESSURE SPECIFICATIONS ARE PSI (on hoist, with wheels free to turn)

Gear Selector Position	Actual Gear	PRESSURE TAPS							
		Underdrive Clutch	Overdrive Clutch	Reverse Clutch	Torque Converter Clutch Off	Torque Converter Clutch On	2/4 Clutch	Low/Reverse Clutch	
PARK - 0 mph *	PARK	0-2	0-5	0-2	60-110	45-100	0-2	115-145	
REVERSE - 0 mph *	REVERSE	0-2	0-7	165-235	50-100	35-85	0-2	165-235	

NEUTRAL - 0 mph *	NEUTRAL	0-2	0-5	0-2	60-110	45-100	0-2	115-145
Low - 20 mph #	FIRST	110-145	0-5	0-2	60-110	45-100	0-2	115-145
Third - 30 mph #	SECOND	110-145	0-5	0-2	60-110	45-100	115- 145	0-2
Third - 45 mph #	DIRECT	75-95	75-95	0-2	60-90	45-80	0-2	0-2
OD - 30 mph #	OVERDRIVE	0-2	75-95	0-2	60-90	45-80	75-95	0-2
OD - 50 mph #	OVERDRIVE WITH TCC	0-2	75-95	0-2	0-5	60-95	75-95	0-2
* Engine Speed at 1500 rpm								
# CAUTION: Both wheels must be turning at same speed.								

DIAGNOSIS AND TESTING - CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located by substituting air pressure for fluid pressure. The clutches may be tested by applying air pressure to their respective passages after the valve body has been removed. Use 6599-1 (1) and 6599-2 (1) from special tool Plate Set 6599 to perform test .

To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

1. Remove oil pan and valve body. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)

2. Apply air pressure to the holes in the special tool (1), one at a time.

3. Listen for the clutch to apply. It will give a slight thud sound. If a large amount of air is heard escaping, the transmission must be removed from vehicle, disassembled and all seals inspected.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer (2). Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole passage. Look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied to the low/reverse or the 2/4 clutches. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

DIAGNOSIS AND TESTING - FLUID LEAKAGE

FLUID LEAKAGE - TORQUE CONVERTER HOUSING AREA

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak. The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing.

TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld.
- Torque converter hub weld.

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils®, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil® tap, or equivalent, and installing a Heli-Coil® insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil®, or equivalent, tools, and inserts are readily available from most automotive parts suppliers.

REMOVAL

1. Disconnect battery negative cable.
2. Raise and support vehicle.

3. Disconnect and lower or remove necessary exhaust components.
4. Remove engine-to-transmission bending braces or engine collar.
5. Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
6. If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/FLUID - STANDARD PROCEDURE)
7. Remove torque converter access structural collar.
8. Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.
9. Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
10. Disconnect wires from the input and output speed sensors .
11. Disconnect wires from the transmission range sensor and the solenoid/pressure switch assembly .

12. Disconnect gearshift cable from transmission manual valve lever.
13. Disconnect shift cable and electrical connector from transfer case.
14. Support rear of engine with safety stand or jack.
15. Raise transmission slightly with service jack to relieve load on skid plate and transmission support.
16. Remove bolts securing rear support and cushion to transmission and skid plate.
17. Remove bolts attaching skid plate to frame and remove skid plate. (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)

18. Disconnect transfer case vent hose.
19. Remove transfer case. (Refer to 21 - TRANSMISSION/TRANSFER CASE - REMOVAL)
20. Remove fill tube bracket bolts and pull tube and vent hose out of transmission. Retain fill tube seal. Remove the bolt attaching transfer case vent tube to converter housing.
21. Remove the fuel line bracket bolt.
22. Disconnect fluid cooler lines at transmission.

23. Remove crank shaft position sensor.
24. Remove all converter housing bolts.
25. Carefully work transmission and torque converter assembly rearward off engine block dowels.
26. Hold torque converter in place during transmission removal.
27. Lower transmission and remove assembly from under the vehicle.
28. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the DRBIII® Scan Tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

Before disassembling transmission, move the shift lever clockwise as far as it will go and then remove the shift lever.

NOTE: Tag all clutch pack assemblies, as they are removed, for reassembly identification.

CAUTION: Do not intermix clutch discs or plates as the unit might then fail.

1. Remove the torque converter from the transmission input shaft .

2. Measure input shaft end play using End Play Set 8266. Set up the required pieces from End Play Set 8266 and a dial

indicator as . Move input shaft in and out to obtain end play reading. End play specifications are 0.127 to 0.635 mm (0.005 to 0.025 inch). Record indicator reading for reference when reassembling the transmission. If endplay exceeds the specified range, the #4 thrust plate needs to be inspected and changed if necessary.

NOTE: The four bolts along the bottom of the adapter housing have a sealing patch applied from the factory. Note the locations of these bolts and separate these bolts for reuse.

3. Remove the bolts that hold the adapter housing onto the transmission case.

NOTE: There are two pry slots located near the bottom corners of the housing for separating the housing from the transmission case

4. Remove the adapter housing from the transmission case.

5. Inspect the lube tube grommet for damage. If the grommet lip is damaged, it will need to be replaced.

6. Using a Slide Hammer C-3752 , remove the 4X4 stub shaft from the transmission output shaft. Inspect the cir-clip on the shaft for damage and replace the clip if necessary.

7. Remove the input speed sensor bolt and sensor.

8. Remove the output speed sensor bolt and sensor .

NOTE: One of the oil pan bolts has a sealing patch applied from the factory. Separate this bolt for reuse.

9. Remove the transmission oil pan bolts .

10. Remove the transmission oil pan .

11. Remove the transmission oil filter screws .

12. Remove transmission oil filter.

13. Remove the oil filter o-ring from the valve body .

14. Remove valve body-to-case bolts .

CAUTION: Do not handle the valve body by the manual shaft. Damage could result.

15. Remove valve body from transmission .

16. Remove underdrive and overdrive accumulators .

17. Remove the low/reverse accumulator snap ring .

18. Remove the low/reverse accumulator plug .

19. Remove low/reverse accumulator piston and springs .

NOTE: The oil pump bolts are not to be reused.

20. Remove and discard the oil pump-to-case bolts .

21. Remove oil pump using Slide Hammers C-3752 .

22. Remove oil pump while pushing in on input shaft .

23. Remove oil pump gasket .

CAUTION: By-pass valve must be replaced if transmission failure occurs.

24. Remove the cooler by-pass valve .

25. Remove the #1 caged needle bearing .

26. Remove the input clutch assembly .

27. Remove the #4 thrust plate .

28. Remove the front sun gear assembly and #4 thrust washer (if still in place) .

29. Remove the front carrier/rear annulus and #6 needle bearing .

NOTE: The number seven needle bearing has three antireversal tabs and is common with the number five and number two position. The orientation should allow the bearing to seat flat against the rear sun gear .

30. Remove the rear sun gear and #7 needle bearing and .

NOTE: Verify that Compressor 5058A is centered properly over the 2/4 clutch retainer before compressing. If necessary, fasten the Compressor 5058A bar to the bellhousing flange with any combination of locking pliers and bolts to center the tool properly.

31. Install and load Compressor 5058A to remove the 2/4 clutch retainer snap ring .

NOTE: The 2/4 Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

32. Remove the 2/4 clutch retainer .

33. Remove the 2/4 clutch return spring .

34. Remove the 2/4 clutch pack.

35. Remove the tapered snap ring .

36. Remove the low/reverse reaction plate .

37. Remove one (1) low/reverse clutch disc to facilitate snap ring removal .

38. Remove the low/reverse reaction plate snap ring .

39. Remove the low/reverse clutch pack .

CAUTION: Failure to grind and open stakes of the output shaft nut will result in thread damage to the shaft during nut removal.

WARNING: Wear safety goggles while grinding stake nuts.

40. Using a die grinder or equivalent, grind the stakes in the shoulder of the shaft nuts as shown in . Do not grind all the way through the nut and into the shaft. There are two stakes on each nut.

41. Using a small chisel, carefully open the stakes on nut .

42. Use Wrench 6497 and Wrench 6498A to remove the transfer shaft nut or the output shaft nut .

43. Remove the output shaft from case using a press .

Use Remover 6596 with a press to remove the front output shaft bearing cup .

44. Use Remover 6597 and Universal Handle C-4171 and Handle Extension C-4171-2 to press the rear output shaft bearing cup rearward .

45. Remove the rear carrier front bearing cone .

46. Install and load compressor

47. Remove the low/reverse belleville spring snap ring .

48. Remove the low/reverse piston belleville spring .
49. Remove the park sprag pivot retaining screw.

50. Drive out the anchor shaft using suitable punch .

51. Remove the guide bracket pivot shaft . Inspect all components for wear and replace if necessary.

NOTE: The Low/Reverse Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

52. Remove the low/reverse clutch piston .
53. Remove the low/reverse piston retainer screws.

54. Remove low/reverse piston retainer .

55. Remove the low/reverse piston retainer gasket .

ASSEMBLY

NOTE: If the transmission assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the Scan Tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

1. Install the output bearing cups using Installer 5050A.
2. Install low/reverse piston retainer gasket .

3. Install low/reverse piston retainer .

4. Install low/reverse piston retainer-to-case screws and torque to 5 N·m (45 in. lbs.).

NOTE: The Low/Reverse Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

5. Install low/reverse clutch piston .

6. Assemble guide bracket assembly as shown in .

CAUTION: When installing, be sure guide bracket and split sleeve touch the rear of the transmission case.

7. Install guide bracket pivot shaft .

8. Install park sprag pivot retaining screw and torque to 4.5 N·m (40 in. lbs.).

9. Install low/reverse piston belleville spring into position .

10. Install snap ring and remove compressor tool .

11. Install rear carrier front bearing cone .

12. Check output bearing preload. **Output bearing preload must be checked and adjusted if any of the following items have been replaced:**

- Output shaft (rear carrier assembly)
- Output shaft bearings
- Transmission case

a. **PRELOAD CHECK/SHIM SELECTION:** Install rear output shaft bearing cone and Support Plate 6618 A.

b. Install Support Plate 6618 A . Lightly tighten retaining screws. Screws should be below the plate surface, but do not snug screws.

c. Turn case over on arbor press so that the plate is resting on the press base. **CAUTION: The output shaft will extend through the hole of Support Plate 6618 A. Ensure your press table has clearance for the output shaft.**

d. Install shim on output shaft . Apply small amount of petrolatum onto the shim to hold it in place. Use the original shim as a starting point. If original shim is not available, use the thickest shim available.

e. Install output shaft/rear carrier into rear bearing. The shaft must be pressed into position. Use special tool Bearing

Installer MD-998911 (Disc) Extension handle C- 4171 and C4171-2 (Handle) to press shaft into rear bearing .

f. **Do not re-use old output shaft nut because the removed stake weakens the nut flange.** Using special Wrench 6497 and Wrench socket 6498-A, install new output shaft nut. Do not reuse old output shaft nut. Tighten new output shaft nut to 271 N·m (200 ft. lbs.).

g. Check the turning torque of the output shaft . The shaft should have 1 to 8 in. lbs. of turning torque. If the turning torque is **higher than** 8 in. lbs., install a thicker shim. If turning torque is **less than** 1 in. lb., install a thinner shim. Make sure there is no end play.

h. The new nut must be staked after the correct turning torque is obtained . Use special Staking Tool 6639 to stake output shaft nut. **CAUTION: Failure to stake nut could allow the nut to back-off during use.**

13. Install low/reverse clutch pack . Leave uppermost disc out to facilitate snap ring installation.

14. Install low/reverse reaction plate snap ring .

15. Install one low/reverse clutch disc .

16. Install low/reverse reaction plate with flat side up .

17. Install a new tapered snap ring (tapered side out) . Make sure that the snap ring ends are oriented as shown.

18. Measure low/reverse clutch pack. . Press down clutch pack with finger and zero dial indicator. Record measurement in four (4) places and take average reading. **Low/Reverse clutch pack clearance is 0.84 to 1.60 mm (0.033 to 0.063 inch).**

19. Select the proper low/reverse reaction plate to achieve specifications.

NOTE: The 2/4 Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

20. Install 2/4 clutch pack .

21. Install 2/4 clutch belleville spring .

22. Install 2/4 clutch retainer .

NOTE: Verify that Compressor 5058A is centered properly over the 2/4 clutch retainer before compressing. If necessary, fasten the 5058A bar to the bellhousing flange with any combination of locking pliers and bolts to center the tool properly.

23. Compress 2/4 clutch just enough to facilitate snap ring installation.

24. **Measure 2/4 clutch clearance:** Set up dial indicator as shown in . Press down clutch pack with finger and zero dial indicator. Record measurement in four (4) places and take average reading. **The 2/4 clutch pack clearance is 0.76 to 2.64 mm (0.030 to 0.104 inch).** If not within specifications, the clutch is not assembled properly or is excessively worn. **There is no adjustment for the 2/4 clutch clearance.**

25. Install the #7 needle bearing to the rear sun gear . **The number 7 needle bearing has three antireversal tabs and is common with the number 5 and number 2 position.** The orientation should allow the bearing to seat flat against the rear sun gear. A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

26. Install rear sun gear and #7 needle bearing .

27. Install front carrier/rear annulus assembly and #6 needle bearing .

28. Install front sun gear assembly and #4 thrust washer .

29. **Determine proper #4 thrust plate thickness.**

- a. Select the thinnest #4 thrust plate thickness.
- b. Install #4 thrust plate using petrolatum to hold into position.
- c. Install input clutch assembly. Ensure the input clutch assembly is completely seated by viewing position through input speed sensor hole. **If the speed sensor tone wheel is not centered in the opening, the input clutch assembly is not seated properly.**
- d. Remove the oil pump o-ring and install oil pump and gasket to transmission. Tighten the oil pump bolts to 30 N·m (265 in. lbs.). **Use screw-in dowels or phillips-head screwdrivers to align pump to case. Be sure to reinstall O-ring on oil pump after selecting the proper No. 4 thrust plate.**
- e. Measure the input shaft end play with the transmission in the vertical position. This will ensure that the measurement will be accurate.
- f. Set up and measure endplay using End Play Set 8266 and Dial Indicator Set C3339.
- g. Measure input shaft end play. **Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch).** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch, which is within specifications.
- h. Remove oil pump, gasket, and input clutch assembly to gain access to and install proper #4 thrust plate.

30. Install #1 caged needle bearing .

31. Install input clutch assembly with proper thrust plate .

CAUTION: By-pass valve MUST be replaced if transmission failure occurs.

32. Replace cooler by-pass valve if transmission failure has occurred .

NOTE: To align oil pump, gasket, and case during installation, use threaded dowels or phillips screwdrivers.

33. Install oil pump gasket .

NOTE: Do not reuse original oil pump bolts.

34. Install oil pump and torque the new oil pump-to-case bolts to 30 N·m (265 in. lbs.) .

35. Install low/reverse accumulator.

36. Install low/reverse accumulator plug .

37. Install low/reverse accumulator snap ring .

38. Install underdrive and overdrive accumulators and springs .

CAUTION: Do not handle the valve body by the manual shaft. Damage could result.

39. Install valve body into place .

40. Install seven (7) valve body-to-case bolts and torque to 12 N·m (105 in. lbs.).

NOTE: Before installing the oil pan bolt in the bolt hole located between the torque converter clutch on and U/D clutch pressure tap circuits , it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

41. Install transmission oil filter . Tighten the bolts to 5 N·m

(45 in. lbs.)

42. Install transmission oil pan with a bead of Mopar® ATF RTV. Torque oil pan-to-case bolts to 20 N·m (14.5 ft. lbs.).

NOTE: Before installing either speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

43. Install both speed sensors into transmission case. Torque the speed sensor bolts to 9 N·m (80 in. lbs.).

44. As a final check of the transmission, measure the input shaft end play. This will indicate when a #4 thrust plate

change is required. The #4 thrust plate is located behind the overdrive clutch hub. Attach a dial indicator to transmission bell housing with its plunger seated against end of input shaft. Move input shaft in and out to obtain end play reading.

Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch). If not within specifications, make the necessary thrust plate adjustment.

45. Inspect the lube tube grommet for damage. If the grommet lip is damaged, it will need to be replaced.

46. Install the 4X4 stub shaft onto the transmission output shaft.

47. Place a bead of Mopar® ATF RTV on the rear surface of the transmission case for the adapter housing.

48. Install the adapter housing onto the transmission case.

NOTE: Before installing the lowermost four adapter housing bolts, it will be necessary to replenish the sealing patch on the bolts using Mopar® Lock & Seal Adhesive.

49. Install the bolts that hold the adapter housing onto the transmission case. Be sure to install any stud bolts to their original locations. Tighten the bolts to 54 N·m (40 ft.lbs.).

INSTALLATION

1. Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

2. Lubricate converter drive hub and oil pump seal lip with transmission fluid.

3. Align converter and oil pump.

4. Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

5. Check converter seating with steel scale and straightedge . Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

6. Temporarily secure converter with C-clamp.

7. Lightly grease crankshaft flange hole.

8. Position transmission on jack and secure it with safety chains.

9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

10. Raise transmission and align converter with drive plate

and converter housing with engine block.

11. Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

12. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

13. Install bolts that attach transmission converter housing to engine block. Tighten bolts to 129 N·m (95 ft. lbs)

CAUTION: Be sure the converter housing is fully seated on the engine block dowels before tightening any bolts.

14. Install torque converter attaching bolts. Tighten bolts to 88 N·m (65 ft. lbs.).

15. Install transmission fill tube , new seal and breather hose

16. Install fuel line bracket bolt.

17. Install crank shaft position sensor.

18. Connect transmission cooler lines to transmission.

19. Install transfer case onto transmission. (Refer to 21 - TRANSMISSION/TRANSFER CASE - INSTALLATION)

20. Remove engine support fixture.

21. Remove transmission jack.

22. Connect input and output speed sensor wires .

23. Connect wires to the transmission range sensor and the solenoid/pressure switch assembly .

24. Install converter housing support collar.
25. Install exhaust pipes and support brackets, if removed.
26. Install starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION) and cooler line bracket. \
27. Connect transfer case shift cable and electrical connectors.
28. Adjust gearshift linkage, if necessary.
29. Align and connect propeller shaft(s). (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
30. Install transmission structural collar.
31. Fill transfer case to bottom edge of fill plug hole.
32. Install all skid plates and attach skid plate to transmission rear support. (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)
33. Lower vehicle and connect battery negative cable.
34. Fill transmission to correct level with Mopar® ATF +4.

8017d5b0

ACCUMULATOR

DESCRIPTION

The 42RLE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, return spring(s), and a cover or plug. The overdrive (1) and underdrive (2) accumulators are located within the transmission case, and are retained by the valve body.

The low reverse (1) accumulator is also located within the transmission case, but the assembly is retained by a cover and a snap-ring.

The 2/4 accumulator (5) is located in the valve body. It is retained by a cover and retaining screws .

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and springs. The intended result is a smooth, firm clutch application.

ADAPTER HOUSING SEAL

REMOVAL

1. Remove the transfer case (Refer to 21 - TRANSMISSION/TRANSFER CASE - REMOVAL).
2. Using a screw mounted in a slide hammer, remove the adapter housing seal.

INSTALLATION

1. Install a new adapter housing seal with Universal Handle C-4171 and Installer C-3860-A.
2. Install the transfer case (Refer to 21 - TRANSMISSION/TRANSFER CASE - INSTALLATION).

BEARINGS

ADJUSTMENTS

BEARING ADJUSTMENT PROCEDURES

Take extreme care when removing and installing bearing cups and cones. **Use only an arbor press for installation**, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat will

give a false end play reading, while gauging for proper shims. Improperly seated bearing cup and cones are subject to low-mileage failure.

Bearing cups and cones should be replaced if they show signs of pitting or heat distress.

If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.

NOTE: Bearing drag torque specifications must be maintained to avoid premature bearing failures.

Used (original) bearing may lose up to 50 percent of the original drag torque after break-in.

NOTE: All bearing adjustments must be made with no other component interference or gear inter-mesh.

Oil all bearings before checking turning torque.

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM

DESCRIPTION

DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI), is a cable and solenoid operated system. It interconnects the automatic transmission floor mounted shifter to the steering column ignition switch .

DESCRIPTION

The Brake Transmission Shift Interlock System (BTSI), consists of a Park-Interlock cable and a solenoid mounted in the shift lever assembly. The Park-Interlock cable connects the automatic transmission floor mounted

shifter to the steering column ignition switch.

OPERATION

OPERATION

The system locks the shifter into the PARK position. The Interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half an inch. A magnetic holding device in line with the park/brake interlock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position unless the shifter is fully locked into the PARK position.

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in the shift lever assembly is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
4. Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

REMOVAL

1. Remove lower steering column cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)
2. Remove lower steering column shroud.
3. Remove tie strap near the solenoid retaining the brake transmission interlock cable to the steering column.
4. Disengage wire connector from solenoid.
5. With the ignition removed or in the unlocked position, disengage lock tab holding cable end to steering column .
6. Pull cable end from steering column.
7. Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
8. Disconnect the cable from the bellcrank .

9. Disconnect and remove the cable from the shift bracket.

INSTALLATION

1. Route replacement cable behind instrument panel and under floor console area to shift mechanism.
2. Insert cable end into opening in steering column hub under ignition lock. Push cable inward until lock tab engages.
3. Insert the cable end into the shifter bellcrank.
4. Place gear selector in PARK.
5. Push the spring-loaded cable adjuster forward and snap cable into bracket.
6. Adjust the brake transmission shifter interlock cable.
7. Verify that the cable adjuster lock clamp is pushed downward to the locked position.
8. Test the park-lock cable operation.
9. Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
10. Install tie strap to hold cable to base of steering column.
11. Install lower steering column shroud and ignition lock.
12. Install lower steering column cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)

ADJUSTMENTS

ADJUSTMENT - BRAKE TRANSMISSION SHIFT INTERLOCK CABLE

1. Shift transmission into PARK.
2. Remove shift lever bezel and console screws. Raise bezel and console for access to cable. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Pull cable lock button up to release cable.
4. Turn ignition switch to LOCK position.
5. Use a spacer to create a one millimeter gap between the shifter pawl and top of the shift gate.
6. Pull the cable forward and release. Ensure the cable end is seated in the bellcrank and press cable lock button down until it snaps in place.
7. Check adjustment as follows:
 - a. Check movement of release shift handle button (floor shift) or release lever (column shift). You should not be able to press button inward or move column lever.
 - b. Turn ignition switch to RUN position.
 - c. Shifting out of park should not be possible.
 - d. Apply the brake and attempt to shift out of PARK. Shifting should be possible.
 - e. While the transmission is shifted out of PARK, release the brake and attempt to shift through all gears. Release the shift button at least once during this procedure. The ignition key should not go to the LOCK position.
 - f. Return transmission to the PARK position without applying the brake.
8. Move shift lever back to PARK and check ignition switch operation. You should be able to turn switch to LOCK position and shift lever release button/lever should not move.
9. Install shift lever bezel and console screws. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

DRIVING CLUTCHES

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive (2), overdrive (3), and reverse (4) clutches are considered input/driving clutches and are contained within the input clutch assembly. The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

NOTE: (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FLUID AND FILTER

DIAGNOSIS AND TESTING

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

1. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
2. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

FLUID LEVEL CHECK

The transmission sump has a dipstick to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the PARK and NEUTRAL positions. Place the selector lever in PARK to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82° C or 180° F), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level should be in COLD region at 21° C (70° F) fluid temperature. Adjust fluid level as necessary. Use only Mopar® ATF+4, Automatic Transmission Fluid.

FILL TUBE EQUIPPED WITH INDICATOR

42RLE Fluid Temperature Chart

NOTE: Engine and Transmission should be at normal operating temperature before performing this procedure.

1. Start engine and apply parking brake.
2. Connect scan tool and select transmission.
3. Select sensors.
4. Read the transmission temperature value.
5. Compare the fluid temperature value with the chart.
6. Adjust transmission fluid level shown on the dipstick according to the 42RLE Fluid Temperature Chart. Use only Mopar® ATF+4, Automatic Transmission Fluid.
7. Check transmission for leaks.

CAPPED FILL TUBE

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

WARNING: There is a risk of accident from vehicle starting off by itself when engine running. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position "P".
4. Shift through the transmission modes several times with the vehicle stationary and the engine idling
5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick 9336 into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

NOTE: The dipstick will protrude from the fill tube when installed.

6. Check transmission oil temperature using the appropriate scan tool.

NOTE: The true transmission oil temperature can only be read by a scan tool in REVERSE or any

forward gear position.

7. The transmission Oil Dipstick 9336 has indicator marks every 10mm. Determine the height of the oil level on the dipstick and using the height, the transmission temperature, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

FLUID/FILTER SERVICE

NOTE: Only fluids of the type labeled Mopar® ATF+4, Automatic Transmission Fluid, should be used in the transmission sump. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transmission is disassembled for any reason, the fluid and filter should be changed.

1. Raise vehicle on a hoist. Place a drain container with a large opening, under transmission oil pan.

NOTE: One of the oil pan bolts (5) has a sealing patch applied from the factory. Separate this bolt for reuse.

2. Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.
3. Install a new filter and o-ring on bottom of the valve body and tighten retaining screws to 5 N·m (45 in. lbs.).

NOTE: Before installing the oil pan bolt (5) in the bolt hole located between the torque converter clutch on and U/D clutch pressure tap circuits, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

4. Clean the oil pan and magnet. Reinstall pan using new Mopar® Silicone Adhesive sealant. Tighten oil pan bolts to 20 N·m (14.5 ft. lbs.).

5. Pour four quarts of Mopar® ATF+4, Automatic Transmission Fluid, through the dipstick opening.
6. Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.
7. Check the transmission fluid level and add an appropriate amount to bring the transmission fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick.
8. Recheck the fluid level after the transmission has reached normal operating temperature, 82° C (180°F).
9. To prevent dirt from entering transmission, make certain that dipstick is fully seated into the dipstick opening.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4 to transmission:
 - a. If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.
 - b. If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.
3. Apply parking brakes.
4. Start and run engine at normal curb idle speed.
5. Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.
6. Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick**. Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.
7. Drive vehicle until transmission fluid is at normal operating temperature.
8. With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

9. Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

GEARSHIFT CABLE

REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.
3. Remove the shift cable eyelet from the transmission manual shift lever .
4. Remove shift cable from the cable support bracket.

5. Lower vehicle.
6. Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
7. Disconnect cable at shift lever and shifter assembly bracket .
8. Remove the nuts holding the shift cable seal plate to the floor pan .

9. Pull cable through floor panel opening.
10. Remove shift cable from vehicle.

INSTALLATION

1. Route cable through hole in floor pan.
2. Install seal plate to studs in floor pan .
3. Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).

4. Install the shift cable to the shifter assembly bracket . Push cable into the bracket until secure.
5. Place the floor shifter lever in PARK position.
6. Loosen the adjustment screw on the shift cable.
7. Snap the shift cable onto the shift lever pin.

8. Raise the vehicle.
9. Install the shift cable to the shift cable support bracket .

10. Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
11. Snap the shift cable onto the transmission manual shift lever.

12. Lower vehicle.
13. Verify that the shift lever is in the PARK position.
14. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
15. Verify correct shifter operation.
16. Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

ADJUSTMENTS - GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the TRS may be faulty.

Gearshift Adjustment Procedure

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Loosen the shift cable adjustment screw .
4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.

6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.
9. Lower vehicle
10. Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access.
(Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

HOLDING CLUTCHES

DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 (2) and Low/Reverse (3) clutches are considered holding clutches and are contained at the rear of the transmission case .

OPERATION

NOTE: (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transmission case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transmission case.

INPUT CLUTCH ASSEMBLY

DISASSEMBLY

1. Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).
2. Tap down (2) reverse clutch reaction plate (4) to release pressure from snap ring .

3. Remove reverse clutch snap ring (3).

4. Pry up reverse clutch reaction plate (1).

5. Remove reverse clutch reaction plate (1).

NOTE: Tag reverse clutch pack for reassembly identification.

6. Remove the reverse clutch pack (two fibers/one steel) (1, 2).

7. Remove the OD/Reverse reaction plate (1) snap ring (3).

8. Remove OD/Reverse pressure plate (1).

9. Remove OD/Reverse reaction plate wave snap ring (2).

10. Remove OD shaft/hub and OD clutch pack (1).

NOTE: Tag overdrive clutch pack for reassembly identification.

11. Remove the overdrive clutch (1, 3) from the overdrive hub/shaft (2).

12. Remove and inspect number 3 and 4 thrust plates (1, 3).

13. Remove the underdrive shaft assembly (2).

14. Remove the number 2 needle bearing (1).

15. Remove the OD/UD reaction plate tapered snap ring (1).

NOTE: The OD/UD clutch reaction plate has a step on both sides. The OD/UD clutches reaction plate goes tapered step side up.

16. Remove the OD/UD reaction plate (1).

17. Remove the first UD clutch disc (1).

18. Remove the UD clutch flat snap ring (1).

NOTE: Tag underdrive clutch pack for reassembly identification.

19. Remove the UD clutch pack (1, 3).

CAUTION: Compress return spring just enough to remove or install snap ring.

20. Using Compressor Tool 5059A (4) and an arbor press (2), compress UD clutch piston enough to remove snap ring (3).

21. Remove the underdrive spring retainer snap ring (2), spring retainer (1), and spring (4).

22. Remove the UD clutch piston (1).

23. Remove the input hub tapered snap ring (2).

24. Tap on input hub (1) with soft faced hammer (2) and separate input hub from OD/Reverse piston and clutch retainer .

25. Separate the input hub from OD/Reverse piston (5) and clutch retainer (2).

26. Separate clutch retainer (2) from OD/Reverse piston (1).

27. Using Disc 16057 (4) and an arbor press (1), compress OD/Reverse piston (5) return spring just enough to remove snap ring (3).

28. Remove the OD/Reverse piston (5) return spring and snap ring (3).

29. Remove input shaft (1) to input clutch hub snap ring (3).

30. Using a suitably sized socket (2) and an arbor press (1), remove input shaft (5) from input shaft hub .

ASSEMBLY

Use petrolatum on all seals to ease assembly of components.

1. Using an arbor press (2), install input shaft (1) to input shaft hub (3).

2. Install input shaft snap ring (3).

3. Position the OD/Reverse piston return spring (2) and snap ring (3) onto the OD/Reverse piston (1).

4. Using an arbor press (1) and Disc 6057 (4), install the OD/Reverse piston return spring (6) and snap ring (3).

5. Install the OD/Reverse piston (1) assembly to the input clutch retainer (2).

6. Install the input hub/shaft assembly (1) to the OD/Reverse piston/clutch retainer assembly (2).

7. Install input hub tapered snap ring (2). **Make sure snap ring is fully seated.**

8. Install the UD clutch piston (1).

9. Install UD piston return spring (1) and Compressor 5067 (2).

10. Position the UD spring retainer (1) and snap ring (2) on the piston return spring (4).

CAUTION: Compress return spring just enough to install snap ring.

11. Using Compressor 5059A (6) and an arbor press (1), install the UD spring retainer and snap ring (3).

12. Install the UD clutch pack (four fibers/four steels) (1, 3). Leave the top disc (2) out until after the snap ring is installed.

13. Install the UD clutch flat snap ring (1).

14. Install the last UD clutch disc (1).

15. Install the OD/UD clutch reaction plate (1). The OD/UD clutches reaction plate has a step on both sides. Install the OD/UD clutches reaction plate tapered step side up.

NOTE: Snap ring ends must be located within one finger of the input clutch hub. Be sure that snap ring is fully seated, by pushing with screwdriver, into snap ring groove all the way around.

16. Install the UD/OD tapered snap ring (1).

17. Seat tapered snap ring (1) to ensure proper installation .

18. Install input clutch assembly (1) to the Input Clutch Pressure Fixture 8391 (2).

19. Set up dial indicator (1) on the UD clutch pack (2).

20. Using moderate pressure, press down and hold (near indicator) the UD clutch pack (2) with screwdriver or suitable tool and zero dial indicator (1). When releasing pressure on clutch pack, indicator reading should advance 0.005-0.010 inches.

CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.

21. Apply 30 psi (206 kPa) to the underdrive hose on Pressure Fixture 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.

22. Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94-1.50 mm (0.037-0.059 in.).**

23. If necessary, select the proper reaction plate to achieve specifications.

24. Install the OD clutch pack (four fibers/three steels) (1).

25. Install OD reaction plate waved snap ring (1).

26. Install the OD/Reverse reaction plate (1) with large step down (towards OD clutch pack).

27. Install OD reaction plate flat snap ring (3).

28. Measure OD clutch pack clearance. Set up dial indicator (1) on top of the OD/Reverse reaction plate (2).

29. Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Pressure Fixture 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.

30. Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

31. Install reverse clutch pack (two fibers/one steel) (1, 2).

32. Install reverse clutch reaction plate (1) with the flat side down towards reverse clutch.

33. Tap reaction plate (3) down to allow installation of the reverse clutch snap ring (1). Install reverse clutch snap ring (1).

34. Pry up reverse reaction plate (4) to seat against snap ring (2).

35. Set up a dial indicator (1) on the reverse clutch pack (2).

36. Using moderate pressure, press down and hold (near indicator) reverse clutch disc (2) with screwdriver or suitable tool and zero dial indicator (1). When releasing pressure, indicator should advance 0.005-0.010 inches as clutch pack relaxes.

37. Apply 30 psi (206 kPa) air pressure to the reverse clutch hose on Tool 8391. Measure and record reverse clutch pack measurement in four (4) places, 90° apart.

38. Take average of four measurements and compare with reverse clutch pack clearance specification. **The reverse clutch pack clearance is 0.89-1.37 mm (0.035-0.054 in.).** Select the proper reverse clutch snap ring to achieve specifications.

39. To complete the assembly, reverse clutch and overdrive clutch must be removed.

40. Install the number 2 needle bearing (1).

41. Install the underdrive shaft assembly (1).

42. Install the number 3 thrust washer (1) to the underdrive shaft assembly (2). Be sure five tabs are seated properly.

43. Install the number 3 thrust plate (3) to the bottom of the overdrive shaft assembly (1). Retain with petrolatum or transmission assembly gel (2).

44. Install the overdrive shaft assembly (1).

45. Reinstall overdrive and reverse clutch. **Rechecking these clutch clearances is not necessary.**

INPUT SPEED SENSOR

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission

Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the input speed sensor.

NOTE: The speed sensor bolt has a sealing patch applied from the factory. Be sure to reuse the same bolt.

4. Remove the bolt holding the input speed sensor to the transmission case.
5. Remove the input speed sensor from the transmission case.

INSTALLATION

1. Install the input speed sensor (1) into the transmission

case.

NOTE: Before installing the speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

2. Install the bolt to hold the input speed sensor into the transmission case. Tighten the bolt to 9 N·m (80 in.lbs.).
3. Install the wiring connector onto the input speed sensor
4. Verify the transmission fluid level. Add fluid as necessary.

5. Lower vehicle.

OIL PUMP

DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transmission case. The oil pump assembly consists of an inner (3) and outer (2) gear, a housing (1), and a cover that also serves as the reaction shaft support (6).

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

DISASSEMBLY

1. Remove the reaction shaft support bolts.
2. Remove the reaction shaft support (2) from the pump housing (1).

3. Remove the pump gears (2, 3) and check for wear and damage on pump housing (1) and gears (2, 3).

4. Re-install the gears and check clearances.
5. Measure the clearance between the outer gear (1) and the pump pocket (2). Clearance should be 0.089-0.202 mm (0.0035-0.0079 in.).
6. Measure clearance between outer gear and crescent. Clearance should be 0.060-0.298 mm (0.0023-0.0117 in.).
7. Measure clearance between inner gear and crescent. Clearance should be 0.093-0.385 mm (0.0036-0.0151 in.).
8. Position an appropriate piece of Plastigage across both pump gears.
9. Align the Plastigage to a flat area on the reaction shaft support housing.
10. Install the reaction shaft to the pump housing. Tighten the bolts to 27 N·m (20 ft. lbs.).
11. Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.
12. Clearance between outer gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.). Clearance between inner gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.).

in.).

ASSEMBLY

1. Assemble oil pump as shown
2. Install and torque reaction shaft support-to-oil pump housing bolts to 28 N·m (20 ft. lbs.) torque.

OUTPUT SPEED SENSOR

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage

Torque converter element speed ratio

REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the output speed sensor (2).

NOTE: The speed sensor bolt has a sealing patch applied from the factory. Be sure to reuse the same bolt.

4. Remove the bolt holding the output speed sensor to the transmission case.
5. Remove the output speed sensor (2) from the transmission case.

INSTALLATION

1. Install the output speed sensor (2) into the transmission case.

NOTE: Before installing the speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

2. Install the bolt to hold the output speed sensor into the transmission case. Tighten the bolt to 9 N·m (80 in.lbs.).
3. Install the wiring connector onto the output speed sensor
4. Verify the transmission fluid level. Add fluid as necessary.

5. Lower vehicle.

OVERDRIVE SWITCH

DESCRIPTION

The overdrive OFF (control) switch is located in the center console . The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

REMOVAL

1. Remove the accessory switch bezel.
2. Remove the overdrive off switch from the accessory switch bezel.

INSTALLATION

1. Install the overdrive off switch to the accessory switch bezel.
2. Install the accessory switch bezel.

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transmission case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft.

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary

members to change output ratio or direction.

OIL PUMP SEAL

REMOVAL

1. Remove the transmission from the vehicle (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - REMOVAL) .
2. Remove the torque converter from the transmission bellhousing.
3. Use special tool C-3981B to remove oil pump seal.

INSTALLATION

1. Clean and inspect oil pump seal seat. Then install seal using special tool C-4193-A.
2. Clean and inspect torque converter hub. If nicks, scratches or hub wear are found, torque converter replacement will be required.

CAUTION: If the torque converter is being replaced, apply a light coating of grease to the crankshaft pilot hole. Also inspect the engine drive plate for cracks. If any cracks are found replace the drive plate. Do not attempt to repair a cracked drive plate. Always use new torque converter to drive plate bolts.

3. Apply a light film of transmission oil to the torque converter hub and oil seal lips. Then install torque converter into transmission. Be sure that the hub lugs mesh with the front pump lugs when installing.
4. Reinstall the transmission into the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION)

SHIFT MECHANISM

DESCRIPTION

The shift mechanism is cable operated and provides six shift positions. The shift indicator is located on the console next to the gear shift. The shift positions are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)

- Manual Second (2)
- Manual Low (1)

OPERATION

Manual low (1) range provides first gear only. Over run braking is also provided in this range. Manual second (2) range provides first and second gear only. Drive range provides first, second, and third gear ranges.

DIAGNOSIS AND TESTING - SHIFT MECHANISM

1. The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
2. Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
3. With floor shift lever handle push-button not depressed and lever in:
 - a. PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.
 - b. PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.
 - c. NEUTRAL position - Normal position. Engine starts must be possible.
 - d. NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

ADJUSTMENTS - SHIFT MECHANISM

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the TRS may be faulty.

Gearshift Adjustment Procedure

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Loosen the shift cable adjustment nut.
4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.
9. Lower vehicle
10. Tighten the shift cable adjustment screw to 12 N·m (105 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/CENTER

CONSOLE - INSTALLATION)

SOLENOID

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include

variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

SOLENOID/PRESSURE SWITCH ASSY

DESCRIPTION

The Solenoid/Pressure Switch Assembly (1) is inside the transmission and mounted to the valve body assembly. The assembly consists of four solenoids that control hydraulic pressure to the L/R, 2/4, OD, and UD friction elements (transmission clutches), and the torque converter clutch. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the TCM. Likewise, the pressure switches can only be serviced by replacing the assembly.

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which allows fluid to pass through in their relaxed or “off” state. By design, this allows transmission limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL
OP = OPEN			
CL = CLOSED			

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

The TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the TCM momentarily turns on element pressure to the 2/4 and OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

REMOVAL

NOTE: If the Solenoid/Pressure Switch Assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Raise vehicle on hoist.
2. Remove valve body assembly from transmission. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
3. Remove Solenoid/Pressure Switch Assembly retaining screws (2) from solenoid.

4. Remove Solenoid/Pressure Switch Assembly (1) and screen from valve body (2).

INSTALLATION

NOTE: If the Solenoid/Pressure Switch assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Install Solenoid/Pressure Switch Assembly (1) and screen (3) to the separator and transfer plates.

2. Install and tighten retaining screws (2) to 5.5 N·m (50 in. lbs.) torque.
3. Install valve body. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)

TORQUE CONVERTER

DESCRIPTION

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

IMPELLER

The impeller is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

The turbine is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

The stator contains an over-running clutch (1-4), which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added to the turbine assembly (5) to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a “hindering” direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a “helping” direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased.

REMOVAL

1. Remove transmission and torque converter from vehicle.
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

NOTE: Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle.
9. Fill the transmission with the recommended fluid.

TRANSMISSION CONTROL RELAY

DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

OPERATION

When the relay is “off”, no power is supplied to the solenoid pack and the transmission is in “limp-in” mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) (2) is mounted to the top of the valve body inside the transmission and can only be serviced by removing the valve body assembly. The electrical connector extends through the transmission case.

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM.

OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position (SLP) to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as “between gear” codes. This results in six codes which should never occur. These are called “invalid” codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRS SWITCH STATES

SLP	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
D	OP	OP	OP	CL
2	OP	OP	CL	OP
1	CL	OP	CL	CL

REMOVAL

1. Remove valve body assembly from vehicle. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
2. Remove the manual shaft seal (1).

3. Remove manual shaft/TRS retaining screw (1).
4. Slide TRS off of manual valve shaft.

INSTALLATION

1. Install the TRS (2) to the manual shaft. Make sure TRS locating pin rests in manual valve bore slot.
2. Install the TRS/manual shaft retaining screw (1) and torque to 5 N·m (45 in. lbs.) torque.

3. Install the manual shaft seal (1).
4. Install valve body to the transmission. (Refer to 21 - TRANSMISSION//AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)

TRANSMISSION TEMPERATURE SENSOR

DESCRIPTION

The transmission temperature sensor (2) is located in the transmission range sensor (1) and communicates transmission sump temperature to the TCM.

OPERATION

The transmission range sensor (TRS) has an integrated thermistor that the TCM uses to monitor the transmission's sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in. The TCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission "overheat" condition exists. If the thermistor circuit fails, the TCM will revert to calculated oil temperature usage.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

VALVE BODY

DESCRIPTION

The valve body assembly consists of a cast aluminum valve body (5), separator plate (4), and transfer plate (3). The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches.

Also mounted to the valve body assembly are the solenoid/pressure switch assembly and the transmission range sensor (2).

The valves contained within the valve body (1) include the following :

- Regulator valve(2)
- Solenoid switch valve(7)
- Manual valve(5)
- Converter clutch switch valve(6)
- Converter clutch control valve(4)
- Torque converter regulator valve(2)

- Low/Reverse switch valve(3)

In addition, the valve body also contains the thermal valve, #2, 3, 4 & 5 check balls and the 2/4 accumulator assembly.

OPERATION

NOTE: (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS) for a visual aid in determining valve location, operation and design.

THERMAL VALVE

The thermal valve (1) is a bi-metallic shudder valve that helps control the venting rate of oil pressure in the underdrive clutch passage during release of the clutch. When the oil temperature is approximately 20 degrees F. (- 6 degrees C.) or less, the valve is fully open to assist in venting oil past the U1 orifice (2). At temperatures above 20 degrees F. (- 6 degrees C.) , the valve starts to close and becomes fully closed at approximately 140 degrees. The thermal valve is located in the transfer plate of the valve body.

REGULATOR VALVE

The regulator valve (9) controls hydraulic pressure in the transmission. It receives unregulated pressure from the pump (6), which works against spring tension (8) to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as “line pressure.”

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid (4). In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves (7).

MANUAL VALVE

The manual valve (4) is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve (10) is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve (5) is fed to the torque converter regulator valve (8). The pressure is then directed to the converter clutch switch valve (10) and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve (5) controls the back (on) side of the torque converter clutch (1). When the controller energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve (5) and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under these operating conditions.

REMOVAL

NOTE: If valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Disconnect the TRS and solenoid wiring connectors.
2. Disconnect the shift cable from the shift lever (at the transmission).
3. Move the manual shift lever clockwise as far as it will go. This should be one position past the L position. Then remove the manual shift lever.

NOTE: One of the oil pan bolts has a sealing patch applied from the factory. Separate this bolts for reuse.

4. Remove transmission pan bolts (2).

5. Remove transmission oil pan (1).

6. Remove oil filter (1) from valve body. It is held in place by two screws.

7. Remove valve body bolts-to-case (1).

CAUTION: The overdrive and underdrive accumulators and springs may fall out when removing the valve body.

8. Carefully remove valve body assembly (1) from the transmission.

DISASSEMBLY

NOTE: If the valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure using the DRBIII® Scan Tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Remove manual shaft seal.
2. Remove manual shaft screw (1).

3. Remove Transmission Range Sensor (TRS) (1) and

manual shaft (2).

4. Remove Solenoid/Pressure Switch Assembly (1) from valve body.

5. Remove valve body stiffener plate (1).

6. Invert valve body assembly and remove transfer plate-to-

valve body screws (1).

7. Remove transfer/seperator plate (1) from valve body (2)

8. Remove separator plate-to-transfer plate screws (2).

80c07336

9. Remove separator plate (1) from transfer plate (2).

80c07335

10. Remove the oil screen (1) from the transfer plate.

80c07337

11. Remove thermal valve (1) from transfer plate.

12. Remove valve body check balls (1-4). Note their location for assembly ease .

13. Remove 2/4 accumulator assembly (1-5).

14. Remove dual retainer plate (2) from valve body. Use special Remover / Installer tool 6301 (1) to remove plate (2).

15. Remove regulator valve spring retainer (2).

A detailed line drawing of the back of an HP-41C calculator, showing the internal circuit board. The board is populated with various electronic components, including integrated circuits, resistors, and capacitors. Two callouts are present: callout 1 points to a small component on the right side of the board, and callout 2 points to a component on the left side. The board has a complex layout of traces and pads.

80665121

17. Remove all valves and springs.

18. Cleanliness through entire disassembly and assembly of the valve body cannot be overemphasized. When disassembling, each part should be washed in a suitable solvent, then dried by compressed air. **Do not wipe parts with shop towels.** All mating surfaces in the valve body are accurately machined; therefore, careful handling of all parts must be exercised to avoid nicks or burrs.

ASSEMBLY

NOTE: If the valve body assembly is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure using the DRBIII® Scan Tool. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

80665121

1. Install all valves and springs as shown.

2. Install regulator valve spring retainer (2).

80be4701

3. Install dual retainer plate (2) using Tool 6301 (1).

80be4700

4. Verify that all retainers (1, 2) are installed as shown. Retainers should be flush or below valve body surface.

80c07330

5. Install 2/4 Accumulator components (1-5) as shown. Torque 2/4 Accumulator retainer plate to 5 N·m (45 in. lbs.).

6. Install check balls into position as shown. If necessary, secure them with petrolatum or transmission assembly gel for assembly ease.

7. Install thermal valve (1) to the transfer plate.

8. Install the oil screen (1) to the transfer plate.

9. Install separator plate (1) to transfer plate (2).

10. Install the two separator plate-to-transfer plate screws (2).

11. Install the transfer plate (1) to the valve body (2).

12. Install the transfer plate-to-valve body screws (1) and torque to 5 N·m (45 in. lbs.).

13. Install the stiffener plate (1).

14. Install the solenoid/pressure switch assembly (1) and screws to the transfer plate and torque to 5.5 N·m (50 in. lbs.).

15. Install the manual shaft/rooster comb (3) and transmission range sensor (1) to the valve body.

16. Install the TRS/manual shaft retaining screw (1) and torque to 5 N·m (45 in. lbs.).
17. Install manual shaft seal.

INSTALLATION

1. Install valve body into position and start bolts (1). Torque valve body to transmission case bolts (1) to 12 N·m (105 in. lbs.) torque.

2. Install transmission oil filter (1).

NOTE: Before installing the oil pan bolt in the bolt hole (5) located between the torque converter clutch on and U/D clutch pressure tap circuits, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

3. Make sure oil pan (1) and case rail are clean and dry. Install an 1/8" bead of RTV to the transmission oil pan and install to case. Tighten bolts (2) to 20 N·m (14.5 ft. lbs.).
4. Lower vehicle and connect the TRS connector.
5. Connect solenoid/pressure switch assembly connector.
6. Lower vehicle.
7. Fill transmission with ATF+4, Automatic Transmission Fluid. Verify proper fluid level. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/FLUID - STANDARD PROCEDURE)

NOTE: If the valve body has been reconditioned or replaced, it is necessary to perform the Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

AUTOMATIC TRANSMISSION - 545RFE - ELECTRICAL

DIAGNOSTICS (DIESEL)

AUTOMATIC TRANSMISSION - 545RFE - ELECTRICAL DIAGNOSTICS (DIESEL)

DIAGNOSIS AND TESTING

P0122-TPS/APP CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The 3 wire TPS provides the PCM with an input signal voltage that represents the throttle blade position of the throttle body. The Throttle Position Sensor (TPS) is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5.0 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range from 0.26 volts at minimum throttle opening (idle), to 4.49 volts at maximum opening (wide open throttle).

The APPS is a linear potentiometer. It provides the PCM/ECM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the PCM/ECM to calculate the throttle plate position.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored TPS voltage drops below .078 volts for the period of 0.48 seconds.

Possible Causes
RELATED ENGINE TPS/APPS DTCS PRESENT
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED ENGINE TPS/APPS DTCS ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine TPS/APPS DTCs present?

Yes

- Refer to the Driveability Category and perform the appropriate Symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.

With the scan tool, erase PCM DTCs and the Event Data.

NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

Using the Event Data recorded earlier, test drive the vehicle while trying to duplicate the operating conditions in which the DTC originally set.

With the scan tool, read DTCs.

Did this DTC reset during the road test?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0123-TPS/APP CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The 3 wire TPS provides the PCM with an input signal voltage that represents the throttle blade position of the throttle body. The Throttle Position Sensor (TPS) is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5.0 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range from 0.26 volts at minimum throttle opening (idle), to 4.49 volts at maximum opening (wide open throttle).

The APPS is a linear potentiometer. It provides the PCM/ECM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the PCM/ECM to calculate the throttle plate position.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored TPS voltage rises above 4.94 volts for the period of 0.48 seconds.

Possible Causes
RELATED ENGINE TPS/APPS DTCS PRESENT
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED ENGINE TPS/APPS DTCS ARE PRESENT

With the scan tool, check Engine DTCs, this includes all one trip failures.

Are there any Engine TPS/APPS DTCs present?

Yes

- Refer to the Driveability category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
With the scan tool, erase PCM DTCs and the Event Data.

NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

Using the Event Data recorded earlier, test drive the vehicle while trying to duplicate the operating conditions in which the DTC originally set.

With the scan tool, read DTCs.

Did this DTC reset during the road test?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0124-TPS/APP INTERMITTENT

For a complete Transmission wiring diagram **Refer to Section 8W**

Theory of Operation

The 3 wire TPS provides the PCM with an input signal voltage that represents the throttle blade position of the throttle body. The Throttle Position Sensor (TPS) is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5.0 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range from 0.26 volts at minimum throttle opening (idle), to 4.49 volts at maximum opening (wide open throttle).

The APPS is a linear potentiometer. It provides the PCM/ECM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the PCM/ECM to calculate the throttle plate position.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored TPS throttle angle between the angles of 6° and 120° and the degree

change is greater than 5° within a period of less than 7.0 msec.

Possible Causes
RELATED TPS ENGINE DTCS PRESENT
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT

With the scan tool, read Engine DTCS.

Are there any Engine TPS/APPS DTCS present?

Yes

- Refer to the Powertrain category and perform the appropriate symptom.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.
With the scan tool, erase PCM DTCS and the Event Data.

NOTE: Clearing DTCS does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

Using the Event Data recorded earlier, test drive the vehicle while trying to duplicate the operating conditions in

which the DTC originally set.
With the scan tool, read DTCs.

Did this DTC reset during the road test?

Yes

- Go to [3](#)

No

- Go to [4](#)

3. CHECK THROTTLE POSITION SENSOR OPERATION

Ignition On, Engine Not Running.

With the scan tool, under Transmission Sensors, monitor the TPS voltage in the following step.

Slowly open and close the throttle while checking for erratic voltage changes.

If equipped with ETC, use the ETC Throttle Follower test in the scan tool to check for erratic voltage changes.

Was the TPS voltage change smooth and consistent?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Throttle Position Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

4. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The DTC is intended as an informational DTC to aid the technician in determining the root cause of a customer driveability issue. The DTC is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler is needed to support the customers driving behavior.

- **When Monitored:**

Whenever the engine is running.

- **Set Condition:**

Immediately after a Overheat shift schedule is activated when the Transmission temperature exceeds 127° C or 260° F.

Possible Causes
HIGH TEMPERATURE OPERATION ACTIVATED
TORQUE CONVERTER CLUTCH SLIPPING / NOT ACTIVATING
OPERATING VEHICLE WITH TRANSMISSION IN LIMP-IN MODE FOR AN EXTENDED PERIOD OF TIME
EXCESSIVE TIME IDLING IN GEAR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. HIGH TEMPERATURE OPERATION

This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints. This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may

generate a customer complaint.

The customer driving patterns may indicate the need for an additional transmission oil cooler.

Verify proper Engine cooling system operation which would affect proper transmission operation.

Verify proper torque converter clutch operation.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

- Repair the cause of transmission overheating. Refer to the Service Information for the proper repair procedure. Make sure to check for any Service Bulletins pertaining to this problem.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0562-BATTERY VOLTAGE LOW

Friction element distress could result from an insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

- **When Monitored:**

With the engine running and the PCM has requested the TIPM to activate the Transmission Control Output circuit.

- **Set Condition:**

If the battery voltage of the Transmission Output circuit(s) to the PCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5-volts for 200ms or where the Transmission Output circuits are less than 7.2-volts for 200ms.

Possible Causes
RELATED CHARGING SYSTEM DTCS
(Z903) GROUND CIRCUITS OPEN OR HIGH RESISTANCE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. RELATED CHARGING SYSTEM DTCS

With the scan tool, read the Engine DTCs.

Are there any related Charging System DTCs also present?

Yes

- Refer to the Charging System category and repair any Engine Charging System DTCs, before testing DTC P0562. NOTE: After repairing the Engine Charging System DTC's, perform the Transmission Verification

test to verify the transmission control system was not damaged.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [2](#)

2. CHECK FOR TIPM DTCS

NOTE: Generator, battery, and charging system must be fully functional before performing this test.

With the scan tool, read TIPM DTCS.

Are there any TCM TIPM DTCS present.

Yes

- Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

No

- Go To [3](#)

3. CONDITION P0562 PRESENT

With the scan tool, read Transmission DTCS.

With the scan tool, check the Starts Since Set counter for P0562.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter set at 0?

Yes

- Go To [4](#)

No

- Go To [7](#)

4. CHECKING (Z903) GROUND CIRCUITS

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Using a 12-volt test light connected to 12-volts, check the PCM (Z903) Ground circuits at the appropriate terminals of Miller tool #8815.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for all of the Ground circuits?

Yes

- Go To [5](#)

No

- Repair the (Z903) Ground circuit(s) for an open or high resistance.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT

Turn the ignition off to the lock position.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.
Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Using a 12-volt test light connected to ground, check all (T16) Transmission Control Output circuits at the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminals of Miller tool #8815.

NOTE: The (T16) Transmission Control Output circuit branches off to both Transmission Solenoid/TRS

Assembly and the PCM.

Does the test light illuminate brightly while cycling on and off on all (T16) Transmission Control Output circuits?

Yes

- Go To [6](#)

No

- Repair the (T16) Transmission Control Output circuit for an open or high resistance.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the TIPM C2 harness connector.
Measure the resistance of the (T16) Transmission Control Output circuit between the TIPM C2 harness connector and both the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminals of Miller tool #8815.

Is the resistance above 5.0 ohms on any circuit?

Yes

- Repair the (T16) Transmission Control Output circuit for an open or high resistance.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0602-CONTROL MODULE PROGRAMMING ERROR/NOT

PROGRAMMED

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The controller is programmed during manufacturing with generic software to facilitate testing. However, generic software does not have the proper calibrations to control a transmission in a vehicle. The check for generic software is made at power-up. If generic software is found, the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

- **When Monitored:**

Check for generic software is made at power-up

- **Set Condition:**

If generic software is found, the MIL will light immediately. This DTC is designed to inform the technician that the controller still has generic software installed.

Possible Causes
PCM - PROGRAMMING ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CONTROL MODULE PROGRAMMING ERROR

NOTE: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.

With the scan tool.

Record the vehicles controller part number.

Select Use Controller Part Number under the Flash Tab.

Flash the controller with the correct software.

Verify the controller flashed successfully.

Test Complete

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

After the controller is reset (ignition turned to the RUN position), the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be same as value written.

- **When Monitored:**

One time after the controller is reset (ignition turned to the RUN position).

- **Set Condition:**

Whenever the Powertrain Control Module (PCM) detects an internal controller problem.

Possible Causes
POWER OR GROUND CIRCUIT
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Wiggle the wires while checking for shorted and open circuits.

Check for any Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair the power and/or ground circuits to the PCM and Transmission Control Relay or TIPM (if equipped) as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

After the controller is reset (ignition turned to the RUN position) the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in the program memory.

- **When Monitored:**

One time after the controller is reset (ignition turned to the RUN position).

- **Set Condition:**

Whenever the Powertrain Control Module (PCM) detects an internal controller problem.

Possible Causes
POWER OR GROUND CIRCUIT
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Wiggle the wires while checking for shorted and open circuits.

Check for any Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair the power and/or ground circuits as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0613-INTERNAL TRANSMISSION PROCESSOR

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The internal Watchdog (WD) is a separate hardware circuit that continuously monitors the microprocessor. To insure the proper operation of the Transmission controller the watchdog must receive a signal from the microprocessor within a specific time window (14 msec $\pm$ 1 msec) to prevent a system shutdown after a short delay (570 msec). The microprocessor periodically tests the WDs ability to provide this shutdown function using a three phase test;

- 1) Send the signal too late > 15 msec
- 2) Send the signal too early < 13 msec
- 3) Delay test < 590 msec

If the watchdog input signal arrives too early or too late, the Watchdog Fault line will go low and the watchdog delay will start to time out. The delay will be reset by the correct timing of watchdog signal sent during subsequent operations.

The Delay Test checks the delay time out. The Delay Monitor line is pulled low, which forces the delay to start timing out. At the end of the delay time the Transmission Relay will be turned off. The delay test, upon detection of the relay turning off, will immediately turn the relay back on before shutdown can occur.

- **When Monitored:**

1) One time after the controller is reset (ignition turned to the RUN position) and every 60 seconds thereafter. The Delay Test is executed after a reset only.

2) 2 seconds after an invalid test.

◦ **Set Condition:**

If either of the following conditions occur 3 times:

1) The watchdog fault line remains high after the period has elapsed for the too early - too late watchdog test.

2) The Transmission Control Relay remains on after the watchdog delay expired.

Possible Causes
POWER OR GROUND CIRCUIT
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK THE WIRING AND CONNECTORS

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Wiggle the wires while checking for shorted and open circuits.

Check for any Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair the power and/or ground circuits as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0706-TRANSMISSION RANGE SENSOR RATIONALITY

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5) Sense circuits communicate the shift lever position to the Transmission Control System. Each circuit is terminated at the transmission by a switch (TRS). Each switch can be either open or closed, depending on the shift lever position. The PCM can decode this information and determine the shift lever position.

Each shift lever position has its own unique combination of closed and open switches. This is called a PRNDL code. There are 5 switches, therefore: there are many possible combinations of open and closed switches (codes). There are 12 valid codes: two for neutral, one for each other gear position (5), and five temporary (transition zone) codes. The remainder of the codes should never occur, these are called invalid codes.

- **When Monitored:**

Continuously with the ignition on.

- **Set Condition:**

The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 seconds.

Possible Causes
TRS SENSE CIRCUIT OPEN
TRS SENSE CIRCUIT SHORT TO GROUND
TRS SENSE CIRCUIT SHORT TO VOLTAGE
METAL DEBRIS IN OIL PAN
TRANSMISSION RANGE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

SHIFT LEVER ERROR CODES

ERROR CODE	SWITCH STUCK	POSITION

Diagnostic Test

1. CHECK TO SEE IF P0706 DTC IS CURRENT

With the scan tool, perform the Shift Lever Position Test.

Select the test outcome from the following:

Test passes:

- Go To [6](#)

Test fails with Error Code:

- Go To [2](#)

Test fails without Error Code:

- Perform the Gearshift Adjustment Procedure per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

2. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, perform the Shift Lever Position Test.

When the scan tool instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator.

The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing "ENTER" on the scan tool.

NOTE: When the scan tool requests the O/D off button be depressed, you must use the O/D OFF button in the vehicle or you will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.

NOTE: If the Shift Lever Position test fails, make sure to note the identification of the TRS Sense circuit for future reference.

Did the Shift Lever Position test pass?

Yes

- Remove the Oil Pan and Main Valve Body Assembly per the Service Information. Check for metal debris on top of the Solenoid/TRS Assembly and the manual valve code plate. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. TRS SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM C4 harness connector and install Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the identified (T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5)) TRS Sense circuit, from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the identified (T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5)) TRS Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

No

- Go To [4](#)

4. TRS SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the identified (T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5)) TRS Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the identified (T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5)) TRS Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. TRS SENSE CIRCUIT SHORT TO OTHER CIRCUITS

Measure the resistance between the identified (T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5)) TRS Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 100k ohms between the identified (T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5)) TRS Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the identified (T41 (C1), T42 (C2), T3 (C3), T1 (C4), T2 (C5)) TRS Sense circuit for a short to other circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter clutch engagement, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set when the desired transmission temperature does not reach a normal operating temperature within a given time frame. Time is variable due to ambient temperature. Approximate times are starting temperature to warm up time: (-40° F / -40° C - 35 min) (-20° F / -28° C - 25 min) (20° F / -6.6° C - 20 min) (60° F / 15.5 ° C - 10 min)

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINE IF RELATED DTC'S ARE PRESENT

With the scan tool, check DTCs.

Are there any other related Transmission Temperature Sensor DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0711.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings to the voltage readings listed on the Transmission Simulator.

Do the readings on the scan tool match the Transmission Simulator readings $\pm$ 0.2 volts?

Yes

- Replace Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0712-TRANSMISSION TEMPERATURE SENSOR LOW

01a79c68

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter clutch engagement, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 volts for the period of 0.45 seconds.

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINE IF RELATED DTC'S ARE PRESENT

With the scan tool, check Transmission DTCs.

Are there any line pressure sensor or throttle position sensor DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0712.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the Transmission Simulator, turn the Input/Output switch to OFF.
With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings $\pm$ 0.2 volts?

Yes

- Replace Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

01a79c68

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermistor. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter clutch engagement, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 0.45 seconds.

Possible Causes
RELATED DTCS PRESENT
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO OTHER CIRCUITS
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINE IF RELATED DTC'S ARE PRESENT

With the scan tool, check Transmission DTCs.

Are there any line pressure sensor or throttle position sensor DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK IF DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0713.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the Transmission Simulator, turn the Input/Output switch to OFF.
With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.
Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings $\pm$ 0.2 volts?

Yes

- Replace Transmission Solenoid/TRS assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (T54) TRANSMISSION SENSOR SIGNAL CIRCUIT SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
 Disconnect the Transmission Simulator, Miller tool #8333.
 Disconnect the PCM harness connectors.
 Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T54) Transmission Temperature Sensor Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the Transmission Temperature Sensor Signal circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
 Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
 Wiggle the wires while checking for shorted and open circuits.
 With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

Test Complete.

P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT

01a79c68

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or system self-diagnostic test are performed. The Powertrain Control Module (PCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

Possible Causes
RELATED DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINE IF RELATED DTC'S ARE PRESENT

With the scan tool, check Transmission DTCs.

Are there any line pressure sensor or throttle position sensor DTCs present?

Yes

Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0714.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading ± 0.2 volts?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion,

damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE

01a79c68

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

- 1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).
- 2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

- **When Monitored:**

The transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If there is an excessive change in input rpm in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

Possible Causes
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND
(T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
INPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF DTC P0716 IS CURRENT

Start the engine in park.

With the scan tool, monitor the Input Speed Sensor rpm.

Is the Input Speed Sensor rpm below 400 rpm?

Yes

- Go To [2](#)

No

- Go To [9](#)

2. INPUT SPEED SENSOR

Turn the ignition off to the lock position.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.

With the scan tool, monitor the Input and Output Speed Sensor rpm.

Does the Input speed read 3000 rpm and the Output speed read 1000 rpm $\pm$ 50 rpm?

Yes

- Replace the Input Speed Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.

NOTE: Make sure to leave the Speed Sensor, Transmission Solenoid/TRS Assembly, and Line Pressure Sensor harness connectors disconnected.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.
With the scan tool in TIPM, actuate the TCM output.
Measure the voltage of the (T52) Input Speed Sensor Signal circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE

With the scan tool in TIPM, actuate the TCM output.
Measure the voltage of the (T13) Speed Sensor Ground circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION

VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN

With the scan tool in TIPM, stop the actuation the TCM output.

Turn the ignition off to the lock position.

Measure the resistance of the (T52) Input Speed Sensor Signal circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (T13) SPEED SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (T13) Speed Sensor Ground circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the Input Speed Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T52) Input Speed Sensor Signal circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0721-OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE

01a79c68

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

- 1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0729 and P0731-P0736).
- 2) An excessive change in input or output speeds indicating signal intermittent will result in codes P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor has 60 teeth and the output speed sensor has 30 teeth, this results in an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

- **When Monitored:**

The transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If there is an excessive change in output rpm in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

Possible Causes
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND
(T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
OUTPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF DTC P0721 IS CURRENT

Turn the ignition off to the lock position.

CAUTION: Properly support the vehicle and raise all drive wheels off the ground.

Release the parking brake.

Start the engine in park.

Place the transmission gear selector in drive, release foot from brake.

WARNING: Be sure to keep hands and feet clear of rotation wheels.

With the scan tool, monitor the Output Speed Sensor rpm.

Is the Output Speed Sensor rpm below 100 rpm?

Yes

- Go To [2](#)

No

- Go To [9](#)

2. OUTPUT SPEED SENSOR

Turn the ignition off to the lock position.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.

With the scan tool, monitor the Input and Output Speed Sensor rpm

Does the Input Speed read 3000 rpm and the Output Speed read 1000 rpm, $\pm$ 50 rpm?

Yes

- Replace the Output Speed Sensor per the Service Information.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333.
Disconnect the PCM harness connectors and connect Miller special tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller special tool #8815 to perform diagnosis.

Measure the resistance of the (T14) Output Speed Sensor Signal circuit from the Output Speed Sensor harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (T13) Speed Sensor Ground circuit from the Output Speed Sensor harness connector to the appropriate terminal in the Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool in TIPM, actuate the TCM output.
Measure the voltage of the (T14) Output Speed Sensor Signal circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [8](#)

8162cc18

8. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

With the scan tool in TIPM, actuate the TCM output. Measure the voltage of the (T13) Speed Sensor Ground circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information.

- With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

8162cb18

9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0726-ENGINE SPEED INPUT CIRCUIT RANGE/PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Control System calculates the engine rpm by directly reading the engine crank position sensor. It compares the calculated value to the engine speed sensor signal transmitted from the Engine Control System over the controllers internal BUS. The calculated engine rpm is also compared to a minimum and a maximum value. **Note: Due to the integration of the Powertrain Control Module (PCM) and Transmission Control Module (TCM), BUS communication between the modules is internal and unserviceable.**

- **When Monitored:**

Continuously every 7 msec with the ignition on and engine running.

- **Set Condition:**

This DTC will set when the calculated engine speed is less than 390 rpm with the engine running, or greater than 8000 rpm, for the period of 2.0 seconds. The PCM will place the Transmission in Limp-in when this DTC is set. **Note: This is not a Transmission Input Speed Sensor DTC.**

Possible Causes
RELATED ENGINE DTCS PRESENT
CRANK POSITION SENSOR OR WIRING
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED ENGINE DTCS

NOTE: This is not a Transmission Input Speed Sensor DTC.

Ignition on, engine not running.

With the scan tool, read all Engine DTCS. This includes any active or stored or one trip DTCS.

Are there any engine rpm related DTCS present?

Yes

- Refer to the Powertrain category and perform the appropriate symptom.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [2](#)

2. CHECK IF DTC IS CURRENT

Ignition on, engine not running.

With a scan tool, read and record all Event Data.

With the scan tool, erase all active and stored transmission DTCs. (Note: it may be necessary to perform a battery disconnect with the scan tool to clear Event Data.)

Using the Event Data, duplicate the conditions in which the original DTC set.

With the scan tool, read transmission and engine DTCs.

NOTE: Refer to all engine DTCs first in the following question.

Pick the answer below that best describes your findings, (this includes one trip failures).

Transmission DTC P0726 set

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Also check the Crank Position sensor and wiring. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Engine DTC set

- Refer to the Driveability category and perform the appropriate symptom.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No DTC set at all

- Go to [3](#)

3. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0731-GEAR RATIO ERROR IN 1ST

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

- 1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).
- 2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

- **When Monitored:**

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

Possible Causes
CUT UD PISTON SEAL
LOW FLUID LEVEL

CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
STUCK OR STICKING MAIN REGULATOR VALVE
FAILED OVERRUNNING CLUTCH
CUT UD ACCUMULATOR SEAL RING
BROKEN UD ACCUMULATOR PISTON
BROKEN REACTION SHAFT SUPPORT SEAL RING
LOW LINE PRESSURE
BROKEN / MISSING MAIN VALVE BODY BLEED ORIFICE
BROKEN / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
POOR MACHINING ON PUMP VALVE BODY FACE
INPUT SPEED SENSOR AND RELATED WIRING
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If any of these DTCs are present, they may cause a Gear Ratio Error. Perform the test for P0944 first if it is present.

No

- Go to [2](#)

2. CHECK IF DTC P0731 IS CURRENT

With the scan tool, perform the 1st Gear Clutch Test. Follow the instructions on the scan tool. Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

- Go to [3](#)

No

- Go to [4](#)

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not currently present.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

- If the Event Data shows fault P0731 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
- If the Event Data shows fault P0731 set with input rpm = zero, check the input speed sensor and related wiring.
- If the Event Data shows fault P0731 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, mis-installed or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
- If the Event Data shows fault P0731 set with the UD pressure switch open (but line pressure matches Desired Line Pressure), air check the UD hydraulic clutch circuit for leakage per the Service Information. If the UD hydraulic clutch circuit is OK, replace the solenoid/TRS assembly.

Check the gearshift linkage adjustment.

Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

Gear ratio DTCs can also be set under extreme temperature conditions.

Verify if the problem is only experienced under extreme hot or cold conditions.

Were there any problems found.

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

4. CHECK INTERNAL TRANSMISSION

Repair internal transmission as necessary. Refer to the Service Information.

If there were any line pressure DTCs present along with this DTC, make sure to inspect the: Primary oil filter and seal, Transmission Oil Pump, and the Main regulator valve per the Service Information.

If DTCs P0876 and/or P0875 were present in addition to the P0731, replace the Transmission Solenoid/TRS Assembly in addition to necessary internal repairs.

Pay particular attention to the following list of possible causes when repairing the transmission:

- Cut UD piston seal
- Failed overrunning clutch
- Cut UD accumulator seal ring
- Burned UD clutch
- Broken UD accumulator piston
- Low line pressure
- Broken/missing main valve body bleed orifice
- Broken/missing dribbler orifice assembly in reaction shaft support
- Poor machining on pump valve body face
- Transmission Solenoid/TRS Assembly

View repair

Repair

- **NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve, low line pressure in Event Data, etc.) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.**

Repair internal transmission per the Service Information.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0732-GEAR RATIO ERROR IN 2ND

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

- 1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).
- 2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

- **When Monitored:**

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

Possible Causes
RELATED DTCS PRESENT
INPUT SPEED SENSOR OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 2C CLUTCH
CUT 2C OR UD PISTON SEAL
BROKEN 2C PISTON CASTING
BROKEN OR MISSING 2C BLEED ORIFICE

BROKEN OR MISSING UD BLEED ORIFICE
CUT 2C OR UD ACCUMULATOR PISTON SEAL
CRACKED 2C OR UD ACCUMULATOR PISTON
CUT OR MISSING #5 OR #7 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN WELD - REACTION CARRIER TO REVERSE SUN GEAR
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read DTCs.

Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

Yes

- Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

No

- Go to [2](#)

2. CHECK IF DTC IS CURRENT

With the scan tool, read and record the Event Data.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Does the Event Data display information for the DTC P0732?

Yes

- Go to [4](#)

No

- Go to [3](#)

3. CHECK EVENT DATA

In the Event Data, identify the DTC that was recorded earlier.

Does the Event Data display information for the DTC P1790, with target gear = 2nd, or with both 2C and UD clutches applying?

Yes

- Go to [4](#)

No

- Go to [7](#)

4. CHECK RPM IN THE EVENT DATA

Refer to the Event Data recorded earlier.

Does the Input rpm read zero?

Yes

- Check the input speed sensor and wiring. Refer to test P0716 and diagnose as if the DTC is current.

No

- Go to [5](#)

5. CHECK LINE PRESSURE READING

Refer to the Event Data recorded earlier.

Is the line pressure reading more than 10 psi below the desired line pressure?

Yes

- Go to [6](#)

No

- Go to [7](#)

6. CHECK TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Remove the Transmission Oil Pump per the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. CHECK IF THE DTC P0732 IS CURRENT

With the scan tool, perform the 2nd Gear Clutch Test. Follow the instructions on the scan tool.

Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the 2C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 2nd gear clutch test will not detect a faulty 2C clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go to [8](#)

No

- Go to [10](#)

8. CHECK FOR INTERMITTENT OPERATION

Check the Shifter adjustment per the Service Information.

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [9](#)

9. CHECK FOR SLIPPAGE

With the scan tool, erase Transmission DTCs.

Road test the vehicle.

Is there an obvious slippage noticed in 2nd gear, or runaway on the 1–2 shift?

Yes

- Go to [12](#)

No

- Go to [15](#)

10. CHECK THE UD HYDRAULIC CLUTCH CIRCUIT

Remove Transmission Oil Pan and check for excessive debris.

Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) per the Service Information.

NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?

Yes

- Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and the dribbler assembly, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [11](#)

11. CHECK THE UD ACCUMULATOR PISTON

Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

Were there any problems found?**Yes**

- Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

12. CHECK FOR EXCESSIVE DEBRIS

Remove the Transmission Oil Pan and check for excessive debris.

If grey sludge is present, check for a improperly assembled 2C clutch with the thick reaction plate not against the case.

Remove the valve body and air check the 2C hydraulic clutch circuit (in the 2C/4C clutch retainer) per the Service Information.

NOTE: The 2C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

Were there any problems found, excessive debris, improperly assembled 2C clutch and/or excessive air leakage in the 2C hydraulic clutch circuit?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 2C piston seals and bleed orifice.

NOTE: If the 2C clutch has failed but no obvious cause is found (such as a cut piston seal, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [13](#)

13. CHECK THE 2C ACCUMULATOR

Check the 2C Accumulator piston for cracks or a cut seal.

Check for a cut or missing #7 or #5 check ball.

Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

Were there any problems found**Yes**

- Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [14](#)

14. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

- 1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
- 2) Rotate the Input Annulus gear and drive shell (the drum that encloses the two rearmost carriers).
- 3) Check to see if the reaction carrier (the front-most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

Is the reaction carrier turning faster than the drive shell?**Yes**

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the reaction carrier per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

15. CHECK IF DTC RESETS

Did the DTC P0732 reset during the road test?**Yes**

- Go to [16](#)

No

- Go to [17](#)

16. LIST OF POSSIBLE CAUSES

If any other DTCs set during the road test, refer to the appropriate symptom in the Transmission category.

If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:

- Check for excessive debris in the Transmission Oil pan, plugged, cracked, or misinstalled Primary Transmission Oil Filter and/or seal.
- Check for cut and/or missing #7 and #5 check balls in the main valve body.
- Check the 2C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.
- Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assembly.
- Check the 2C clutch piston seals, and bleed orifice.
- Check the main regulator valve for sticking in its bore and the flatness of the pump valve body and pump housing faces.
- Check for a improperly assembled 2C clutch with the thick reaction plate not against the case.

View repair**Repair**

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: If the UD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

17. INTERMITTENT DTC

The conditions to set this DTC are not currently present.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

- If the Event Data shows fault P0732 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
- If the Event Data shows fault P0732 set with input rpm = zero, check the input speed sensor and related wiring.
- If the Event Data shows fault P0732 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
- If the Event Data shows fault P0732 set with the UD or 2C pressure switch open (but line pressure matches Desired Line Pressure), air check the UD and 2C hydraulic clutch circuits for leakage per the Service Information. If the UD and 2C hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.

Check the gearshift linkage adjustment.

Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

Gear ratio DTCs can also be set under extreme temperature conditions.

Verify if the problem is only experienced under extreme hot or cold conditions.

Were there any problems found.

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0733-GEAR RATIO ERROR IN 3RD

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

- 1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).
- 2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

- **When Monitored:**

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

Possible Causes
RELATED DTCS PRESENT
INPUT SPEED SENSOR OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
BENT OR BROKEN ACCUMULATOR COVER ON MAIN VALVE BODY
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR OD CLUTCH
CUT OD OR UD PISTON SEAL
BROKEN OR MISSING UD OR OD BLEED ORIFICE IN MAIN VALVE BODY
BROKEN OR MISSING BLEED ORIFICE IN UD OR OD CLUTCH PISTON
CUT OD OR UD ACCUMULATOR PISTON SEAL

CRACKED OD OR UD ACCUMULATOR PISTON
CUT OR MISSING NO. 6 CHECK BALL
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN WELD - REVERSE CARRIER HUB TO CARRIER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, read DTCs

Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

Yes

- Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

No

- Go to [2](#)

2. CHECK EVENT DATA

With the scan tool, read and record the Event Data.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Does the Event Data display information for the DTC P0733?

Yes

Go to [4](#)

No

- Go to [3](#)

3. CHECK THE TARGET GEAR IN THE EVENT DATA

In the Event Data, identify the DTC that was recorded earlier.

Does the Event Data display information for the DTC P1790, with target gear = 3rd, or with both OD and UD clutches applying?

Yes

- Go to [4](#)

No

- Go to [7](#)

4. CHECK THE INPUT RPM IN THE EVENT DATA

Refer to the Event Data recorded earlier.

Does the Input rpm read zero?

Yes

- Check the input speed sensor and wiring. Refer to test P0716 and diagnose as if the DTC is current.

No

- Go to [5](#)

5. CHECK LINE PRESSURE READING

Refer to the Event Data recorded earlier.

Is the line pressure reading more than 10 psi below the desired line pressure?

Yes

- Go to [6](#)

No

- Go to [7](#)

6. CHECK TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-installed?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Remove the Transmission Oil Pump per the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. CHECK IF DTC P0733 IS CURRENT

With the scan tool, perform the 3rd Gear Clutch Test. Follow the instructions on the scan tool.

Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the OD clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 3rd gear clutch test will not detect a faulty OD clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go to [8](#)

No

- Go to [10](#)

8. CHECK FOR INTERMITTENT OPERATION

Check the Shifter adjustment per the Service Information.

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [9](#)

9. CHECK FOR SLIPPAGE

With the scan tool, erase Transmission DTCs.

Road test the vehicle. Check operation in 3rd gear, 4th gear, and Reverse.

Is there an obvious slippage noticed in 3rd gear, or runaway on the 2-3 shift?

Yes

- Go to [12](#)

No

- Go to [16](#)

10. CHECK THE UD HYDRAULIC CLUTCH CIRCUIT

Remove Transmission Oil Pan and check for excessive debris.

Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) per the Service Information.

NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

Were there any problems found, excessive debris and/or excessive air leakage in the UD hydraulic clutch circuit?

Yes

- Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [11](#)

11. CHECK UD ACCUMULATOR PISTON

Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

Were there any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.

No

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

12. CHECK FOR EXCESSIVE DEBRIS

Remove the Transmission Oil Pan and check for excessive debris.

Remove the valve body and check if the accumulator cover is intact.

Air check the OD hydraulic clutch circuit (in the case) per the Service Information.

NOTE: The OD clutch passage contains a small bleed orifice which connects to the Reverse clutch hydraulic circuit, a small amount of air leakage into the Reverse clutch passage is normal.

Were there any problems found, excessive debris, and/or excessive air leakage in the OD hydraulic clutch circuit?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the bleed orifice in the OD/Reverse clutch piston.

NOTE: If the OD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [13](#)

13. CHECK THE OD ACCUMULATOR

Check the OD Accumulator piston for cracks or a cut seal.

Check for a cut or missing No. 6 check ball.

Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

Were there any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [14](#)

14. CHECK FOR NO REVERSE

During the road test on a previous test, did the vehicle have no reverse and no 3rd gear, but 1st and 2nd gears were OK?

Yes

- Go to [15](#)

No

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

15. CHECK FOR BROKEN REVERSE CARRIER WELD

Remove the Transmission per the Service Information and inspect the weld on the reverse carrier hub.

Were there any problems found?**Yes**

- Repair as necessary.

No

- Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

16. CHECK IF DTC RESETS

Did the DTC P0733 reset during the road test?**Yes**

- Go to [17](#)

No

- Go to [18](#)

17. LIST OF POSSIBLE CAUSES

If any other DTCs set during the road test, refer to the appropriate symptom in the Transmission category. If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those. Check for:

- Excessive debris in the Transmission Oil pan, plugged, cracked, or mis-installed Primary Transmission Oil Filter and/or seal.
- Cut or missing No. 6 check ball in the main valve body.
- OD and UD accumulator pistons and seals and bleed orifices, and the Solenoid Switch Valve and Plugs in the main valve body.
- OD and UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness

- of the pump valve body and pump housing faces.
- Main regulator valve for sticking in its bore.

View repair

Repair

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: If the OD or UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

18. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not currently present.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

- If the Event Data shows fault P0733 was set in the Park, Reverse, or Neutral, replace the Powertrain Control Module.
- If the Event Data shows fault P0733 set with input rpm = zero, check the input speed sensor and related wiring.
- If the Event Data shows fault P0733 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
- If the Event Data shows fault P0733 set with the OD or UD pressure switch open (but line pressure matches Desired Line Pressure), air check the OD and UD hydraulic clutch circuits for leakage per the Service Information. If the OD and UD hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.

Check the gearshift linkage adjustment.

Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

Gear ratio DTCs can also be set under extreme temperature conditions.

Verify if the problem is only experienced under extreme hot or cold conditions.

Were there any problems found.

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0734-GEAR RATIO ERROR IN 4TH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

- 1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P01736).
- 2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

- **When Monitored:**

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

Possible Causes
LOW FLUID LEVEL
INPUT SPEED SENSOR OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED

CUT OD OR 4C ACCUMULATOR SEAL
CRACKED OD OR 4C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 4C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5 OR NO. 6 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 4C PISTON SEAL
STUCK MAIN REGULATOR VALVE
BURNED OD OR 4C CLUTCH
BROKEN OR MISSING 4C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
BROKEN REVERSE CARRIER HUB WELD
BROKEN REVERSE SUN GEAR WELD TO REACTION CARRIER

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs
If any of these DTCs are present, perform their respective tests first.

Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If any of these DTCs are present, they may cause a Gear Ratio Error. Perform the test for P0944 first if it is present.

No

- Go to [2](#)

2. CHECK EVENT DATA

With the scan tool, read and record the Event Data.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Does the Event Data display information for the DTC P0734?

Yes

- Go to [4](#)

No

- Go to [3](#)

3. CHECK FOR ANOTHER DTC

In the Event Data recorded earlier, does the Event Data show the DTC P1790, with Target Gear = 4th, or with both the 4C and OD clutches applying?

Yes

- Go to [4](#)

No

- Go to [6](#)

4. CHECK INPUT RPM

In the Event Data recorded earlier, does the Input rpm read zero?

Yes

Refer to the Transmission category and perform the diagnostic procedure for P0715 (Input Speed Sensor Error). Diagnose the DTC as if it is set and current.

No

- Go to [5](#)

5. CHECK LINE PRESSURE READING

In the Event Data recorded earlier, is the line pressure reading more than 10 PSI below the desired line pressure reading?

Yes

- Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK TRANSMISSION FOR SLIPPAGE

Erase DTCs and road test the vehicle.

Check the transmission operation in reverse and all forward gears.

During the road test, was there any obvious slippage noted in 4th gear or a runaway during the 3-4 shift?

Yes

- Go to [8](#)

No

- Go to [7](#)

7. CHECK IF DTC RESETS

With the scan tool, check for Transmission DTCs after the road test.

Did the DTC P0734 reset?

Yes

- Go to [8](#)

No

- Test Complete.

8. CHECK INTERNAL TRANSMISSION

Remove the Transmission Oil Pan and Valve Body per the Service Information and check for the following:

- Excessive debris in the oil pan.
- Remove the Valve Body and check if the accumulator cover is intact and the 4C tower seal is not cut or split.
- OD and 4C accumulator pistons for cracks and/or cut seals.
- Solenoid Switch Valve and its plugs for stickiness or wear.
- Cut or missing No. 5 and/or No. 6 check ball.
- OD bleed orifice on top of the Valve Body
- Air check the OD and 4C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

NOTE: Both the OD and 4C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.

Were there any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: If the OD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [9](#)

9. CHECK REVERSE GEAR

Was there no reverse gear during the road test?

Yes (no reverse)

- Go to [10](#)

No (reverse gear OK)

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

10. CHECK ROAD TEST RESULTS

During the road test, was there no 2nd gear and no 4th gear, but 3rd gear (limp-in) was OK?

Yes

- Go to [11](#)

No

- Go to [12](#)

11. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

- 1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
- 2) Rotate the Input Annulus gear and drive shell (the drum that encloses the two rearmost carriers).
- 3) Check to see if the reaction carrier (the front most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

Is the reaction carrier turning faster than the drive shell?

Yes

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the reaction carrier per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

12. CHECK REVERSE CARRIER HUB WELD

Remove the Transmission per the Service Information and inspect the weld on the reverse carrier hub.

Were there any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0735-GEAR RATIO ERROR IN 5TH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

- 1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).
- 2) An excessive change in input or output speeds indicating signal intermittent will result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

- **When Monitored:**

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

Possible Causes
LOW FLUID LEVEL

INPUT SPEED SENSOR OR WIRING
VALVE BODY ACCUMULATOR COVER FAILED
CUT OD OR 2C ACCUMULATOR SEAL
CRACKED OD OR 2C ACCUMULATOR PISTON
BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY
CUT 2C TOWER SEAL
TRANSMISSION SOLENOID/TRS ASSEMBLY
CUT OR MISSING NO. 5, NO. 6, OR NO. 7 CHECK BALL
WORN SOLENOID SWITCH VALVE OR PLUGS
CUT OD OR 2C PISTON SEAL
STUCK MAIN REGULATOR VALVE
BURNED OD OR 2C CLUTCH
BROKEN OR MISSING 2C BLEED ORIFICE IN 2C/4C RETAINER
BROKEN REACTION SHAFT SUPPORT SEAL RING
POOR MACHINING ON PUMP VALVE BODY FACE
LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT
CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE
BROKEN REVERSE CARRIER HUB WELD
BROKEN REVERSE SUN GEAR WELD TO REACTION CARRIER

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.
If any of these DTCs are present, perform their respective tests first.

Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If any of these DTCs are present, they may cause a Gear Ratio Error. Perform the test for P0944 first if it is present.

No

- Go to [2](#)

2. CHECK EVENT DATA

With the scan tool, read and record the Event Data.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Does the Event Data display information for the DTC P0735?

Yes

- Go to [4](#)

No

- Go to [3](#)

3. CHECK THE TARGET GEAR

In the Event Data recorded earlier, does the Event Data show the DTC P1790, with Target gear = 5th, or with both the 2C and OD clutches applying?

Yes

- Go to [4](#)

No

- Go to [6](#)

4. CHECK INPUT RPM

In the Event Data recorded earlier, does the Input rpm read zero?

Yes

- Refer to the Transmission category and perform the diagnostic procedure for P0716. Diagnose the DTC as if it is set and current.

No

- Go to [5](#)

5. CHECK LINE PRESSURE READING

In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure reading?

Yes

- Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK TRANSMISSION FOR SLIPPAGE

Erase DTCs and road test the vehicle.

Check the transmission operation in reverse and all forward gears.

During the road test, was there any obvious slippage noted in 5th gear or a runaway during the 4–5 shift?

Yes

- Go to [8](#)

No

- Go to [7](#)

7. CHECK IF DTC RESETS

With the scan tool, check for Transmission DTCs after the road test.

Did the DTC P0735 reset?**Yes**

- Go to [8](#)

No

- Test Complete.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

8. CHECK INTERNAL TRANSMISSION

Remove the Transmission Oil Pan and Valve Body, per the Service Information, and check for the following:

- Excessive clutch and or metal debris in the oil pan.
- If the accumulator cover is intact and the 2C tower seal is not cut or split.
- OD and 2C accumulator pistons for cracks or cut seals.
- Solenoid Switch Valve and its plugs for stickiness or wear.
- Cut or missing No. 5, No. 6, or No. 7 check ball.
- OD bleed orifice on top of the valve body.
- Air check the OD and 2C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

NOTE: Both the OD and 2C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.

Were there any problems found?**Yes**

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: If the OD or 2C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0736-GEAR RATIO ERROR IN REVERSE

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

- 1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).
- 2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

◦ **When Monitored:**

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

◦ **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

Possible Causes
LOW FLUID LEVEL
CUT L/R TOWER SEAL ON MAIN VALVE BODY
CUT L/R CLUTCH PISTON SEALS
BROKEN OR MISSING L/R CLUTCH BLEED ORIFICE (IN L/R CLUTCH RETAINER)
CUT L/R ACCUMULATOR PISTON SEAL IN MAIN VALVE BODY
CRACKED L/R ACCUMULATOR PISTON IN MAIN VALVE BODY

CUT OD/REV PISTON SEALS
BROKEN OR MISSING OD/REV BLEED ORIFICE (IN OD/REV CLUTCH PISTON)
BROKEN REVERSE CARRIER HUB WELD
BROKEN REVERSE SUN GEAR WELD TO THE REACTION CARRIER

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCS.

Are there any Transmission solenoid, line pressure, speed sensor, and/or loss of prime DTCS present?

Yes

- Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

No

- Go to [2](#)

2. CHECK IF DTC IS CURRENT

With the scan tool, perform the Reverse Gear Clutch test. Follow the instructions on the scan tool. Increase the throttle angle, TPS degree, to 30°, for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Did the clutch test pass, input speed remain at zero?

Yes

- Go to [3](#)

No

- Go to [4](#)

3. CHECK EVENT DATA

The conditions necessary to set this DTC are not currently present.
With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Does the Event Data show an input speed reading of zero?

Yes

- Go to [8](#)

No

- Go to [4](#)

4. POSSIBLE INTERNAL TRANSMISSION CAUSES

Remove the Transmission Oil Pan and Valve Body and check the following per the Service Information:

- Clutch or metal debris in the pan
- L/R clutch tower seal on the main valve body for cuts and the L/R accumulator piston and seals.
- Air check the Reverse and L/R Hydraulic Clutch circuits (in the case) for excessive air leakage.

NOTE: Both Hydraulic Clutch circuits contain a small bleed orifice , a small amount of air leakage is normal. The Reverse hydraulic clutch circuit bleed orifice connects to the OD hydraulic clutch cavity. A small amount of air leakage into the OD hydraulic clutch circuit is considered normal.

Were there any problems found?

Yes

- Repair as necessary. If clutch debris is present, remove the transmission and inspect the Reverse and L/R clutches, and inspect the Transmission Oil Pump and Main Regulator Valve for damage or sticking in its bore.

NOTE: If the L/R clutch has failed but no obvious cause is found (such as a cut piston seal, stuck regulator valve, low line pressure reading in the Event Data, or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CLUTCH TEST FAILURE

Did the clutch test fail in reverse?

Yes

- Go to [6](#)

No

- Test complete.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

- 1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
- 2) Rotate the Input Annulus gear and drive shell, (the drum that encloses the two rearmost carriers).
- 3) Check to see if the reaction carrier (the front-most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

Is the reaction carrier turning faster than the drive shell?

Yes

- Go to [7](#)

No

- Replace the reaction carrier per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. CHECK REVERSE CARRIER HUB

Remove the Transmission per the Service Information and inspect the weld on the reverse carrier hub.

Were there any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Disassemble and inspect the input clutch assembly. Check the Reverse clutch reaction plate snap ring. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the Reverse hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

8. CHECK FOR INTERMITTENT OPERATION

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test complete.

P0740-TCC OUT OF RANGE

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

When in 2nd, through 5th gear, the torque converter clutch (TCC) can be engaged when certain conditions are met. The L/R-TCC piston is electronically modulated by increasing the duty cycle of the L/R-TCC Solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 rpm. Then the L/R-TCC solenoid is fully energized (FEMCC – 100% duty cycle). Torque converter slip is

monitored in FEMCC to ensure adequate clutch capacity.

- **When Monitored:**

During Electronically Modulated Converter Clutch (EMCC) Operation.

- **Set Condition:**

Transmission must be in EMCC, with input speed greater than 1750 rpm. L/R-TCC Solenoid achieves the maximum duty cycle and can not pull engine speed within 60 rpm of input speed. Also when the transmission is in FEMCC and the engine slips TCC more than 100 rpm for 10 seconds. This DTC can take up to five minutes of problem identification before illuminating the MIL.

Possible Causes
RELATED DTC P0750 PRESENT
L/R-TCC SOLENOID
TCC SWITCH VALVE STUCK
TCC REGULATOR VALVE STUCK
INPUT SHAFT SEAL RING CUT
TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTC P0750

With the scan tool, read transmission DTCs.

Is the DTC P0750 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

Go to [2](#)

2. CHECK IF DTC P0740 IS CURRENT

With the scan tool, Read and RECORD ALL Transmission DTCs. After recording DTCs, erase DTCs. Drive the vehicle until the transmission temperature is at least 43° C or 110° F and the engine temperature at least 49° C or 120° F.

Perform the following steps 3 times.

Drive the vehicle to the speed of at least 88 Km/h or 55 mph.

Allow 4th or 5th gear to engage for at least 10 seconds.

Close the throttle.

Tip back into the throttle until the TPS angle is between 25 and 29 degrees.

NOTE: If the throttle angle goes over 30 degrees, you must close the throttle and try again.

Did the TCC engage during any of the attempts, Engine speed approximately equal to input speed?

Yes

- Go to [3](#)

No

- Go to [4](#)

3. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorts and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

4. CHECK THE L/R-TCC SOLENOID

With the scan tool, check for other transmission DTCs.

Are the DTCs P1775 and P0841 present also?

Yes

- Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION

Repair internal transmission as necessary.

Check for the following possible causes. Refer to the Service information for the proper repair procedures.

Inspect the Transmission Oil Pump and Valve Body.

Check the Torque Converter Switch Valve and the Torque Converter Clutch Control Valve for sticking in the bore.

Check the Teflon seal rings on the input shaft. Note: If one of the seal rings is cut, the loose piece will often lodge in the TCC switch valve, causing it to stick in its bore.

If no problems are found, replace the Transmission Solenoid/TRS Assembly.

View repair

Repair

- In all cases, replace the Torque Converter. Make sure to check all other possible causes in addition to the Torque Converter.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0750-LR SOLENOID CIRCUIT

81ac056

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

- **When Monitored:**

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

- **Set Condition:**

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement — do not replace the Valve Body.

Possible Causes
RELATED DTCS PRESENT
(T20) L/R SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
(T20) L/R SOLENOID CONTROL CIRCUIT OPEN
(T20) L/R SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK DTCS

With the scan tool, check DTCs.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF P0750 IS PRESENT

Ignition on, engine not running.

With the scan tool, erase all Transmission DTCs.

Turn the ignition off to the lock position.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, actuate the L/R Solenoid.

Monitor the L/R Solenoid LED on the Transmission Simulator.

Did the L/R Solenoid LED on the Transmission Simulator blink on and off?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the Transmission simulator still connected, continue to actuate the L/R solenoid for 2 minutes.

After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0750 reset during the actuation test?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. WIGGLE TEST WITH TRANSMISSION SIMULATOR

With the Transmission simulator still connected, continue to actuate the L/R solenoid for another 2 minutes while wiggling the related wiring harness and connectors.

With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0750 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. **Note: Do NOT replace the entire Valve Body.** (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM harness connectors.

Measure the resistance between the (T20) L/R Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T20) L/R Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T20) L/R Solenoid Control circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR AN OPEN

Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T20) L/R Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T20) L/R Solenoid Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC -

45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T20) L/R Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T20) L/R Solenoid Control circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention

- to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0755-2C SOLENOID CIRCUIT

81ac056

Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

- **When Monitored:**

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

- **Set Condition:**

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement — do not replace the Valve Body.

Possible Causes
RELATED DTCS PRESENT
(T219) 2C SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS

(T219) 2C SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK DTCS

With the scan tool, check DTCs.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF P0755 IS PRESENT

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the scan tool, actuate the 2C Solenoid.

Did the 2C Solenoid LED blink on and off on the Transmission Simulator?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the Transmission simulator still connected, continue to actuate the 2C solenoid for 2 minutes.
After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0755 reset during the actuation test?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. WIGGLE TEST WITH TRANSMISSION SIMULATOR

With the Transmission simulator still connected, continue to actuate the 2C solenoid for another 2 minutes while wiggling the related wiring harness and connectors.

With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0755 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. **Note: Do NOT replace the entire Valve Body.** (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333.
Disconnect the PCM harness connectors.
Measure the resistance between the (T219) 2C Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T219) 2C Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T219) 2C Solenoid Control circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR AN OPEN

Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T219) 2C Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T219) 2C Solenoid Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T219) 2C Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T219) 2C Solenoid Control circuit for a short to ground.

81b2ebf7

TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK DTCS

With the scan tool, check DTCs.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF P0760 IS PRESENT

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the scan tool, clear Transmission DTCs.
With the scan tool, actuate the OD Solenoid.
Monitor the OD Solenoid LED on the Transmission Simulator.

Did the OD Solenoid LED on the Transmission Simulator blink on and off?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the Transmission simulator still connected, continue to actuate the OD solenoid for 2 minutes.
After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0760 reset during the actuation test?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. WIGGLE TEST WITH TRANSMISSION SIMULATOR

With the Transmission simulator still connected, continue to actuate the OD solenoid for another 2 minutes while wiggling the related wiring harness and connectors.

With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0760 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. **Note: Do NOT replace the entire Valve Body.** (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM harness connectors.

Measure the resistance between the (T60) OD Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T60) OD Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T60) OD Solenoid Control circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION

VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR AN OPEN

Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller special tool #8815 to perform diagnosis.

Measure the resistance of the (T60) OD Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T60) OD Solenoid Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC -
45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T60) OD Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T60) OD Solenoid Control circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion,

damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0765-UD SOLENOID CIRCUIT

81ac056

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

- **When Monitored:**

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

- **Set Condition:**

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement — do not replace the Valve Body.

Possible Causes
RELATED DTCS PRESENT
(T59) UD SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
(T59) UD SOLENOID CONTROL CIRCUIT OPEN
(T59) UD SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK DTCS

With the scan tool, check DTCs.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK IF P0765 IS PRESENT

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the scan tool, clear Transmission DTCs.
With the scan tool, actuate the UD Solenoid.
Monitor the UD Solenoid LED on the Transmission Simulator.

Did the UD Solenoid LED on the Transmission Simulator blink on and off?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the Transmission simulator still connected, continue to actuate the UD solenoid for 2 minutes.
After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0765 reset during the actuation test?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. WIGGLE TEST WITH TRANSMISSION SIMULATOR

With the Transmission simulator still connected, continue to actuate the UD solenoid for another 2 minutes while wiggling the related wiring harness and connectors.

With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0765 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. **Note: Do NOT replace the entire Valve Body.** (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
 Disconnect the Transmission Simulator, Miller tool #8333.
 Disconnect the PCM harness connectors.
 Measure the resistance between the (T59) UD Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T59) UD Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T59) UD Solenoid Control circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION

VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR AN OPEN

Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T59) UD Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T59) UD Solenoid Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC -

45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T59) UD Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T59) UD Solenoid Control circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention

to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0770-4C SOLENOID CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

- **When Monitored:**

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

- **Set Condition:**

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement — do not replace the Valve Body.

Possible Causes
RELATED DTCS PRESENT
(T259) 4C SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
(T259) 4C SOLENOID CONTROL CIRCUIT OPEN
(T259) 4C SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK DTCS

With the scan tool, check DTCs.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF P0770 IS PRESENT

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the scan tool, clear Transmission DTCs.
With the scan tool, actuate the 4C Solenoid.
Monitor the 4C Solenoid LED on the Transmission Simulator.

Did the 4C Solenoid LED on the Transmission Simulator blink on and off?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the Transmission simulator still connected, continue to actuate the 4C solenoid for 2 minutes.
After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0770 reset during the actuation test?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. WIGGLE TEST WITH TRANSMISSION SIMULATOR

With the Transmission simulator still connected, continue to actuate the 4C solenoid for another 2 minutes while wiggling the related wiring harness and connectors.

With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0770 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. **Note: Do NOT replace the entire Valve Body.** (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE (T259) 4C SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM harness connectors.

Measure the resistance between the (T259) 4C Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T259) 4C Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T259) 4C Solenoid Control circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION

VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK THE (T259) 4C SOLENOID CONTROL CIRCUIT FOR AN OPEN

Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller special tool #8815 to perform diagnosis.

Measure the resistance of the (T259) 4C Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T259) 4C Solenoid Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC -
45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T259) 4C SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T259) 4C Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T259) 4C Solenoid Control circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion,

damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0841-LR PRESSURE SWITCH RATIONALITY

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set if the L/R Pressure Switch reads open or closed at the wrong time in a given gear.

Possible Causes
LOSS OF PRIME AND/OR TIPM DTC PRESENT
LOW FLUID LEVEL
LOW LINE PRESSURE
REVERSE CARRIER SNAP RING DISLODGED
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR FILTER SEAL
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
NO. 1 CHECK BALL CUT OR DAMAGED
WIRING AND CONNECTORS
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

GEAR	L/R	2C	4C	UD	OD

REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN
1ST	CLOSED*	OPEN	OPEN	CLOSED	OPEN
2ND	OPEN	CLOSED	OPEN	CLOSED	OPEN
2nd PRIME	OPEN	OPEN	CLOSED	CLOSED	OPEN
3TH	OPEN	OPEN	OPEN	CLOSED	CLOSED
4TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
5TH	OPEN	CLOSED	OPEN	OPEN	CLOSED

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.

**May be open when rolling in Neutral or at low oil temperatures.

Diagnostic Test

1. CHECK IF OTHER RELATED DTCS PRESENT

Ignition on, engine not running.

With the scan tool, check for other transmission DTCs.

Are there any Loss of Prime, TCM Power Input, and/or TIPM TCM Power Control Circuit DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If the DTC P0944 is present, perform its respective test first.

No

- Go To [2](#)

2. CHECK IF THE CONDITION P0841 IS PRESENT

With the scan tool, check the DTC EVENT DATA for P0841.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Does the DTC EVENT DATA show the DTC P0841?

Yes

- Go To [3](#)

No

- Refer to the Transmission category and perform diagnostics for the DTC reported in the DTC EVENT DATA.

3. CHECK IF THE DTC SET IN REVERSE

Does the DTC EVENT DATA show the DTC P0841 set while in Reverse?

Yes

- Go To [10](#)

No

- Go To [4](#)

4. CHECK IF THE L/R PRESSURE SWITCH IS CLOSED

Does the DTC EVENT DATA show the L/R Pressure Switch reading CLOSED when the DTC P0841 was set?

Yes

- Go To [5](#)

No

- Go To [14](#)

5. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

Turn the Pressure Switch selector to L/R on the Transmission Simulator.

With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the L/R Pressure Switch state change from open to closed while pressing the Pressure Switch Test button on the Transmission Simulator?

Yes

- Go To [6](#)

No

- Go To [10](#)

6. CHECK FOR POOR WIRING AND CONNECTIONS

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK IF THE DTC SET IN FIRST GEAR

With the DTC EVENT DATA recorded earlier, check what gear the transmission was in when the DTC P0841 was set.

Does the DTC EVENT DATA show the Present Gear as first gear when the DTC P0841 was set ?

Yes

- Go To [8](#)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

8. CHECK IF THE NO. 1 CHECK BALL IS CUT OR DAMAGED

Turn the ignition off to the lock position.

Remove the Transmission Valve Body per the Service Information.

Check the No. 1 Check Ball for any possible cuts or damage.

Is the No. 1 Check Ball cut or damaged?

Yes

- Replace the No. 1 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the L/R Clutch assembly. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECK IF THE REVERSE CARRIER SNAP RING IS DISLODGED AND THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Looking through the windows in the bottom of the case, check whether the snap ring at the front of the Reverse (center) Carrier has dislodged.

NOTE: It may be necessary to pry the Input Annulus Gear Shell rearward to check this snap ring.

Is the Reverse Carrier Snap Ring dislodged?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

10. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect the Transmission Simulator, Miller tool #8333 if connected in a previous step or disconnect the Transmission Solenoid/TRS Assembly harness connector.
 Disconnect the PCM C4 harness connector and connect Miller tool #8815.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of the Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [11](#)

11. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [12](#)

12. CHECK THE PCM POWERS AND GROUNDS

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. ROAD TEST THE VEHICLE

With the scan tool, clear the DTC and road test the vehicle.

Try to duplicate the conditions in which the DTC originally set using the DTC EVENT DATA recorded earlier.

Did the DTC P0841 reset?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [17](#)

14. CHECK FOR LOW LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check for low fluid level. Check the Primary Oil Filter seal for a split, crack, or improperly installed. Refer to the Service Information for the proper installation procedure. If the fluid level and Primary Oil Filter are OK, check the Main Regulator Valve in the Oil Pump per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [15](#)

15. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
 Disconnect the Transmission Solenoid/TRS Assembly harness connector.
 Disconnect all PCM harness connectors.
 Measure the resistance between the (T50) L/R Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T50) L/R Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

Repair the (T50) L/R Pressure Switch Sense circuit for a short to another circuit(s).

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [16](#)

16. ROAD TEST THE VEHICLE

With the scan tool, clear the DTC and road test the vehicle.

Try to duplicate the conditions in which the DTC originally set using the DTC EVENT DATA recorded earlier.

Did the DTC P0841 reset?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [17](#)

17. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?**Yes**

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0845-2C HYDRAULIC PRESSURE TEST

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

- **When Monitored:**

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed above 1000 rpm, the PCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
RELATED DTC'S PRESENT
TRANSMISSION SOLENOID/TRS ASSEMBLY
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO ANOTHER CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check DTCs.

Is there any Loss of Prime, TCM Power Input, Line Pressure Sensor and/or TIPM TCM Power Control Circuit DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If the DTC P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To [2](#)

2. CHECK IF THE DTC P0755 IS PRESENT

With the scan tool, check DTCs.

Is the DTC P0755 also present?

Yes

- Refer to the symptom list and perform diagnostics for P0755-2C SOLENOID CIRCUIT.

No

- Go To [3](#)

3. CHECK IF THE DTCS P0732, P0729 AND/OR P0846 ARE PRESENT

With the scan tool, check DTCs.

Are the DTCs P0732, P0733, and/or P0846 present also?

Yes

- Go To [12](#)

No

- Go To [4](#)

4. CHECK TO SEE IF DTC P0845 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0845.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [5](#)

No

- Go To [15](#)

5. CHECK IF THE LINE PRESSURE STAYS THE SAME

Start the engine.

Warm the transmission to 82° C or 180° F.

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

Yes

- Go To [6](#)

No

- Go To [10](#)

6. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, **engine not running**.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

- Go To [7](#)

7. CHECK THE LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa (2.0 psi) or 0.1 volts of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect Transmission Simulator.
 Disconnect the PCM C1 harness connector and connect
 Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are

- found, replace the PCM per the Service Information.
 With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

10. COMPARE SCAN TOOL TO PRESSURE GAUGE

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

CAUTION: Apply parking brake.

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

CAUTION: Do not overheat transmission.

With the gear selector in park, raise the rpm to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the rpm to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the rpm to 1500, and compare the line pressure readings.

Did the scan tool Line Pressure readings match the Pressure Gauge readings $\pm$ 10 psi?

Yes

- Go To [11](#)

No

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

11. CHECK THE WIRING AND CONNECTORS

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.
Install the Transmission Simulator, Miller tool #8333.

On the Transmission Simulator, turn the Pressure Switch selector switch to 2C.

Ignition on, engine not running.

With the scan tool, monitor the 2C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 2C Pressure Switch.

Did the 2C Pressure Switch state change to closed and remain closed while wiggling the wires?

Yes

- Go To [12](#)

No

- Go To [14](#)

12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.
Remove the Transmission Simulator, Miller tool #8333.
Remove and inspect the Transmission Oil Pan per the Service Information.

Does the Transmission Oil Pan contain excessive debris or contamination?

Yes

- Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. CHECK THE 2C HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the 2C clutch hydraulic circuit, in the 2C/4C clutch retainer, for leakage per the Service Information.

NOTE: The 2C hydraulic clutch circuit contains a small bleed orifice, a small amount of air leakage is normal.

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the 2C clutch piston, piston seals and bleed orifice assembly.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the 2C Accumulator piston and seals. Check for an extra check ball downstream from the #7 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

14. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Disconnect all PCM harness connectors.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T147) 2C Pressure Switch Sense circuit and any other circuit(s) in

the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

15. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

If the DTC EVENT DATA shows the DTC P0845 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0846-2C PRESSURE SWITCH RATIONALITY

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

- **When Monitored:**

Continuously with the ignition on, engine running, with the transmission in gear.

- **Set Condition:**

The DTC is set if the 2C Pressure Switch reads open or closed at the wrong time in a given gear .

Possible Causes
RELATED TIPM TCM DTCS PRESENT
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT OPEN
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
(T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS
EXCESSIVE FLUID LEAKAGE IN 2C CLUTCH CIRCUIT
NO. 5 AND/OR NO. 7 CHECK BALL CUT OR DAMAGED
EXTRA CHECK BALL DOWNSTREAM OF THE NO. 7 CHECK BALL SOCKET
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE
WIRING AND CONNECTORS

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN

**May be open when rolling in Neutral or at low oil temperatures.					

Diagnostic Test

1. CHECK FOR TCM TIPM DTCS

With the scan tool read DTCS.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCS present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

No

- Go To [2](#)

2. CHECK IF THE DTC DATA SHOWS THE CURRENT DTC

With the scan tool, check the DTC EVENT DATA.

Does the DTC EVENT DATA show data for DTC P0846?

Yes

- Go To [3](#)

No

- Refer to the Transmission category and perform the appropriate symptom shown in the DTC EVENT DATA.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

3. CHECK IF MULTIPLE DTCS ARE PRESENT

With the scan tool, check DTCs.

Are there two or more related pressure switch rationality DTCs present in addition to P0846?

Yes

- Go To [4](#)

No

- Go To [7](#)

4. CHECK IF ALL THE PRESSURE SWITCHES READ CLOSED

With the scan tool, check the DTC EVENT DATA for P0846.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Do all the pressure switches read CLOSED in the DTC EVENT DATA for P0846?

Yes

- Refer to Transmission category and perform diagnostics for P0882.

No

- Go To [5](#)

5. CHECK IF ALL THE PRESSURE SWITCHES READ OPEN

In the DTC EVENT DATA recorded earlier, read the state of all pressure switches.

Do all the pressure switches read OPEN?

Yes

- Go To [6](#)

No

- Go To [7](#)

6. CHECK FOR LOW LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. CHECK IF THE DTC SET IN PARK, NEUTRAL, OR REVERSE

With the scan tool, check the DTC EVENT DATA for P0846.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Does the DTC EVENT DATA show the DTC P0846 set in Park, Neutral, or Reverse?

Yes

- Go To [12](#)

No

- Go To [8](#)

8. CHECK IF THE 2C PRESSURE SWITCH READS CLOSED

With the scan tool, check the DTC EVENT DATA for P0846.

Does the DTC EVENT DATA show the 2C Pressure Switch reading CLOSED?

Yes

- Go To [10](#)

No

- Go To [9](#)

9. CHECK THE LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [15](#)

10. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to the 2C position.

With the scan tool, monitor the 2C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

Did the state of the 2C Pressure Switch change while pressing the Pressure Switch Test button?

Yes

- Go To [11](#)

No

- Go To [12](#)

11. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorted and open circuits.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

12. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect the Transmission Simulator, Miller tool #8333.
 Disconnect the PCM C4 harness connector.
 Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T147) 2C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connect and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T147) 2C Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [14](#)

14. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all the other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

15. CHECK IF THE #5 AND/OR #7 CHECK BALL IS CUT OR DAMAGED

Turn the Ignition off to the lock position.

Remove the Valve Body Assembly per the Service Information.

Inspect the #5 and #7 check balls for any cuts or damage.

Check for an extra check ball in the passage downstream from the #7 check ball pocket.

Inspect the 2C accumulator piston and seals and also the 2C tower seal on top of the valve body. Refer to the Service Information.

Where there any problems found?

Yes

- Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 2C clutch as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [16](#)

16. CHECK FOR EXCESSIVE FLUID LEAKAGE WITHIN THE 2C CLUTCH CIRCUIT

Air check the 2C Clutch hydraulic circuit. Refer to the Service Information.

NOTE: This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.

Was there excessive air leakage in the 2C Clutch hydraulic circuit?

Yes

- Repair as necessary. Refer to the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0868-LINE PRESSURE LOW

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired (target) line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

- **When Monitored:**

Continuously while driving in a forward gear.

- **Set Condition:**

The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure is more than 15 psi below Desired Line Pressure for 3.5 seconds continuously will cause this DTC to set.

Possible Causes
CHECK FOR RELATED DTCS
LOW FLUID LEVEL
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
POOR LINE PRESSURE SENSOR CONNECTION
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
(T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT
INTERNAL TRANSMISSION
LINE PRESSURE SENSOR
CRACKED, PLUGGED, OR MIS-INSTALLED PRIMARY OIL FILTER
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STUCK OR STICKING MAIN REGULATOR VALVE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

Is the DTC P0932 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0868.

NOTE: This counter only applies to the last DTC set.

Is the START SINCE SET COUNTER 2 or less?

Yes

- Go To [3](#)

No

- Go To [11](#)

3. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, **engine not running.**

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

- Go To [4](#)

4. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
Ignition on, engine not running.
With the scan tool, monitor the Line Pressure during the following steps.
Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa (2.0 psi) of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa (2.0 psi) in all three positions?

Yes

- Go To [5](#)

No

- Go To [7](#)

5. CHECK THE LINE PRESSURE SENSOR

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors. Install the Line Pressure Adaptor, Miller tool #8259, and the Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa (0 to 300 psi).

Start the engine in park.

Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

Yes

- Go To [6](#)

No

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK FOR A PLUGGED TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

NOTE: Make sure the Primary Transmission Oil Filter and/or O-ring is not cracked or split.

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or O-ring. If the Primary Transmission Oil Filter is plugged refer to the Service Information for the proper Hydraulic repair procedure.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Repair internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary. If no problem is found, replace the Solenoid/TRS Assembly.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Transmission Simulator, Miller tool #8333.
Reconnect all previously disconnected connectors except the Line Pressure Sensor harness connector.

Ignition on, engine not running.

Measure the voltage of the (F856) 5-volt Supply circuit in the Line Pressure Sensor harness connector.

Is the voltage above 5.5 volts?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C1 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [10](#)

10. CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
 Disconnect the Transmission Solenoid/TRS Assembly harness connector.
 Disconnect all PCM harness connectors.
 Measure the resistance between the (T118) Pressure Control Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T118) Pressure Control Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

**Yes**

- Repair the (T118) Pressure Control Solenoid Control circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

11. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?**Yes**

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0869-LINE PRESSURE HIGH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The actual line pressure is continuously being compared to the desired (target) line pressure. If the actual line pressure is consistently higher than the highest desired line pressure ever used in the current gear, the line pressure high DTC P0869 will set.

- **When Monitored:**

Continuously while driving in a forward gear.

- **Set Condition:**

The PCM continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the maximum desired line pressure ever used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure) for 3.5 seconds continuously will cause this DTC to set.

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
LINE PRESSURE SENSOR CONNECTION
(T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT
LINE PRESSURE SENSOR
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTC'S

With the scan tool, check DTCs.

Is the DTC P0932 or P0882 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0869.

Is the STARTS SINCE SET COUNTER 2 or less?

Yes

- Go To [3](#)

No

- Go To [10](#)

3. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, **engine not running**.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa

(30 psi) or 0.7 volts and did not change)

- Go To [4](#)

4. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
Ignition on, engine not running.
With the scan tool, monitor the Line Pressure during the following step.
Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa (2.0 psi) or 0.1 volts of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa (2.0 psi) in all three positions?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. CHECK THE LINE PRESSURE SENSOR CALIBRATION

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors.
Install the Line Pressure Adaptor, Miller tool #8259, and Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa (0 to 300 psi).
Start the engine in park.
Monitor the Line Pressure readings on the scan tool and the pressure gauge.
Compare the Line Pressure readings between the scan tool and the pressure gauge.

Is the pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?

Yes

- Repair the internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly, possible cause is a stuck Pressure Control Solenoid.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Line Pressure Sensor per the Service information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333.
Disconnect the Powertrain Control Module C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T118) Pressure Control Solenoid Control circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T118) Pressure Control Solenoid Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T118) Pressure Control Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T118) Pressure Control Solenoid Control circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Disconnect the PCM C1 harness connector.
Disconnect the Line Pressure Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No**

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

10. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0870-OD HYDRAULIC PRESSURE TEST

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

- **When Monitored:**

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed above 1000 rpm, the PCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
TRANSMISSION SOLENOID/TRS ASSEMBLY
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
TRANSMISSION CONTROL RELAY DTCS PRESENT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, check DTCs.

Is there any Loss of Prime, TCM Power Input, Line Pressure Sensor and/or TIPM TCM Power Control Circuit DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To [2](#)

2. CHECK IF THE DTC P0760 IS PRESENT

With the scan tool, check DTCs.

Is the DTC P0760 also present?

Yes

- Refer to the symptom list and perform diagnostics for P0760-OD SOLENOID CIRCUIT.

No

- Go To [3](#)

3. CHECK IF OTHER DTCS ARE PRESENT

With the scan tool, check DTCs.

Are any of the DTCs, P0733, P0734 ,P0735 and/or P0871 present also?

Yes

- Go To [12](#)

No

- Go To [4](#)

4. CHECK TO SEE IF DTC P0870 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0870.

Is the STARTS SINCE SET COUNTER 2 or less?

Yes

- Go To [5](#)

No

- Go To [15](#)

5. CHECK IF THE LINE PRESSURE STAYS THE SAME

Start the engine.

Warm the transmission to 82° C (180° F).

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

Did the line pressure remain at a steady value between 585 and 655 kPa (85 and 95 psi) in each position?

Yes

- Go To [6](#)

No

- Go To [10](#)

6. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, **engine not running**.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as

necessary.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

- Go To [7](#)

7. CHECK THE LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa (2.0 psi) of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect Transmission Simulator.
 Disconnect the PCM C4 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention

81b2f7b7

to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

10. COMPARE THE SCAN TOOL TO THE PRESSURE GAUGE

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

CAUTION: Apply parking brake.

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

CAUTION: Do not overheat transmission.

With the gear selector in park, raise the rpm to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the rpm to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the rpm to 1500, and compare the line pressure readings.

Did the scan tool Line Pressure readings match the Pressure Gauge readings $\pm$ 10 psi?

Yes

- Go To [11](#)

No

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

11. CHECK THE WIRING AND CONNECTORS

Turn the ignition off to the lock position.

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

On the Transmission Simulator, turn the Pressure Switch selector switch to OD.

Ignition on, engine not running.

With the scan tool, monitor the OD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the OD Pressure Switch.

Did the OD Pressure Switch state change to closed and remain closed while wiggling the wires?

Yes

- Go To [12](#)

No

- Go To [14](#)

12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Remove and inspect the Transmission Oil Pan per the Service Information.

Does the Transmission Oil Pan contain excessive debris or contamination?

Yes

- Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. CHECK THE OD HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the OD hydraulic clutch circuit (in the case) for leakage per the Service Information.

NOTE: The OD hydraulic clutch circuit contains a small bleed orifice which connects to the Reverse hydraulic clutch circuit. A small amount of air leakage is normal.

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the OD/Rev clutch piston seals, bleed orifice assembly, reaction shaft support seal rings, and machining of the main mating faces on the pump housing, pump valve body, and reaction shaft support.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the OD Accumulator piston and seals. Check for an extra check ball downstream from the #6 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

14. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Disconnect all PCM harness connectors.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

NOTE: Check connectors - Clean/repair as necessary.

Measure the resistance between the (T9) OD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T9) OD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T9) OD Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

15. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

If the DTC EVENT DATA shows the DTC P0870 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0871-OD PRESSURE SWITCH RATIONALITY

01ad00a1

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The appropriate DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear.

Possible Causes
RELATED TCM POWER INPUT DTCS PRESENT
LINE PRESSURE DTCS PRESENT

**May be open when rolling in Neutral or at low oil temperatures.					

Diagnostic Test

1. CHECK DTCS

With the scan tool, read DTCs.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK IF LINE PRESSURE DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

Are there any Line Pressure DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [3](#)

3. CHECK FOR OTHER PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTCs.

Are there two or more other pressure switch rationality DTCs present in addition to P0871?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. CHECK IF DTC IS CURRENT

With the scan tool, read and record the DTC EVENT DATA.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Does the DTC EVENT DATA show data for P0871

Yes

- Go To [8](#)

No

- Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

CHECK IF RELATED DTC IS PRESENT

5.

With the scan tool, read and record the DTC EVENT DATA.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Do all the pressure switches read CLOSED in the DTC EVENT DATA?

Yes

- Refer to the Transmission category and perform diagnostics for P0882. Follow instructions as if the DTC is current. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

No

- Go To [6](#)

6. CHECK IF PRESSURE SWITCHES READ OPEN

In the DTC EVENT DATA recorded earlier, read the state of all pressure switches.

Do all the pressure switches read open?

Yes

- Go To [7](#)

No

- Go To [8](#)

7. CHECK FOR LOW LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure to the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter weal for a spit, crack , or improperly installed. If the filer and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

8. CHECK IF IN PARK, NEUTRAL, OR REVERSE

Ignition on, engine not running.

With the scan tool, read and record the DTC EVENT DATA for P0871.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Does the DTC EVENT DATA show the OD Pressure Switch DTC set while in Park, Neutral, or Reverse?

Yes

- Go To [18](#)

No

- Go To [9](#)

9. CHECK IF THE OD PRESSURE SWITCH WAS OPEN

Refer to the DTC EVENT DATA recorded earlier for P0871.

Did the OD Pressure Switch read OPEN?

Yes

- Go To [10](#)

No

- Go To [15](#)

10. CHECK FOR LOW LINE PRESSURE

Refer to the DTC EVENT DATA recorded earlier and compare the Line Pressure and the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

Repair as necessary to correct low line pressure. Check the fluid level. Check the Primary Oil Filter seal for a split, crack, or improperly installed. Refer to the Service Information for the proper installation procedure. If the fluid level and filter are OK, check the Main Regulator Valve in the Oil Pump.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [11](#)

11. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
Disconnect all PCM harness connectors.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.
Measure the resistance between the (T9) OD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T9) OD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T9) OD Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [12](#)

12. CHECK TO SEE IF THE DTC RESETS

Reconnect all previously disconnected connectors.

With the scan too, erase transmission DTCs.

Test drive the vehicle, use the DTC EVENT DATA recorded earlier to help duplicate the conditions when the DTC originality set.

Does the DTC P0871 reset?

Yes

- Go To [13](#)

No

- Go To [22](#)

13. CHECK THE POWERTRAIN CONTROL MODULE

Remove the Transmission Control Relay.

Operate the vehicle in Drive.

Is the transmission slipping while in Drive?

Yes

- Go To [14](#)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

14. AIR CHECK TRANSMISSION CLUTCH OPERATION

Perform an Air Check Transmission Clutch Operation procedure per the Service Information.

NOTE: The OD/Rev piston contains a small bleed orifice, a small amount of leakage between the OD and Reverse hydraulic clutch circuits is considered normal.

Is there excessive air leakage in any clutch circuit?

Yes

- Check the OD/Rev piston seals and bleed orifice, reaction shaft support seal rings, dribbler orifice assemblies in the reaction shaft support and for poor machine on the pump valve body faces. Refer to the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Repair the Valve Body. Check the OD Accumulator piston and seals, OD bleed orifice, and No.6 check ball cuts or damage. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

15. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to OD.

With the scan tool, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the state of the OD Pressure Switch change from OPEN to CLOSED while pressing the Test button?

Yes

- Go To [16](#)

No

- Go To [18](#)

16. CHECK IF THE NO. 4 AND/OR NO. 6 CHECK BALL IS CUT OR DAMAGED

With the scan tool, erase previously stored DTC's and test drive the vehicle, use the DTC EVENT DATA to help duplicate the conditions when the DTC originality set. Note any DTCs that may set.

Remove the Transmission Valve Body per the Service Information.

Check the No. 4 and No. 6 Check Balls for cuts or damage.

Is the No. 4 and/or No. 6 Check Ball cut or damaged?

Yes

- Replace the No. 4 and/or No. 6 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the OD Clutch Assembly. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [17](#)

17. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Did the DTC P0871 reset during the test drive in the previous step?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [22](#)

18. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.
Disconnect the Transmission Solenoid /TRS Assembly harness connector

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T9) OD Pressure Switch Sense circuit from the appropriate terminal of Miller tool #8815 to the Solenoid/TRS Assembly harness connector.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T9) OD Pressure Switch Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [19](#)

19. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T9) OD Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T9) OD Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [20](#)

20. CHECK WIRING AND CONNECTORS

Using the schematics as a guide, inspect the wiring and connectors. Pay particular attention to all power and ground circuits.

Were there any problems found

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [21](#)

21. CHECK THE POWERTRAIN CONTROL MODULE

Reconnect all previously disconnected connectors.

Make sure all DTC EVENT DATA is recorded.

With the scan tool, erase previously stored DTC's and test drive the vehicle, use the DTC EVENT DATA to help duplicate the conditions when the DTC originality set.

Does the DTC P0871 reset?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [22](#)

22. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0875-UD HYDRAULIC PRESSURE TEST

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine .

- **When Monitored:**

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed above 1000 rpm, the PCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

Possible Causes
RELATED DTCS PRESENT
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
TRANSMISSION CONTROL RELAY DTCS PRESENT
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, check DTCs.

Is there any Loss of Prime, TCM Power Input, TIPM TCM Power Control Circuit and/or Line Pressure Sensor DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

No

- Go To [2](#)

2. CHECK IF THE DTC P0765 IS PRESENT

With the scan tool, check DTCs.

Is the DTC P0765 also present?

Yes

- Refer to the Transmission category and perform diagnostics for the symptom P0765-UD SOLENOID CIRCUIT.

No

- Go To [3](#)

3. CHECK IF OTHER DTCS ARE PRESENT

With the scan tool, check DTCs.

Are any of the DTCs, P0731, P0732, P0733, P1736, and/or P0876 present also?

Yes

Go To [12](#)

No

- Go To [4](#)

4. CHECK TO SEE IF DTC P0875 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0875.

Is the STARTS SINCE SET COUNTER 2 or less?

Yes

- Go To [5](#)

No

- Go To [17](#)

5. CHECK IF THE LINE PRESSURE STAYS THE SAME

Start the engine.

Warm the transmission to 82° C or 180° F.

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?

Yes

- Go To [6](#)

No

- Go To [10](#)

6. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, **engine not running**.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

- Go To [7](#)

7. CHECK THE LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect Transmission Simulator.
 Disconnect the PCM C1 harness connector and connect
 Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit from the Line Pressure Sensor harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion,

damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

10. COMPARE THE SCAN TOOL READING TO PRESSURE GAUGE READING

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

CAUTION: Apply parking brake.

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

CAUTION: Do not overheat transmission.

With the gear selector in park, raise the rpm to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the rpm to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the rpm to 1500, and compare the line pressure readings.

Did the scan tool Line Pressure readings match the Pressure Gauge readings $\pm$ 10 psi?

Yes

- Go To [11](#)

No

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

11. CHECK THE WIRING AND CONNECTORS

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.
Install the Transmission Simulator, Miller tool #8333.
On the Transmission Simulator, turn the Pressure Switch selector switch to UD.
Ignition on, engine not running.
With the scan tool, monitor the UD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the UD Pressure Switch.

Did the UD Pressure Switch state change to closed and remain closed while wiggling the wires?

Yes

- Go To [12](#)

No

- Go To [14](#)

12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.
Remove the Transmission Simulator, Miller tool #8333.
Remove and inspect the Transmission Oil Pan per the Service Information.

Does the Transmission Oil Pan contain excessive debris or contamination?

Yes

- Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. CHECK THE UD HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) for leakage per the Service Information.

NOTE: The UD hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the UD clutch piston, piston seals and bleed orifice, reaction shaft support seal rings, and machining of the main mating faces of the pump housing, pump valve body, and reaction shaft support.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the UD Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

14. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Remove the Transmission Simulator, Miller tool #8333.
 Disconnect the PCM C4 harness connector and connect Miller tool #8815.
 Measure the resistance of the (T29) UD Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for

an open.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [15](#)

15. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [16](#)

16. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Disconnect all PCM harness connectors.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

17. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

If the DTC EVENT DATA shows the DTC P0875 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0876-UD PRESSURE SWITCH RATIONALITY

01ad00e1

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC is set if the UD pressure switch is in the wrong state for the current gear. For example, this code would be set if the UD pressure switch remained off while the transmission was in second gear.

Possible Causes
RELATED DTCS PRESENT
LOW FLUID LEVEL
NO. 2 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
CRACKED OR MIS-INSTALLED SUMP FILTER OR SEAL
LOOSE COOLER RETURN SPIN ON FILTER (IF EQUIPPED)
STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY
(T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN
(T29) UD PRESSURE SWITCH CIRCUIT SHORT TO GROUND
(T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO ANOTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.					
**May be open when rolling in Neutral or at low oil temperatures.					

Diagnostic Test

1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, check DTCs.

Are there any TCM Power Input, TIPM TCM Power Control Circuit, Line Pressure, and/or Loss of Prime DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If a Loss of Prime DTC is present, perform its respective test first.

No

- Go To [2](#)

2. CHECK FOR PRESSURE SWITCH DTCS

Are there two or more other pressure switch rationality DTCs present in addition to P0876?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK IF ALL PRESSURE SWITCHES READ CLOSED

With the scan tool, read and record all DTC EVENT DATA.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Does the DTC EVENT DATA show all pressure switches reading CLOSED?

Yes

- Refer to the Transmission category and perform the diagnostics for P0882. Diagnose the symptom as if the DTC is current.

No

- Go To [4](#)

4. CHECK FOR OTHER DTCS

With the scan tool, check DTCs.

Is the DTC P2704 present also?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK THE DTC EVENT DATA

With the scan tool, read and record the DTC EVENT DATA.

NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.

Does the DTC EVENT DATA display information for the DTC P0876?**Yes**

- Go To [6](#)

No

- Refer to the Transmission category and perform the diagnostics for the DTC listed in the DTC EVENT DATA. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

6. CHECK IF DTC EVENT DATA WAS SET IN PARK, NEUTRAL OR REVERSE

Refer to the DTC EVENT DATA recorded earlier.

Did the DTC P0876 set in Park, Neutral, or Reverse?**Yes**

- Go To [10](#)

No

- Go To [7](#)

7. CHECK THE UD PRESSURE SWITCH STATUS

Refer to the DTC EVENT DATA recorded earlier.

Did the DTC P0876 set with the UD Pressure Switch closed?**Yes**

- Go To [10](#)

No

- Go To [8](#)

8. CHECK THE LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?**Yes**

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are

OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [9](#)

9. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
Disconnect all PCM harness connectors.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.
Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

10. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to the UD position.

With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

Yes

- Go To [14](#)

No

- Go To [11](#)

11. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T29) UD Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [12](#)

12. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [13](#)

13. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Disconnect all PCM harness connectors.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

14. PERFORM A WIGGLE TEST USING THE TRANSMISSION SIMULATOR

Perform the steps in the previous test while wiggling the wiring harness and connectors pertaining to the UD Pressure Switch.

Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?

Yes

- Repair the wiring harness and/or connectors as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [15](#)

15. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY FOR A SHORT TO GROUND

Disconnect the Transmission Simulator and reconnect the Transmission Solenoid/TRS Assembly harness connector. Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit in the appropriate terminal of Miller tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [16](#)

16. CHECK IF THE DTC RESETS

Reconnect all previously disconnected connectors.

With the scan tool, erase all transmission DTCs.

Test drive the vehicle. Using the DTC EVENT DATA recorded earlier, try to duplicate the conditions in which the DTC originally set.

Does the DTC P0876 reset?

Yes

- Go To [17](#)

No

- Go To [18](#)

17. CHECK FOR A CUT NO. 2 CHECK BALL

Remove the Valve Body per the Service Information.

Check the No. 2 check ball for cuts or damage.

Is the No. 2 check ball cut or damaged?

Yes

Replace the No. 2 check ball. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

18. CHECK FOR INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0882-TCM POWER INPUT LOW

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/TRS Assembly and to the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into “limp-in” mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If the Transmission Control System detects less than 3.0 volts when the output is commanded on, the DTC will set. **Note: Inadequate Transmission Control Output voltage can also cause DTCs P0846, P0869, P0871, P0876 or P0988 to set. Repairing the P0882 fault should also eliminate the related DTCs.**

- **When Monitored:**

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

- **Set Condition:**

This DTC is set when there is less than 3.0 volts present at the transmission control output circuits located in the Powertrain Control Module (PCM) when the Transmission Control System request the power up of those circuits. .

Possible Causes
RELATED TIPM DTCS
(T15) TRANSMISSION CONTROL CIRCUIT SHORT TO GROUND
(T15) TRANSMISSION CONTROL CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC P0882 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0882.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter equal to 0?

Yes

- Go To [2](#)

No

- Go To [5](#)

2. CHECK FOR TIPM RELATED DTCs

With the scan tool, check TIPM DTCs.

Are there any TCM TIPM DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [3](#)

3. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Disconnect the TIPM C1 harness connector.
Measure the resistance between ground and the (T15) Transmission Control circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T15) Transmission Control circuit for a short to ground.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (T15) Transmission Control circuit between the TIPM C1 harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T15) Transmission Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0883-TCM POWER INPUT HIGH

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/TRS Assembly and to the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into "limp-in" mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If voltage is detected on the Transmission Output circuits before the request is sent, the DTC will set.

- **When Monitored:**

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

- **Set Condition:**

This DTC is set if the Powertrain Control Module senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the PCM to TIPM to energize the Transmission Output circuits.

Possible Causes
TIPM DTCS PRESENT
(T15) TRANSMISSION CONTROL CIRCUIT SHORT TO VOLTAGE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR TCM TIPM DTCS

With the scan tool, read DTCs.

Are there any TIPM TCM Power Control Circuit DTCS present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF DTC P0883 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter set to 0?

Yes

- Go To [3](#)

No

- Go To [6](#)

3. (T16) TRANSMISSION OUTPUT CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.
Disconnect the TIPM C10 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.
Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts on any (T16) Transmission Control Output circuit?

Yes

- Go To [4](#)

No

- Go To [5](#)

4. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.
Ignition on, engine not running.
Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE (T515) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage of the (T515) Transmission Control circuit.

Is the voltage above 0.5 volts?

Yes

- Repair the (T515) Transmission Control circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0884-POWER UP AT SPEED

If a vehicle loses power to the Transmission Control System, the solenoids (L/R, 2C, OD, UD, 4C) will go to their respective power off state. Some solenoids are normally vented and some are normally applied in their power off state. The transmission is designed to be in 3rd gear with all of the solenoids in this state. However, if power is restored, the Transmission Control System will power-up and normal operation will be restored.

This code identifies that power to the Transmission Control System was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 Km/h (20 mph). **This DTC does not indicate a problem with the transmission or Transmission Control System**, instead, it suggests intermittent problems in the fused ignition switch output, fused B(+), or ground circuits to the TCM. Alternately, if a person performs a rolling restart maneuver, the DTC can be set. Therefore it is critical that this DTC be investigated if the vehicle is experiencing intermittent 3rd gear operation and a subsequent return to normal operation.

- **When Monitored:**

When Powertrain Control Module initially powers up.

- **Set Condition:**

This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear, with no PRNDL DTCs, and an output speed above 800 rpm, approximately 32 Km/h or 20 mph.

Possible Causes
POWER UP AT SPEED

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK THE POWER AND GROUND CIRCUITS

This DTC is set when the Transmission portion of the Powertrain Control Module is initialized while the vehicle is moving down the road in a valid forward gear.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Check all of the Fused B(+), Fused Ignition Switch Output, and ground circuits to the PCM for an intermittent open or short to ground.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

View repair.

Repair

Check all power and ground circuits to the PCM and repair as necessary.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0890-SWITCHED BATTERY

01ad00a1

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Totally Integrated Control Module (TIPM) replaces the Transmission control relay. The Transmission Control Output circuit is used to supply power to the solenoids and pressure switches (Transmission Solenoid/TRS Assembly) when the transmission is in normal operating mode. When the Transmission Control Output circuit is off, no power is supplied and the transmission.

Immediately after a controller reset (ignition key turned to the "run" position or after cranking engine), the TCM verifies that the Transmission Control Output circuits are open by checking for no voltage at the transmission control output terminals at the PCM. After this is verified, the voltage at the pressure switches are checked. There should be no voltage on the pressure switches at this time. The PCM will then activate the relay.

- **When Monitored:**

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

- **Set Condition:**

This DTC is set if the Powertrain Control Module senses voltage on any of the pressure switch inputs prior to the Transmission Control Output circuit being energized.

Possible Causes
PRESSURE SWITCH SENSE CIRCUITS SHORT TO VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR TIPM TCM DTCS

With the scan tool, read DTCs.

Are there any TCM Power Control DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. CHECK TO SEE IF DTC P0890 IS PRESENT

With the scan tool, Check the STARTS SINCE SET counter for P0890.

NOTE: This counter only applies to the last DTC set.

Is the "Starts Since Set" counter set at 0?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. CHECK THE PRESSURE SWITCH SENSE CIRCUITS FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.
 Disconnect the PCM C4 harness connector and connect Miller tool #8815.
 Disconnect the Transmission Solenoid/TRS Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.
 With the scan tool under TIPM, actuate the Transmission.
 Measure the voltage of the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and (T29) UD Pressure Switch Sense circuits in Miller tool #8815.

Is the voltage above 0.5 volt on any of the measured circuits?

Yes

- Repair the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and/or (T29) UD Pressure Switch Sense circuit(s) for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the scan tool under TIPM, stop the Transmission actuation.

Turn the ignition off.

Reconnect the Transmission Solenoid/TRS Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and (T29) UD Pressure Switch Sense circuits in Miller tool #8815.

Is the voltage above 0.5 volts on any of the sense circuits?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No**

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0933-LINE PRESSURE SENSOR CIRCUIT PERFORMANCE

01a79c68

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

- **When Monitored:**

Continuously with the ignition on, engine running, with the transmission in gear.

- **Set Condition:**

The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure reading is more than 172 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure ever used in the current gear, the DTC sets.

Possible Causes
RELATED DTCS PRESENT
LINE PRESSURE CONNECTOR AND WIRING
LINE PRESSURE SENSOR
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read DTCs.

Are there any other line pressure DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. Perform the test for P0934 and/or P0935 first if present.

No

- Go to [2](#)

2. COMPARE ACTUAL LINE PRESSURE TO DESIRED LINE PRESSURE

CAUTION: Apply Parking Brake

Start the engine.

CAUTION: Firmly apply the brakes.

With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees.

While firmly applying the brakes, place the shifter in reverse, then slowly press the accelerator pedal to a TPS degree of 15°.

Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

Does the Line Pressure stay within ± 34 kPa or 5 psi of the Desired Line Pressure?**No**

- Go to [3](#)

Yes

- Go to [6](#)

3. CHECK LINE PRESSURE CONNECTOR AND WIRING

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor and the Transmission Solenoid/TRS Assembly.

Did the voltage remain steady while wiggling the wiring harness and connectors?**Yes**

- Go to [4](#)

No

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

4. CHECK PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.
Ignition on, engine not running.
With the scan tool, monitor the Line Pressure during the following step.
With the Transmission Simulator, turn the selector switch to each of the 3 Line Pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi or 0.1 volts of the reading specified on the Transmission Simulator.

Does the Line Pressure on the scan tool fluctuate up and down more than 69 kPa or 10 psi at any of the 3 line pressure positions on the Transmission Simulator?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. CHECK THE LINE PRESSURE SENSOR

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors.
Install the Line Pressure Adaptor, Miller tool #8259, and the Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa (0 to 300 psi).
Start the engine in park.
Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

Is the line pressure gauge reading within 34 kPa (5 psi) of the scan tool reading?**Yes**

- Repair internal transmission and inspect the oil pump per the Service information and replace if necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly — possible cause is the Pressure Control Solenoid is stuck.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?**Yes**

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0934-LINE PRESSURE SENSOR CIRCUIT LOW

01a79c68

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 volts for 0.18 seconds.

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0934.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [2](#)

No

- Go To [7](#)

2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the scan tool, under Transmission Sensors, monitor the Line Pressure.
Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: The readings should be within ± 14 kPa (2.0 psi) on the scan tool to the pressure readings specified on Transmission Simulator.

Does the Line Pressure on the scan tool match the line pressures on the Transmission Simulator?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.
 Disconnect the PCM C4 harness connector and connect Miller tool #8815.
 Disconnect the Transmission Simulator, Miller tool #8333.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the PCM C4 harness connector and connect Miller tool #8815.
 Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION

VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are

found, replace the PCM per the Service Information.
With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0935-LINE PRESSURE SENSOR CIRCUIT HIGH

01a79c68

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

- **When Monitored:**

Continuously with ignition on and engine running.

- **Set Condition:**

This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for the period of 0.18 seconds

Possible Causes
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(K900) SENSOR GROUND CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0935.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter 2 or less?

Yes

- Go To [2](#)

No

- Go To [6](#)

2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the scan tool, monitor the Line Pressure.
Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: The readings should be within ± 14 kPa or 2.0 psi on the scan tool of the pressure reading specified on Transmission Simulator.

Does the 3 line pressures on the scan tool match the Line pressure readings on the Transmission Simulator?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [3](#)

CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN

3.

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333.
Disconnect the PCM C1 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (K900) Sensor Ground circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (K900) Sensor Ground circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION

VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T38) Line Pressure Sensor Signal circuit.

Is the voltage above 5.5 volts?

Yes

- Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention

to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0944-LOSS OF HYDRAULIC PUMP PRIME

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Loss of prime test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or cracked oil filter.

The Loss of Prime DTC is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

- **When Monitored:**

If the transmission is slipping in any forward gear and all the pressure switches are not indicating pressure, a loss of prime test is run.

- **Set Condition:**

If the transmission begins to slip in a forward gear and all the pressure switch(s) that should be closed are open a loss of prime test begins. Available elements are turned on by the PCM to see if pump prime exists. The DTC sets if no pressure switch(s) respond.

Possible Causes
SHIFT LEVER OUT OF ADJUSTMENT
IMPROPER FLUID LEVEL
CRACKED OR IMPROPERLY INSTALLED PRIMARY OIL FILTER OR SEAL
LOOSE COOLER RETURN FILTER
STUCK OR STICKING MAIN REGULATOR VALVE
TRANSMISSION OIL PUMP

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. SHIFT LEVER POSITION TEST

Using the scan tool, perform a Shift Lever Position test. Follow the instructions on the scan tool.

Did the Shift Lever Position Test pass?**Yes**

- Go to [2](#)

No

- Refer to the Transmission category and perform the appropriate symptom.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

2. CHECK TO SEE IF DTC P0944 IS CURRENT

Place the gear selector in Park.

Start the engine.

The transmission must be at operating temperature prior to checking pressure. A cold transmission will give higher readings.

Run the engine at 1500 rpm.

With the scan tool, monitor the Transmission Line Pressure.

Does the Line Pressure match the Desired Line Pressure within ± 5 psi?**No**

- Go to [6](#)

Yes

- Go to [3](#)

3. CHECK LINE PRESSURE IN DRIVE AND REVERSE

Firmly apply the brake and repeat the previous test in both Drive and the Reverse gear positions.

With the scan tool, monitor the Transmission Line Pressure.

Does the Line Pressure match the Desired Line Pressure within ± 5 psi in all gear ranges?**Yes**

- Go to [4](#)

No

- Go to [5](#)

4. REVIEW CUSTOMER COMMENTS

The conditions necessary to set this DTC are not present at this time.

Verify with the customer if a delayed engagement and/or an intermittent "No Drive" condition has occurred.

If the customers answer is "No" erase the DTC and return the vehicle to the customer.
 Make sure to check for any TSBs or controller flash updates that may apply.
 With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Has the customer experienced any delayed engagement and/or "No Drive" conditions?

Yes

- Go to [6](#)

No

- Test Complete.

5. DTC VERIFICATION

Read and record the DTC and the Event Data information.
 Test drive the vehicle and attempt to operate the vehicle within the parameters in which the DTC set.
 With the scan tool, read DTCs.

Did any following DTCs set, P0868, P0944, P0841, P0846, P0871, P0876, or P0988?

Yes

- Go to [6](#)

No

- Test Complete.

6. CHECK TRANSMISSION OIL FILTER

Remove and inspect the Transmission Oil Pan per the Service Information.
 Remove and inspect the Primary Oil Filter per the Service Information.
 Inspect the oil filter seal for damage and proper installation.

Does the Oil Pan contain excessive debris, or is the oil filter plugged, loose, or damaged?

Yes

- Repair the cause of the plugged transmission oil filter or excessive debris. Check the Transmission Oil Filter seal for improper installation onto filter neck instead of into the pump bore, not fully seated against pump housing, filter neck not engaged into pump. Check that the spin-on cooler return filter (if equipped) is not loose, and that its gasket is in good condition and properly seated. Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Repair the Transmission Oil Pump as necessary. Check for a stuck main regulator valve and clean if necessary. Refer to the Service Information for the proper repair procedure.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P0987-4C HYDRAULIC PRESSURE TEST

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

- **When Monitored:**

In any forward gear with engine speed above 1000 rpm shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed above 1000 rpm, the PCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

Possible Causes
LINE PRESSURE SENSOR
TRANSMISSION FLUID CONTAMINATION
RELATED DTCS PRESENT
TRANSMISSION SOLENOID/TRS ASSEMBLY
EXCESSIVE DEBRIS IN OIL PAN
POOR LINE PRESSURE SENSOR CONNECTION
RELATED TCM POWER INPUT DTCS PRESENT
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHERS
TRANSMISSION SOLENOID/TRS ASSEMBLY
INTERNAL TRANSMISSION
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, read DTCs.

Is there any Loss of Prime, TCM Power Input, TIPM TCM Power Control Circuit and/or Line Pressure Sensor DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom. If the DTC P0944 is present, perform its respective test first.

No

- Go to [2](#)

2. CHECK FOR DTCS

With the scan tool, check Transmission DTCs.

Is the DTC P0770 also present?

Yes

- Refer to the symptom list and perform diagnostics for P0770.

No

- Go to [3](#)

3. OTHER DTCS PRESENT

With the scan tool, check for other transmission DTCs

Are the DTCs P0988 and/or P1736 present also?

Yes

- Go to [12](#)

No

- Go to [4](#)

4. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, check if the DTC is active or stored.

Is the DTC active?

Yes

- Go to [5](#)

No

- Go to [17](#)

5. CHECK IF THE LINE PRESSURE STAYS THE SAME

Start the engine.

Warm the transmission to 82° C or 180° F.

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?

Yes

- Go to [6](#)

No

- Go to [10](#)

6. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, **engine not running**.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

Did the Line Pressure reading on the scan tool CHANGE to about 207 kPa (30 psi) or 0.7 volts when the connector was pushed inward?

Yes (value was higher and changed to 207 kPa (30 psi) or 0.7 volts)

- Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as

necessary.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No (value is higher than 207 kPa (30 psi) or 0.7 volts and did not change or the value was already 207 kPa (30 psi) or 0.7 volts and did not change)

- Go to [7](#)

7. CHECK THE LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?

Yes

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect Transmission Simulator.
 Disconnect the PCM C1 harness connector and connect
 Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [9](#)

9. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (F856) 5-volt Supply circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information.

- With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

10. COMPARE SCAN TOOL TO PRESSURE GAUGE

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

CAUTION: Apply parking brake.

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

CAUTION: Do not overheat transmission.

With the gear selector in park, raise the rpm to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the rpm to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the rpm to 1500, and compare the line pressure readings.

Did the scan tool Line Pressure readings match the Pressure Gauge readings $\pm$ 10 psi?

Yes

- Go to [11](#)

No

- Replace the Line Pressure Sensor per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

11. CHECK PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.

Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

On the Transmission Simulator, turn the Pressure Switch selector switch to 4C.

Ignition on, engine not running.

With the scan tool, monitor the 4C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 4C Pressure Switch.

Did the 4C Pressure Switch state change to closed and remain closed while wiggling the wires?

Yes

- Go to [12](#)

No

- Go to [14](#)

12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Remove and inspect the Transmission Oil Pan per the Service Information.

Does the Transmission Oil Pan contain excessive debris or contamination?

Yes

- Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [13](#)

13. CHECK 4C HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the 4C hydraulic clutch circuit (in the case) for leakage per the Service Information.

NOTE: The 4C hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.

Was there excessive air leakage noticed during the air check?

Yes

- Repair as necessary. Check the 4C clutch piston, piston seals and bleed orifice assembly.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Disassemble and inspect the Valve Body and repair as necessary. Inspect the 4C Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

14. CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333 and connect Miller tool #8815.

Disconnect the PCM C4 harness connector.

Measure the resistance of the (T48) 4C Pressure Switch

Sense circuit between the Transmission Solenoid/TRS

Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC -
45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [15](#)

15. CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [16](#)

16. CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Disconnect all PCM harness connectors.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.

NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.

NOTE: Check connectors - Clean/repair as necessary.

Measure the resistance between the (T48) 4C Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T48) 4C Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

17. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If the Event Data shows the DTC Pie set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P0988-4C PRESSURE SWITCH RATIONALITY

01ad00e1

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the L/R, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

- **When Monitored:**

Continuously with the ignition on, engine running, with the transmission in gear.

- **Set Condition:**

The DTC is set if the 4C Pressure Switch reads open or closed at the wrong time in a given gear .

Possible Causes
RELATED DTCS PRESENT
DTC P0871 ALSO PRESENT
LOSS OF 12-VOLT FEED
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN
(T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
EXCESSIVE FLUID LEAKAGE WITH 4C CLUTCH CIRCUIT
NO. 5 CHECK BALL CUT OR DAMAGED
LOW LINE PRESSURE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE
WIRING AND CONNECTORS

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

GEAR	L/R	2C	4C	UD	OD
REVERSE	OPEN	OPEN	OPEN	OPEN	OPEN
P/N	CLOSED**	OPEN	OPEN	OPEN	OPEN

2nd PRIME	OPEN	OPEN	CLOSED	CLOSED	OPEN
3TH	OPEN	OPEN	OPEN	CLOSED	CLOSED
4TH	OPEN	OPEN	CLOSED	OPEN	CLOSED
5TH	OPEN	CLOSED	OPEN	OPEN	CLOSED
*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.					
**May be open when rolling in Neutral or at low oil temperatures.					

Diagnostic Test

1. CHECK FOR OTHER DTCS

With the scan tool, read DTCs.

Are there any TCM Power Input DTCs or TIPM TCM Power Control Circuit present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. DTC DATA SHOW CURRENT DTC

With the scan tool, read the Event Data.

Does the Event Data show data for DTC P0988?

Yes

- Go to [3](#)

No

- Refer to the Transmission category and perform the appropriate symptom identified in the Event Data.

3. CHECK IF MULTIPLE DTCS ARE PRESENT

With the scan tool, check DTCs.

Are there two or more related Pressure Switch Sense DTCs present in addition to P0988?

Yes

- Go to [4](#)

No

- Go to [7](#)

4. RELATED DTC PRESENT

With the scan tool, read the Event Data for P0988.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Do all the pressure switches read CLOSED in the Event Data for P0988?

Yes

- Refer to Transmission category and perform diagnostics for the DTC P0882.

No

- Go to [5](#)

5. CHECK IF THE PRESSURE SWITCHES READ OPEN

In the Event Data recorded earlier, read the state the state of all pressure switches.

Do all the pressure switches read OPEN?

Yes

- Go to [6](#)

No

- Go to [7](#)

6. CHECK FOR LOW LINE PRESSURE

In the Event Data recorded earlier, compare the Line Pressure and the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. CHECK IF THE DTC P0871 ALSO SET

With the scan tool, check DTCs.

Is the DTC P0871 also present?

Yes

- Refer to the Transmission category and perform the diagnostic procedure for P0871.

No

- Go to [8](#)

8. CHECK IF THE DTC SET IN PARK, REVERSE OR NEUTRAL

With the scan tool, read the Event Data for P0988.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Does the Event Data show the DTC P0988 set in Park, Neutral, or Reverse?

Yes

- Go to [13](#)

No

- Go to [9](#)

9. CHECK IF THE Event Data READS CLOSED

With the scan tool, read the Event Data for P0988.

Does the Event Data show the 4C Pressure Switch reading CLOSED?

Yes

- Go to [11](#)

No

- Go to [10](#)

10. CHECK THE PRIMARY OIL FILTER SEAL

In the Event Data recorded earlier, compare the Line Pressure and the Desired Line Pressure.

Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?

Yes

- Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [15](#)

11. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the Transmission Simulator, turn the Pressure Switch selector switch to the 4C position.

With the scan tool, monitor the 4C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

Did the state of the 4C Pressure Switch change while pressing the Pressure Switch Test button?

Yes

- Go to [12](#)

No

- Go to [13](#)

12. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorted and open circuits.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

13. CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
 Disconnect the Transmission Simulator, Miller tool #8333.
 Disconnect the PCM C4 harness connector.
 Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T48) 4C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of

Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [14](#)

14. CHECK THE (T48) 4C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST.

No

- Replace the Powertrain Control Module per the Service Information. With the scan tool, perform the

Quick Learn procedure.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

15. CHECK IF THE NO. 5 AND/OR NO. 7 CHECK BALL IS CUT OR DAMAGED

Turn the Ignition off to the lock position.

Remove the Valve Body Assembly per the Service Information.

Inspect the #5 and #7 check balls for any cuts or damage.

Inspect the 4C accumulator piston and seals and also the 4C tower seal on top of the valve body. Refer to the Service Information.

Where there any problems found?

Yes

- Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 4C clutch as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [16](#)

16. CHECK FOR EXCESSIVE LEAKAGE WITHIN THE 4C CLUTCH CIRCUIT

Air check the 4C Clutch hydraulic circuit. Refer to the Service Information.

NOTE: This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.

Was there excessive air leakage in the 4C Clutch hydraulic circuit?

Yes

- Repair as necessary. Refer to the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P128B-TCM POWER CONTROL CIRCUIT 2 LOW - TIPM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

- **Set Condition:**

A shorted condition is detected in the Transmission Control Output circuit.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes

- Go to [2](#)

No

- Go to [5](#)

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND

Turn the ignition off
Disconnect the TIPM C2 harness connector.
Disconnect the PCM C4 harness connector and install Miller tool #8815.

**CAUTION: Do not probe the PCM harness connectors.
Probing the PCM harness connectors will damage the
PCM terminals resulting in poor terminal to pin**

connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T16) Transmission Control Output circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to ground.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [3](#)
-

3. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Connect the TIPM C2 harness connector.
Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at all the (T16)

Transmission Control Output circuits?

Yes

- Go to [4](#)

No

- Repair the (T16) Transmission Control Output circuit for an open.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

4. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test complete.

P128C-TCM POWER CONTROL CIRCUIT 2 HIGH - TIPM

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

A shorted condition is detected in the TIPM Transmission Control Output circuit.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes

- Go to [2](#)

No

- Go to [4](#)

2. (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.
Disconnect the TIPM C2 harness connector.
Disconnect the PCM C4 harness connector.
Ignition on, engine not running.
Measure the voltage of the (T16) Transmission Control Output circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the (T16) Transmission Control Output circuit for a short to voltage.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors. Check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

4. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors. Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test complete.

P128D-TCM POWER CONTROL CIRCUIT 2 OPEN - TIPM

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

An open condition of the Transmission Control Output circuit is detected by the Totally Integrated Power Module (TIPM).

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, read DTCs.

Is the status Active for this DTC?

Yes

- Go to [2](#)

No

- Go to [4](#)

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and install Miller tool #8815.
Disconnect the Transmission Solenoid harness connector.
Disconnect the Line Pressure Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin

connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go to [3](#)

No

- Repair the (T16) Transmission Control Output circuit for an open.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

3. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module per Service Information.

- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

4. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test complete.

P128E-TCM POWER CONTROL CIRCUIT 2 OVERCURRENT - TIPM

With the ignition on. Battery voltage greater than 10 volts.

◦ **Set Condition:**

An overcurrent condition is detected in the TCM Power Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With a scan tool, read TIPM DTCs.

Is the DTC active at this time?

Yes

- Go to [2](#)

No

- Go to [5](#)

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT

Turn the ignition off to the lock position.
Disconnect the TIPM C2 harness connector.
Connect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector.
Read the amperage on the ammeter.

Does the amperage read below 2.0 amps?

Yes

- Go to [4](#)

No

- Go to [3](#)

3. CHECK THE PCM

Disconnect the ammeter from the TIPM C2 harness connector and battery positive.
 Disconnect the PCM C4 harness connector.
 Reconnect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector.
 Read the amperage on the ammeter.

Does the amperage read below 2.0 amps?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. CHECK THE TRANSMISSION SOLENOIDS

Disconnect the ammeter from the TIPM C2 harness connector.

Disconnect the PCM C4 harness connector and install Miller tool #8815.

Connect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C10 harness connector. While monitoring the amperage reading of the ammeter and using a jumper wire, jump each solenoid control circuit to ground one at a time in the appropriate terminals of Miller tool #8815.

NOTE: The amperage draw should be approximately .02 milliampere on each solenoid circuit with the PCM C4 harness connector disconnected.

Does the amperage read between .05 and .015 milliampere ($\pm .005$ milliampere) on each solenoid tested?

Yes

- Replace the Totally Integrated Control Module per the Service Information.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS per the Service Information.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P1684-BATTERY WAS DISCONNECTED

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The PCM uses a battery backed RAM (Random Access Memory) is used to maintain some learned values. When the battery B(+) is disconnected, the memory is lost. When the B(+) is restored, this memory loss is detected by the Transmission Control System. The DTC is set and the learned values are initialized to known constants or previously learned values from EEPROM (Electronic Erasable Programmable Read Only Memory). This results in the reinitialization of some parameters.

- **When Monitored:**

Whenever the ignition is in the Run/Start position.

- **Set Condition:**

This DTC will set whenever Powertrain Control Module is disconnected from Fused B(+) or ground. It will also be set using the scan tool to perform a Battery Disconnect and/or Quick Learn procedure.

Possible Causes
BATTERY WAS DISCONNECTED
SCAN TOOL BATTERY DISCONNECT PERFORMED
PCM WAS REPLACED OR DISCONNECTED
QUICK LEARN WAS PERFORMED

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. POSSIBLE CAUSES

This DTC is an informational DTC only.

This DTC is set due to a momentary loss of power and/or the ground circuits to the PCM.

Below are a list of possible causes associated with this DTC.

Battery was disconnected.

The Battery Disconnect feature (if equipped) on the scan tool was performed.

The Quick Learn feature on the scan tool was performed.

PCM was replaced or disconnected.

Were any of the above possible causes performed?

Yes

- This is the cause of the DTC. Erase the DTC and return vehicle to customer.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [2](#)

2. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

NOTE: Check all power and ground circuits to the PCM for a intermittent or high resistance condition.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P1715-RESTRICTED MANUAL VALVE IN T3 RANGE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Whenever the PRNDL code indicates Temp 3.

- **Set Condition:**

This DTC sets when conditions for the DTC P1776 are satisfied or 3 unsuccessful attempts to engage 1st gear while the shifter is in the temp 3 zone. This indicates a restricted port at the manual valve because the shifter is not fully engaged in the drive position.

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
CUSTOMER DRIVING HABITS
MISADJUSTED SHIFTER

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check DTCs.

Are any of the following DTCs P0731, P0732, P0733, P0734, P0736, or P0716 present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK SHIFTER ADJUSTMENT

Check Shifter adjustment per the Service Information.

Is the shifter properly adjusted?

Yes

- Go to [3](#)

No

- Adjust the Shifter Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

3. CHECK CUSTOMER DRIVING HABIT

This DTC can be set if the customer rests their hand on the shift lever while they are driving. The transmission can be put in the T3 position if just enough upward pressure towards neutral is exerted on the shift lever. When this occurs, the feed port to the clutch is restricted, the transmission will declare neutral, and this DTC will be set. The customer should be informed not to rest their hand on the shifter while driving. This DTC can also be set by simply bumping the shift lever toward neutral while accelerating. With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

- This DTC can be set by putting too much forward pressure on the shift lever while it is in the OD position. Make sure the customer is informed.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

P1736-GEAR RATIO ERROR IN 2ND PRIME

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

NOTE: Various Gear Ratio Error DTCs will set only if the transmission slips after first achieving the correct ratio. Therefore, a transmission with no drive (or reverse) may not set any Gear Ratio Error DTC because it never achieves a correct gear ratio.

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).

2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the

output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

- **When Monitored:**

Continuously with the ignition on, engine running, and after the transmission has achieved the proper gear ratio.

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

Possible Causes
RELATED DTCS PRESENT
INPUT SPEED SENSOR OR WIRING
LOW FLUID LEVEL
CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL
WORN SOLENOID SWITCH VALVE OR PLUGS
STUCK OR STICKING MAIN REGULATOR VALVE
BURNED UD OR 4C CLUTCH
CUT 4C OR UD PISTON SEAL
BROKEN 4C PISTON CASTING
BROKEN OR MISSING 4C BLEED ORIFICE
BROKEN OR MISSING UD BLEED ORIFICE
CUT 4C OR UD ACCUMULATOR PISTON SEAL
CRACKED 4C OR UD ACCUMULATOR PISTON
TRANSMISSION SOLENOID/TRS ASSEMBLY
BROKEN WELD - REACTION CARRIER TO REVERSE SUN GEAR
MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer

to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**Diagnostic Test****1. CHECK IF RELATED DTCS ARE PRESENT**

With the scan tool, read DTCs.

Are any Transmission solenoid, line pressure, speed sensor, or loss of prime DTCs present?

Yes

- Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

No

- Go to [2](#)

2. CHECK THE EVENT DATA

With the scan tool, read and record the Event Data.

NOTE: Make sure to record all Event Data stored in the scan tool for future reference in this test procedure.

Does the Event Data display information for the DTC P1736?

Yes

- Go to [3](#)

No

- Go to [6](#)

3. CHECK INPUT RPM IN THE EVENT DATA

In the Event Data recorded earlier, does the Input rpm read zero?

Yes

- Check the input speed sensor and wiring. Refer to test P0716 and diagnose as if the DTC is current.

No

- Go to [4](#)

4. CHECK LINE PRESSURE READING

In the Event Data recorded earlier, is the line pressure reading more than 10 psi below the desired line pressure?

Yes

- Go to [5](#)

No

- Go to [6](#)

5. PLUGGED TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

NOTE: Make sure the Primary Transmission Oil Filter and/or seal is not cracked or split.

Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?

Yes

- Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If the Primary Transmission Oil Filter is plugged, refer to the Service Information for the proper hydraulic clutch repair procedure.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Remove the Transmission Oil Pump per the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK IF THE DTC P1736 IS CURRENT

With the scan tool, perform the 2nd Prime Gear Clutch Test. Follow the instructions on the scan tool.

Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

NOTE: If the 4C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 2nd Prime Gear Clutch Test will not detect a faulty 4C clutch. However, it will detect a faulty UD clutch.

Did the clutch test pass, did the Input Speed remain at zero?

Yes

- Go to [7](#)

No

- Go to [9](#)

7. CHECK FOR INTERMITTENT OPERATION

Check the Shifter adjustment per the Service Information.

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [8](#)

8. CHECK FOR SLIPPAGE

With the scan tool, erase Transmission DTCs.

Road test the vehicle.

During the road test, operate in 4th gear, and perform kickdown shifts from 4th to 2nd (prime) gears.

Is there an obvious slippage noticed in 4th or 2nd prime gears, or runaway on the 4-2 shift?

Yes

- Go to [11](#)

No

- Go to [14](#)

9. UD CLUTCH HYDRAULIC CIRCUIT

Remove Transmission Oil Pan and check for excessive debris.

Remove the Valve Body and air check the UD clutch hydraulic circuit (in the case) per the Service Information.

NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?

Yes

- Repair as necessary. Check the UD clutch piston seals and the dribbler assembly, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore .

NOTE: If the UD clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [10](#)

10. UD ACCUMULATOR PISTON

Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

Were there any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

11. EXCESSIVE DEBRIS

Remove the Transmission Oil Pan and check for excessive debris.

Remove the valve body and air check the 4C clutch hydraulic circuit per the Service Information.

NOTE: The 4C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.

Were there any problems found, excessive debris, improperly assembled 4C clutch and/or excessive air leakage in the 4C clutch hydraulic circuit?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 4C piston seals and bleed orifice.

NOTE: If the 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [12](#)

12. 4C ACCUMULATOR

Check the 4C Accumulator piston for cracks or a cut seal.

Check for a cut or missing No. 5 check ball.

Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

Were there any problems found?

Yes

- Repair as necessary. Refer to the Service Information for proper repair procedures.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [13](#)

13. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

- (1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.
- (2) Rotate the Input Annulus gear and drive shell, (the drum that encloses the two rearmost carriers).
- (3) Check to see if the reaction carrier (the front most carrier, whose outer shell is splined to the 4C clutch) is

rotating faster than the drive shell is being turned.

Is the reaction carrier turning faster than the drive shell?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the reaction carrier per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

14. CHECK IF THE DTC RESET

Did the DTC P1736 reset during the road test?

Yes

- Go to [15](#)

No

- Go to [16](#)

15. LIST OF POSSIBLE CAUSES

If any other DTCs set during the road test, refer to the appropriate symptom in the Transmission category.
If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:
Check for excessive debris in the Transmission Oil pan, plugged, cracked, or split Primary Transmission Oil Filter and/or seal.

Check for cuts or missing No. 5 check ball in the main valve body.

Check the 4C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.

Check the UD clutch piston seals, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces.

Check the 4C clutch piston seals, and bleed orifice.

Check the UD clutch piston seals, reaction shaft support seal rings, and dribbler assemblies, and the flatness of the pump valve body and pump housing faces.

View repair

Repair

- Repair as necessary. Refer to the Service Information for proper repair procedures.

NOTE: If the UD or 4C clutch has failed but no obvious cause is found (such as a cut piston seal, broken seal ring, stuck regulator valve or any other items listed above) replace the Transmission

Solenoid/TRS Assembly in addition to any necessary internal repairs.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

16. INTERMITTENT DTC

The conditions necessary to set this DTC are not present at this time.

Use the Event Data to help identify the conditions and/or possible causes that may have caused the DTC to set. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 5th gear, it will be in the upshifted position and directing the fluid to the torque converter clutch (TCC) control circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R Pressure Switch is monitored to confirm SSV movement. If movement is not confirmed (the L/R pressure switch does not close), EMCC is inhibited until SSV operation is confirmed.

- **When Monitored:**

During an attempted shift into 1st gear.

- **Set Condition:**

This DTC is set if three unsuccessful attempts are made to shift the Solenoid Switch Valve (SSV) into the downshifted position in one given ignition start. This DTC can take up to five minutes to mature before illuminating the MIL.

Possible Causes
RELATED DTC P0841 PRESENT
SOLENOID SWITCH VALVE STICKING
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, read DTCs.

Is the DTC P0841 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [3](#)

No

- Go to [6](#)

3. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.

With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?

Yes

- Go to [4](#)

No

- Go to [5](#)

4. CHECK IF THE SOLENOID SWITCH VALVE STICKING

Turn the ignition off to the lock position.
 Remove the Transmission Oil Pan per the Service Information.
 Remove the Transmission Valve body per the Service Information.
 Inspect the Solenoid Switch Valve and Plugs for sticking.

Is the Solenoid Switch Valve or Plugs sticking?

Yes

- Clean and inspect per the Service Information. Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. CHECK THE L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.
 Disconnect the Transmission Solenoid/TRS Assembly harness connector.
 Disconnect all PCM harness connectors.
 Measure the resistance between the (T50) L/R Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T50) L/R Pressure Switch Sense circuit and all other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to another circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion,

damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 5th gear, it will be in the upshifted position and directing the fluid to the torque converter clutch (TCC) control circuit.

When in 2nd through 5th gear, the Torque Converter Clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L/R solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 rpm. Then the L/R solenoid is fully energized (FEMCC - 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

- **When Monitored:**

Continuously when performing partial or full EMCC - PEMCC or FEMCC.

- **Set Condition:**

If the transmission senses the L/R pressure switch closing while performing PEMCC or FEMCC. This DTC will set after two unsuccessful attempts to perform PEMCC or FEMCC. This DTC can take up to five minutes of problem identification before illuminating the MIL.

Possible Causes
RELATED DTC P0841 PRESENT
L/R PRESSURE SWITCH SENSE CIRCUIT OPEN
L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND
SOLENOID SWITCH VALVE
POWERTRAIN CONTROL MODULE
CHECK THE WIRING AND CONNECTORS

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR RELATED DTCS

With the scan tool, read DTCs.

Is the DTC P0841 present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

- Go to [3](#)

No

- Go to [7](#)

3. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the Transmission Simulator, turn the Pressure Switch selector switch to the L/R position.
With the scan tool, monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?

Yes

- Go to [4](#)

No

- Go to [5](#)

4. CHECK THE SOLENOID SWITCH VALVE

Remove the Valve Body per the Service Information.

Inspect the Solenoid Switch Valve and plugs for sticking in the bore and/or wear.

Were there any problems found?

Yes

- Clean and repair as necessary per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [7](#)

5. CHECK THE L/R PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the Solenoid/TRS Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [6](#)

6. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

7. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

This DTC can also be set by the Solenoid Switch Valve intermittently sticking in its bore under extreme temperature conditions, or by a worn Solenoid Switch Valve or plugs.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P1794-SPEED SENSOR GROUND ERROR

01a79c68

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

- 1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36 and P1736).
- 2) An excessive change in input or output speeds indicating signal intermittent which will result in the DTCs P0716 and/or P0721 being set.
- 3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

- **When Monitored:**

The gear ratio is monitored continuously while the Transmission is in gear.

- **Set Condition:**

After a controller reset in neutral and a ratio of input to output, of 1 to 2. This DTC can take up to five minutes of problem identification before illuminating the MIL.

Possible Causes
(T13) SPEED SENSOR GROUND CIRCUIT OPEN
(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND
(T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF DTC P1794 IS CURRENT

Engine Running, Shift lever in park.

With the scan tool, read the Transmission Output and Input Speed Sensor states.

Is the Output Speed Sensor reading twice the Input Speed Sensor reading?

Yes

- Go to [2](#)

No

- Go to [6](#)

2. PCM AND WIRING

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool 8333.
With the Transmission Simulator, set the Input/Output Speed selector switch to the "3000/1000" position. Turn the Input/Output Speed switch to "ON".
Ignition on, engine not running.
With the scan tool, monitor the Input and Output Speed Sensor state.

Does the Input speed read 3000 rpm and the Output speed read 1000 rpm, within 50 rpm?

Yes

- Go to [6](#)

No

- Go to [3](#)

3. (T13) SPEED SENSOR GROUND CIRCUIT OPEN

Turn the ignition off to the lock position.
Disconnect the PCM C4 harness connector and connect Miller tool #8815.
Disconnect the Transmission Simulator, Miller tool #8333.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T13) Speed Sensor Ground circuit between both Input and Output Speed Sensor harness connectors and the appropriate terminal of Miller tool #8815 to the.

Is the resistance above 5.0 ohms on any of the above measurements?

Yes

- Repair the (T13) Speed Sensor Ground circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [5](#)

5. (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE

Ignition on, engine not running.
With the scan tool under TIPM, actuate the Transmission.
Measure the voltage of the (T13) Speed Sensor Ground circuit.

Is the voltage above 0.5 volt?

Yes

- Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are

found, replace the PCM per the Service Information.
With the scan tool, perform Quick Learn.

- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P2700-INADEQUATE ELEMENT VOLUME LR

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

- **When Monitored:**

Whenever the engine is running. The L/R clutch volume index (CVI) is updated during a 3-1 or 2-1 manual downshift with throttle angle below 5 degrees. Transmission temperature must be at least 43° C (110° F).

- **Set Condition:**

When the L/R clutch volume index (CVI) falls below 16.

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN L/R CLUTCH PISTON RETURN SPRING OR SPRING RETAINERS
BROKEN L/R ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. OTHER DTCS PRESENT

With the scan tool, read DTCs.

Are there any Pressure Switch Sense circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK L/R CLUTCH VOLUME INDEX

With the scan tool, erase DTCs.

Start the engine and warm the transmission.

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

Drive the vehicle and perform at least ten 3-1 manual downshifts at closed throttle from speeds of about 32 Km/h or 20 mph.

With the scan tool, read the L/R CL VOL INDEX.

Is the L/R CL VOL INDEX below 20?

Yes

- Go to [3](#)

No

- Go to [5](#)

3. L/R CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the service information.

Check condition of the L/R accumulator springs.

Look for possible leak paths into the L/R clutch hydraulics circuit within the valve body.

Were any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. AIR CHECK L/R CLUTCH CIRCUITS

Perform an air check on the L/R Clutch circuit per the Service Information.

Watch and listen for L/R Clutch piston movement.

Does the L/R piston stroke and return properly?

Yes

- Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Repair internal transmission as necessary. Pay attention to the components related to the L/R clutch. A broken or weak L/R clutch return spring, Accumulator Spring, and/or dislocated snap ring could cause this problem.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. VERIFY PCM OPERATION

NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.

With the scan tool, record the CL VOL INDEX (CVI) for all clutches

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P2701-INADEQUATE ELEMENT VOLUME 2C

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

- **When Monitored:**

Whenever the engine is running. The 2C clutch volume index (CVI) is updated during a 3-2 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

- **Set Condition:**

When the 2C CVI falls below 5.

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN 2C CLUTCH PISTON RETURN SPRING / DISLODGED SNAP RING
BROKEN ACCUMULATOR SPRING(S)
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. OTHER DTCS PRESENT

With the scan tool, read DTCs.

Are there any Pressure Switch Sense circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK 2C CLUTCH VOLUME INDEX

With the scan tool, erase Transmission DTCs.

Drive the vehicle at about 80 Km/h (50 mph), then depress the OD off button. This will put the vehicle into third gear.

NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

Perform at least ten 3-2 kickdowns by depressing the throttle between 10 and 54 TPS Degrees at speeds of about 80 Km/h (50 mph).

With the scan tool, read the 2C CL VOL INDEX.

Is the 2C CL VOL INDEX below 10?

Yes

- Go to [3](#)

No

- Go to [5](#)

3. 2C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the service information.

Check condition of the 2C accumulator springs .

Look for possible leak paths into the 2C clutch hydraulics circuit within the valve body.

Were any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. AIR CHECK 2C CLUTCH CIRCUIT

Turn the ignition off to the lock position.

Perform an air check on the 2C Clutch circuit per the Service Information.

Watch and listen for 2C Clutch piston movement.

Dose the piston stroke and return properly?**Yes**

- Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Repair internal transmission as necessary. Pay attention to the components related to the 2C clutch. A broken or dislodged 2C return spring, snap ring or broken 2C Accumulator Spring could cause this problem.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. VERIFY PCM OPERATION

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.

With the scan tool, record the CL VOL INDEX (CVI) for all clutches

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?**Yes**

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P2702-INADEQUATE ELEMENT VOLUME OD

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

- **When Monitored:**

Whenever the engine is running. The OD clutch volume index (CVI) is updated during a 2-3 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

- **Set Condition:**

When the OD CVI falls below 5.

Possible Causes
HYDRAULIC LEAK IN THE VALVE BODY
BROKEN OD ACCUMULATOR SPRING
BROKEN OD/REV PISTON BELLEVILLE SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP ASSEMBLY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. OTHER DTCS PRESENT

With the scan tool, check DTCs.

Are there any Pressure Switch Sense circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK THE OD CLUTCH VOLUME INDEX

With the scan tool, erase DTCs.

NOTE: The TRANS TEMP DEG must be at least 43° C (110° F) before performing the following steps.

Drive the vehicle and perform at least ten 2-3 upshifts with the TPS degree between 10 and 54.
With the scan tool, read the OD CL VOL INDEX.

Is the OD CL VOL INDEX below 10?

Yes

- Go to [3](#)

No

- Go to [5](#)

3. OD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the service information.

Check condition of the OD accumulator spring.

Look for possible leak paths into the OD clutch hydraulics circuit within the valve body.

Were any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. AIR CHECK OD CLUTCH CIRCUIT

Perform an air check on the OD Clutch circuit per the Service Information.

Watch and listen for OD Clutch piston movement.

Air check all other pump passages and watch for air leakage into the OD clutch passage.

NOTE: There is a bleed orifice between the OD and Reverse Clutch passages, so a small amount of air leakage from Reverse to OD is normal.

Were any problems found?

Yes

- Repair internal transmission. Pay attention to the OD Clutch. Broken or weak return spring or a dislocated snap ring could cause this problem. If no problems were found in the OD clutch, or if leakage into the OD passage was noted, replace Pump Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission/TRS Solenoid Assembly per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. VERIFY PCM OPERATION

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 MPH, then brake lightly to a stop. Turn off engine.

With the scan tool, record the CL VOL INDEX (CVI) for all clutches.

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P2703- INADEQUATE ELEMENT VOLUME UD

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

- **When Monitored:**

Whenever the engine is running. The UD clutch volume index (CVI) is updated during a 4-3 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

- **Set Condition:**

When the UD CVI falls below 11.

Possible Causes
BROKEN UD ACCUMULATOR SPRING(S)
BROKEN UD CLUTCH PISTON SPRING OR DISLODGED SNAP RING
INTERNAL LEAKAGE IN PUMP OR VALVE BODY ASSEMBLIES
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. OTHER DTCS PRESENT

With the scan tool, check DTCs.

Are there any Pressure Switch Sense circuit DTCs present also?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go to [2](#)

2. CHECK UD CLUTCH VOLUME INDEX

With the scan tool, erase Transmission DTCs.

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

Drive the vehicle and perform at least ten 4-3 kickdowns by depressing the throttle between 30 and 54 TPS degrees at speeds about 80 Km/h or 50 mph.

With the scan tool, read the UD clutch volume index (CVI).

Is the UD CVI below 10?

Yes

- Go to [3](#)

No

- Go to [5](#)

3. UD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan and valve body per the Service Information.

Check the condition of the UD accumulator springs.

Look for possible leak paths into the UD clutch hydraulics circuit within the valve body.

Were there any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. AIR CHECK UD CLUTCH CIRCUIT

Perform an air check on the UD Clutch circuit per the Service Information.

Watch and listen for UD Clutch piston movement.

Air check all other pump passages for air leakage into the UD Clutch circuit.

Were any problems found?**Yes**

- Repair internal transmission. Pay attention to components related to the UD clutch. Broken or weak return spring or a dislocated snap ring. If no trouble is found in UD clutch component or UD clutch leakage was noted in passage, replace the Pump Assembly.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. VERIFY PCM OPERATION

NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Km/h or 50 mph, then brake lightly to a stop. Turn off engine.

With the scan tool, record the clutch volume index (CVI) for all clutches.

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVIs and compare them to the readings recorded before the BATTERY DISCONNECT.

Are any of the CVIs less than 5 or different than before the BATTERY DISCONNECT?**Yes**

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P2704-INADEQUATE ELEMENT VOLUME 4C

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTCs, which indicates an internal transmission problem.

- **When Monitored:**

Whenever the engine is running. The 4C clutch volume index (CVI) is updated during a 3-4 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).

- **Set Condition:**

When the 4C CVI falls below 5.

Possible Causes
BROKEN 4C RETURN SPRING OR DISLODGED SNAP RING
BROKEN 4C ACCUMULATOR SPRING(S)
HYDRAULIC LEAK IN THE VALVE BODY
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK THE 4C CLUTCH VOLUME

With the scan tool, record the 4C clutch volume index (CVI) and erase DTCs.

Perform at least 10, 3-4 upshifts with the throttle between 10 and 54 degrees. The Transmission temperature must be at least 43° C or 110° F.

With the scan tool, read the 4C CVI.

Is the current 4C CVI below 10?

Yes

- Go to [2](#)

No

- Go to [5](#)

2. DTC P0876 PRESENT

With the scan tool, check DTCs.

NOTE: The DTC P0876 must also be set with P2704 in order for this test to be valid.

Is the DTC P0876 also present?

Yes

- Replace the Transmission Solenoid/TRS Assembly per the Service Information.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [3](#)

3. 4C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the Service Information.

Check condition of the 4C accumulator springs.

Look for possible leak paths into the 4C clutch hydraulics circuit within the valve body.

Were any problems found?

Yes

- Repair as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go to [4](#)

4. AIR CHECK 4C CLUTCH CIRCUIT

Perform an air check on the 4C Clutch circuit per the Service Information.

Listen for proper 4C Clutch piston movement.

Were any problems found?

Yes

- Repair Internal transmission as necessary. Pay attention to the mechanical components related to the 4th clutch. A broken or weak return spring or a dislocated snap ring could cause this problem.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the service information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. VERIFY PCM OPERATION

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 50 MPH, then brake lightly to a stop. Turn off engine.

With the scan tool, record Transmission CL VOL INDEX (CVI) for all clutches.

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVIs and compare them to the reading recorded before the BATTERY DISCONNECT.

Are any of the CVIs less than 5 or are they different than before the battery disconnect?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform Quick Learn.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Test Complete.

P2706-MS SOLENOID CIRCUIT

81ac056

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC.

- **When Monitored:**

Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

- **Set Condition:**

After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

NOTE: This DTC is strictly an electrical fault and cannot be caused by any internal transmission failure other than an open in the Transmission Solenoid/TRS Assembly. If the Transmission Solenoid/TRS Assembly is in need of replacement — do not replace the Valve Body.

Possible Causes
RELATED DTCS PRESENT
(T140) MS SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS
(T140) MS SOLENOID CONTROL CIRCUIT OPEN
(T140) MS SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

Diagnostic Test

1. RELATED TCM POWER INPUT DTCS PRESENT

With the scan tool, check DTCs.

Are there any TIPM TCM Power Control Circuit or TCM Power Input DTCs present?

Yes

- Refer to the Transmission category and perform the appropriate symptom.

No

- Go To [2](#)

2. TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.
Remove the Ignition Switch Feed fuse from the TIPM.

CAUTION: Removal of the Ignition Switch Feed fuse from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Ignition Switch Feed fuse must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install Transmission Simulator, Miller tool #8333.
Ignition on, engine not running.
With the scan tool, actuate the MS Solenoid.
Monitor the MS Solenoid LED on the Transmission Simulator.

Did the MS Solenoid LED on the Transmission Simulator blink on and off?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. TRANSMISSION SOLENOID/TRS ASSEMBLY

With the scan tool, continue to actuate the MS Solenoid for the period of 2 minutes with the Transmission Simulator still connected.

After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P2706 reset during the actuation test?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. WIGGLE TEST WITH TRANSMISSION SIMULATOR

With the Transmission simulator still connected, continue to actuate the 4C solenoid for another 2 minutes while wiggling the related wiring harness and connectors.

With the scan tool, stop the actuation and check for transmission DTCs.

Did the DTC P0770 reset during the actuation test?

Yes

- Repair wiring harness or connectors as necessary.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Replace the Transmission Solenoid/TRS Assembly per the Service Information. **Note: Do NOT replace the entire Valve Body.** (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

5. (T140) MS SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS

Turn the ignition off to the lock position.
Disconnect the Transmission Simulator, Miller tool #8333.
Disconnect the PCM harness connectors.
Measure the resistance between the (T140) MS Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 5.0 ohms between the (T140) MS Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

- Repair the (T140) MS Solenoid Control circuit for a short to other circuit(s).
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (T140) MS SOLENOID CONTROL CIRCUIT OPEN

Connect Miller tool #8815 to the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller special tool #8815 to perform diagnosis.

Measure the resistance of the (T140) MS Solenoid Control circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T140) MS Solenoid Control circuit for an open.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Go To [7](#)

7. (T140) MS SOLENOID CONTROL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T140) MS Solenoid Control circuit.

Is the resistance below 5.0 ohms?

81b2fb9a

Yes

- Repair the (T140) MS Solenoid Control circuit for a short to ground.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

U0002-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Some NGC controllers communicate with other controllers over the CAN C Bus. The transmission controller continuously monitors the Bus activity and receives the messages it needs. The CAN C Bus is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, the Engine Controller will light the MIL.

- **When Monitored:**

Every 7 msec. when:

- 1) Engine speed greater than 500 rpm.
- 2) Battery voltage greater than 10v but less than 16v.

- **Set Condition:**

CAN C Bus messages not received for 10 seconds.

Diagnose the U0002 CAN C BUS OFF PERFORMANCE as the U0001 CAN C BUS CIRCUIT test in 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0100-NO COMMUNICATION WITH THE ECM/PCM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Communication over the CAN bus is continuously monitored between the Engine Control System and the Transmission Control System. Due to the integration of both systems into one module (NGC3), (Powertrain Control Module) the bus communication between the systems is internally transmitted over the dual port ram. The NGC4 controller contains only one processor. This DTC will set if the NGC4 controller (transmission only) is used in conjunction with an Engine Controller (ECM).

- **When Monitored:**

Every 7 msec. with the ignition on.

- **Set Condition:**

ECM/PCM CAN bus message not received by the Transmission Control System for the period of 10 seconds.

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0121-LOST COMMUNICATION WITH ABS

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Some NGC controllers communicate with other controllers over the CAN C Bus. The transmission controller continuously monitors the Bus activity and receives the messages it needs. The CAN C Bus is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, the Engine Controller will light the MIL.

- **When Monitored:**

Every 7 msec. with:

- 1) Engine speed greater than 500 rpm.
- 2) Battery voltage greater than 10v but less than 16v.

- **Set Condition:**

CAN C Bus messages not received for 10 seconds.

Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0141 LOST COMMUNICATION WITH FCM

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

Some NGC controllers communicate with other controllers over the CAN C Bus. The transmission controller continuously monitors the Bus activity and receives the messages it needs. The CAN C Bus is also used to communicate transmission MIL status to the Engine Controller, If the Engine Controller is unable to communicate with the Transmission Controller, the Engine Controller will light the MIL.

- **When Monitored:**

Every 7 msec. with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage greater than 10v but less than 16v.

- **Set Condition:**

CAN C Bus messages not received for 10 seconds.

Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

STANDARD PROCEDURE

45RFE/545RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W.**

Perform the following before attempting any diagnostic procedures:

- With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
- Check the transmission fluid level. If the fluid level is low, locate and repair any leaks and fill the

transmission to the proper level. Refer to the appropriate Service Information for procedures. Many transmission symptoms can be caused by a low fluid level.

- Check the battery. To avoid false diagnosis, testing should only be performed with the battery fully charged.
- With the scan tool, read Engine (PCM) DTCs. If DTCs are present, refer to the Driveability Category and perform to the appropriate diagnostic procedure(s) before proceeding.
- With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
- With the scan tool, read and record the DTC EVENT DATA. Use this data to identify the conditions in which the DTC was set.
- **NOTE: DTC Event Data may exist even if no DTCs are stored. DTC Event Data is only erased by a Battery Disconnect, reflash, or QuickLearn procedure. Clearing DTCs does NOT erase the DTC Event Data. Some DTCs require two "bad trips" before they are stored (and the MIL illuminates). The transmission may enter "limp-in" mode during the first "bad trip," but if the fault condition is not present after the vehicle is restarted, the pending DTC may be cleared without lighting the MIL. Nevertheless, the DTC Event Data for the pending DTC will remain stored and can still be retrieved with the scan tool. If the customer reports a "limp-in" event but no DTCs are present, check the DTC Event Data.**
- Performing a Battery Disconnect will clear all DTC EVENT DATA and reset all learned Transmission values to the default values, which may temporarily result in erratic shift schedules.
- With the scan tool, perform the Shift Lever Position Test. If the test does not pass, refer to the diagnostic procedure for P0706 Transmission Range Sensor Rationality.
- For Gear Ratio Error DTCs, use the scan tool to view CVI Monitor data. Read and record the Clutch Volume Index information.
- Use the wiring diagram as a guide. Inspect the wiring and connectors related to this circuit. Repair as necessary.
- Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, after driving under specific conditions and after diagnostic monitors have been run.
- Refer to applicable Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) or Transmission (TCM) controller software.
- Refer to any Service Information Tune Ups or Technical Service Bulletins that apply.

Were there any repairs made that fixed the vehicle?

Yes

- Testing complete.
- Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

No

- Refer to the Transmission category and perform the appropriate diagnostic procedure(s).

45RFE/545RFE TRANSMISSION VERIFICATION TEST

For a complete wiring diagram **Refer to Section 8W.**

Perform the following after completion of a diagnostic repair:

After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed.

- With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
- Connect the scan tool to the Data Link Connector (DLC).
- Reconnect any disconnected components.
- If the PCM has been replaced or updated (flashed), or the transmission has been repaired or replaced, using the scan tool, perform a Quick Learn Procedure.
- With the scan tool, erase all Transmission and Engine DTCs.
- With the scan tool, perform a BATTERY DISCONNECT, this will clear the DTC EVENT DATA
- With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT.
- Check the Transmission fluid level and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/FLUID - STANDARD PROCEDURE)
- Road test the vehicle.
- Perform the following shifts from a standing start with a constant throttle opening of 20 to 25 degrees to the speeds of 97 Km/h (60 mph); make fifteen to twenty 1 to 2, 2 to 3, 3 to 4 4 to 5.upshifts.
- Perform the following shifts with speeds below 40 Km/h (25 mph); make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
- Check for DTCs during and after the road test.
- If after performing the road test, if any shift concerns are noted, perform the drive learn procedure for those affected shifts. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)
- **Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC does not re-mature.**

Were there any Diagnostic Trouble Codes (DTCs) set during the road test?

Yes

- Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

No

- Repair is complete.

AUTOMATIC TRANSMISSION - 545RFE

AUTOMATIC TRANSMISSION - 545RFE

DESCRIPTION

The 545RFE automatic transmission is a sophisticated, multi-range, electronically controlled transmission which combines optimized gear ratios for responsive performance, state of the art efficiency features and low NVH. Other features include driver adaptive shifting and three planetary gear sets to provide wide ratio capability with precise ratio steps for optimum driveability. The three planetary gear sets also make available a unique alternate second gear ratio. The primary 2nd gear ratio fits between 1st and 3rd gears for normal through-gear accelerations. The alternate second gear ratio (2prime) allows smoother 4-2 kickdowns at high speeds to provide 2nd gear passing performance over a wider highway cruising range. An additional overdrive ratio (0.67:1) is also provided for greater fuel economy and less NVH at highway speeds.

The hydraulic portion of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components.

The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Three multiple disc holding clutches
- Five hydraulic accumulators
- Three planetary gear sets
- Dual Stage Hydraulic oil pump
- Valve body
- Solenoid pack

The Transmission Control Module (TCM) is the “heart” or “brain” of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. Depending on the vehicle configuration, the TCM may be a standalone module or it may be housed along with the Powertrain Control Module (PCM) in a single module. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

TRANSMISSION IDENTIFICATION

Transmission identification numbers (1) are stamped on the left side of the case just above the oil pan sealing surface . Refer to this information when ordering replacement parts. A label is attached to the transmission case above the stamped numbers. The label gives additional information which may also be necessary for identification purposes.

GEAR RATIOS

The 545RFE gear ratios are: **1st** - 3.00:1

2nd - 1.67:1

2nd Prime - 1.50:1

3rd - 1.00:1

4th - 0.75:1

5th - 0.67:1

Reverse - 3.00:1

OPERATION

The 545RFE offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

To help reduce efficiency-robbing parasitic losses, the transmissions includes a dual-stage transmission fluid pump with electronic output pressure control. Under most driving conditions, pump output capacity greatly exceeds that which is needed to keep the clutches applied. The 45RFE/545RFE pump-pressure control system monitors input torque and adjusts the pump pressure accordingly. The primary stage of the pump works continuously; the second stage is bypassed when demand is low. The control system also monitors input and output speed and, if incipient clutch slip is observed, the pressure control solenoid duty cycle is varied, increasing pressure in proportion to demand.

A high-travel torque converter damper assembly allows earlier torque converter clutch engagement to reduce slippage. Needle-type thrust bearings reduce internal friction. The 45RFE/545RFE is packaged in a one-piece die-cast aluminum case. To reduce NVH, the case has high lateral, vertical and torsional stiffness. It is also designed to maximize the benefit of the structural dust cover that connects the bottom of the bell housing to the engine bedplate, enhancing overall power train stiffness. Dual filters protect the pump and other components. A cooler return filter is added to the customary main sump filter. Independent lubrication and cooler circuits assure ample pressure for normal transmission operation even if the cooler is obstructed or the fluid cannot flow due to extremely low temperatures.

The hydraulic control system design (without electronic assist) provides the transmission with PARK, REVERSE, NEUTRAL, SECOND, and THIRD gears, based solely on driver shift lever selection. This design allows the vehicle to be driven (in “limp-in” mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION

CAUTION: Before attempting any repair on a 545RFE automatic transmission, check for Diagnostic Trouble Codes with the scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and

condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Record all DTCs and the accompanying DTC Event Data.
2. Check for an appropriate Technical Service Bulletin that applies to the customer complaint.
3. Check fluid level and condition.
4. Road test and note how transmission upshifts, downshifts, and engages.
5. If the complaint was related to shift quality, perform the Quick Learn procedure, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE), and the Drive Learn Procedure, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).
6. If the shift complaint still exists, compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off.
7. Perform air-pressure test to check clutch operation. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)
8. Replace the Transmission Solenoid/TRS Assembly and perform the Quick Learn and Drive Learn procedures again.
9. If the complaint still exists, remove, inspect, and repair the transmission as necessary

VEHICLE IS DISABLED

1. Record all DTCs and the accompanying DTC Event Data.
2. With engine running, place transmission in gear and verify correct PRNDL reading. Observe the Input and Output speeds using the scan tool. If output RPM is greater than zero but vehicle does not move, check for transfer case in Neutral (or failed internally), failed propshaft, or failed / disconnected drive axle. If output RPM is zero and input RPM is greater than zero, internal transmission slippage is indicated. Run clutch slip tests using the scan tool, check oil pan for debris, and air check the various clutch circuits.
3. Shift the transmission into neutral, if both input and output speeds are zero, check flexplate bolts, torque converter, and transmission input shaft.
4. Compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off. If line pressure is incorrect, check fluid level and condition.
5. Remove, inspect, and repair the transmission as necessary

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

545RFE CLUTCH APPLICATION CHART

SLP	UD	OD	R	2C	4C	L/R	OVERRUNNING

*L/R clutch is on only with the output shaft speed below 150 rpm.							

HYDRAULIC PRESSURE TEST

An accurate tachometer and pressure test gauges are required. Oil Pressure Gauge C-3293-SP has a 300 psi range and is used at all locations where pressures exceed 100 psi.

Pressure Test Port Locations

Only two pressure ports are supplied on the transmission case. The torque converter clutch apply (3) and release (1) ports are located on the right side of the transmission case.

To determine the line pressure, there are two available methods. The scan tool can be used to read line pressure from the line pressure sensor. The second method is to install Line Pressure Adapter 8259 (3) into the transmission case and then install the pressure gauge and the original sensor (2) into the adapter. This will allow a comparison of the scan tool readings and the gauge reading to determine the accuracy of the line pressure sensor. The scan tool line pressure reading should match the gauge reading within ± 10 psi.

TEST PROCEDURE

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature, and the engine at 1500 rpm. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question, check the pressure readings in at least two gear positions that employ that element. Refer to the Hydraulic Schematics at the rear of this section to determine the correct pressures for each element in a given gear position.

NOTE: The 45RFE/545RFE utilizes closed loop control of pump line pressure. The pressure readings may therefore vary greatly but should always follow line pressure.

Some common pressures that can be measured to evaluate pump and clutch performance are the upshift/downshift pressures, garage shift pressures, and TCC pressure. The upshift/downshift pressure for all shifts are shown in [UPSHIFT PRESSURES](#) and [DOWNSHIFT PRESSURES](#). In-gear maximum pressure for each gear position is shown in [IN-GEAR PRESSURES](#). The garage shift pressure when performing a N-R shift is 220 psi. The garage shift pressure for the R-N shift is 120 psi. The garage shift pressure for the N-1 shift is 135 psi. Torque converter lock-up pressure is 120 psi.

UPSHIFT PRESSURES

1-2	2-3	2prime-3	3-4	2prime-4	2-5	3-5	4-5
120	120	120	120	120	120	120	130

DOWNSHIFT PRESSURES

5-4	5-3	5-2	4-3	4-2prime	3-2	3-2prime	2prime-1	2-1	3-1
120	120	120	120	120	120	120	120	120	120

IN-GEAR PRESSURES

1	2	2prime	3	4	5	NEUTRAL	REVERSE
135	120	120	120	120	120	120	220

AIR CHECKING TRANSMISSION CLUTCH OPERATION

Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The clutch apply passages are shown in the Air Pressure Test Passages graphic .

NOTE: The air supply which is used must be free of

moisture and dirt. Use a pressure of 30 psi to test clutch operation.

Apply air pressure at each port. If the clutch is functioning, a soft thump will be heard as the clutch is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

1. Verify that a leak condition actually exists.
2. Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the converter. Pump cover seal leaks tend to run down the cover and the inside surface of the bellhousing.

Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye should be used to locate and confirm a leak.

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

1. Leaks at the weld joint around the outside diameter weld .
2. Leaks at the converter hub weld .

In most cases, a torque converter which is wet from transmission fluid indicates a leak at one of these areas.

STANDARD PROCEDURE -

ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle
3. Remove any necessary skid plates (1). (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)

4. Mark propeller shaft and axle companion flanges for assembly alignment.
5. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
6. Remove the front propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
7. Disengage the output speed sensor connector from the

output speed sensor (2).

8. Disengage the input speed sensor connector from the input speed sensor (2).

9. Disengage the transmission solenoid/TRS assembly connector from the transmission solenoid/TRS assembly (2).

10. Disengage the line pressure sensor connector from the line pressure sensor (2).

11. Remove the bolts (1) holding the exhaust crossover pipe to the pre-catalytic converter pipe flanges.

12. Remove the bolts holding the exhaust crossover pipe to the catalytic converter flange.

13. Disconnect gearshift cable (2) from transmission manual valve lever.

14. Disengage the shift cable from the cable support bracket.

15. Remove the starter motor.

16. Remove the engine to transmission collar (2).

17. Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.
18. Disconnect transmission fluid cooler lines at transmission fittings and clips.
19. Disconnect the transmission vent hose from the transmission.
20. Remove transfer case.
21. Support rear of engine with safety stand or jack.
22. Raise transmission slightly with service jack to relieve load on crossmember and supports.
23. Remove bolts securing rear support and cushion (2) to transmission and crossmember (1).
24. Remove bolts attaching crossmember to frame and remove crossmember.

25. Remove all remaining converter housing bolts.
26. Disconnect fuel line retainers at the transmission (if necessary).
27. Carefully work transmission and torque converter assembly rearward off engine block dowels.
28. Hold torque converter in place during transmission removal.
29. Lower transmission and remove assembly (2) from under the vehicle.
30. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

1. Drain fluid from transmission.
2. Clean exterior of transmission with suitable solvent or pressure washer.
3. Remove the torque converter from the transmission.

4. Remove the manual shift lever (1) from the transmission.

5. Remove the input (3), output (1), and line pressure sensors (2) from the transmission case.

6. Inspect the ends of the sensors for debris, which may indicate the nature of the transmission failure.

7. Install Support Stand 8257 (1) onto the transmission case.

8. Using Adapter 8266-1 from End-Play Tool Set 8266 (1)

and Dial Indicator C-3339 (2), measure and record the input shaft end-play.

NOTE: When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.

9. Remove the bolts holding the transmission extension/adaptor housing to the transmission case.
10. Remove the extension/adaptor housing from the transmission case.
11. Using Alignment Plate 8261 (1), Adapter 8266-17 from End-Play Tool Set 8266 (2) and Dial Indicator C-3339 (3), measure and record the output shaft end-play.

12. Remove the bolts holding the transmission oil pan to the transmission case.
13. Remove the transmission oil pan from the transmission case.
14. Remove the primary oil filter (1) and the oil cooler return filter (2).

15. Remove the bolts (1) holding the valve body to the transmission case.

16. Remove the valve body from the transmission case.

17. Remove the outer snap-ring (3) securing the transmission front cover (1) into the transmission case.

18. Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover (1) from the transmission case.

19. Remove the bolts (1) holding the oil pump into the transmission case.

20. Remove the oil pump (2). Hold inward on the input shaft to prevent pulling the input clutch assembly with the oil pump.

CAUTION: If the input shaft is not held during oil pump removal, the input clutch assembly will attempt to move forward with the oil pump and the numbers 2, 3, or 4 bearings inside the input clutch assembly may become dislodged.

21. Remove the number 1 thrust bearing (4) from the input clutch assembly.

22. Remove the input clutch assembly (3) from the transmission case.

23. Remove the number 5 thrust bearing (1) and selective thrust plate (2) from the input clutch assembly (3), or the 4C clutch retainer/bulkhead.

24. Remove the 4C clutch retainer/bulkhead tapered snap-ring (1) from the transmission case.
25. Remove the 4C clutch retainer/bulkhead (2) from the transmission case.

26. Remove the front 2C clutch pack snap-ring (1) from the transmission case.
27. Remove the 2C clutch pack (2, 3, 4) from the transmission case.

Remove Reaction Annulus and Carrier

1 - THRUST BEARING NUMBER 8	5 - THRUST BEARING NUMBER 7
2 - THRUST BEARING NUMBER 9	6 - THRUST PLATE (SELECT)
3 - REACTION PLANETARY CARRIER	7 - THRUST BEARING NUMBER 6
4 - REACTION SUN GEAR	8 - REACTION ANNULUS

28. Remove the rear selective thrust plate (6) and number 6 thrust bearing (7) from the reaction annulus (8).
29. Remove the reaction annulus (8) from the reaction planetary carrier (3).
30. Remove the number 7 thrust bearing (5).
31. Remove the reaction sun gear (4).
32. Remove the number 8 thrust bearing (1) from the reaction planetary carrier (3).
33. Remove the reaction planetary carrier (3) . Note that this planetary gear set has three pinion gears.
34. Remove the number 9 thrust bearing (2) from the reverse planetary gear set.

35. Remove the snap-ring (1) holding the park sprag gear onto the output shaft.

36. Remove the park sprag gear (1) from the output shaft.

80c07413

808a301b

37. Remove the input/reverse planetary assembly (1).
38. Remove the number 12 thrust bearing (3) from the input/reverse planetary assembly (1).
39. Remove the snap-ring (2) holding the low/reverse clutch retainer (1) into the transmission case.
40. Remove the low/reverse clutch retainer (1) from the transmission case.

41. Remove the park rod (7) and e-clip.
42. Remove the park rod guide snap-ring (2).
43. Remove the park rod guide (1).
44. Remove the park pawl pivot shaft (3), park pawl (5), and spring (4).
45. Remove the manual selector shaft (6).
46. Remove the manual selector shaft seal.
47. Remove the dipstick tube seal.

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

NOTE: Apply trans jell or petroleum jelly to all slide portions, rolling contacts surfaces, thrust surfaces etc. to prevent burnout during initial operation. Lubricate O-rings and O-ring seals with MOPAR® ATF+4. Soak all friction disks in MOPAR® ATF+4 for at least two hours before assembly of clutch packs.

NOTE: Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

1. Install a new selector shaft seal (1) using Seal Installer 8253 (2).

2. Install the manual selector shaft and retaining screw. Tighten the manual selector shaft retaining screw to 28 N·m (250 in.lbs.).
3. Install the manual shift lever (1) onto the manual selector shaft. Tighten the retaining cross-bolt to 16 N·m (140 in.lbs.).

4. Install the park pawl (5), spring (4), and shaft (3).
5. Install the park rod (7) and e-clip.
6. Install the park rod guide (1) and snap-ring (2).

808a3020

7. Install a new fill tube seal (2) using Seal Installer 8254 (1).

NOTE:
Before
final
assembly
of

80c07359

80c07416

transmission centerline, the 2C/4C clutch components should be installed into position and measured as follows:

8. Install the 2C reaction plate (4) with the beveled edge down (rearward) into the transmission case.
9. Install the 2C clutch pack (2, 3) into the transmission case.
10. Install the flat 2C clutch snap-ring (1) into the transmission case.

11. Install the 4C retainer/bulkhead (2) into the transmission

case. Make sure that the oil feed holes are pointing toward the valve body area.

12. Install the 4C retainer/bulkhead tapered snap-ring (1) into the transmission case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.

13. Using a feeler gauge through the opening in the rear of the transmission case, measure the 2C clutch pack clearance between the 2C reaction plate and the transmission case at four different points. The average of these measurements is the 2C clutch pack clearance. The correct clutch clearance is 0.455-1.335 mm (0.018-0.053 in.). The reaction plate is not selective. If the clutch pack clearance is not within specification, the reaction plate, all the friction discs, and steels must be replaced.

14. Remove the 4C retainer/bulkhead and all of the 2C clutch components from the transmission case.

15. Install the low/reverse clutch assembly (1). Make sure that the oil feed hole points toward the valve body area and that the bleed orifice is aligned with the notch in the rear of the transmission case.

16. Install the snap-ring (2) to hold the low/reverse clutch retainer into the transmission case. The snap-ring is tapered and must be installed with the tapered side forward. Once installed, verify that the snap-ring is fully seated in the snap-ring groove.

17. Air check the low/reverse clutch and verify correct overrunning clutch operation.

18. Install the number 12 thrust bearing (3) over the output shaft and against the rear planetary gear set. The flat side of the bearing goes toward the planetary gearset and the raised tabs on the inner race should face the rear of the transmission.

19. Install the reverse/input planetary assembly (1) through the low/reverse clutch assembly.

20. Install the park sprag gear (1) onto the output shaft.

21. Install the snap-ring (1) to hold the park sprag onto the output shaft.

22. Install the 2C reaction plate (4) with the beveled edge down (rearward) into the transmission case.

23. Install the 2C clutch pack (2, 3, 4) into the transmission case.

Install Reaction Annulus and Carrier

1 - THRUST BEARING NUMBER 8	5 - THRUST BEARING NUMBER 7
2 - THRUST BEARING NUMBER 9	6 - THRUST PLATE (SELECT)
3 - REACTION PLANETARY CARRIER	7 - THRUST BEARING NUMBER 6
4 - REACTION SUN GEAR	8 - REACTION ANNULUS

24. Install the number 8 thrust bearing (1) inside the reaction carrier with the outer race against the reaction planetary carrier (3).

25. Install the reaction planetary gear set and the number 9 thrust bearing (2), with the inner race against the reaction planetary carrier (3), into the transmission case.

26. Install the flat 2C clutch snap-ring into the transmission case.

27. Install the reaction sun gear (4) into the reaction planetary gear set. **Make sure** the small shoulder is facing

the front of the transmission.

28. Install the number 7 thrust bearing (5) onto the reaction sun gear (4) with the inner race against the sun gear.

29. Install the output shaft selective thrust plate (2) onto the reaction annulus with the oil grooves facing the annulus gear and the lugs (1) and notches aligned as shown.

Install Reaction Annulus and Carrier

1 - THRUST BEARING NUMBER 8	5 - THRUST BEARING NUMBER 7
2 - THRUST BEARING NUMBER 9	6 - THRUST PLATE (SELECT)
3 - REACTION PLANETARY CARRIER	7 - THRUST BEARING NUMBER 6
4 - REACTION SUN GEAR	8 - REACTION ANNULUS

30. Install the number 6 thrust bearing (7) against the output shaft selective thrust plate (6) with the flat side against the thrust plate and the raised tabs on the inner race facing the front of the transmission.
31. Install the reaction annulus (8) into the reaction planetary gear set.

32. Install the 4C retainer/bulkhead (2) into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area. Rotate the reaction annulus during the installation of the 4C retainer/bulkhead to ease installation.
33. Install the 4C retainer/bulkhead tapered snap-ring (1) into the transmission case with the taper toward the front of the case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.
34. Air check the 2C and 4C clutch operation.

35. Using Alignment Plate 8261 (1), Adapter 8266-17 from End-Play Tool Set 8266 (2) and Dial Indicator C-3339 (3), measure and record the output shaft end-play. The correct output shaft end-play is 0.22-0.55 mm (0.009-0.021 in.). Adjust as necessary. Install the chosen output shaft selective thrust plate and re-measure end-play to verify selection.

Output Shaft End Play Selectable Bearing Spacer Thickness

- 09 = 2.18 mm (0.086 in.)
- 10 = 2.33 mm (0.092 in.)
- 11 = 2.48 mm (0.098 in.)
- 12 = 2.63 mm (0.103 in.)
- 13 = 2.78 mm (0.109 in.)
- 14 = 2.69 mm (0.115 in.)
- 43 = 3.08 mm (0.121 in.)
- 16 = 3.23 mm (0.127 in.)
- 17 = 3.38 mm (0.133 in.)
- 18 = 3.53 mm (0.139 in.)
- 19 = 3.68 mm (0.145 in.)

36. Apply a bead of RTV silicone and install the extension/adaptor housing onto the transmission case.
37. Install and torque the bolts to hold the extension/adaptor housing onto the transmission case. The correct torque is 54 N·m (40 ft.lbs.).

38. Install the number 5 thrust bearing (1) and selective thrust

plate (2) onto the 4C retainer/bulkhead. Be sure that the outer race of the bearing is against the thrust plate.

39. Install the input clutch assembly (3) into the transmission case. Make sure that the input clutch assembly is fully installed by performing a visual inspection through the input speed sensor hole. If the tone wheel teeth on the input clutch assembly are centered in the hole, the assembly is fully installed.

40. Install the number 1 thrust bearing (4) with the outer race up in the pocket of the input clutch assembly.

41. Install the oil pump (2) into the transmission case making certain the oil pump is flush with the transmission case.

42. Install the bolts (1) to hold the oil pump into the transmission case. Tighten the oil pump bolts to 28 N·m (250 in.lbs.).

NOTE: When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading. If NO input shaft end play is noted, disassemble the input clutch assembly and check for the #2, #3, or #4 thrust bearing fallen out of position or cracked. Replace any cracked thrust bearing and reassemble using trans jell or petroleum jelly to retain the thrust bearings.

43. Using Adapter 8266-1 from End-Play Tool Set 8266 (1) and Dial Indicator C-3339 (2), measure and record the input shaft end-play. The correct end-play is 0.46-0.89 mm (0.018-0.035 in.). Adjust as necessary. Install the chosen thrust plate on the number 5 thrust bearing and re-measure end-play to verify selection.

Input Shaft End Play Selectable Bearing Spacer Thickness

- 27 = 1.57 mm (0.062 in.)
- 28 = 1.71 mm (0.067 in.)
- 29 = 1.85 mm (0.073 in.)
- 30 = 1.99 mm (0.078 in.)
- 31 = 2.13 mm (0.084 in.)
- 32 = 2.27 mm (0.089 in.)
- 33 = 2.41 mm (0.095 in.)
- 34 = 2.55 mm (0.100 in.)
- 35 = 2.69 mm (0.106 in.)
- 36 = 2.83 mm (0.111 in.)
- 37 = 2.97 mm (0.117 in.)
- 38 = 3.11 mm (0.122 in.)
- 39 = 3.25 mm (0.128 in.)
- 40 = 3.39 mm (0.133 in.)
- 41 = 3.67 mm (0.144 in.)

NOTE: To avoid contamination and garter spring dislodgement, do not handle the front cover seal when installing the front cover into the transmission case.

44. Position the new front cover (1) onto transmission case.

45. Using a dead-blow mallet and the Front Cover installation tool 9955, install the front cover into the transmission case .

46. Install the snap ring into the transmission case.

47. Install the valve body. Verify that the pin on the manual lever has properly engaged the TRS selector plate. Tighten the valve body to transmission case bolts (1) to 12 N·m (105 in.lbs.).

CAUTION: The primary oil filter seal **MUST** be fully installed flush against the oil pump body. **DO NOT** install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

48. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

49. Install the primary oil filter (1) and the oil cooler return filter (2) . Tighten the screw to hold the primary oil filter to the valve body to 4.5 N·m (40 in.lbs.). Using Filter Wrench 8321, tighten the cooler return oil filter to the transmission case to 9.5 N·m (84 in.lbs.).

50. Apply RTV silicone to the oil pan and install the transmission oil pan. Tighten the bolts to 12 N·m (105 in.lbs.).

51. Install the input (3), output (1), and line pressure sensors (2). Tighten the bolts to 12 N·m (105 in.lbs.).

INSTALLATION

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.
4. Align converter and oil pump.
5. Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.
6. Check converter seating with steel scale (1) and

straightedge (2). Surface of converter lugs should be at least 13 mm (1/2 in.) to rear of straightedge when converter is fully seated.
7. Temporarily secure converter with C-clamp.

8. Position transmission on jack and secure it with chains.
9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
10. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
11. Raise transmission (2) and align the torque converter with the drive plate and transmission converter housing with the engine block.

12. Move transmission forward. Then raise, lower or tilt transmission to align the converter housing with engine block dowels.
13. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
14. Install two bolts to attach the transmission to the engine.
15. Install remaining torque converter housing to engine bolts. Tighten the four upper bolts to 41 N·m (30 ft. lbs.), tighten the four lower bolts to 54 N·m (40 ft. lbs.), tighten the four collar bolts to 68 N·m (50 ft. lbs.).

16. Install transfer case, if equipped. Tighten transfer case nuts to 35 N·m (26 ft. lbs.).
17. Install rear transmission crossmember. Tighten crossmember to frame bolts to 68 N·m (50 ft. lbs.).
18. Install rear support to transmission. Tighten bolts to 47 N·m (35 ft. lbs.).
19. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).

20. Remove engine support fixture.

21. Connect fuel line retainer at transmission (if necessary).

22. Connect gearshift cable (3) to support bracket and transmission manual lever.

23. Connect wires to solenoid and pressure switch assembly (2).

24. Connect wires to input speed sensor (2).

25. Connect wires to output speed sensor (2).

26. Connect wires to line pressure sensor (2). Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

27. Install torque converter-to-driveplate bolts. Tighten bolts to 31 N·m (270 in.lbs.).

28. Install starter motor and cooler line bracket.

29. Connect cooler lines to transmission.

30. Install transmission fill tube.

31. Install exhaust components (1).

32. Install the structural dust cover (2) onto the transmission and the engine.

33. Align and connect propeller shaft(s).

34. Adjust gearshift cable if necessary.

35. Install any skid plates (1) removed previously. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

36. Lower vehicle.

37. Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

1. Remove the 2C piston Belleville spring snap-ring (5) from the 4C retainer/bulkhead (11).
2. Remove the 2C piston Belleville spring (4) from the retainer/bulkhead (11).
3. Remove the 2C piston (1) from the retainer/bulkhead (11). Use 20 psi of air pressure to remove the piston if necessary.
4. Remove the 4C clutch snap-ring (6) from the retainer/bulkhead (11)
5. Remove the 4C clutch pack (2, 3, 7) from the retainer/bulkhead (11).
6. Using Spring Compressor 8250 (2) and a suitable shop press (1), compress the 4C piston return spring and remove the snap-ring.

7. Remove the 4C piston return spring (10) and piston (11) from the retainer/bulkhead (12). Use 20 psi of air pressure to remove the piston if necessary.

ASSEMBLY

NOTE: Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

1. Lubricate all seals with Mopar® ATF +4 prior to installation.

NOTE: The 4C piston installation aid is only available with procurement of a new 4C piston.

2. Insert the installation aid (1) into the 4C retainer / bulkhead (2) .

3. Lubricate the inner and outer 4C piston seals (3) with MOPAR® ATF+ 4.

4. Install the 4C piston (3) into the installation aid (1) .

5. Push the 4C piston (3) down evenly until it is seated in the 4C retainer / bulkhead (2).

6. Remove the installation aid (1) from the 4C retainer / bulkhead (2).

7. Position the 4C piston return spring onto the 4C piston.
8. Using Spring Compressor 8250 (2) and a suitable shop press (1), compress the 4C piston return spring and install the snap-ring.

9. Assemble and install the 4C clutch pack (2, 3) into the retainer/bulkhead (11) with a steel separator plate against the piston.
10. Install the 4C reaction plate (7) and snap-ring (6) into the retainer/bulkhead (11) . The 4C reaction plate is non-directional.
11. Measure the 4C clutch clearance. The correct clutch clearance is 0.770-1.390 mm (0.030-0.055 in.). The snap-ring (6) is selectable. Install the chosen snap-ring and re-measure to verify the selection.

The 4C selectable snap ring thickness are as follows:

4C SELECTABLE SNAP RING THICKNESS

- One Butterfly End, One Square End = 1.79 mm (0.070 in.).
- Both Ends Buttery Fly Cut = 2.20 mm (0.087 in.).
- One Butterfly End, One Inverted Butterfly End = 2.61 mm (0.103 in.).

12. Install the 2C piston (1) into the retainer/bulkhead (11).
13. Position the 2C Belleville spring (5) onto the 2C piston (2).
14. Position the 2C Belleville spring snap-ring (6) onto the 2C Belleville spring (5).

15. Using Spring Compressor 8249 (2) and a suitable shop press (1), compress the Belleville spring until the snap-ring is engaged with the snap-ring groove in the retainer/bulkhead.

SEAL-ADAPTER HOUSING

REMOVAL

1. Remove the transfer case from the transmission.
2. Using a screw mounted on a slide hammer, remove the adapter housing seal.

80c07418

INSTALLATION

1. Clean the adapter seal bore in the adapter housing of any residue or particles remaining from the original seal.
2. Install new oil seal in the adapter housing using Seal Installer C-3860-A (1) . A properly installed seal is flush to the face of the seal bore.
3. Install the transfer case onto the transmission.

SYSTEM-BRAKE TRANSMISSION SHIFT INTERLOCK

DESCRIPTION

The Brake Transmission Shift Interlock System (BTSI), consists of a Park-Interlock cable and a solenoid mounted in the shift lever assembly. The Park-Interlock cable connects the automatic transmission floor mounted shifter to the steering column ignition switch.

80c07424

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in the shift lever assembly is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT

INTERLOCK SYSTEM

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK And the shift handle pushbutton is in the “OUT” position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
4. Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

COVER-FRONT

REMOVAL

1. Remove the bolts holding the transmission oil pan to the transmission case .
2. Remove the transmission oil pan from the transmission case.
3. Remove the snap ring (3) from the transmission case.
4. Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover (1) from the transmission case.

INSTALLATION

NOTE: To avoid contamination and garter spring dislodgement, do not handle the front cover seal (4) when positioning the front cover into the transmission case.

1. Position a new front cover (1) into the transmission case.

2. Using the front cover installation tool 9955 (1) and a dead-blow mallet, install the front cover into transmission case .

3. Install the snap ring (3) into the transmission case.
4. Apply RTV silicone to the oil pan and install the transmission oil pan.
5. Tighten the bolts to 12 N·m (105 in. lbs.).

FLUID AND FILTER

DIAGNOSIS AND TESTING

EFFECTS OF INCORRECT FLUID

LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition

by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82° C. or 180° F), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approximately at the upper COLD hole of the dipstick at 21° C (70° F) fluid temperature.

FILL TUBE EQUIPPED WITH INDICATOR

BUX 545RFE FLUID FILL CHART

80c072fc

NAFTA 545 RFE FLUID TEMPERATURE

NOTE: Engine and Transmission should be at normal operating temperature before performing this procedure. After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

1. Start engine and apply parking brake.
2. Shift the transmission into DRIVE for approximately 2 seconds.
3. Shift the transmission into REVERSE for approximately 2 seconds.
4. Shift the transmission into PARK.
5. Hook up scan tool and select transmission.
6. Select sensors.
7. Read the transmission temperature value.
8. Compare the fluid temperature value with the chart.
9. Adjust transmission fluid level shown on the dipstick according to the Transmission Fluid Temperature Chart.

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

10. Check transmission for leaks.

CAPPED FILL TUBE

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

WARNING: There is a risk of accident from vehicle starting off by itself when engine is running. There is

a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position "P".
4. Shift through the transmission modes several times with the vehicle stationary and the engine idling.
5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick 9336 into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

NOTE: The dipstick will protrude from the fill tube when installed.

6. Check transmission oil temperature using the appropriate scan tool.

NOTE: The true transmission oil temperature can only be read by a scan tool in REVERSE or any forward gear position.

7. The transmission Oil Dipstick 9336 has indicator marks every 10 mm. Determine the height of the oil level on the dipstick and using the height, the transmission temperature, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

REMOVAL

1. Hoist and support vehicle on safety stands.
2. Place a large diameter shallow drain pan beneath the transmission pan.
3. Remove bolts holding front and sides of pan to transmission.
4. Loosen bolts holding rear of pan to transmission.
5. Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
6. Hold up pan and remove remaining bolts holding pan to transmission.
7. While holding pan level, lower pan away from transmission.
8. Pour remaining fluid in pan into drain pan.

9. Remove the screw holding the primary oil filter (1) to valve body.
10. Separate filter from valve body and oil pump and pour fluid in filter into drain pan.
11. Inspect the oil filter seal in the bottom of the oil pump. If the seal is not installed completely in the oil pump, or is otherwise damaged, then remove and discard the oil filter seal from the bottom of the oil pump. If the seal is installed correctly and is in good condition, it can be reused.
12. If replacing the cooler return filter (2), use Oil Filter Wrench 8321 to remove the filter from the transmission.
13. Dispose of used trans fluid and filter(s) properly.

INSPECTION

Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts of debris, refer to the diagnosis section of this group.

CLEANING

1. Using a suitable solvent, clean pan and magnet.
2. Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

INSTALLATION

CAUTION: The primary oil filter seal **MUST** be fully installed flush against the oil pump body. **DO NOT** install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

1. If necessary, install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with Installer 6960-A or another suitable tool (appropriately sized drift or socket, the butt end of a hammer etc.).
2. Place replacement filter in position on valve body and into the oil pump.
3. Install screw to hold the primary oil filter (1) to valve body. Tighten screw to 4.5 N·m (40 in. lbs.) torque.
4. Install new cooler return filter (2) onto the transmission, if necessary. Torque the filter to 9.5 N·m (84 in.lbs.).
5. Place bead of Mopar® RTV sealant onto the transmission case sealing surface.
6. Place pan in position on transmission.
7. Install bolts to hold pan to transmission. Tighten bolts to 12 N·m (105 in. lbs.) torque.
8. Lower vehicle and fill transmission with MOPAR® ATF +4.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4 to transmission:
 - a. If only fluid and filter were changed, add **10 pints (5 quarts)** of ATF +4 to transmission.
 - b. If transmission was completely overhauled and the torque converter was replaced or drained, add **24 pints (12 quarts)** of ATF +4 to transmission.
3. Check the transmission fluid (Refer to 21 - TRANSMISSION/AUTOMATIC - RFE/FLUID - STANDARD PROCEDURE) and adjust as required.

CABLE-GEARSHIFT

DIAGNOSIS AND TESTING - SHIFT MECHANISM

1. The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
2. Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
3. With floor shift lever handle push-button not depressed and lever in:
 - a. PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.
 - b. PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.
 - c. NEUTRAL position - Normal position. Engine starts must be possible.

d. NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.
3. Remove the shift cable eyelet from the transmission manual shift lever .
4. Remove shift cable from the cable support bracket.

5. Lower vehicle.
6. Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
7. Disconnect cable at shift lever and shifter assembly bracket .
8. Remove the nuts holding the shift cable seal plate to the floor pan .

9. Pull cable through floor panel opening.
10. Remove shift cable from vehicle.

INSTALLATION

1. Route cable through hole in floor pan.
2. Install seal plate to studs in floor pan .
3. Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).

4. Install the shift cable to the shifter assembly bracket . Push cable into the bracket until secure.
5. Place the floor shifter lever in PARK position.
6. Loosen the adjustment screw on the shift cable.
7. Snap the shift cable onto the shift lever pin.

8. Raise the vehicle.
9. Install the shift cable to the shift cable support bracket .
10. Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
11. Snap the shift cable onto the transmission manual shift lever.

12. Lower vehicle.
13. Verify that the shift lever is in the PARK position.

14. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
15. Verify correct shifter operation.
16. Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

ADJUSTMENTS - GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the TRS may be faulty.

Gearshift Adjustment Procedure

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Loosen the shift cable adjustment screw .

4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.
9. Lower vehicle
10. Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

CLUTCHES-HOLDING

DESCRIPTION

819997aa

Three hydraulically applied multi-disc clutches are used to hold some planetary geartrain components stationary while the input clutches drive others. The 2C, 4C, and Low/Reverse clutches are considered holding clutches. The 2C and 4C clutches are located in the 4C retainer/bulkhead (12).

The Low/Reverse clutch is located at the rear of the transmission case.

OPERATION

2C CLUTCH

The 2C clutch is hydraulically applied in second and fifth gear by pressurized fluid against the 2C piston. When the 2C clutch is applied, the reverse sun gear assembly is held or grounded to the transmission case by holding the reaction planetary carrier.

4C CLUTCH

The 4C clutch is hydraulically applied in second prime and fourth gear by pressurized fluid against the 4C clutch piston. When the 4C clutch is applied, the reaction annulus gear is held or grounded to the transmission case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gear, only at low speeds, by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the input annulus assembly is held or grounded to the transmission case.

ASSEMBLY-INPUT CLUTCH

DESCRIPTION

1 - THRUST BEARING NUMBER 3	10 - SNAP-RING (SELECT)
2 - OD HUB/SHAFT	11 - PLATE
3 - SNAP-RING (WAVE)	12 - DISC
4 - REV/OD REACTION PLATE	13 - OD CLUTCH
5 - THRUST BEARING NUMBER 4	14 - SNAP-RING (TAPERED)
6 - SNAP-RING (FLAT)	15 - UD/OD REACTION PLATE
7 - REVERSE HUB/SHAFT	16 - SNAP-RING (FLAT)
8 - REVERSE CLUTCH	17 - UD HUB/SHAFT
9 - REVERSE REACTION PLATE	18 - THRUST BEARING NUMBER 2

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly.

The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, second prime, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the input sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct), fourth, and fifth gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the reverse carrier/input annulus assembly.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the reaction annulus gear is driven.

DISASSEMBLY

NOTE: If the input clutch assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

808a2e68

1 - THRUST BEARING NUMBER 3	10 - SNAP-RING (SELECT)
2 - OD HUB/SHAFT	11 - PLATE
3 - SNAP-RING (WAVE)	12 - DISC
4 - REV/OD REACTION PLATE	13 - OD CLUTCH
5 - THRUST BEARING NUMBER 4	14 - SNAP-RING (TAPERED)
6 - SNAP-RING (FLAT)	15 - UD/OD REACTION PLATE
7 - REVERSE HUB/SHAFT	16 - SNAP-RING (FLAT)
8 - REVERSE CLUTCH	17 - UD HUB/SHAFT
9 - REVERSE REACTION PLATE	18 - THRUST BEARING NUMBER 2

1. Remove the reverse reaction plate selective snap-ring (10) from the input clutch retainer.
2. Remove the reverse reaction plate (9) from the input clutch retainer.
3. Remove the reverse hub (7) and reverse clutch pack (8) from the input clutch retainer.
4. Remove the number 4 thrust bearing (5) from the overdrive hub (2).
5. Remove the overdrive hub (2) from the input clutch retainer.
6. Remove the number 3 thrust bearing (1) from the underdrive hub (17).
7. Remove the OD/reverse pressure plate snap-ring (6) from the OD/reverse piston.
8. Remove the underdrive hub (17), overdrive clutch (13), and overdrive reaction plate (15) from the input clutch retainer.

NOTE: The overdrive friction discs and steel discs are thicker than the matching components in the underdrive and reverse clutches.

9. Remove the number 2 thrust bearing (18) from the input clutch hub.
10. Remove the overdrive clutch wave snap-ring (3) from the OD/reverse piston.

11. Remove the UD/OD reaction plate tapered snap-ring (14) from the input clutch retainer (13).
12. Remove the UD/OD reaction plate (15) from the input clutch retainer.
13. Remove the UD/OD reaction plate flat snap-ring (16) from the input clutch retainer.

1 - INPUT CLUTCH HUB	11 - UD CLUTCH
2 - O-RING SEALS	12 - PLATE
3 - SEAL	13 - CLUTCH RETAINER
4 - SNAP-RING	14 - SEAL
5 - SNAP-RING	15 - OD/REV PISTON
6 - UD BALANCE PISTON	16 - BELLEVILLE SPRING
7 - SNAP-RING	17 - SNAP-RING
8 - UD PISTON	18 - SEAL RINGS
9 - SPRING	19 - INPUT SHAFT
10 - DISC	20 - LUBRICATION CHECK VALVE AND SNAP-RING

14. Remove the underdrive clutch pack (11) from the input clutch retainer (13).

15. Using Spring Compressor 8251 (2) , compress the UD balance piston (3) and remove the snap-ring from the input clutch hub.

80c07426

808a2e66

1 - INPUT CLUTCH HUB	11 - UD CLUTCH
2 - O-RING SEALS	12 - PLATE
3 - SEAL	13 - CLUTCH RETAINER
4 - SNAP-RING	14 - SEAL
5 - SNAP-RING	15 - OD/REV PISTON
6 - UD BALANCE PISTON	16 - BELLEVILLE SPRING
7 - SNAP-RING	17 - SNAP-RING
8 - UD PISTON	18 - SEAL RINGS

9 - SPRING	19 - INPUT SHAFT
10 - DISC	20 - LUBRICATION CHECK VALVE AND SNAP-RING

16. Remove the UD balance piston (6) and piston return spring (9) from the input clutch retainer (13).
17. Remove the underdrive piston (8) from the input clutch retainer (13).

NOTE: Both the UD balance piston and the underdrive piston have seals molded onto them. If the seal is damaged, do not attempt to install a new seal onto the piston. The piston/seal must be replaced as an assembly.

18. Remove the input clutch retainer tapered snap-ring (5).
19. Separate input clutch retainer (13) from input clutch hub (1).
20. Separate OD/reverse piston (15) from input clutch hub retainer (13).

21. Using Arbor Press (1) and tool 8349-1 (2) compress the OD / Reverse belleville spring just enough to remove the snap ring.
22. Remove the belleville spring and snap ring from the OD / Reverse piston (3).
23. Remove all seals and o-rings from the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to make note of which o-ring belongs in which location.

ASSEMBLY

NOTE: When installing the OD / Reverse piston belleville spring, orientate it such that it contacts a new surface on the piston.

1. Install the belleville spring and snap ring loosely onto the OD / Reverse piston (3).
2. Using an Arbor Press (1) and tool 8349-1 (2) compress the belleville spring just enough to install the snap ring.

1 - INPUT CLUTCH HUB	11 - UD CLUTCH
2 - O-RING SEALS	12 - PLATE
3 - SEAL	13 - CLUTCH RETAINER
4 - SNAP-RING	14 - SEAL
5 - SNAP-RING	15 - OD/REV PISTON
6 - UD BALANCE PISTON	16 - BELLEVILLE SPRING
7 - SNAP-RING	17 - SNAP-RING
8 - UD PISTON	18 - SEAL RINGS

9 - SPRING	19 - INPUT SHAFT
10 - DISC	20 - LUBRICATION CHECK VALVE AND SNAP-RING

NOTE: Install all new seals and o-rings onto the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to install the correct o-ring in the correct location.

3. Check the transmission lubrication check valve (20) located in the input shaft using shop air. The valve should only allow air flow in one direction. If the valve allows no air flow, or air flow in both directions, the valve will need to be replaced.
4. Lubricate all seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.
5. Assemble the OD/reverse piston (15) onto the input clutch hub (1).
6. Assemble the input clutch retainer (13) onto the input clutch hub (1).
7. Install the input clutch retainer tapered snap-ring (5) with tapered side up onto the input clutch hub (1).

8. Install Piston Installer 8504 (1) into the input clutch retainer and onto the input clutch hub to guide the inner and outer underdrive piston seals into position.
9. Install the underdrive piston into the input clutch retainer and over the input clutch hub.

10. Install the UD balance piston return spring pack into the input clutch retainer.
11. Install Piston Installer 8252 (1) into the input clutch retainer to guide the UD balance piston seal into position inside the underdrive piston.

80c07428

NOTE: The UD clutch discs can be identified by their tan color and cross-hatched groove pattern (two sets of parallel grooves at 90 degrees to each other). The UD separator plates can be identified by semi-circular cutouts on the edges of the teeth. The reverse clutch and UD clutch use common separator plates.

12. Install the UD balance piston (3) into the input clutch retainer and the underdrive piston.

13. Using Spring Compressor 8251 (2), compress the UD return spring pack and secure the piston in place with the snap-ring.

14. Install the underdrive clutch pack into the input clutch retainer.

80c07428

808a2e68

1 - THRUST BEARING NUMBER 3	10 - SNAP-RING (SELECT)
2 - OD HUB/SHAFT	11 - PLATE
3 - SNAP-RING (WAVE)	12 - DISC
4 - REV/OD REACTION PLATE	13 - OD CLUTCH
5 - THRUST BEARING NUMBER 4	14 - SNAP-RING (TAPERED)
6 - SNAP-RING (FLAT)	15 - UD/OD REACTION PLATE
7 - REVERSE HUB/SHAFT	16 - SNAP-RING (FLAT)
8 - REVERSE CLUTCH	17 - UD HUB/SHAFT
9 - REVERSE REACTION PLATE	18 - THRUST BEARING NUMBER 2

15. Install the UD reaction plate lower flat snap-ring (16) . The correct snap-ring can be identified by the two tabbed ears.

16. Install the UD reaction plate (15) into the input clutch retainer. The reaction plate is to be installed with the big step down.

17. Install the UD reaction plate upper tapered snap-ring (14) with tapered side up.

18. Install the input clutch assembly into Input Clutch Pressure Fixture 8260 (2).

80c07429

19. Mount a dial indicator C-3339A (1) on the input clutch hub. Push down on the UD clutch discs and zero the indicator against the underdrive clutch discs. Apply 20 psi of air pressure to the underdrive clutch and record the dial indicator reading. Measure and record UD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with UD clutch pack clearance specification. The correct clutch clearance is 0.84-1.54 mm (0.033-0.061 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.

1 - THRUST BEARING NUMBER 3	10 - SNAP-RING (SELECT)
2 - OD HUB/SHAFT	11 - PLATE
3 - SNAP-RING (WAVE)	12 - DISC
4 - REV/OD REACTION PLATE	13 - OD CLUTCH
5 - THRUST BEARING NUMBER 4	14 - SNAP-RING (TAPERED)
6 - SNAP-RING (FLAT)	15 - UD/OD REACTION PLATE
7 - REVERSE HUB/SHAFT	16 - SNAP-RING (FLAT)

8 - REVERSE CLUTCH	17 - UD HUB/SHAFT
9 - REVERSE REACTION PLATE	18 - THRUST BEARING NUMBER 2

20. Install the overdrive clutch pack (13) into the input clutch retainer. The overdrive steel separator plates can be identified by the lack of the half-moon cuts in the locating tabs. The OD clutch discs can be identified by their radial groove pattern. The OD clutch discs can be identified by their radial groove pattern.

21. Install the overdrive clutch wavy snap-ring (3) with the two tabbed ears into the OD/reverse piston .

22. Install the OD/reverse pressure plate (4) into the input clutch retainer. The pressure plate is non-directional.

23. Install the OD/reverse reaction plate flat snap-ring (6) into the OD/reverse piston .

24. Mount a dial indicator C-3339A (1) on the input clutch hub and zero the indicator against the OD/reverse pressure plate (2). . Apply 20 psi of air pressure to the overdrive clutch and record the dial indicator reading. Measure and record OD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with OD clutch pack clearance specification. Verify that the clutch clearance is 1.103-1.856 mm (0.043-0.073 in.). The pressure plate is not selective. If the clutch clearance is not within specification, replace the pressure plate along with all the friction and steel discs.

25. Install the reverse clutch pack into the input clutch retainer.

26. Install the reverse reaction plate into the input clutch retainer.

27. Install the reverse reaction plate selective snap-ring into the input clutch retainer.

28. Mount a dial indicator to the assembly, push down on the clutch discs, pull up on the reaction plate to ensure the plate is properly seated and zero the indicator against the reverse clutch discs (2) . Apply 20 psi of air pressure to the reverse clutch and record the dial indicator reading. Measure and record Reverse clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with Reverse clutch pack clearance specification. The correct clutch clearance is 0.81-1.24 mm (0.032-0.049 in.). Adjust as necessary. Install the chosen snap-ring and re-measure to verify selection.

NOTE: The 545RFE uses one of three (3) different selective snap rings. They are identified by the end cuts (either straight [square] cut or "butterfly" [S-curved] cut):

SELECTABLE END PLAY SNAP RINGS

- One Square End, One Buttery Fly End = 1.55 mm (0.061 in.)
- Both Ends Square Cut = 1.85 mm (0.073 in)
- Both Ends Buttery Fly Cut = 2.2 mm (0.087 in.)

1 - THRUST BEARING NUMBER 3	10 - SNAP-RING (SELECT)
2 - OD HUB/SHAFT	11 - PLATE
3 - SNAP-RING (WAVE)	12 - DISC
4 - REV/OD REACTION PLATE	13 - OD CLUTCH
5 - THRUST BEARING NUMBER 4	14 - SNAP-RING (TAPERED)
6 - SNAP-RING (FLAT)	15 - UD/OD REACTION PLATE
7 - REVERSE HUB/SHAFT	16 - SNAP-RING (FLAT)
8 - REVERSE CLUTCH	17 - UD HUB/SHAFT
9 - REVERSE REACTION PLATE	18 - THRUST BEARING NUMBER 2

29. Remove the reverse clutch pack (8) from the input clutch retainer.
30. Install the number 2 thrust bearing (18) onto the underdrive hub (17) with outer race against the hub with petroleum jelly.
31. Install the underdrive hub (17) into the input clutch retainer.
32. Install the number 3 thrust bearing (1) into the overdrive hub (2) with the outer race against the hub with petroleum jelly.
33. Install the overdrive hub (2) into the input clutch retainer.
34. Install the number 4 thrust bearing (5) into the reverse hub with outer race against the hub with petroleum

jelly.

35. Install the reverse hub (7) into the input clutch retainer.
36. Install the complete reverse clutch pack (8).
37. Install the reverse reaction plate (9) and snap-ring (10).
38. Push up on reaction plate to allow reverse clutch to move freely.

SENSOR-INPUT SPEED

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM . The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the park gear teeth . The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the input speed sensor (3).
4. Remove the bolt holding the input speed sensor to the transmission case.
5. Remove the input speed sensor (3) from the transmission case.

INSTALLATION

1. Install the input speed sensor (3) into the transmission case.
2. Install the bolt to hold the input speed sensor (3) into the transmission case. Tighten the bolt to 12 N·m (105 in.lbs.).
3. Install the wiring connector onto the input speed sensor.
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

SENSOR-LINE PRESSURE (LP)

DESCRIPTION

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid, which is part of the pressure switch assembly. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the pump inlet. The system contains a Line Pressure Sensor, which is a direct input to the TCM. The line pressure sensor monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts, to ensure consistent shift quality. During all other operation, the desired line pressure value is adjusted based on torque level and other transmission requirements.

REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the line pressure sensor (2).
4. Remove the bolt holding the line pressure sensor (2) to the transmission case.
5. Remove the line pressure sensor (2) from the transmission case.

INSTALLATION

1. Install the line pressure sensor (2) into the transmission case.
2. Install the bolt to hold the line pressure sensor (2) into the transmission case. Tighten the bolt to 12 N·m (105 in.lbs.).
3. Install the wiring connector onto the line pressure sensor (2).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

CLUTCH-LOW/REVERSE

DISASSEMBLY

1. Remove the inner overrunning clutch snap-ring (11) from the low/reverse clutch retainer (5).
2. Remove the outer low/reverse reaction plate flat snap-ring (1).
3. Remove the low/reverse clutch (3, 4) and the overrunning clutch (10) from the low/reverse clutch retainer (5) as an assembly.
4. Separate the low/reverse clutch (3, 4) from the overrunning clutch (10).

NOTE: The ORC is no longer serviced , it is sold an assembly only. Be certain that the outer race will rotate in one direction but not both relative to the inner race

5. Using Spring Compressor 8285 (2) and a suitable shop press (1), compress the low/reverse Belleville spring (3) and remove the split retaining ring holding the Belleville spring into the low/reverse clutch retainer.

6. Remove the low/reverse Belleville spring (3) and piston from the low/reverse clutch retainer. Use 20 psi of air pressure to remove the piston if necessary.

CLEANING

Clean the overrunning clutch assembly, clutch cam, and low-reverse clutch retainer. Dry them with compressed air after cleaning.

INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the LR clutch retainer if the piston bores or ID bushings are scored or damaged.

ASSEMBLY

1. Check the bleed orifice to ensure that it is not plugged or restricted.
2. Lubricate the seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.
3. Install the low/reverse piston into the low/reverse clutch

retainer.

4. Position the low/reverse Belleville spring (3) on the low/reverse piston.
5. Using Spring Compressor 8285 (2) and a suitable shop press (1), compress the low/reverse Belleville spring (3) and install the split retaining ring to hold the Belleville spring into the low/reverse clutch retainer.

6. Install the lower overrunning clutch snap-ring.
7. Assemble the inner and outer races (2) of the overrunning clutch (3).
8. Position the overrunning clutch spacer (4) on the overrunning clutch (3).
9. Install the upper overrunning clutch snap-ring (1).

819997aa

10. Assemble and install the low/reverse clutch pack (3, 4) into the low/reverse clutch retainer (5).
11. Install the low/reverse reaction plate (2) into the low/reverse clutch retainer (5). The reaction plate is directional and must be installed with the flat side down.
12. Install the low/reverse clutch pack snap-ring (1). The snap-ring is selectable and should be chosen to give the correct clutch pack clearance.
13. Measure the low/reverse clutch pack clearance and adjust as necessary. The correct clutch clearance is 1.00-1.74 mm (0.039-0.069 in.).

NOTE: When installing the overrunning clutch be certain the steps on the gear face upward.

14. Install the overrunning clutch (10) into the low/reverse clutch retainer (5) making sure that the index splines are aligned with the retainer.
15. Install the overrunning clutch inner snap-ring (11).

PUMP-OIL

DESCRIPTION

The oil pump (2) is located at the front of the transmission inside the bell housing and behind the transmission front cover.

The oil pump consists of two independent pumps.

The oil pump also contains a number of valves. The converter clutch switch (3) and control valves (2), pressure regulator valve (5), and converter pressure limit valve (6) are all located in the oil pump valve body.

808a2e46

A filter seal (2), and a bolt on reaction shaft (4) complete the oil pump assembly.

OPERATION

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, a vacuum is created when the gear teeth come out of mesh. This suction draws fluid through the pump inlet from the oil pan. As the gear teeth come back into mesh, pressurized fluid is forced into the pump outlet and to the oil pump valves.

At low speeds, both sides of the pump supply fluid to the transmission. As the speed of the torque converter increases, the flow from both sides increases until the flow from the primary side alone is sufficient to meet system demands. At this point, the check valve located between the two pumps closes. The secondary side is shut down and the primary side supplies all the fluid to the transmission.

CONVERTER CLUTCH SWITCH VALVE

The converter clutch switch valve is used to control the direction of oil flow to the torque converter. When the converter clutch is released (CC switch valve downshifted), hydraulic pressure is supplied to the front (OFF) side of the torque converter clutch. When the converter clutch is applied (CC switch valve upshifted), regulated oil pressure is supplied to the back (ON) side of the converter clutch.

CONVERTER CLUTCH REGULATOR VALVE

The converter clutch regulator valve is used to control the hydraulic pressure supplied to the back (ON) side of the torque converter clutch.

TORQUE CONVERTER LIMIT VALVE

The torque converter limit valve serves to limit the available line pressure to the torque converter clutch.

STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, Automatic Transmission Fluid.

1. Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

2. Run the engine **at 1800 rpm**, with the shift selector in neutral. Verify that the transmission fluid temperature is below 104.5° C (220° F) for this test.
3. If one quart of transmission fluid is collected in the container in 30 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 30 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.
4. Re-connect the **To cooler** line to the transmission cooler inlet.
5. Refill the transmission to proper level.

DISASSEMBLY

81999F24

1. Remove the bolts holding the reaction shaft support (4) to the oil pump.
2. Remove the reaction shaft support (4) from the oil pump.
3. Remove all bolts holding the oil pump halves together.
4. Using suitable prying tools, separate the oil pump sections by inserting the tools in the supplied areas and prying the halves apart.

NOTE: The oil pump halves are aligned to each other through the use of two dowels. Be sure to pry upward evenly to prevent damage to the oil pump components.

5. Remove the screws (7) holding the separator plate (1) onto the oil pump housing (4).
6. Remove the separator plate (1) from the oil pump housing (4).
7. Mark all gears for location. The gears are select fit and if the oil pump is to be reused, the gears must be returned to their original locations.
8. Remove the oil pump flapper valve (3) from its pocket in the pump housing.
9. Remove the oil pump gears (2, 6) from the oil pump housing (4).

10. Remove the oil pump valve retainers (1) and associated valve (2) and spring one at a time. Mark the combination of components as a group and tag them as to the location from which they were removed.

11. Remove the T/C regulator valve (1), T/C limit valve (2), and regulator valve (3).

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump reaction shaft support bushings. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the oil pump valve body. Use a penlight to view the bore interiors.

Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores. Tip the pump valve body back and forth and check to see that each valve slides freely in its bore under its own weight (without pushing or prying).

ASSEMBLY

NOTE: Clean and inspect all components. Make sure that all passages are thoroughly cleaned and are free from dirt or debris. Make sure that all valves move freely in their proper bore. Make sure that all gear pockets and bushings are free from excessive wear and scoring. Replace the oil pump if any excessive wear or scoring is found.

1. Lubricate the oil pump valves with Mopar® ATF +4 and install the valve (2), spring, and retainer (1) into the appropriate oil pump valve body (3) bore.

2. Install the T/C regulator valve (1), T/C limit valve (2), and regulator valve (3).

NOTE: The pump separator plate is heat treated and therefore may exhibit a blue color or other discoloration in some areas. This is normal.

3. Coat the gears (2, 6) with Mopar® ATF +4 and install into their original locations.
4. Place the oil pump flapper valve (3) into its pocket in the pump housing, with the rounded edges facing down.
5. Place the separator plate (1) onto the oil pump housing (4).
6. Install the screws (7) to hold the separator plate (1) onto the oil pump housing (4). Tighten the screws to 4.5 N·m (40 in.lbs.).

7. Position the oil pump valve body (5) onto the locating dowels.
8. Seat the two oil pump halves together and install all bolts finger tight.
9. Torque all bolts down slowly starting in the center and working outward. The correct torque is 4.5 N·m (40 in.lbs.).
10. Verify that the oil pump gears rotate freely and smoothly.
11. Position the reaction shaft support (4) onto the oil pump valve body (6).
12. Install and tighten the bolts to hold the reaction shaft support (4) to the oil pump valve body (5). The correct torque is 12 N·m (105 in.lbs.).

SENSOR-OUTPUT SPEED

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the park gear teeth. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the output speed sensor (1).
4. Remove the bolt holding the output speed sensor (1) to the transmission case.
5. Remove the output speed sensor (1) from the transmission case.

INSTALLATION

1. Install the output speed sensor (1) into the transmission case.
2. Install the bolt to hold the output speed sensor (1) into the transmission case. Tighten the bolt to 12 N·m (105 in.lbs.).
3. Install the wiring connector onto the output speed sensor (1).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

SWITCH-OVERDRIVE

DESCRIPTION

The overdrive OFF (control) switch is located in the shifter handle. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

OPERATION

At key-on, fourth gear operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoids and allow upshifts to fourth gear. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

CABLE-PARK INTERLOCK

REMOVAL

1. Lower the steering column.
2. With the ignition switch in the "RUN" position depress the park-interlock cable locking tab (2), located on top of the cable connector at the steering column and pull the cable straight out.

3. Remove the park-interlock cable from steering column.
4. Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
5. Disconnect the park-interlock cable (3) from the shift lever assembly and remove the cable from the shifter assembly bracket.
6. Release the park-interlock cable from any remaining clips.
7. Remove park-interlock cable from the vehicle.

INSTALLATION

NOTE: The gearshift cable must be secured into position and properly adjusted before the installation of the Park-Interlock Cable.

1. Push the park-interlock cable (3) straight into the square mounting hole in the steering column until cable snaps in place.
2. Snap park-interlock cable tie strap into hole in steering column tube.

3. Route cable to the shifter mechanism.
4. Install the cable end fitting into shifter lever (1).
5. Snap cable adjuster ears into floor shifter bracket.
6. Place the ignition key cylinder in the LOCK position.
7. Push the cable adjuster lock clamp downward to lock it.
8. Test the park-interlock cable operation.
9. Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

ADJUSTMENTS - PARK-INTERLOCK CABLE

The park-interlock cable is part of the Brake Transmission Shift Interlock (BTSI) system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

1. Remove floor console as necessary for access to the park-interlock cable.
2. Shift the transmission into the PARK position.
3. Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**
4. Pull cable lock button up to release cable (3).
5. Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.
6. Push lock button down until it snaps in place.
7. Verify proper operation. (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC -
42RLE/SHIFT INTERLOCK MECHANISM - DIAGNOSIS AND TESTING)
8. Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE -
INSTALLATION)

GEARTRAIN-PLANETARY

DESCRIPTION

Reaction Planetary Geartrain

1 - THRUST BEARING NUMBER 8	5 - THRUST BEARING NUMBER 7
2 - THRUST BEARING NUMBER 9	6 - THRUST PLATE (SELECT)

3 - REACTION PLANETARY CARRIER	7 - THRUST BEARING NUMBER 6
4 - REACTION SUN GEAR	8 - REACTION ANNULUS

The planetary geartrain is located behind the 4C retainer/bulkhead, toward the rear of the transmission. The planetary geartrain consists of three primary assemblies:

- Reaction (3, 4, 8).

1. Snap Ring	4. Input Planetary Carrier
2. Thrust Bearing No. 10	5. Input Sun Gear
3. Input Annulus	6. Reverse Carrier

- Reverse (6).
- Input (3, 4, 5).

OPERATION

REACTION PLANETARY GEARSET

The reaction planetary carrier and reverse sun gear of the reaction planetary gearset are a single component which is held by the 2C clutch when required. The reaction annulus gear is a stand alone component that can be driven by the reverse clutch or held by the 4C clutch. The reaction sun gear is driven by the overdrive clutch.

REVERSE PLANETARY GEARSET

The reverse planetary gearset is the middle of the three planetary sets. The reverse planetary carrier can be driven by the overdrive clutch as required. The reverse planetary carrier is also splined to the input annulus gear, which can be held by the low/reverse clutch. The reverse planetary annulus, input planetary carrier, and output shaft are all one piece.

INPUT PLANETARY GEARSET

The input sun gear of the input planetary gearset is driven by the underdrive clutch.

DISASSEMBLY

819217a5

1. Snap Ring	4. Input Planetary Carrier
2. Thrust Bearing No. 10	5. input Sun Gear
3. Input Annulus	6. Reverse Carrier

1. Remove the snap-ring (1) holding the input annulus (3) into the input carrier (4).
2. Remove the input annulus (3) from the input carrier (4).
3. Remove the reverse planetary gear carrier (6).
4. Remove the number 10 thrust bearing (2) from the input sun gear (5).
5. Remove the input sun gear (5) from the input carrier (4).

CLEANING

Clean the planetary components in solvent and dry them with compressed air.

INSPECTION

Inspect each planetary carrier assembly for damage. Check that each pinion gear rotates freely and smoothly on its shaft. Check that the tabbed thrust washer on each side of each pinion gear is in place. Check that the outer ends of the pinion shafts are not discolored from overheating. Replace the carrier assembly if jammed or sticky pinion gears, spun or missing tabbed washers, or blackened pinion shafts are found.

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

ASSEMBLY

NOTE: Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

1. Snap Ring	4. Input Planetary Carrier
2. Thrust Bearing No. 10	5. input Sun Gear
3. Input Annulus	6. Reverse Carrier

1. Install the input sun gear (5) into the input carrier (4).
2. Install the number 10 thrust bearing (2) onto the rear of the reverse planetary carrier (6) with the inner race toward the carrier.
3. Install the reverse planetary gear carrier (6) into the input carrier (4).
4. Install the input annulus gear (3) into the input carrier (4).
5. Install the snap-ring (1) to hold the input annulus gear (3) into the input carrier (4).

MECHANISM-SHIFT

DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual second (2)
- Manual low (1)

OPERATION

MANUAL LOW (1) range provides FIRST gear only. Overrun braking is also provided in this range. MANUAL SECOND (2) range provides FIRST and SECOND gear only.

DRIVE range provides FIRST, SECOND, THIRD and OVERDRIVE FOURTH and FIFTH gear ranges. The shift into OVERDRIVE FOURTH and FIFTH gear range occurs only after the transmission has completed the shift into D THIRD gear range. No further movement of the shift mechanism is required to complete the 3-4 or 4-5 shifts.

The FOURTH and FIFTH gear upshifts occurs automatically when the overdrive selector switch is in the ON position. An upshift to FOURTH and FIFTH gears may not occur or may be delayed in some of the possible shift schedules. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - OPERATION)

REMOVAL

1. Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
2. Shift transmission into PARK.
3. Disconnect the transmission shift cable at shift lever and shifter assembly bracket .
4. Disconnect the park-interlock cable from the shifter lever and the shifter assembly bracket.
5. Disengage all wiring connectors from the shifter assembly.
6. Remove all nuts holding the shifter assembly to the floor pan .

7. Remove the shifter assembly from the vehicle.

INSTALLATION

1. Install shifter assembly onto the shifter assembly studs on the floor pan.
2. Install the nuts to hold the shifter assembly onto the floor pan. Tighten nuts to 28 N·m (250 in.lbs.).
3. Install wiring harness to the shifter assembly bracket. Engage any wire connectors removed from the shifter assembly.
4. Install the park-interlock cable into the shifter assembly bracket and into the shifter lever.
5. Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
6. Place the floor shifter lever in park position.
7. Loosen the adjustment screw on the shift cable.
8. Snap the shift cable onto the shift lever pin.
9. Verify that the shift lever is in the PARK position.
10. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
11. Verify correct shifter operation.
12. Verify proper BTSI operation. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RL/SHIFT INTERLOCK MECHANISM - DIAGNOSIS AND TESTING)
13. Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

SWITCH-VALVE-SOLENOID

DESCRIPTION

The Solenoid Switch Valve (SSV) is located in the main valve body and directs the output from the L/R-TCC solenoid to either the L/R clutch or the TCC control valves

OPERATION

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and 5th gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

CONVERTER-TORQUE

DESCRIPTION

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (2), an overrunning clutch, an impeller (5), and an electronically applied converter clutch (6). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub (3) drives the transmission oil (fluid) pump and contains an o-ring seal (4) to better control oil flow.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

IMPELLER

The impeller is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

80bfe26b

The turbine is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

The stator contains an over-running clutch (1-4), which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added to the turbine assembly (5) to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a “hindering” direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a “helping” direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear, and above approximately 72 km/h (45 mph). If the control switch is in the OFF position, the clutch will engage after the shift to third gear, at approximately 56 km/h (35 mph) at light throttle.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the L/R-CC Solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the L/R Solenoid duty cycle.

REMOVAL

1. Remove transmission and torque converter from vehicle.
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

NOTE: Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub o-ring while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be at least 13 mm (1/2

- in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
 8. Install the transmission in the vehicle.
 9. Fill the transmission with the recommended fluid.

RELAY-TRANSMISSION CONTROL

DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

OPERATION

When the relay is “off”, no power is supplied to the solenoid pack and the transmission is in “limp-in” mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

SENSOR-TRANSMISSION RANGE

DESCRIPTION

The Transmission Range Sensor (TRS) is part of the solenoid module, which is mounted to the top of the valve body inside the transmission.

The Transmission Range Sensor (TRS) has five switch contact pins that:

- Determine shift lever position
- Supply ground to the Starter Relay in Park and Neutral only.
- Supply +12 V to the backup lamps in Reverse only.

The TRS also has an integrated temperature sensor (thermistor) that communicates transmission temperature to the TCM and PCM.

OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

There are many possible combinations of open and closed switches (codes). Seven of these possible codes are related to gear position and five are recognized as “between gear” codes. This results in many codes which should **never occur**. These are called “invalid” codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

GEAR	C5	C4	C3	C2	C1
Park	CL	OP	OP	CL	CL
Temp 1	CL	OP	OP	CL	OP
Reverse	OP	OP	OP	CL	OP
Temp 2	OP	OP	CL	CL	OP
Neutral 1	OP	OP	CL	CL	CL
Neutral 2	OP	CL	CL	CL	CL
Temp 3	OP	CL	CL	CL	OP
Drive	OP	CL	CL	OP	OP

Manual 2	CL	CL	OP	OP	OP
Temp 5	CL	OP	OP	OP	OP
Manual 1	CL	OP	CL	OP	OP

ASSEMBLY-TRANSMISSION SOLENOID/TRS

DESCRIPTION

The transmission solenoid/TRS assembly is internal to the

transmission and mounted on the valve body assembly . The assembly consists of six solenoids that control hydraulic pressure to the six friction elements (transmission clutches), and the torque converter clutch. The pressure control solenoid is located on the side of the solenoid/TRS assembly. The solenoid/TRS assembly also contains the Transmission Range Sensor (TRS) and five pressure switches that feed information to the TCM.

OPERATION

SOLENOIDS

Solenoids are used to control the L/R, 2C, 4C, OD, and UD friction elements. The reverse clutch is controlled by line pressure and the position of the manual valve in the valve body. All the solenoids are contained within the Solenoid and Pressure Switch Assembly. The solenoid and pressure switch assembly contains one additional solenoid, Multi-Select (MS), which serves primarily to provide 2nd and 3rd gear limp-in operation.

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid as necessary. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The MS and UD solenoids are normally applied to allow transmission limp-in in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on five pressure switches to monitor fluid pressure in the L/R, 2C, 4C, UD, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The switches close at approximately 23 psi and open at approximately 11 psi, and simply indicate whether or not pressure exists. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

GEAR	L/R	2C	4C	UD	OD
R	OP	OP	OP	OP	OP
P/N	CL	OP	OP	OP	OP

1ST	CL*	OP	OP	CL	OP
2ND	OP	CL	OP	CL	OP
2ND PRIME	OP	OP	CL	CL	OP
D	OP	OP	OP	CL	CL
4TH	OP	OP	CL	OP	CL
5TH	OP	CL	OP	OP	CL
*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is open in Manual 1.					

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

REMOVAL

NOTE: If the Transmission Solenoid/TRS Assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Remove the valve body from the transmission . (Refer to 21 - TRANSMISSION/AUTOMATIC - 45RFE/545RFE/VALVE BODY - REMOVAL)

2. Remove the bolts (1) holding the transmission solenoid/TRS assembly onto the valve body .
3. Separate the transmission solenoid/TRS assembly from the valve body.

INSTALLATION

1. Place TRS selector plate in the PARK position.
2. Position the transmission solenoid/TRS assembly onto the valve body. Be sure that both alignment dowels are fully seated in the valve body and that the TRS switch contacts are properly positioned in the selector plate
3. Install the bolts (1) to hold the transmission solenoid/TRS assembly onto the valve body.
4. Tighten the solenoid assembly screws adjacent to the arrows cast into the bottom of the valve body first. Tighten the screws to 6 N·m (50 in.lbs.).
5. Tighten the remainder of the solenoid assembly screws to 6 N·m (50 in.lbs.).
6. Install the valve body into the transmission.

SENSOR-TRANSMISSION TEMPERATURE

DESCRIPTION

The transmission temperature sensor is a thermistor that is integral to the Transmission Range Sensor (TRS).

OPERATION

The transmission temperature sensor is used by the TCM to sense the temperature of the fluid in the sump. Since fluid temperature can affect transmission shift quality and converter lock up, the TCM requires this information to determine which shift schedule to operate in.

Calculated Temperature

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

BODY-VALVE

DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and a transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch and frictional clutches. The valve body contains the following components:

- Solenoid switch valve
- Manual valve
- Low/reverse shuttle valve
- 5 Accumulators
- 7 check balls

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

SOLENOID SWITCH VALVE

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and fifth gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

MANUAL VALVE

The manual valve is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the top of the valve body. The valve is connected mechanically by a cable to the gearshift mechanism. The valve is held in each of its positions by a roller detent spring (2) that engages the roostercomb of the TRS selector plate (1).

LOW/REVERSE SWITCH VALVE

The low/reverse switch valve allows the low/reverse clutch to be operated by either the LR/CC solenoid or the MS solenoid.

REMOVAL

NOTE: The valve body can be removed for service without having to remove the transmission assembly. The valve body can be disassembled for cleaning and inspection of the individual components. (Refer to 21 - TRANSMISSION/AUTOMATIC - 45RFE/VALVE BODY - DISASSEMBLY)

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disconnect wires at the solenoid and pressure switch assembly 23 pin electrical connector.
4. Position drain pan under transmission oil pan.
5. Remove transmission oil pan.
6. Remove the primary oil filter (1) from valve body.

7. Remove bolts (1) attaching valve body to transmission case.
8. Lower the valve body and work the electrical connector out of transmission case.
9. Separate the valve body from the transmission.

DISASSEMBLY

1. Remove the bolts (1) holding the solenoid and pressure switch assembly to the valve body. Do not remove the screws on the top of the solenoid and pressure switch assembly.

2. Separate the solenoid and pressure switch assembly from the valve body.

- 3. Remove the screw holding the detent spring (2) onto the valve body.
- 4. Remove the detent spring (2) from the valve body.
- 5. Remove the TRS selector plate (1) from the valve body and the manual valve.
- 6. Remove the clutch passage seals (3) from the valve body, if necessary.

808a2e54

7. Remove the screws holding the accumulator cover onto the valve body .

8. Remove the accumulator springs and pistons (1, 6-9) from the valve body. Note which accumulator piston and spring belong in each location.

9. Place the valve body on the bench with the transfer plate upward.

NOTE: The valve body contains seven check balls. The transfer plate must be placed upward to prevent losing the check balls when the transfer plate is removed from the valve body.

10. Remove the screws holding the valve body to the valve body transfer plate.

11. Remove the transfer plate from the valve body. Note the location of all check balls .

12. Remove the check balls from the valve body.

80c072f

13. Remove the retainer securing the solenoid switch valve (5) from the valve body. Remove the solenoid switch valve and plugs (5), the manual valve (4) and low reverse shuttle valve and plug (2). Tag each valve and plug combination with location information to aid in assembly.

CLEANING

Clean the valve housings, valves, plugs, springs, and separator plate with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

INSPECTION

NOTE: Only the INNER accumulator seal ring actually seals the pressure in the bore. The outer seal ring only serves to guide the piston in the bore. Gouges which do not extend past the inner seal ring (and have no raised edges, which could damage the guide ring) are acceptable. The machined accumulator bores often have a tiger-striped appearance. This is NORMAL and does NOT require replacement, as long as the bores are smooth in the inner seal ring area.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

Inspect all the accumulator bores in the valve body. Use a penlight to view the bore interiors. Replace the valve

body if any bores are distorted or scored. Inspect all of the accumulator springs. The springs must be free of distortion, warpage or broken coils.

Inspect all the fluid seals on the valve body. Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

ASSEMBLY

1. Lubricate valves and the housing valve bores with clean transmission fluid.

2. Install solenoid switch valve and plugs (5) and manual valve (4) into the valve body.
3. Install the retainers to hold each valve into the valve body.

4. Install the valve body check balls into their proper locations.
5. Position the separator and transfer plate onto the valve body.
6. Install the screws to hold the transfer plate to the valve body. Tighten the screws to 6 N·m (50 in. lbs.).

7. Install the accumulator pistons (1, 6-9) and springs into the valve body in the location from which they were removed. Note that all accumulators except the overdrive have two springs. The overdrive accumulator piston (6) has only one spring.
8. Install the Low / Reverse shuttle valve, plug and retainer (2) into the valve body housing.
9. Position the accumulator cover onto the valve body.
10. Install the screws to hold the accumulator cover onto the valve body. Tighten the screws to 7 N·m (60 in. lbs.).

11. Install the TRS selector plate (1) onto the valve body and the manual valve.
12. Position the detent spring (2) onto the valve body.
13. Install the screw to hold the detent spring (2) onto the valve body. Tighten the screw to 4.5 N·m (40 in. lbs.).
14. Install new clutch passage seals (3) onto the valve body, if necessary.

15. Install the solenoid and pressure switch assembly onto the valve body.
16. Install the bolts (1) to hold the solenoid and pressure switch assembly onto the valve body. Tighten the bolts to 6 N·m (50 in. lbs.). Tighten the bolts adjacent to the arrows cast into the bottom of the transfer plate first.

INSTALLATION

1. Check condition of seals on valve body and the solenoid and pressure switch assembly. Replace seals if cut or worn.
2. Place TRS selector plate in the PARK position.
3. Place the transmission in the PARK position.
4. Lubricate seal on the solenoid and pressure switch assembly connector with petroleum jelly.
5. Position valve body in transmission and align the manual lever on the valve body to the pin on the transmission manual shift lever.
6. Seat valve body in case and install one or two bolts to hold valve body in place.
7. Tighten valve body bolts alternately and evenly to 12 N·m (105 in. lbs.) torque.
8. Operate the external manual shift lever and ensure that the TRS selector plate moves correctly into all gear range

positions.

CAUTION: The primary oil filter seal **MUST** be fully installed flush against the oil pump body. **DO NOT** install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.

9. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.

10. Place replacement filter (1) in position on valve body and into the oil pump.

11. Install screw to hold filter to valve body. Tighten screw to 4.5 N·m (40 in. lbs.) torque.

12. Connect the solenoid and pressure switch 23 pin electrical assembly connector.

13. Install oil pan using silicone gasket sealer. Tighten pan bolts to 12 N·m (105 in. lbs.) torque.

14. Lower vehicle and fill transmission with Mopar® ATF +4.

15. Check and adjust gearshift cable, if necessary.

TRANSFER CASE - ELECTRICAL DIAGNOSTICS

TRANSFER CASE - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

C1404- TRANSFER CASE RANGE POSITION SENSOR CIRCUIT LOW

01940104

For a complete wiring diagram **Refer to Section 8W.**

◦ **When Monitored:**

Ignition on. Battery voltage between 9.0 and 16.0 volts.

◦ **Set Condition:**

The TIPM detects a short to ground on the Transfer Case Position Sensor Signal circuit for 2.0 seconds.

Possible Causes
(T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO (K91) SENSOR GROUND CIRCUIT
TRANSFER CASE (4WD) SWITCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. T-CASE POSITION SENSOR VOLTAGE BELOW 0.2 VOLTS

Ignition on, engine not running.

With the scan tool under TIPM, read the T-Case Position Sensor voltage.

Is the voltage below 0.2 volts?

Yes

- Go To [2](#)

No

- Go To [5](#)

2. (T313) MODE SENSOR SIGNAL CIRCUIT VOLTAGE BELOW 4.9 VOLTS

Turn the ignition off to the lock position.

Disconnect the Transfer Case (4WD) Switch harness connector.

Ignition on, engine not running.

Measure the voltage of the (T313) Mode Sensor Signal circuit and the (K91) Sensor Ground at the Transfer Case

(4WD) Switch harness connector.

Is the voltage below 4.9 volts?

Yes

- Go To [3](#)

No

- Replace the Transfer Case (4WD) Switch in accordance with the Service Manual.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

3. (T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off to the lock position.
Disconnect the TIPM C1 harness connector.
Measure the resistance between ground and the (T313) Mode Sensor Signal circuit at the Transfer Case (4WD) Switch harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T313) Mode Sensor Signal circuit for a short to ground.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO (K91) SENSOR GROUND CIRCUIT

Measure the resistance between the (T313) Mode Sensor Signal circuit and the (K91) Sensor Ground circuit at the Transfer Case (4WD) Switch harness connector.

Is the resistance below 5.0 ohms?

Yes

- Repair the (T313) Mode Sensor Signal circuit for a short to the (K91) Sensor Ground circuit.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module in accordance with the Service Information.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors. Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer To 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Test complete.

C1405- TRANSFER CASE RANGE POSITION SENSOR CIRCUIT HIGH

01940104

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on. Battery voltage between 9.0 and 16.0 volts

◦ **Set Condition:**

The TIPM detects 5.0 volts on the Transfer Case Range Position Sensor Signal circuit for 2.0 seconds when voltage should not be present.

Possible Causes
(T313) MODE SENSOR SIGNAL CIRCUIT OPEN
(K91) SENSOR GROUND CIRCUIT OPEN
(T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
TRANSFER CASE (4WD) SWITCH
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. T-CASE POSITION SENSOR VOLTAGE ABOVE 4.8 VOLTS

Ignition on, engine not running.

With the scan tool under TIPM, read the T-Case Position sensor voltage.

Is the voltage above 4.8 volts?

Yes

- Go To [2](#)

No

- Go To [7](#)

2. (T313) MODE SENSOR SIGNAL CIRCUIT VOLTAGE

Turn the ignition off to the lock position.

Disconnect the Transfer Case (4WD) Switch harness connector.

Ignition on, engine not running.
Measure the voltage of the (T313) Mode Sensor Signal circuit and the (K91) Sensor Ground at the Transfer Case (4WD) Switch harness connector.

Is the voltage between 4.8 and 5.2 volts?

Yes

- Replace the Transfer Case (4WD) Switch in accordance with the Service Manual.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Go To [3](#)

3. (T313) MODE SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off to the lock position.
Disconnect the TIPM C1 harness connector.
Measure the resistance of the (T313) Mode Sensor Signal circuit between the Transfer Case (4WD) Switch harness connector and the TIPM C1 harness connector.

Is the resistance above 5.0 ohms?

Yes

- Repair the (T313) Mode Sensor Signal circuit for an open.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Go To [4](#)

4. (K91) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K91) Sensor Ground circuit between the Transfer Case (4WD) Switch harness connector and the TIPM C1 harness connector.

Is the resistance above 5.0 ohms?

Yes

- Repair the (K91) Sensor Ground circuit for an open.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Go To [5](#)

5. (T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Ignition on, engine not running.
Measure the voltage of the (T313) Mode Sensor Signal circuit at the Transfer Case (4WD) Switch harness connector.

Is the voltage above 0.2 volts?

Yes

- Repair the (T313) Mode Sensor Signal circuit for a short to voltage.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Go To [6](#)

6. (K91) SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K91) Sensor Ground circuit at the Transfer Case (4WD) Switch harness connector.

Is the voltage above 0.2 volts?

Yes

- Repair the (K91) Sensor Ground circuit for a short to voltage.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Replace the Totally Integrated Power Module in accordance with the Service Information.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
 Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
 While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
 Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

- Repair as necessary.
- Perform the TRANSFER CASE VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - STANDARD PROCEDURE)

No

- Test complete.

STANDARD PROCEDURE

TRANSFER CASE VERIFICATION TEST VER 1

Diagnostic Test

1. TRANSFER CASE VERIFICATION TEST— VER 1

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
 With the scan tool, select Clear Stored DTCs.
 Make sure that all accessories are turned off and that the battery is fully charged.
 Test drive the vehicle in each Transfer Case range and verify proper operation in each range.

NOTE: To shift into 4LO (if equipped), vehicle speed must be below 3 M.P.H. (5 KM/H) with the ignition ON and the transmission in neutral (auto trans).

NOTE: To shift the Transfer Case into Neutral, vehicle speed must be 0 M.P.H. with the ignition ON, engine OFF, the brake pedal applied, and the transmission in neutral (auto trans). Shift the Transfer Case until the Neutral Indicator is illuminated solidly and the cluster displays '4WD System in Neutral'.

WARNING: Apply the parking brake. The vehicle may roll with the Transfer Case in neutral.

NOTE: To verify that the Transfer Case is in Neutral, shift the automatic transmission into reverse and release the brake pedal for three seconds. There should be no vehicle movement if the Transfer Case is in

Neutral.

With the scan tool, select View DTCs in the Final Drive Control Module.

Are there any DTCs present in the Final Drive Control Module?**Yes**

- Return to the symptom list and perform the appropriate diagnostic test.

No

- Repair is complete.
-

TRANSFER CASE - NV241 GENII**TRANSFER CASE - NV241 GENII****DESCRIPTION**

The NV241 GENII transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The gear cases and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

IDENTIFICATION

An identification tag (2) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION**OPERATING RANGE**

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range)

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

Operating ranges are selected with a floor mounted shift lever. The shift lever is connected to the transfer case range lever by a shift cable. A straight line shift pattern is used. Range positions are marked on the shifter knob bezel.

SHIFTING

The transfer case can be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into and out of the 4L operating range.

DIAGNOSIS AND TESTING - TRANSFER CASE - NV241 GENII

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer Case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting.	1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift.
	2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind.	2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces.

	3) Transfer case external shift linkage binding.	3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary.
	4) Insufficient or incorrect lubricant.	4) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid.
	5) Internal components binding, worn, or damaged.	5) Disassemble the transfer case and replace worn or damaged components as necessary.
Transfer Case noisy in all operating ranges.	1) Insufficient or incorrect lubricant.	1) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid.
Noisy in, or jumps out of, four wheel drive low range.	1) Transfer case not completely engaged in 4L position.	1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position.
	2) Shift linkage out of adjustment.	2) Adjust linkage.
	3) Shift linkage loose or binding.	3) Tighten, lubricate, or repair linkage as necessary.
	4) Range fork damaged, inserts worn, or fork is binding on the shift rail.	4) Disassemble unit and repair as necessary.
	5) Low range gear worn or damaged.	5) Disassemble unit and repair as necessary.
Lubricant leaking from output shaft seal or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Vent closed or restricted.	2) Clear or replace vent as necessary.
	3) Output shaft seals damaged or installed incorrectly.	3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal.
Abnormal tire wear.	1) Extended operation on hard, dry surfaces in the 4H position.	1) Operate vehicle in the 2H position on hard, dry surfaces.

REMOVAL

1. Shift transfer case into NEUTRAL.
2. Raise vehicle.
3. Remove skid plate (1).

4. Drain transfer case lubricant.
5. Mark front and rear propeller shaft yokes for alignment reference.
6. Remove the front/rear propeller shafts at transfer case.
(Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
7. Disconnect transfer case position sensor connector (1) from the position sensor (2).

8. Disconnect transfer case shift cable (2) at the range lever.
9. Disconnect the transfer case shift cable (2) from the shift cable bracket (5).

10. Disconnect transfer case vent hose (3).
11. Support transfer case (2) with transmission jack.
12. Secure transfer case to jack with chains.
13. Remove nuts attaching transfer case to transmission (1).
14. Pull transfer case and jack rearward to disengage transfer

case.

15. Remove transfer case from under vehicle.

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

COMPANION FLANGE AND RANGE LEVER

1. Remove transfer case position sensor (1).

2. Install two bolts (2) partially into the propeller shaft companion flange (3), 180° from each other.
3. Install the rectangular end of the Flange Holder C-3281 (1) over the bolts to hold the companion flange stationary and remove the nut holding the companion flange to the output shaft.

4. Use Remover C-452 (3) to remove the companion flange

(2).

5. Remove seal washer from front output shaft. Discard washer as it should not be reused.

6. Remove the bolt (2) that attaches the range lever (1) to sector shaft. Then move sector to neutral position and remove range lever from shaft.

NOTE: Be sure to note the orientation of the range lever (lever up or down) so that it may be re-installed in the same direction.

REAR EXTENSION

1. Remove rear extension (1) bolts.

2. Remove rear extension housing (1). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

3. Remove output bearing (2) retaining ring (3) with heavy duty snap-ring pliers.

OIL PUMP AND REAR CASE

1. Remove rear case(1)-to-front case (2) bolts (3).

2. Loosen rear case (1) with pry tool to break sealer bead. Insert tool in slot (3) at each end of case.

3. Unseat rear case (1) from alignment dowels.
4. Remove rear case and oil pump assembly from front case.

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft bearing inner race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

1. Remove shift rail (1) cup (3) and spring (2).

2. Remove front sprocket (1) retaining ring (2).

3. Pull mainshaft (3), front sprocket (1) and chain outward about 25.4 mm (1-inch) simultaneously.

4. Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

SHIFT FORKS AND MAINSHAFT

1. Loosen detent plug (2).
2. Remove detent plug (2), spring (3), and plunger (4). Note that the plug has an O-ring seal. Remove and discard this seal.

3. Remove front output shaft (2) from bearing in the front case (1).

4. Pull mainshaft assembly (2) out of input gear, mode sleeve, and front case (1).

5. Remove mode fork (1), mode sleeve (3), and shift rail (2) as assembly. Note which way the sleeve fits in the fork (long side of sleeve goes to front).

6. Remove range fork retaining ring.
7. Remove range fork (2) and hub (1) as an assembly. Note fork position for installation reference.

8. Remove the shift sector support (1).

9. Remove shift sector (1).

MAINSHAFT

1. Remove the drive sprocket retaining ring (2) from the output shaft (1).

2. Remove the drive sprocket (3) thrust washer (2) from the output shaft (1).

3. Remove drive sprocket (2) from the output shaft (1).

4. Remove the clutch gear (2) from the output shaft (1).

Remove the sprocket hub (2) from the output shaft (1).

5. Remove the mode hub (3) retaining ring (2) from the output shaft (1).

6. Remove the mode hub (2) from the output shaft (1).

INPUT AND PLANETARY GEAR

1. Remove input gear seal with suitable screw and slide hammer.
2. Remove input gear (1) retaining ring (2) with heavy duty

snap-ring pliers.

3. Place front case in horizontal position. Then remove input gear and low range gear as an assembly (2). Tap gear out of bearing with plastic mallet, if necessary.

INPUT AND PLANETARY GEAR

1. Remove snap-ring (1) that retains input gear in low range gear.

2. Remove retainer (3).

3. Remove front tabbed thrust washer (1).

4. Remove input gear (1).

5. Remove rear tabbed thrust washer (2) from low range gear (1).

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Input Gear and Carrier Components

1 - PLANETARY CARRIER	4 - CARRIER LOCK RING
2 - REAR THRUST WASHER	5 - CARRIER LOCK RETAINING RING
3 - FRONT THRUST WASHER	6 - INPUT GEAR

Check the teeth on the input gear (6). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the planetary carrier body (1) and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the carrier lock ring (4) and both thrust washers (2, 3) for wear or cracks. Replace them if necessary. Also replace the carrier lock retaining ring (5) if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (2). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (3, 4). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR RETAINER COMPONENTS

Inspect the retainer components. Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended.

Inspect rear extension bushing. Replace if worn or scored.

DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear (2) condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear.

FRONT CASE AND REAR CASE

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

BEARINGS AND SEALS

1. Remove the input shaft bearing (1) from the front case (2) with suitable snap-ring pliers.
2. Transfer the retaining ring to the new bearing if necessary and install the bearing into the front case.

3. Using Installer 6436 (2) and Universal Handle C-4171 (3), remove front output shaft bearing.
4. Start front output shaft bearing in case. Then seat bearing with Universal Handle C-4171 and Bearing Installer 6953.
5. Install front output shaft bearing retaining ring.

6. Remove input gear pilot bearing by inserting a suitably sized drift (1) into the splined end of the input gear (2) and driving the bearing out with the drift and a hammer.
7. Install new pilot bearing with Bearing Installer 8684.

8. Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 (2) and Cup 8148 (3).

9. Install new bearing with Universal Handle C-4171 (1) and Bushing Installer 5066 (3).

10. The bearing bore is chamfered (1) at the top. Install the bearing so it is flush with the lower edge of this chamfer.

11. Remove the rear output shaft bearing from the rear case using Bearing Installer 8684 (2) and Universal Handle C-4171 (3).

12. Install the rear output shaft bearing into the rear case (1) using Bearing Installer 6953 (2) and Universal Handle C-

4171 (3).

INPUT AND PLANETARY GEAR

1. Lubricate gears (3, 4) and thrust washers (5) with recommended transmission fluid.
2. Install first thrust washer (5) in low range gear (3). Be sure washer tabs are properly aligned in gear notches.
3. Install input gear (3) in low range gear (4). Be sure input gear is fully seated.
4. Install remaining thrust washer (5) in low range gear (4) and on top of input gear (3). Be sure washer tabs are properly aligned in gear notches.
5. Install retainer (2) on input gear and install snap-ring (1).

6. Align and install low range/input gear assembly (2) in front case (1). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

7. Install snap-ring (2) to hold input/low range gear (1) into front bearing.
8. Install a new input gear seal using Installer 8841 and Universal Handle C-4171.

SHIFT FORKS AND MAINSHAFT

1. Lubricate mainshaft splines with recommended transmission fluid.
2. Install the mode hub (1) onto the output shaft.

3. Install the mode hub retaining ring (2) onto the output shaft (1).

4. Install the sprocket hub (2) onto the output shaft (1).

5. Install the clutch gear (2) onto the output shaft (1).

6. Install the drive sprocket (2) onto the output shaft (1).

7. Install the drive sprocket (3) thrust washer (2) onto the output shaft (1).

8. Install the drive sprocket retaining ring (2) onto the output shaft (1).

9. Lubricate sector shaft with transmission fluid and install shift sector (1) in case. Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

10. Install the shift sector support (1). Tighten the sector support to 27-42 N·m (20-30 ft.lbs.).

11. Assemble and install range fork (2) and hub (1). Be sure hub is properly seated in low range gear and engaged to the input gear.

12. Align and insert range fork pin in shift sector slot.

13. Install the range fork retaining ring.

14. Install mode fork (1) and shift rail (2) onto the mode sleeve (3).

15. Install the mode fork, sleeve, and shift rail into the transfer case.

16. Install mainshaft (2) into the transfer case (1). Guide mainshaft through the mode and range sleeves and into the input gear.

17. Install new o-ring on detent plug (2).

18. Install detent plunger (4), spring (3), and plug (2). Tighten the plug to 16-25 N·m (12-18 ft. lbs.).

FRONT OUTPUT SHAFT AND DRIVE CHAIN

1. Install the front output shaft (2) into the front output shaft bearing.

2. Insert front sprocket in drive chain.
3. Install drive chain (2) around mainshaft sprocket (1). Then position front sprocket over front shaft.
4. Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

5. If mainshaft and mode sleeve were unseated during chain installation, align and reseat mainshaft in input gear and hub.
6. Install front sprocket (1) retaining ring (2).

7. Install spring (2) and cup (1) on shift rail.

8. Insert magnet (1) in front case pocket (2).

OIL PUMP AND REAR CASE

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

1. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.
2. Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case (1) and oil pump assembly.

3. Install 4-5 rear case(1)-to front case (2) bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

4. Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Tighten bolts to 20-27 N·m (15-24 ft. lbs.),
5. Install rear output bearing (2) snap-ring (3) to output shaft.

REAR EXTENSION

1. Install new seal in rear extension housing seal with Installer D-163 and Universal Handle C-4171..
2. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.
3. Align and install rear extension housing (1) on retainer.
4. Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 16-24 N·m (12-18 ft. lbs.) torque.

COMPANION FLANGE AND RANGE LEVER

1. Install range lever (1) and bolt (2) on sector shaft. Tighten bolt to 27-34 N·m (20-25 ft. lbs.) torque.

2. Inspect the o-ring on the transfer case position sensor. Replace the o-ring if necessary.
3. Install the transfer case position sensor (1) in the front case (2). Tighten sensor to 20-34 N·m (15-25 ft. lbs.) torque.

4. Install new seal washer (1) on front output shaft.
5. Lubricate companion flange hub with transmission fluid and install flange onto the front output shaft.
6. Install new flange nut onto front output shaft.
7. Tighten flange nut to 122-176 N·m (90-130 ft. lbs.) torque.

INSTALLATION

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case on transmission.
5. Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque.
6. Connect vent hose (3).

7. Connect transfer case position sensor connector (1) to sensor (2).

8. Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION) .

9. Connect shift cable (2) to transfer case range (1) lever.

10. Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.

11. Install skid plate (1). (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

12. Remove transmission jack and support stand.

13. Lower vehicle and verify transfer case shift operation.

SPECIFICATIONS

SEAL-EXTENSION HOUSING

REMOVAL

1. Raise and support vehicle.
2. Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

INSTALLATION

1. Clean fluid residue from sealing surface and inspect for defects.
2. Using Seal Installer D-163 (2) and Universal Handle C-4171 (1), install seal in extension housing .
3. Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
4. Verify proper transfer case fluid level.
5. Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND FILL

The fill (2) and drain (3) plugs are both in the rear case. Correct fill level is to the bottom edge of the fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.

SEAL-FRONT OUTPUT SHAFT

REMOVAL

1. Raise vehicle.
2. Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Remove front output shaft companion flange.
4. Remove seal (1) from front case with pry tool (2).

INSTALLATION

1. Install new front output seal in front case (2) with Seal Installer 6952-A (1) as follows:
 - a. Place new seal on tool. Garter spring on seal goes toward interior of case.
 - b. Start seal in bore with light taps from hammer. Once seal is started, continue tapping seal into bore until installer tool seats against case.
2. Install the front output shaft companion flange. Tighten the companion flange nut to 149 N·m (110 ft.lbs.).
3. Install the front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

SENSOR-POSITION

DESCRIPTION

The transfer case position sensor (2) is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.

OPERATION

Position Sensor Linear Movement

1 - POSITION 1 - 10mm ± 0.5 mm
2 - POSITION 2 - 12mm ± 0.5 mm
3 - POSITION 3 - 14mm ± 0.5 mm
4 - POSITION 4 - 16mm ± 0.5 mm
5 - POSITION 5 - 18mm ± 0.5 mm
6 - POSITION 6 - 20mm ± 0.5 mm - FULL EXTENSION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the [Operating Mode Versus](#)

[Resistance](#) table for the correct resistance for each position.

Operating Mode Versus Resistance

SENSOR POSITION	OPERATING MODE	SENSOR RESISTANCE (ohms)
1	2WD	1124-1243
2	4WD PART TIME	650-719
3	4WD FULL TIME	389-431
4	NEUTRAL	199-221
5	4WD LOW	57-64

REMOVAL

1. Raise and support the vehicle.
2. Disengage the transfer case position sensor connector from the position sensor (2).
3. Remove the position sensor from the transfer case.

INSTALLATION

1. Inspect the o-ring seal on the transfer case position sensor (1). Replace the o-ring if necessary.
2. Install the transfer case position sensor into the transfer case. Torque the sensor to 27 N·m (20 ft.lbs.).
3. Engage the transfer case position sensor connector to the position sensor.
4. Lower vehicle.
5. Verify proper sensor operation.

CABLE-SHIFT

REMOVAL

1. Shift transfer case into 4L.
2. Raise vehicle.
3. Remove clip securing the transfer case shift cable (2) to the shift cable support bracket.
4. Disengage any additional shift cable routing clips, if necessary.
5. Disengage the shift cable from the transfer case manual lever.

6. Lower the vehicle.
7. Remove the floor console as necessary to access the shifter mechanism. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
8. Disengage the transfer case shift cable from the shift lever pin and body.
9. Disengage the shift cable grommet from the floor and remove the shift cable from the vehicle.

INSTALLATION

81a27e09

1. Route the shift cable through the opening in the floor pan.
2. Connect the transfer case shift cable to the shift lever body and pin.
3. Install any floor console components previously removed. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
4. Verify that the floor shifter is in the 4L position.

81a27e09

5. Raise vehicle.
6. Route the shift cable through the opening in the shift cable support bracket.
7. Install the cable and a new spring clip into the slot in the support bracket.
8. Install any additional routing clips on the shift cable.
9. Verify that the transfer case is in the 4L position. The 4L position for the transfer case is with the manual lever to the full rearward position.
10. Attach the shift cable to the transfer case manual lever.
11. Lower vehicle and check for proper transfer case shifter operation.

LEVER AND KNOB-SHIFT REMOVAL SHIFT LEVER

1. Shift transfer case into 4L.
2. Remove the floor console as necessary to access the shifter mechanism. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Disengage the transfer case shift cable from the shift lever pin and body.

4. Remove the nuts attaching lever assembly (1) to floorpan and remove assembly (2).
5. Remove the shifter mechanism from the vehicle.

REMOVAL

1. Pull up on gearshift knob with moderate force to remove from gearshift mechanism.

INSTALLATION

SHIFT LEVER

1. Position the shift mechanism over the shifter retaining studs on the floor pan.
2. Install the nuts to hold the shifter mechanism to the floor pan. Tighten the nuts to 11.9 N·m (105 in.lbs.).

81a27d95

3. Verify that the floor shifter is in the 4L position.
4. Connect the transfer case shift cable to the shift lever body and pin.
5. Install any floor console components previously removed. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
6. Check for proper transfer case shifter operation.

INSTALLATION

CAUTION: Do not strike the gearshift mechanism knob during the installation procedure. Failure to follow this caution may result in gearshift mechanism damage.

81a27e09

1. Position knob hole over the gearshift mechanism and align the shift pattern.
2. Apply downward pressure by **HAND** on the knob to engage the gearshift mechanism.
3. Verify that shift pattern is aligned properly.

TRANSFER CASE - NV241OR

TRANSFER CASE - NV241OR

DESCRIPTION

The NV241OR transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 4.0:1 for increased low speed torque capability.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

IDENTIFICATION

An identification tag (1) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

OPERATION

OPERATING RANGES

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range)

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 4.0:1.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

SHIFTING

The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into the 4L operating range.

DIAGNOSIS AND TESTING - TRANSFER CASE

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer Case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting.	1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift.
	2) If vehicle was operated for an extended period in 4H on a dry paved	2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces.

	surface, the driveline torque load may be causing a bind.	
	3) Transfer case external shift linkage binding.	3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary.
	4) Insufficient or incorrect lubricant.	4) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid.
	5) Internal components binding, worn, or damaged.	5) Disassemble the transfer case and replace worn or damaged components as necessary.
Transfer Case noisy in all operating ranges.	1) Insufficient or incorrect lubricant.	1) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid.
Noisy in, or jumps out of, four wheel drive low range.	1) Transfer case not completely engaged in 4L position.	1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position.
	2) Shift linkage out of adjustment.	2) Adjust linkage.
	3) Shift linkage loose or binding.	3) Tighten, lubricate, or repair linkage as necessary.
	4) Range fork damaged, inserts worn, or fork is binding on the shift rail.	4) Disassemble unit and repair as necessary.
	5) Low range gear worn or damaged.	5) Disassemble unit and repair as necessary.
Lubricant leaking from output shaft seal or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Vent closed or restricted.	2) Clear or replace vent as necessary.
	3) Output shaft seals damaged or installed incorrectly.	3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal.
Abnormal tire wear.	1) Extended operation on hard, dry surfaces in the 4H position.	1) Operate vehicle in the 2H position on hard, dry surfaces.

REMOVAL

1. Raise and support vehicle.
2. Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)
3. Position drain oil container under transfer case.
4. Remove transfer case drain plug and drain lubricant into container.
5. Disconnect vent hose and vacuum harness at transfer case switch.
6. Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.

7. Support transmission with jack stand.
8. Remove rear crossmember.
9. Mark front and rear propeller shafts for assembly reference.
10. Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
11. Support transfer case with suitable jack. Secure transfer case to jack with safety chains.
12. Remove nuts attaching transfer case to transmission.
13. Move transfer case assembly rearward until free of transmission output shaft.
14. Lower jack and move transfer case from under vehicle.

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

REAR EXTENSION, RETAINER, AND REAR CASE

1. Install bolts (4) into two threaded holes in the rear propeller shaft companion flange 180° apart.
2. Place the Holder 6719 (2) over the two bolts and use the Holder to remove the rear companion flange nut.
3. Remove the rear companion flange (3) from the output shaft.

NOTE: The companion flange is a taper fit onto the output shaft. It may be necessary to use Puller 8992 to remove the companion flange.

4. There is a seal slinger located on the rear of the companion flange that can be replaced if necessary. Use a suitable cold chisel to strike the slinger hub parallel to the centerline in several spots to expand the slinger hub. A new slinger can be driven onto the flange hub using a suitable pipe tool.
5. Remove rear extension bolts.
6. Remove rear extension housing. Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

YOKE AND SHIFT LEVER

1. Shift transfer case into a 4WD mode.
2. Use Spanner Wrench 6958 to secure the yoke (3) and remove the yoke nut. Discard nut after removal. It is not reusable.

NOTE: The yoke is a taper fit onto the output shaft. It may be necessary to use a puller such as C-452 to remove the yoke.

3. Remove the yoke (2) from the front output shaft.
4. There is a seal slinger located on the rear of the yoke that can be replaced if necessary. Use a suitable cold chisel to strike the slinger hub parallel to the centerline in several spots to expand the slinger hub. A new slinger can be driven onto the yoke hub using a suitable pipe tool.
5. Remove yoke rubber seal from front output shaft.

6. Remove bolt (2) that retains the shift lever (1) to sector shaft (3).

7. Remove the shift lever (1) from the shift sector (3).

8. Remove the detente plug (1).

9. Remove the detente plug (1), spring (2), and plunger (3) from the transfer case.

10. Remove the transfer case position sensor (1).

11. Remove the shift sector support (2).

MAINSHAFT, FRONT OUTPUT SHAFT, AND DRIVE CHAIN

1. Note position of bolts that attach rear case (1) to front case (2). Some bolts are unique. Mark position of these bolts with paint or scribe.

2. Remove rear case-to-front case bolts (3).

3. Loosen rear case (1) with pry tool to break sealer bead.

4. Unseat rear case from alignment dowels (3).

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft bearing inner race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

5. Remove rear case (1) and oil pump assembly from front case (2).

6. Remove shift rail cups (3) and spring (2).

7. Remove front drive sprocket (2) retaining ring (3).

8. Remove mainshaft (1), front sprocket (3), and chain (2) as an assembly.

SHIFT FORKS

1. Remove front output shaft (2) from bearing in case (1).

2. Remove the shift rail (2) from the shift forks.

3. Remove mode fork (1), mode sleeve (2). Note which way sleeve fits in fork (long side of sleeve goes to front).

4. Remove range fork (1) and hub (2) as an assembly. Note fork position for installation reference.

5. Remove shift sector (2).

MAINSHAFT

1. Remove the snap-ring (3) that secures the chain drive sprocket (2) onto mainshaft (1). Use standard (instead of parallel jaw) snap-ring pliers to remove this snap-ring.

2. Remove drive sprocket (2).

3. Remove the sliding clutch gear (2) from the mainshaft (1).

4. Rotate the

mainshaft (1) 180° and remove the mode hub (2) snap-ring (3).

5. Remove the mode hub (2) from the mainshaft.

6. Remove the drive sprocket drive hub (2) from the mainshaft (1).

INPUT AND PLANETARY GEAR

1. Remove front input retainer (1) attaching bolts (3).

2. Remove the input gear (2) seal with a suitable screw and slide hammer.

3. Remove the input gear snap-ring (3) from the input retainer (1).

4. Remove the input gear (2) from the input gear bearing with suitable hammer.

5. Remove front input retainer (1).

6. Remove the low range planetary (1) plastic spacer (2) from the planetary carrier or back side of the input retainer.

7. Remove the low range planetary gear set (2) from the front case half (1).

8. Remove the annulus gear (2) from the front case half (1).

9. Support the input retainer (1) on Cup 8148 (2) as shown.

10. While using suitable snap-ring pliers to spread the input gear bearing snap-ring, press downward on the retainer (1) to remove the bearing (3).

11. Remove the front output shaft bearing with Universal Handle C-4171 (1) and Installer 8239 (2).

12. Remove the rear output shaft bearing with Universal Handle C-4171 (2) and Installer 8239 (3).

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear. Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged. Inspect the plastic washer on the inside, bottom of the planetary carrier. The washer is trapped by the pinion gears and the complete planetary will need to be replaced if the washer is worn or damaged.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads. The mode and range fork pads are serviceable and can be replaced if necessary.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear can be serviced separately.

FRONT-REAR CASES

Inspect the cases for wear and damage. Replace the input retainer seal, do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any evidence of debris or damage exists. Do not disassemble the pump from the rear case half as individual parts are not available and it will not be possible to reassemble the pump cover to the rear case half. The pump is only available as part of the rear case half assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

BEARINGS AND SEALS

1. Position the input gear bearing in the input retainer bearing bore. Spread the snap-ring captured in the retainer with suitable snap-ring pliers and press the bearing into place. Verify that the snap-ring has engaged the groove in the bearing.
2. Start front output shaft bearing (3) in case. Then seat bearing with Universal Handle C-4171 (1) and Bearing Installer 6953 (2).

3. Install the front output shaft bearing retaining ring.
4. Install the rear output shaft bearing into the rear case half with Bearing Installer 6953 (3) and Universal Handle C-4171 (2).

5. Remove the input gear pilot bearing using Remover Jaws 8240 and Cup 8148.
6. Remove the input gear cup plug with a suitable drift (1) and hammer inserted from the front of the input gear (2).

7. Install a new input gear cup plug with Cup Seal Installer 9045 and Universal Handle C-4171.
8. Install new input gear pilot bearing with Bearing Installer 9047 and Universal Handle C-4171.
9. Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 (2) and Cup 8148 (3).

10. Install new bearing with Universal Handle C-4171 (1) and Bushing Installer 5066 (3).

11. The bearing (1) bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (2).

INPUT AND PLANETARY GEAR

1. Install the annulus gear (2) into the front case half (1).

2. Align and install low range planetary (2) assembly into the front case half (1). Be sure low range planetary pinions are engaged in annulus gear (3).

3. Install the low range planetary plastic spacer (2) onto the low range planetary carrier (1).
 4. Clean gasket sealer residue from retainer and inspect

retainer for cracks or other damage.

5. Apply a 3 mm (1/8 in.) bead of MOPAR® Gasket Maker, or equivalent silicone adhesive, to sealing surface of retainer.

6. Install the front input retainer (1) onto the front case half (2).

7. Install bolts (3) to hold retainer (1) to transfer case (4). Tighten to 21 N·m (16 ft. lbs.) of torque.

8. Install the input gear (2) to the low range planetary assembly and the input gear bearing.

9. Install the input gear retaining snap-ring (3) onto the input gear (2).

10. Install new oil seal in front input retainer with Seal Installer 8841 (2) and Universal Handle C-4171 (1).

SHIFT FORKS AND MAINSHAFT

1. Lubricate mainshaft splines with recommended transmission fluid.
2. Install the drive sprocket drive hub (2) onto the mainshaft (1). Verify that the long shoulder is towards the front of the mainshaft.

3. Install the mode hub (2) onto the mainshaft (1).

4. Install the mode hub snap-ring (3) onto the mainshaft (1).

5. Rotate the mainshaft (1) 180° and install the sliding clutch gear (2) onto the drive sprocket drive hub.

6. Install the mainshaft drive sprocket (2) onto the drive hub.

7. Install the mainshaft drive sprocket retaining ring (3) onto the drive hub.

8. Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case.
9. Lubricate mainshaft components with transmission fluid.
10. Lubricate sector shaft with transmission fluid and install shift sector (2) in case (1). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

11. Assemble and install range fork (1) and hub (2). Be sure hub is properly seated in low range gear and engaged to the input gear.
12. Align and insert range fork pin in shift sector slot.

13. Install mode fork (1) and mode sleeve (2). Verify that the long side of the mode sleeve is towards the front of the transfer case.

14. Install the shift rail (2) through the shift forks and into the shift rail pocket in the front case half (1).

FRONT OUTPUT SHAFT AND DRIVE CHAIN

1. Install front output shaft (2) into the front output shaft bearing.

2. Install the front output shaft snap-ring onto the front output shaft.
3. Install new front output seal in front case with Seal

Installer 9041 (2) and Universal Handle C-4171 (1).

4. Insert front sprocket (3) in drive chain (2).
5. Install drive chain around mainshaft drive sprocket. Then position front sprocket over front output shaft.
6. Install the mainshaft (1) into the range hub and mode sleeve and seat the front drive sprocket onto the front output shaft.

7. Install the front drive sprocket retaining ring (3).

8. Install spring (2) and cups (1) on shift rail.

9. Insert magnet (1) in front case pocket (2).

OIL PUMP AND REAR CASE

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly **MUST** be replaced.

Lubricate the oil pump components before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

1. Install new o-ring in pickup tube inlet of oil pump.
2. Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and that pickup tube is aligned in case notches. Be sure hose that connects tube to filter is securely positioned.
3. Install the transfer case position sensor (1). Tighten the sensor to 20-34 N·m (16-25 ft.lbs.).
4. Install the shift sector support (2). Tighten the sector support to 27-42 N·m (20-30 ft.lbs.).

5. Install detente plunger (3) and spring (2) into the front case half.
6. Install new o-ring on detente plug (1) and install plug in front case. Tighten plug to 16-25 N·m (12-18 ft. lbs.).

7. Install shift lever (1) onto the shift sector (3).

8. Install the shift lever bolt (2). Tighten the bolt to 20-34 N·m (15-25 ft.lbs.)

9. Shift the transfer case into a 4WD range. This will raise the mainshaft slightly and make installation of the rear case half much easier.

10. Verify that the transfer case alignment dowels are properly installed.

11. Apply bead of MOPAR® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

12. Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case (1) and oil pump assembly. Be sure oil pickup tube remains in position during case installation.

CAUTION: Verify that shift rail, and case alignment dowels (3) are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

13. Install 4-5 rear case-to-front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

14. Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts (3). Tighten all bolts to 20-27 N·m (15-20 ft. lbs.).

YOKE

1. Install yoke seal (2) onto front shaft (1).

2. Install yoke (2) onto front shaft. Then install and tighten a new yoke nut to 122-176 N·m (90-130 ft. lbs.) torque. Never re-use a yoke nut.

REAR EXTENSION

1. Clean mating surfaces of transfer case housing and the rear retainer of any original gasket material.
2. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear case. Keep sealer bead width to

maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

3. Align and install rear extension on rear case.

4. Apply MOPAR® Silicone Sealer to threads of rear extension bolts. Then install extension bolts. Tighten the extension bolts to 16-25 N·m (12-18 ft.lbs.).

5. Install new seal in rear extension housing with Seal Installer 9041 and Universal Handle C-4171.

6. Install the rear companion flange (3) onto the output shaft.

7. Install bolts (4) into two threaded holes in the rear propeller shaft companion flange 180° apart.

8. Place the Holder 6719 (2) over the two bolts and use the Holder to install a new rear companion flange nut. Never re-use the companion flange nut once it has been installed.

Tighten the companion flange nut to 122-176 N·m (90-130 ft.lbs.).

INSTALLATION

1. Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.

2. Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N·m (20-30 ft.lbs.).

3. Install rear crossmember.

4. Remove jack stand from under transmission.

5. Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

6. Connect vacuum harness and vent hose.

7. Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.

8. Adjust shift linkage, if necessary.

9. Fill transfer case with recommended transmission fluid and install fill plug.

10. Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

11. Lower vehicle

SEAL-REAR EXTENSION

REMOVAL

1. Raise and support vehicle.
2. Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Remove the rear companion flange from the output shaft.
4. Using a suitable pry tool or slide-hammer mounted screw, remove the rear extension seal.

INSTALLATION

1. Clean fluid residue from sealing surface and inspect for defects.
2. Using Seal Installer 9041 (2) and Universal Handle C-4171 (1), install seal in rear extension.
3. Install the companion flange onto the output shaft.
4. Install a new companion flange nut and tighten to 176-271 N·m (130-200 ft.lbs.).
5. Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
6. Verify proper transfer case fluid level.

7. Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND FILL

The fill (2) and drain plugs (3) are both in the rear case. Correct fill level is to the bottom edge of the fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.

SEAL-FRONT OUTPUT SHAFT

REMOVAL

1. Shift transfer case into NEUTRAL.
2. Raise vehicle.
3. Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
4. Using Spanner Wrench 6958 (2), remove yoke nut. Discard nut after removal. It is not reusable.

5. Remove yoke (2) from output shaft. Use puller C-452 if flange can not be removed by hand.

6. Remove yoke rubber seal (1) from front output shaft.
7. Remove front output shaft seal with suitable pry tool, or a slide hammer mounted screw.

INSTALLATION

1. Install new front output seal in front case with Seal Installer 9041 (2) and Universal Handle C-4171 (1).

2. Install yoke seal (2) on front output shaft (1).

3. Install yoke (2) on front output shaft. Install a new yoke nut onto the front output shaft.

4. Using Spanner Wrench 6958 (2), tighten the yoke nut to 176-271 N·m (130-200 ft. lbs.) torque.
5. Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

SENSOR-POSITION

DESCRIPTION

The transfer case position sensor is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.

OPERATION

Operating Mode Versus Resistance

SENSOR POSITION	OPERATING MODE	SENSOR RESISTANCE (ohms)
1	2H	1124-1243
2	4H	650-719
3	NEUTRAL	389-431
4	4L	199-221
5	NOT USED	57-64

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the [Operating Mode Versus Resistance](#) table for the correct resistance (1-6) for each position.

REMOVAL

1. Raise and support the vehicle.
2. Disengage the transfer case position sensor connector from the position sensor.
3. Remove the position sensor from the transfer case.

INSTALLATION

1. Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
2. Install the transfer case position sensor into the transfer case. Torque the sensor to 20-34 N·m (15-25 ft.lbs.).
3. Engage the transfer case position sensor connector to the position sensor.
4. Lower vehicle.
5. Verify proper sensor operation.

CABLE-SHIFT

REMOVAL

1. Shift transfer case into 4L.
2. Raise vehicle.
3. Remove clip securing the transfer case shift cable (2) to the shift cable support bracket.
4. Disengage any additional shift cable routing clips, if necessary.
5. Disengage the shift cable from the transfer case manual lever.

81a27e93

6. Lower the vehicle.
7. Remove the floor console as necessary to access the shifter mechanism. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
8. Disengage the transfer case shift cable from the shift lever pin and body.
9. Disengage the shift cable grommet from the floor and remove the shift cable from the vehicle.

INSTALLATION

81a27e09

1. Route the shift cable through the opening in the floor pan.
2. Connect the transfer case shift cable to the shift lever body and pin.
3. Install any floor console components previously removed. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
4. Verify that the floor shifter is in the 4L position.

81a27e09

5. Raise vehicle.
6. Route the shift cable through the opening in the shift cable support bracket.
7. Install the cable and a new spring clip into the slot in the support bracket.
8. Install any additional routing clips on the shift cable.
9. Verify that the transfer case is in the 4L position. The 4L position for the transfer case is with the manual lever to the full rearward position.
10. Attach the shift cable to the transfer case manual lever.
11. Lower vehicle and check for proper transfer case shifter operation.

LEVER-SHIFT

REMOVAL

SHIFT LEVER

81a27e93

1. Shift transfer case into 4L.
2. Remove the floor console as necessary to access the shifter mechanism. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Disengage the transfer case shift cable from the shift lever pin and body.

81a27e09

4. Remove the nuts attaching lever assembly (1) to floorpan and remove assembly (2).
5. Remove the shifter mechanism from the vehicle.

REMOVAL

81a27d95

1. Pull up on gearshift knob with moderate force to remove from gearshift mechanism.

INSTALLATION

SHIFT LEVER

81a27d95

1. Position the shift mechanism over the shifter retaining studs on the floor pan.
2. Install the nuts to hold the shifter mechanism to the floor pan. Tighten the nuts to 11.9 N·m (105 in.lbs.).

81a27d95

3. Verify that the floor shifter is in the 4L position.
4. Connect the transfer case shift cable to the shift lever body and pin.
5. Install any floor console components previously removed. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
6. Check for proper transfer case shifter operation.

INSTALLATION

CAUTION: Do not strike the gearshift mechanism knob

during the installation procedure. Failure to follow this caution may result in gearshift mechanism damage.

1. Position knob hole over the gearshift mechanism and align the shift pattern.
2. Apply downward pressure by **HAND** on the knob to engage the gearshift mechanism.
3. Verify that shift pattern is aligned properly.

22 - TIRES/WHEELS

TIRES/WHEELS - ELECTRICAL DIAGNOSTICS

TIRE PRESSURE MONITORING - ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

C0077- LOW TIRE PRESSURE

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously.

- **Set Condition:**

A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

Possible Causes
INTERMITTENT PERFORMANCE DTC
INCORRECT TIRE PRESSURE
TIRE PRESSURE SENSOR
WCM (SKREEM)

Diagnostic Test

1. DTC STATUS

NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.

NOTE:

If the following conditions are present:

- **Low Tire Pressure DTC**
- **Tire Pressure Sensor Internal DTC**
- **Spare Tire is not equipped with a Tire Pressure Sensor**
- **Spare Tire is currently on the vehicle**

Repair the tire and place it back on the vehicle.

Test drive the vehicle.

Turn the ignition on.

Is the TPM telltale lamp/Low pressure EVIC message on at this time?

Yes

- Go to [2](#)

No

- Go to [5](#)

2. LOW TIRE PRESSURE

NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.

NOTE: Seasonal temperature changes will affect tire pressure, and may have caused the tire pressure to fall below the low pressure warning threshold. Tire pressure should always be set based on cold inflation tire pressure (placard). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours, and in outside ambient temperatures.

Correct all tire pressure to the recommended specifications and wait 2 minutes.

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h. (24 km/h).

Use a TPM-RKE Analyzer tool 9936 to scan each tire pressure sensor, and make sure the Sensor IDs matches what is programmed into the WCM. The Sensor Identifications are located under “Data Display” for the “WCM Wireless Control Module”. If the sensor IDs does not match, following the programming steps outlined in the diagnostic scan tool for “Program Tire Sensor ID w/TPM Tool” under “Miscellaneous Functions” for the “WCM/Wireless Control Module” menu item.

NOTE: When scanning a sensor with a TPM-RKE Analyzer 9936 , replace the TPM sensor if the results show a “Damaged Accel”, “Damaged Temp”, or “Damaged Press”.

Is the TPM telltale lamp/Low pressure EVIC message on at this time?

Yes

- Go to [3](#)

No

- Test Complete.

3. TIRE PRESSURE SENSOR

NOTE: Before continuing, ensure the tire is free from any leaks or damage that would cause a low tire pressure condition. If a problem is found, repair as necessary and retest.

With the scan tool, go under “Data Display” for the “WCM Wireless Control Module” and find the compensated tire pressure values. Located underneath each Sensor Identification locations. If any compensated tire pressure values are equal or lower then the Tire Low Pressure Threshold. The corresponding TPM sensor needs to be located and replaced.

NOTE: The following tests are used to locate the Tire Pressure Sensor/Transmitter that is setting the low pressure fault. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing. Use one or more of the following methods below.

METHOD 1: Use a TPM-RKE Analyzer tool 9936 to scan each tire pressure sensor. If a suspected sensor has been located, lower the tire pressure to 20 PSI, wait for 2 minutes, and check the scan tool for changes to any compensated tire pressure values.

If there was a pressure change to any compensated tire pressure values, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each wheel on the vehicle until the faulty Sensor/Transmitter has been identified.

NOTE: When scanning a sensor with a TPM-RKE Analyzer 9936 , replace the TPM sensor if the results show a “Damaged Accel”, “Damaged Temp”, or “Damaged Press”.

METHOD 2: Starting with the left front wheel, deflate the tire to 20 PSI, wait 2 minutes, and check the scan tool for changes to any compensated tire pressure values.

If there was a pressure change to any compensated tire pressure value, repeat this process on each wheel on the vehicle until the faulty Sensor/Transmitter has been identified.

Has the malfunctioning/faulty TPM sensor been located?

Yes

- Replace the Tire Pressure sensor.
- Perform the TPM verification (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No

- Go To [4](#)

4. WIRELESS CONTROL MODULE

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

With the scan tool, read WCM/SKREEM DTC(s).

Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h).

During this time the system will learn the sensor IDs.

Are there any DTC(s) present?

Yes

- Repair not complete, refer to the appropriate symptom.
- Perform the TPM verification (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No

- Repair is complete.

5. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h. (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes

- Repair as necessary.
- Perform the TPM verification (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No

- Test complete.

C1501–TIRE PRESSURE SENSOR 1 INTERNAL

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**

With vehicle speed greater than 15 MPH (24 km/h).

- **Set Condition:**

The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded within a maximum period of 10 minutes. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

Possible Causes
WRONG SENSOR
TEMPORARY SPARE TIRE IN USE
OUTSIDE INTERFERENCE
TIRE PRESSURE SENSOR
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE:

If the following conditions are present:

- Tire Pressure Sensor Internal DTC (Active)
- Spare Tire is not equipped with a Tire Pressure Sensor
- Spare Tire is currently on the vehicle

Repair the tire and place it back on the vehicle .

Test drive the vehicle.

If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes

- Go to [2](#)

No

- Go to [4](#)

2. TIRE PRESSURE SENSOR

NOTE:

When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.

- 1. Set all tire pressures to the recommended specifications and recheck for fault/alert.**
- 2. Turn the ignition on.**
- 3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.**
- 4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.**

Once a fault/alert has set, it will establish the location of the tire pressure sensor/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes

- Go to [3](#)

No

- Test Complete.
- Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

- Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

*STORED LOST COMMUNICATION DTC'S

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

- **Set Condition:**

Bus messages not received for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
IOD FUSE WAS REMOVED DURING SHIPPING
CHECK FOR RELATED TSB'S

Diagnostic Test

1. VERIFY DTC IS STORED

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

With the scan tool, read stored DTC's.

Is this DTC stored?

Yes

- Go To [2](#)

No

- Diagnose the active DTC. Refer to the Table of Contents for a list of the symptoms.

2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN B or C hardware electrical, battery, ignition voltage, VIN missing/mismatch, TIPM configuration DTC's present with matching environmental data?

Yes

- These DTC's may have been the result of other service procedures performed. Clear DTC's.

No

- Go To [3](#)

3. VERIFY INTERMITTENT LOST COMMUNICATION DTC – WIRING CONCERNS

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTC's “Logged Against” the module and one or more lost communication DTC's stored in the offending module?

Yes

- Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No

- Go To [4](#)

4.

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTC's "Logged Against" the module and NO lost communication DTC's stored in the offending module?

Yes

- Check for TSB(s) related to this offending module.

No

- Go To [5](#)

5. VERIFY INTERMITTENT LOST COMMUNICATION DTC – REPORTING MODULE

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there ONLY ONE ECU with stored DTC's "Logged Against" the module?

Yes

- Check for TSB(s) related to the module that set this DTC.

No

- Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

STANDARD PROCEDURE

TPM VERIFICATION

For a complete wiring diagram **Refer to Section 8W.**

Diagnostic Test

1. TPM

Was the WCM/SKREEM replaced during the test procedure?

Yes

- Go to [2](#)

No

- Go to [3](#)

2. WCM/SKREEM

NOTE: When entering the PIN, care should be taken because the SKREEM will only allow three consecutive attempts to enter the correct PIN. If three consecutive incorrect PIN's are entered the SKREEM will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain in the Run position for one hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.

- Reconnect the previously removed and/or disconnected components and connectors.
- Obtain the vehicle's unique Personal Identification Number (PIN) assigned to its original SKREEM. This number can be obtained from the vehicle invoice or from the DaimlerChrysler Customer Center (Phone 1-800-992-1997).
- With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
- If the WCM/SKREEM was replaced, all the customer's keys must be programmed to the new module. Use the scan tool and the Program Key procedure
- With the scan tool, erase all DTCs. Perform 5 ignition key cycles, leaving the key on for at least 90 seconds per cycle.
- Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID code and will clear any DTC(s) automatically.
- With the scan tool, read WCM/SKREEM DTC(s).

Are there any DTC(s) present?

Yes

- Repair not complete, refer to the appropriate symptom.

No

- Repair is complete.

3. TIRE PRESSURE SENSOR/TIRE PRESSURE TRANSPONDER REPLACE

- Reconnect the previously removed and/or disconnected components and connectors.
- Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID code and will clear any DTC(s) automatically.
- With the scan tool, read TPM DTC(s).

Are there any DTC(s) present?

Yes

- Repair not complete, refer to the appropriate symptom.

No

- Repair is complete.

TIRES/WHEELS - SERVICE INFO**TIRES/WHEELS - SERVICE INFO****DIAGNOSIS AND TESTING****TIRE AND WHEEL RUNOUT**

Radial runout is the difference between the high and low points on the tire or wheel.

Lateral runout is the **wobble** of the tire or wheel.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

METHOD 1 (RELOCATE WHEEL ON HUB)

1. Drive vehicle 10-15 minutes at highway speed to adequately warm tire to eliminate tire flat spotting from a parked position.

NOTE: Immediately following tire warm-up, lift vehicle off of ground to avoid flat spotting the tires. Flat spotted tires can lead to vibration and imbalance.

2. Check wheel bearings and adjust if adjustable or replace if necessary.
3. Check the wheel mounting surface.
4. Rotate wheel on the mounting, two studs over from the original position.
5. Tighten wheel nuts in a crossing pattern until all are properly torqued, to eliminate brake distortion.
6. Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

1. Remove tire from wheel and mount wheel on service dynamic balance machine.
2. Check the wheel radial runout.

3. Check the wheel lateral runout.

- STEEL WHEELS: Radial runout 0.031 in., Lateral runout 0.031 in. (maximum)
- ALUMINUM WHEELS: Radial runout 0.02 in., Lateral runout 0.02 in. (maximum)

4. If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout.

STANDARD PROCEDURE

MATCH MOUNTING

Wheels and tires that are mounted means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the outboard surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the outboard flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

1. Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.
2. Measure the total runout on the center of the tire tread rib (3) with a dial indicator. Record the indicator reading. Mark the tire to indicate the high spot (2). Place a mark on the tire at the valve stem (1) location (1).

3. Break down the tire and remount it 180 degrees on the rim (1)(2).

4. Measure the total indicator runout again. Mark the tire to indicate the high spot.

5. If runout is still excessive, the following procedures must be done.

- If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
- If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.
- If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot (1) to first (2). Break down the tire and remount it 90 degrees on rim in that direction. This procedure will normally reduce the runout to an acceptable amount, if not replace the rim.

TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

NOTE: 20" wheels do not have an outer flange. Apply adhesive weights on midplane surface

For static balancing, find the location of the heavy spot (1) causing the imbalance (5). Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance (4). Place half of this weight on the **inner** rim flange (3) and the other half on the **outer** rim flange (3).

For dynamic balancing (3), the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (2).

ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

TIRES

DESCRIPTION

TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE). This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code.

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 99 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **W** (consult the tire manufacturer for the specific speed rating)
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S**, **M & S** or **M-S** (indicating mud and snow traction) imprinted on the side wall.

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 80 KPH (50 MPH) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

TIRE INFLATION PRESSURES

WARNING: Over or under inflated tires can affect vehicle handling and tread wear. This may cause the tire to fail suddenly, resulting in loss of vehicle control.

Under inflation will cause rapid shoulder wear (1), tire flexing, and possible tire failure.

Over inflation will cause rapid center wear (1) reduction in the tire's ability to cushion shocks.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the tire label

placard usually located on the drivers door latch pillar.

TIRE PRESSURE FOR HIGH SPEED

Refer to the Vehicles Owners Manual package.

SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 KMH (50 MPH). when using the temporary spare tire. Refer to Owner's Manual for complete details.

FULL SIZE, SPARE WHEEL WITH MATCHING TIRE

The spare is a full usage wheel with a matching tire. It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.

DIAGNOSIS AND TESTING

PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

TREAD WEAR INDICATORS

Tread wear indicators (3) are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators (3) will appear as a 13 mm (1/2 in.) band.

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

TIRE WEAR PATTERNS

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT	1.  2. 						
CAUSE	UNDER-INFLATION OR LACK OF ROTATION 	OVER-INFLATION OR LACK OF ROTATION 	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER 	INCORRECT TOE 	UNBALANCED WHEEL  OR TIRE DEFECT*	LACK OF ROTATION OF TIRES OR WORN OR OUT- OF-ALIGNMENT SUSPENSION.
CORRECTION	ADJUST PRESSURE TO SPECIFICATIONS WHEN TIRES ARE COOL ROTATE TIRES			ADJUST CAMBER TO SPECIFICATIONS	ADJUST TOE-IN TO SPECIFICATIONS	DYNAMIC OR STATIC BALANCE WHEELS	ROTATE TIRES AND INSPECT SUSPENSION SEE GROUP 2

* HAVE TIRE INSPECTED FOR FUTURE USE.

812014d7

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

TIRE/VEHICLE LEAD

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem.

812014c7

STANDARD PROCEDURE

TIRE REPAIR AREA

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.

CLEANING

TIRES

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of the tires.

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

NOTE: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

WHEELS

DESCRIPTION

WHEEL DESIGN

The rim size is on the vehicle safety certification label located on the drivers door shut face. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges (1) and rim drop well (3) called safety humps.

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle. Used wheels are not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.

WARNING: Daimlerchrysler corporation does not recommend that customers use “reconditioned” wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death.

For Clarification:

- Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit.
- Damaged wheels are those which have been bent, broken, cracked or sustained some other physical damage which may have compromised the wheel structure
- Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.
- Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.

STANDARD PROCEDURE

WHEEL INSTALLATION

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces (1). Ensure wheels (2) are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel (2), first position it properly on the mounting surface (1). All wheel nuts (3) should then be tightened just snug.

Gradually tighten them in sequence to the proper torque specification . **Never use oil or grease on studs or nuts.**

WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Pilot Bore Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

SPECIAL TOOLS

WHEELS

STUDS

REMOVAL

FRONT WHEEL STUD

CAUTION: Do not use a hammer to remove wheel studs.

1. Raise and support vehicle.
2. Remove wheel and tire assembly.
3. Remove brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Remove stud (2) from hub with Remover C-4150-A (1).

REAR WHEEL STUD

CAUTION: Do not use a hammer to remove wheel studs.

1. Raise and support vehicle.
2. Remove wheel and tire assembly.

3. Remove brake caliper and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Remove stud (2) from hub with Remover 8677 (1).

5. Remove the stud (1) from between the hub/bearing and brake shoes (2)

INSTALLATION

FRONT WHEEL STUD

CAUTION: Do not use a hammer to remove wheel studs.

1. Install the new stud into the hub flange.

2. Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.
5. Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
6. Install the wheel and tire assembly, use new lug nut on stud or studs that were replaced.
7. Remove the support and lower vehicle.

REAR WHEEL STUD

1. Install the new stud (1) into the hub flange by rotating the stud (1) in between the hub/bearing and park brake shoes (2).
2. Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.
5. Install the brake rotor and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
6. Install the wheel and tire assembly, use new lug nut on stud or studs that were replaced.
7. Remove the support and lower vehicle.

TIRE PRESSURE MONITORING SYSTEM

DESCRIPTION

BASE TIRE PRESSURE MONITORING

This system will consist of Tire Pressure Monitoring (TPM) sensors attached to each wheel through the valve

stem mounting hole, a Wireless Control Module (WCM) and a yellow TPM telltale lamp. A TPM sensor shall be installed in the spare wheel if the vehicle is equipped with a matching full size spare wheel and tire assembly.

NOTE: The Tire Pressure Monitoring System (TPMS) will warn the driver of a low tire pressure based on the vehicle recommended cold placard pressure.

The tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). When the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure. This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours - and in outside ambient temperature. The tire pressure will also increase as the vehicle is driven - this is normal and there should be no adjustment for this increased pressure.

The TPM System will warn the driver of a low tire pressure if the tire pressure falls below the low pressure warning threshold for any reason, including low temperature effects.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off until the tire pressure is at or above recommended cold placard pressure. Once the low tire pressure warning has been illuminated, the tire pressure must be increased to the recommended cold placard pressure in order for the TPM warning lamp to be turned off. The system will automatically update and the TPM warning lamp will extinguish once the updated tire pressures have been received. The vehicle may need to be driven for up to 10 minutes above 15 mph (25 kph) to receive this information.

WIRELESS CONTROL MODULE (WCM)

The receiver circuit for the TPM system is integrated into the WCM. for non-remote start vehicles. For factory installed remote start vehicles, the remote start antenna is external to the WCM. The WCM can also include the Remote Keyless Entry (RKE) receiver, Remote Start (if equipped), and the Sentry Key Immobilizer (SKIM) receiver. All Four receivers share a number of common components. The WCM decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

The WCM communicates with the module that controls the "TPM telltale lamp", via the vehicle bus system.

Upon detection of a warning or fault condition, the WCM will send a request to illuminate or flash the yellow TPM telltale. Also, upon detection of a warning or fault condition, the display module will send a request to sound the "chime". A chime will only be requested once per ignition cycle per warning or fault condition detected.

The WCM will store all warning and fault conditions, placard pressure values, low-pressure threshold values and low pressure threshold hysteresis values in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WCM will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WCM memory.

The WCM automatically learns and stores the sensor's ID while driving "within 10 minutes continuously above 15 m.p.h. (24 Km/h)" after a sensor has been replaced.

The learning sequence will initiate when the vehicle has been stopped for more then 20 minutes. A new TPM sensor ID can also be programmed directly into the WCM by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new TPM sensor ID has been programmed, the RKE-TPM Analyzer can be used to update the TPMS by activating the TPM sensor.

OPERATION

The tire pressure monitoring system is designed to operate without loss of function for all OEM tire construction for this vehicle. Tire Pressure Monitoring Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM). These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). If the TPM system detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (see placard table below), the TPM system will continuously illuminate an indicator lamp. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

If the WCM detects a warning or fault condition at ignition key "on" it will wait ten seconds +/- 10 % before sending the first request to illuminate the yellow TPM telltale lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The WCM shall continuously monitor for the receipt of tire pressure RF message transmissions from the TPM sensors during both the ignition key "on" and key "off" cycles. The TPM sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. The recommended "placard pressure", "low-pressure threshold" and "Hysteresis Pressure Values" for the tires installed on the vehicle, are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required.

The recommended "Placard Pressure", "Low-pressure Threshold", and "Hysteresis Pressure Values" for the tires installed on the vehicle, are stored in the non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label, and then apply the placard pressure to the following table. The Low Pressure Off Threshold is defined as the Low Pressure On Threshold plus the Hysteresis Pressure Value.

TPM THRESHOLD PRESSURES

NOTE: To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label found on the Driver's B-Pillar, then apply the placard pressure to the following table.

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)
28	22	26
29	23	27
30	24	28
31	25	29
32	25	29

DIAGNOSIS AND TESTING

TIRE PRESSURE MONITORING SYSTEM

All Tire Pressure Monitoring System Faults are specific to one location. If a "BATTERY LOW" fault is detected it will cause a loss of signal fault. If a "SENSOR FAILURE" fault is detected, the location will be displayed (Premium Systems). The appropriate sensor/transmitter can then be replaced. If a single sensor/transmitter cannot be detected by the WCM, replace that sensor transmitter. If none of the sensors/transmitters can be detected, refer to symptoms in the WCM section. For additional system description and diagnosis, refer to Tire Pressure Monitoring in the Body Diagnostic manual .

TIRE PRESSURE

Check the tire pressure yellow telltale in the instrument cluster. If the yellow telltale is illuminating continuously, adjust the air pressure as necessary to that listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle. After adjusting air pressure in a tire, allow approximately two minutes for the message or yellow telltale to go out. Inspect all the tires for leaks. A water "dunk tank" or other water test may be used as long as any water at the valve core is removed once the procedure is complete. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original valve stem cap is securely installed to keep moisture out of the sensor. If the yellow telltale is still illuminating continuously or if the yellow telltale is flashing on/off for 60 seconds, once every ten minutes while drive, there is a system fault detected (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE).

Tire Pressure Sensor/Transmitter Mounting Nut	6	—	53

SENSOR

DESCRIPTION

NOTE: On vehicles equipped with a Tire Pressure Monitoring System (TPMS), when the spare tire pressure sensor is replaced with a new pressure sensor, a diagnostic scan tool **MUST** be used to run a routine that will program the new pressure sensor ID into the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM). Please copy the ID number off of the new pressure sensor before installing it into the spare tire. Then follow the programming steps outlined in the diagnostic scan tool for: "Learn Spare Tire Sensor ID" under Miscellaneous Functions for the "WCM/Wireless Control Module" menu item as appropriate. If a TPM-RKE Analyzer special tool is available, put the new spare tire pressure sensor into "Park" mode to conserve the battery life of the sensor. If a TPM-RKE Analyzer special tool is not available, rotate the spare tire with one of the road tires.

NOTE: If replacing the WCM, the spare tire must be dismounted from its wheel to access and note the spare tire pressure sensor ID. Alternatively, a TPM-RKE Analyzer Tool can be used to obtain the TPM sensor ID also. Then follow the programming steps outlined in the diagnostic scan tool for “Learn Spare Tire Sensor ID” under Miscellaneous Functions for the WCM wireless control module menu item as appropriate.

On vehicles equipped with Tire Pressure Monitoring System, one tire pressure sensor (6) is mounted to each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.

The TPM system operates on a 315 MHz radio frequency. The 315 MHz sensors can be easily identified by a black sensor body, with (an oval insignia) (1) and a grey valve cap (2).

The Export TPM system operates on a 433 MHz radio frequency. The 433 MHz sensors can be easily identified by a gray sensor body (with an oval insignia) and a black valve cap (2).

CAUTION: Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct color sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.

NOTE: Sensors may be identified by valve stem cap color. From the factory, 315 MHz sensors have a gray valve stem cap while 433 MHz sensors have a black valve stem cap. Otherwise, once mounted inside a tire and wheel assembly you are not able to visually tell the difference between a 315 MHz and 433 MHz sensor. The tire must be dismounted allowing visual inspection of the sensor body.

NOTE: If aftermarket wheels are installed and do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

The TPM sensors are designed for original style factory wheels. **It is not recommended to install a tire pressure sensor in an aftermarket wheel. (This could cause sealing and system performance issues).**

The serviceable components of the tire pressure sensor are:

- Sensor-To-Wheel Seal (4)
- Valve Stem Cap (2)
- Valve Stem Core
- Valve Stem Nut (3)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and

corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

NOTE: On vehicles equipped with a Tire Pressure Monitoring System (TPMS), when the spare tire pressure sensor is replaced with a new pressure sensor, a diagnostic scan tool **MUST** be used to run a routine that will program the new pressure sensor ID into the wireless control module (WCM), commonly referred to as the sentry key remote entry module (SKREEM). Please copy the ID number off of the new pressure sensor before installing it into the spare tire. Then follow the programming steps outlined in the diagnostic scan tool for: “Learn Spare Tire Sensor ID” under Miscellaneous Functions for the WCM wireless control module menu item as appropriate. If a TPM-RKE Analyzer special tool is available, put the new spare tire pressure sensor into “Park” mode to conserve the battery life of the sensor. If a TPM-RKE Analyzer special tool is not available, rotate the spare tire with one of the road tires

NOTE: If replacing the WCM, the spare tire must be dismounted from its wheel to access and note the spare tire pressure sensor ID. Alternatively, a TPM-RKE Analyzer Tool can be used to obtain the TPM sensor ID also. Then follow the programming steps outlined in the diagnostic scan tool for “Learn Spare Tire Sensor ID” under Miscellaneous Functions for the WCM wireless control module menu item as appropriate.

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer, or from a transponder. (Refer to 22 – TIRES/WHEELS/TIRE PRESSURE MONITORING/TRANSPONDER - OPERATION) The TPM-RKE Analyzer has the ability to change the sensor’s operating mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor. The TPM sensor can be in one of the following modes:

- • **Sleep Mode** – This is the operating mode of a new TPM sensor. If placed on the vehicle as a road tire, the sensor will transmit once every 20 seconds when the vehicle is driven at speeds over 15 mph (24 km/h). If the vehicle is not moving, the sensor will only transmit on a pressure change greater than 1 PSI. Driving the vehicle continuously at this speed for more than 4 minutes will change the sensor state into 30 BLOCK MODE. The TPM sensor will not return to SLEEP MODE. Now, if the vehicle has been stopped for 20 minutes, the TPM sensor state will change to PARK MODE. If the vehicle is equipped with a full size matching spare tire and the spare tire sensor has been replaced, The sensor must be changed to Park Mode to conserve battery life. Either use a TPM-RKE Analyzer, or swap the spare tire with a road tire.
- • **Park Mode** – This is the correct operating mode when the vehicle is not moving. The sensor will transmit once every 13 hours to update the WCM, or will transmit on a 1 PSI delta change. The sensors will internally take a measurement of the tire pressure every minute to determine a change in tire pressure
- • **30 Block Mode** – If the vehicle has been stopped for more than 20 minutes, or if the sensor’s operating mode was forced to Park Mode using a TPM-RKE Analyzer, the sensor’s operating mode will transition from Park Mode to 30 Block Mode once the vehicle is driven over 15mph. In this mode, the sensor will

transmit once every 15 seconds when the vehicle is driven at speeds over 15 mph (24 km/h) for the first 30 transmissions. After about 8 minutes of continuous driving above 15 mph (24 km/h), the sensor's mode will change to Drive Mode

- • **Drive Mode** – In this mode, the sensor will transmit once every minute when the vehicle is driven at speeds over 15 mph (24 km/h). At any time the vehicle speed drops below 15 mph, the sensor will not transmit. The sensor mode will still be in drive mode when the sensor reaches speeds over 15 mph (24 km/h). If the vehicle has been stationary for more than 20 minutes, the TPM sensor will change to PARK MODE.

Each sensor's (transmitter) broadcast is uniquely coded so that the wireless control module (WCM) can monitor the state of each of the sensors on the four rotating road wheels. The WCM can automatically learn and store the sensor's ID while driving "within 10 minutes continuously above 15 m.p.h. (24 Km/h)" after a sensor has been replaced. The vehicle must be stationary for more than 20 minutes in order to initiate the learning sequence. The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool" under "MISC" for the "WCM/WIRELESS CONTROL MODULE".

CAUTION

CAUTION: The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. After-market wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.

NOTE: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new seal, cap and valve core must be installed on the stem to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

REMOVAL

1. Raise and support vehicle.
2. Remove the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

3. Let the air out of the tire.
4. Remove the nut (3).
5. Push the sensor into the tire (1) (so the sensor is loose inside the tire).
6. Remove the tire from the rim.
7. Retrieve the sensor (1) from the tire.

INSTALLATION

NOTE: If replacing the spare tire pressure sensor, take the time now to write down the tire pressure sensor ID.

NOTE: Before reinstalling an existing tire pressure sensor (6), replace valve cap (2), Nut (3), valve core and sensor seal (4) to ensure proper sealing.

NOTE: The notch/flat should be lined up together and facing towards the wheel during installation.

1. Wipe area clean around sensor/valve stem mounting hole in wheel. Make sure surface of wheel is not damaged.

2. Insert sensor (1) through wheel (2) as shown keeping pressure against rear of metal valve stem (See Arrow). Potted side of sensor is to be positioned toward wheel. Damage to the sensor may occur if the sensor is installed incorrectly.

NOTE: A flat on the seal seat is used to key the seat to the sensor housing. The notch/flat should be lined up together and facing towards the wheel during installation.

3. Install sensor nut (3) and hand tighten.

NOTE: Before tightening sensor nut, push downward on sensor housing (2) in an attempt to make it flush with interior contour of wheel (1).

4. While holding sensor in position, tighten sensor nut to 6 N·m (53 in. lbs.).

CAUTION: Over-tightening the sensor to as much as 10 N·m (88 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function, however, the condition should be corrected immediately.

5. Mount tire on wheel following tire changer manufacturer's instructions, paying special attention to the following to avoid damaging tire pressure sensor:

a.

Rotating Wheel Tire Changers- Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 180° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads.

b.

Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located

approximately 180° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.

6. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.

7. Install tire and wheel assembly on vehicle (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

8. Lower vehicle.

9. If the vehicle has been stationary for more than 20 minutes, drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID. A new sensor ID can also be programmed directly into the WCM by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the RKE-TPM Analyzer can be used to update the TPMS by activating the sensor.

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

SPARE TIRE SENSOR REPLACEMENT

NOTE: When the spare tire sensor is replaced on vehicles equipped with a Tire Pressure Monitoring System (TPMS) and a full-sized matching spare tire and wheel assembly, a diagnostic scan tool MUST be used to run a routine that will program the new pressure sensor ID into the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM). Please copy the ID number off of the new pressure sensor before installing it into the spare tire. Then follow the programming steps outlined in the diagnostic scan tool for: “Learn Spare Tire Sensor ID” under Miscellaneous Functions for the (WCM) Wireless Control Module menu item as appropriate. If a TPM-RKE Analyzer special tool is available, put the new spare tire pressure sensor into “Park” mode. If a TPM-RKE Analyzer special tool is not available, rotate the spare tire with one of the road tires.

23 - BODY

BODY

DESCRIPTION - VEHICLE IDENTIFICATION

Throughout this group, references to the DaimlerChrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to Introduction Group of this manual for detailed information on vehicle identification. If a procedure is common to all vehicles covered in this manual, no reference will be made to a vehicle family code.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: Use an OSHA approved breathing filter when spraying paint or solvents in a confined area. Personal injury can result.

Avoid prolonged skin contact with petroleum or alcohol-based cleaning solvents. Personal injury can result.

Do not stand under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions can result.

Always have a fire extinguisher ready for use when welding.

Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.

Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline-based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.

Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

Use of Heat During Repair

WARNING: Chrysler Group engineering's position on the use of heat during collision repair is as follows:

- Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.
- During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the

parts which will be replaced and not allowed to affect any other components.

This “no heat” recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer. Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle. Failure to follow these instructions may result in serious or fatal injury. This statement supersedes any previously released information by the Chrysler Group.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BUZZ, SQUEAK & RATTLE

Buzz, Squeak & Rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the [Buzz, Squeak & Rattle Kit](#) table for material contents and usage.

Buzz, Squeak & Rattle Kit

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Itch And Squeak Tape	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 107° C (-40° to

			225° F)
Black Nylon Flock	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 82° C (-40° to 180° F)
High Density Urethane Foam	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 82° C (-40° to 180° F)
Open Cell Foam Tape	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 82° C (-40° to 180° F)
Closed Cell Low Density Foam Tape	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 82° C (-40° to 180° F)
NYE® Grease 880	Long life.	Suspensions. Examples: Strut bushings, sway bars.	-40° to 200° C (-40° to 390° F)
Krytox® Oil	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-34° to 205° C (-30° to 400° F)
Krytox® Grease	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-34° to 205° C (-30° to 400° F)

STANDARD PROCEDURE - HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
 - a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
 - b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.

5. Install trim panel.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- Eye protection should be used when servicing components. Personal injury can result.
- Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.

- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES
PBTP/EEBC	POLYBUTYLENE THEREPTHALATE/EEBC ALLOY	BEXLOY, "M", PBTP/EEBC	FASCIAS, ROCKER PANEL, MOLDINGS

PC	POLYCARBONATE	LEXAN, MERLON, CALIBRE, MAKROLON PC	TAIL LIGHT LENSES, IP TRIM, VALANCE PANELS
PC/ABS	PC/ABS ALLOY	GERMAX, BAY BLENDS, PULSE	DOORS, INSTRUMENT PANELS
PPO	POLYPHENYLENE OXIDE	AZDEL, HOSTALEN, MARLEX, PRFAX, NORYL, GTX, PPO	INTERIOR TRIM, DOOR PANELS, SPLASH SHIELDS, STEERING COLUMN SHROUD
PPO/PA	POLYPHENYLENE/POLYAMID	PPO/PA, GTX 910	FENDERS, QUARTER PANELS
PR/FV	FIBERGLASS REINFORCED PLASTIC	FIBERGLASS, FV, PR/FV	BODY PANELS
PS	POLYSTYRENE	LUSTREX, STYRON, PS	DOOR PANELS, DASH PANELS
RTM	RESIN TRANSFER MOLDING COMPOUND	RTM	BODY PANELS
SMC	SHEET MOLDED COMPOUND	SMC	BODY PANELS
TMC	TRANSFER MOLDING COMPOUND	TMC	GRILLES
UP	UNSATURATED POLYESTER (THERMOSETTING)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	GRILLE OPENING PANEL, LIFTGATES, FLARESIDE FENDERS, FENDER EXTENSIONS
EEBC	ETHER/ESTER BLOCKED CO- POLYMER	EEBC	BUMPERS
EEBC/PBTP	EEBC/POLYBUTYLENE TEREPHTHALATE	EEBC, PBTP, BEXLOY	BUMPER, ROCKER PANELS
EMPP	ETHYLENE MODIFIED POLYPROPYLENE	EMPP	BUMPER COVERS
EPDM	ETHYLENE/PROPPYLENE DIENE MONOMER	EPDM, NORDEL, VISTALON	BUMPERS
EPM	ETHYLENE/PROPPYLENE CO-POLYMER	EPM	FENDERS
MPU	FOAM POLYURETHANE	MPU	SPOILERS
PE	POLYETHYLENE	ALATHON, DYLAN, LUPOLEN, MARLEX	—
PP	POLYPROPYLENE (BLENDS)	NORYL, AZDEL, MARLOX, DYLAN, PRAVEX	INNER FENDER, SPOILERS, KICK PANELS
PP/EPDM	PP/EPDM ALLOY	PP/EPDM	SPOILERS, GRILLES

PUR	POLYURETHANE	COLONELS, PUR, PU	FASCIAS, BUMPERS
PUR/PC	PUR/PC ALLOY	TEXIN	BUMPERS
PVC	POLYVINYL CHLORIDE	APEX, GEON, VINYLITE	BODY MOLDINGS, WIRE INSULATION, STEERING WHEELS
RIM	REACTION INJECTED MOLDED POLYURETHANE	RIM, BAYFLEX	FRONT FASCIAS, MODULAR WINDOWS
RRIM	REINFORCED REACTION INJECTED MOLDED	PUR, RRIM	FASCIAS, BODY PANELS, BODY TRIMS
TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMPERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever

possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.

13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

14. Apply a coat of adhesive to the exposed ends of the support squares.

15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.

16. Allow adhesive to cure, and remove all screws.

17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.

18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.

19. Mix enough adhesive to cover the entire patch area.

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

STANDARD PROCEDURE - BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

1. When necessary, lubricate the operating mechanisms with the specified lubricants.
2. Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.
3. Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.
4. The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.
5. The door lock cylinders should be lubricated twice each year (preferably autumn and spring):
 - Spray a small amount of lock cylinder lubricant directly into the lock cylinder.
 - Apply a small amount to the key and insert it into the lock cylinder.
 - Rotate it to the locked position and then back to the unlocked position several times.
 - Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

Component	Fluid, Lubricant, or Genuine Part
Hinges:	
Door And Hood	Mopar® Engine Oil
Liftgate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches:	
Door, Hood/Safety Catch, Liftgate	Mopar® Multi-Purpose Lube NLG Grade 2 EP, GC-LB
Seat Regulator & Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Window System Components	Mopar® Spray White Lube
Lock Cylinders	Mopar® Lock Cylinder Lube
Parking Brake Mechanism	Mopar® Wheel Brg. Grease NLGI Grade 1, GC-LBB
Soft Top	Mopar® Soft Top Zipper Cleaner & Lubricant

CAUTION: * Whenever a body isolator bolt requires servicing or tightening, it is necessary to remove the bolt and install new thread locker compound to the threads.

SPECIAL TOOLS

BODY

STICK, TRIM C 4755

REMOVER, MOLDINGS C-4829-A

STRAIN GAUGE HOLDER 9689

REMOVER, OUTER DOOR BELT MOLDING 9093**DOOR - FULL FRONT****CABLE****REMOVAL**

1. Remove the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - REMOVAL).
2. Release the cable clip at the inside handle (4) and disconnect the cable (1).

3. Release the clips (3) and disconnect the cable from the latch assembly.

4. Remove the cable from the carrier plate.

INSTALLATION

1. Install the cable onto the carrier plate and connect to the latch.

2. Secure the cable clip (3) fully.

3. Connect the cable (1) to the interior handle (3) and secure the cable clip (4).

4. Install the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - INSTALLATION).

CARRIER PLATE

DESCRIPTION

POWER CARRIER PLATE

1 - LATCH & LOCK CABLES
2 - GLASS CLIP
3 - REGULATOR SCREWS
4 - CARRIER PLATE
5 - INSIDE HANDLE
6 - REGULATOR MOTOR SCREWS
7 - LATCH MOUNTING BRACKET
8 - LATCH
9 - GLASS DISCONNECT HOLES (PLUGS MUST BE REMOVED TO SERVICE GLASS)
10 - WIRE HARNESS
11 - MOTOR
12 - GLASS LIFT PLATE
13 - REGULATOR

NOTE: Full front door shown, full rear door similar.

Door carrier plates include the hardware, window regulators, latch, remote handle and links and wiring harness. In addition to providing manufacturing efficiencies, the door modules benefit the customer too. Having all the parts assembled into a module improves build accuracy and fit and finish between the components and trim as a result of greater communication between the release engineers and suppliers.

CAUTION: Care must be used when servicing the carrier plate that the seal isn't damaged.

REMOVAL

1. Position the glass into the down position.
2. Remove the door trim panel, (Refer to 23 - BODY/DOOR - FULL FRONT/TRIM PANEL - REMOVAL).
3. If equipped, using a punch or similar tool, carefully remove the glass disconnect hole plugs, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - DESCRIPTION).
4. Release the two glass retainer tabs (3) and separate the glass clip (4) from the regulator lift plate and position into

the full up position.

5. Position the glass (1) into the full up position and using tape or equivalent, secure the glass.

6. Disconnect the door wire harness at the A-pillar and separate the check strap from the hook.
7. Remove the screws (6) and separate the wire harness push pins from the door structure.
8. Remove the door handle screw (1).
9. Remove the latch screws (4).
10. Remove the rubber hole plug in the door and remove the nut (2).
11. Remove the upper latch bracket screw (3).
12. Remove the carrier plate screws (5) and remove the carrier plate assembly (7) from the door.

INSTALLATION

1. Place the latch assembly into the door opening and install the carrier plate (7) onto the door.
2. Install the latch screws (4) and tighten to 8 N·m (71 in. lbs.) top screws first.
3. Install the latch bracket screw (3).
4. Install the 10 carrier plate screws (5) and tighten to 10 N·m (90 in. lbs.).
5. Install the outside door handle nut (2) through the hole in the inner door and tighten to 4.5 N·m (40 in. lbs.).
6. Install the inside door handle screw (1) and tighten to 8.5 N·m (75 in. lbs.).

7. Slowly lower the glass (1) all the way down into the regulator lift plate (3) and seat the glass clip (4) fully until a snap sound is heard.
8. Seal the glass disconnect holes with a suitable foam tape or equivalent.

9. Install the trim panel (1), (Refer to 23 - BODY/DOOR - FULL FRONT/TRIM PANEL - INSTALLATION).

CYLINDER - DOOR LOCK

REMOVAL

1. Remove the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - REMOVAL).

2. Remove the clip (3) and separate the lock cylinder (2) and gasket (1) from the door.

INSTALLATION

1. Assemble gasket (1) onto lock cylinder (2) until fully seated.

2. Install lock cylinder (2) into hole in outer door panel.

NOTE: Cylinder post must point forward.

NOTE: Cylinder drain hole must point down.

3. While holding lock cylinder (2) in place slide retainer clip (3) onto lock cylinder.

NOTE: Visually verify that pin on lock cylinder is engaged with bell crank on door module at door module install.

4. Install the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - INSTALLATION).

DOOR

REMOVAL

1. Remove the lower B-pillar trim panel (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

NOTE: Front door check strap shown, rear doors are similar.

2. Disconnect the electrical connector (3) at the A-pillar cowl area and separate the check strap (2) from the footman's loop (1).

NOTE: Full front door shown, all others similar.

3. Remove the nuts (1) and lift the door (2) up off hinges and remove.

INSTALLATION

NOTE: Full front door shown, all others similar.

1. Align pins on door hinge to holes in hinge on body and position door into place.
2. Install the nuts (1) and tighten to 8.5 N·m (75 in. lbs.).
3. If necessary, adjust the door (2) (Refer to 23 - BODY/DOOR - HALF REAR/DOOR - ADJUSTMENTS)

NOTE: Front door check strap shown, rear doors are similar.

4. Secure the check strap (2) over the footman's loop (1) and connect the electrical connector (3).

5. Install the lower B-pillar trim (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT

NOTE: For four door vehicles, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

Full front door shown, all others similar.

- **Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**
- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the door fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the upper (1) and lower (4) hinge to door fasteners. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge to door bolts to 26 N·m (19 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. If necessary, loosen the hinge to hinge pillar fasteners (2) and (3). (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
4. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

5. If

necessary, Loosen the hinge to door fasteners (1) and (4). (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

6. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
7. Tighten the door to hinge fasteners to 26 N·m (19 ft. lbs.).

8. Tighten the latch striker bolts (3) 26 N·m (19 ft. lbs.). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER -

INSTALLATION)

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to body fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. Loosen the hinge to body fasteners (2) and (3), (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

6.
Tighten
the latch

striker
bolts (3)
to 26
N·m (19
ft. lbs.).
(Refer to
23 -

BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

GLASS - DOOR

REMOVAL

1. Remove the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - REMOVAL).

2. Remove the nut (2) and position the run channel (1) aside.

3. Separate the clip (2) from the glass (1) and lower the glass in the run channel.

4. Turn the glass so the front of the glass is facing down and remove the glass through the glass opening.

INSTALLATION

1. Install the glass (1) into the door (3), front and first.
2. Rotate glass into the correct orientation and push up into the weather seal.
3. Secure glass in the up position using tape or other suitable method.
4. Install the glass clip (2).

5. Position the glass run channel (1) back into place and install the nut (2).
6. Tighten the nut to 10 N·m (90 in. lbs.).

7. Install the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - INSTALLATION).

HANDLE - EXTERIOR DOOR

REMOVAL

1. Remove the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - REMOVAL).

2. Remove the nut (2) and remove the handle (1).

INSTALLATION

1. Install the handle (1) and install the front nut (2).

2. Tighten the nut to 4.5 N·m (40 in. lbs.).

3. Install the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - INSTALLATION).

HANDLE - INSIDE RELEASE

REMOVAL

1. Remove the door trim panel, (Refer to 23 - BODY/DOOR - FULL FRONT/TRIM PANEL - REMOVAL).

2. Remove the screw (2) securing the handle (1) to the carrier plate.

3. Disconnect the clips (4) and disconnect the cables (1).
4. Slide the handle (3) off of the retaining tabs (2) and remove.

INSTALLATION

1. Position the handle (3) onto the carrier plate tabs (2) and slide into place fully.
2. Connect the cables (1) and secure the clips (4).

3. Install the inside door handle screw (2) and tighten to 8.5 N·m (75 in. lbs.).

4. Install the trim panel (1), (Refer to 23 - BODY/DOOR - FULL FRONT/TRIM PANEL - INSTALLATION).

HINGE

REMOVAL

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Remove the door (2), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - REMOVAL).

2. Using a grease pencil or equivalent, mark the body hinge (1) and (4) location and remove the bolts (2) and (3).

3. Using a grease pencil or equivalent, mark the door hinge (2) and (3) location and remove the bolts (1) and (4).

INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the door hinges (2) and (3), and install the bolts (1) and (4).
2. Align the hinges to the door using the reference marks made during the removal procedure and tighten the bolts to 26 N·m (19 ft. lbs.).

819cea6e

3. Install the body hinges (1) and (4), and install the bolts (2) and (3).

4. Align the hinges to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).

819cea62

5. Install the door (2), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - INSTALLATION).

LATCH

REMOVAL

1. Remove the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - REMOVAL).

NOTE: Front door shown, rear door similar.

2. Disconnect the actuator rods.
3. Disconnect the electrical connector (1).
4. Disconnect the latch cables (3).
5. Slide the latch off the latch bracket tabs (2) and remove the latch.

INSTALLATION

NOTE: Front door latch shown, rear door similar.

1. Install the latch onto the latch bracket tabs (2) and seat fully.
2. Connect the electrical connector (1).
3. Connect the latch cables (3).
4. Connect actuator rods.

5. Install the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - INSTALLATION).
6. Adjust the front door latch, (Refer to 23 - BODY/DOOR - FULL FRONT/LATCH - ADJUSTMENTS).

ADJUSTMENTS

1. Locate the access hole in the door to adjust the door latch (1) and remove the mylar tape (2).
2. Loosen latch adjusting screw (3) through access slot in door shut face (1/2 to 1 full turn).
3. Operate the door handles several times to reduce any possible linkage binding and tighten the adjustment screw to 3 N·m (30 in. lbs.).
4. Operate the door handles again to verify proper operation and reinstall the mylar tape.

MOUNTING BRACKET - LATCH

REMOVAL

1. Remove the latch (3), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - REMOVAL).
2. Slide the latch bracket (5) off of the carrier plate tabs and remove.

INSTALLATION

1. Slide the latch bracket (5) onto the carrier plate and secure fully.
2. Install the latch (3), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - REMOVAL).

REGULATOR - FRONT DOOR

WINDOW REMOVAL

1. Remove the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - REMOVAL).
2. Remove the screws (1) and disconnect the electrical connector (2).
3. Remove the motor (3).

4. Remove the rail screws (2) and separate the lift regulator (3) from the carrier plate (1).

INSTALLATION

1. Position the regulator (3) onto the carrier plate (1) and install the screws (2).

2. Install the motor (3) and install the screws (1).
3. Connect the electrical connector (2).

4. Install the carrier plate, (Refer to 23 - BODY/DOOR - FULL FRONT/CARRIER PLATE - INSTALLATION).

STRIKER - DOOR

REMOVAL

1. Remove the screws (3).

2. Remove the striker (2) and the shims (1), if equipped.

INSTALLATION

1. Install the shims (1), if equipped, and install the striker (2).
2. Install the screws (3) and tighten to 26 N·m (19 ft. lbs.).
3. If necessary, adjust the door latch striker (Refer to 23 - BODY/DOOR - FULL FRONT/STRIKER - ADJUSTMENTS).

ADJUSTMENTS

1. Using a grease pencil or equivalent, mark the location of the door latch striker (2) on the B-pillar to aid in adjustment.
2. Loosen the two screws (3) that secure the door latch striker to the B-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 26 N·m (19 ft. lbs.), (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Verify correct door and latch position.

TRIM PANEL

REMOVAL

1. Using a standard window handle tool (2), release the handle clips and remove the handle (1) from the window lift mechanism, if equipped with a manual regulator.

NOTE: Full front door shown, rear door similar.

2. Remove the pull handle trim plugs (2) and remove the pull handle screws (3).
3. Remove the screws (1), if equipped.

NOTE: Full front door shown, rear door similar.

4. Using a trim stick C-4829 or equivalent, starting at the bottom by the check strap, separate the push pin fasteners (3) and remove the trim panel (1).

INSTALLATION

NOTE: Full front door shown, rear door similar.

1. Position the trim panel (1) into place and seat the push pin fasteners (3) fully.

NOTE: Full front door shown, rear door similar.

2. Install the pull handle screws (3) and install the trim caps (2).
3. Install the trim panel screws (1), if equipped.

4. If equipped with a manual window regulator, position the window crank handle retaining clip (1) back into place and install the window crank handle (2) onto the lift mechanism shaft and seat fully.

DOOR - FULL REAR

CARRIER PLATE

DESCRIPTION

POWER CARRIER PLATE

1 - LATCH & LOCK CABLES

2 - GLASS CLIP

3 - REGULATOR SCREWS

4 - CARRIER PLATE

5 - INSIDE HANDLE
6 - REGULATOR MOTOR SCREWS
7 - LATCH MOUNTING BRACKET
8 - LATCH
9 - GLASS DISCONNECT HOLES (PLUGS MUST BE REMOVED TO SERVICE GLASS)
10 - WIRE HARNESS
11 - MOTOR
12 - GLASS LIFT PLATE
13 - REGULATOR

NOTE: Full front door shown, full rear door similar.

Door carrier plates include the hardware, window regulators, latch, remote handle and links and wiring harness. In addition to providing manufacturing efficiencies, the door modules benefit the customer too. Having all the parts assembled into a module improves build accuracy and fit and finish between the components and trim as a result of greater communication between the release engineers and suppliers.

CAUTION: Care must be used when servicing the carrier plate that the seal isn't damaged.

REMOVAL

NOTE: Front door trim shown, rear door similar.

1. Position the glass into the down position.
2. Remove the trim panel (1), (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).

3. If equipped, using a punch or similar tool, carefully remove the glass disconnect hole plugs, (Refer to 23 - BODY/DOOR - FRONT/CARRIER PLATE - DESCRIPTION).

4. Release the two glass retainer tabs (3) and separate the glass clip (4) from the regulator lift plate and position into the full up position.

5. Position the glass (1) into the full up position and using tape or equivalent, secure the glass.

6. Remove the lower B-pillar trim panel (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

7. Disconnect the door wire harness at the B-pillar and separate the check strap from the hook.
8. Remove the screws (5) and separate the wire harness push pins from the door structure.
9. Remove the door handle screw (1).
10. Remove the latch screws (3).
11. Separate the foam seal and disconnect the exterior handle rods from the access hole in the carrier plate.
12. Remove the carrier plate screws (4) and remove the carrier plate assembly (6) from the door.

INSTALLATION

1. Place the latch assembly into the door opening and install the carrier plate (6) onto the door.
2. Install the latch screws (3) and tighten to 8 N·m (71 in. lbs.) top screws first.
3. Install the eight carrier plate screws (4) and tighten to 10 N·m (90 in. lbs.).
4. Install the inside door handle screw (1) and tighten to 8.5 N·m (75 in. lbs.).
5. Connect the exterior handle latch rods.
6. Replace the foam sealer over the access hole.
7. Install the wire harness onto the door and install the screws (5).
8. Connect the wire harness electrical connector at the B-pillar.

NOTE: Front door shown, rear door similar.

9. Slowly lower the glass (1) all the way down into the regulator lift plate (3) and seat the glass clip (4) fully until a snap sound is heard.
10. Seal the glass disconnect holes with a suitable foam tape or equivalent.

NOTE: Front door shown, rear door similar.

11. Install the door trim panel (1), (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

12. Install the lower B-pillar trim (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

DOOR

REMOVAL

1. Remove the lower B-pillar trim panel (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

NOTE: Front door check strap shown, rear doors are similar.

2. Disconnect the electrical connector (3) at the A-pillar cowl area and separate the check strap (2) from the footman's loop (1).

NOTE: Full front door shown, all others similar.

3. Remove the nuts (1) and lift the door (2) up off hinges and remove.

INSTALLATION

NOTE: Full front door shown, all others similar.

1. Align pins on door hinge to holes in hinge on body and position door into place.
2. Install the nuts (1) and tighten to 8.5 N·m (75 in. lbs.).
3. If necessary, adjust the door (2), (Refer to 23 - BODY/DOOR - FULL REAR/DOOR - ADJUSTMENTS)

NOTE: Front door check strap shown, rear doors are similar.

4. Secure the check strap (2) over the footman's loop (1) and connect the electrical connector (3).

5. Install the lower B-pillar trim (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT

NOTE: For four door vehicles, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

Full front door shown, all others similar.

- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.
- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.
- A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the door fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the upper (1) and lower (4) hinge to door fasteners. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge to door bolts to 26 N·m (19 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. If necessary, loosen the hinge to hinge pillar fasteners (2) and (3). (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
4. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

5. If

necessary, Loosen the hinge to door fasteners (1) and (4). (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

6. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
7. Tighten the door to hinge fasteners to 26 N·m (19 ft. lbs.).

8. Tighten the latch striker bolts (3) 26 N·m (19 ft. lbs.). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER -

INSTALLATION)

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to body fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. Loosen the hinge to body fasteners (2) and (3), (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

6.
Tighten
the latch

striker
bolts (3)
to 26
N·m (19
ft. lbs.).
(Refer to
23 -

BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

GLASS - DOOR

REMOVAL

1. Remove the carrier plate (6), (Refer to 23 - BODY/DOORS - REAR/CARRIER PLATE - REMOVAL)

2. Remove the nut (2) and position the run channel (1) aside.
3. Lower the glass into the bottom of the door.
4. Remove the outer belt molding.
5. Remove the stationary glass division bar bolt and separate the stationary glass and weatherstrip assembly from the door.
6. Remove the door glass from the door window opening.

INSTALLATION

1. Install the door glass into the door through the window opening and position into the bottom of the door.
2. Install the stationary glass and weatherstrip and seat fully.
3. Install the division bar bolt and tighten to 12 N·m (9 ft. lbs.).
4. Install the outer belt molding.
5. Position the glass into the full up position and secure in

place using tape or other suitable device.

6. Install the glass run channel (1) and install the nut (2).

7. Tighten the nut to 10 N·m (90 in. lbs.).

8. Install the carrier plate (6), (Refer to 23 - BODY/DOORS - REAR/CARRIER PLATE - INSTALLATION).

HANDLE - EXTERIOR DOOR

REMOVAL

1. Remove the carrier plate (6), (Refer to 23 - BODY/DOORS - REAR/CARRIER PLATE - REMOVAL)

2. Remove the nuts (1) and remove the handle (2).

INSTALLATION

1. Install the handle (2) and install the nuts (1).

2. Tighten the nuts to 4.5 N·m (40 in. lbs.).

81968a51

81968a5e

3. Install the carrier plate (6), (Refer to 23 - BODY/DOORS - REAR/CARRIER PLATE - INSTALLATION).

HANDLE - INSIDE RELEASE

REMOVAL

NOTE: Front door shown, rear door similar.

1. Remove the door trim panel (1), (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).

2. Remove the screw (2) securing the handle (1) to the carrier plate.

3. Disconnect the clips (4) and disconnect the cables (1).

4. Slide the handle (3) off of the retaining tabs (2) and remove.

INSTALLATION

1. Position the handle (3) onto the carrier plate tabs (2) and slide into place fully.
2. Connect the cables (1) and secure the clips (4).

3. Install the inside door handle screw (2) and tighten to 8.5 N·m (75 in. lbs.).

NOTE: Front door shown, rear door similar.

4. Install the trim panel (1), (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

HINGE

REMOVAL

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Remove the door (2), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - REMOVAL).

2. Using a grease pencil or equivalent, mark the body hinge (1) and (4) location and remove the bolts (2) and (3).

3. Using a grease pencil or equivalent, mark the door hinge (2) and (3) location and remove the bolts (1) and (4).

INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the door hinges (2) and (3), and install the bolts (1) and (4).

2. Align the hinges to the door using the reference marks made during the removal procedure and tighten the bolts to 26 N·m (19 ft. lbs.).

3. Install the body hinges (1) and (4), and install the bolts (2) and (3).

4. Align the hinges to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).

5. Install the door (2), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - INSTALLATION).

LATCH

REMOVAL

1. Remove the carrier plate (6), (Refer to 23 - BODY/DOOR - FULL REAR/CARRIER PLATE - REMOVAL).

NOTE: Front door shown, rear door similar.

2. Disconnect the actuator rods.
3. Disconnect the electrical connector (1).
4. Disconnect the latch cables (3).
5. Slide the latch off the latch bracket tabs (2) and remove the latch.

INSTALLATION

NOTE: Front door latch shown, rear door similar.

1. Install the latch onto the latch bracket tabs (2) and seat fully.
2. Connect the electrical connector (1).
3. Connect the latch cables (3).

4. Install the carrier plate (6), (Refer to 23 - BODY/DOOR - FULL REAR/CARRIER PLATE - INSTALLATION).
5. Adjust the door latch, (Refer to 23 - BODY/DOOR - FULL REAR/LATCH - ADJUSTMENTS).

ADJUSTMENTS

1. Locate the access hole in the door to adjust the door latch (1) and remove the mylar tape (2).
2. Loosen latch adjusting screw (3) through access slot in door shut face (1/2 to 1 full turn).
3. Operate the door handles several times to reduce any possible linkage binding and tighten the adjustment screw to 3 N·m (30 in. lbs.).
4. Operate the door handles again to verify proper operation and reinstall the mylar tape.

MOUNTING BRACKET - LATCH

REMOVAL

NOTE: Front door shown, rear door similar.

1. Remove the latch (3), (Refer to 23 - BODY/DOOR - FULL REAR/LATCH - REMOVAL)
2. Slide the latch bracket (5) off of the carrier plate tabs and remove.

INSTALLATION

NOTE: Front door shown, rear door similar.

1. Slide the latch bracket (5) onto the carrier plate and secure fully.
2. Install the latch (3), (Refer to 23 - BODY/DOOR - FULL REAR/LATCH - INSTALLATION)

REGULATOR - REAR DOOR WINDOW REMOVAL

1. Remove the carrier plate, (Refer to 23 - BODY/DOOR - FULL REAR/CARRIER PLATE - REMOVAL).

NOTE: Front door shown, rear door similar.

2. Remove the screws (1) and disconnect the electrical connector (2).

3. Remove the motor (3).

4. Remove the rail screws (2) and separate the lift regulator (3) from the carrier plate (1).

INSTALLATION

NOTE: Front door shown, rear door similar.

1. Position the regulator (3) onto the carrier plate (1) and install the screws (2).

NOTE: Front door shown, rear door similar.

2. Install the motor (3) and install the screws (1).
3. Connect the electrical connector (2).

4. Install the carrier plate, (Refer to 23 - BODY/DOOR - FULL REAR/CARRIER PLATE - INSTALLATION).

STRIKER - DOOR

REMOVAL

1. Remove the screws (1).
2. Remove the striker (4) and the shims (3), if equipped.

INSTALLATION

1. Install the shims (3), if equipped, and install the striker (4).
2. Install the screws (1) and tighten to 26 N·m (19 ft. lbs.).
3. If necessary, adjust the door latch striker,

ADJUSTMENTS

1. Using a grease pencil or equivalent, mark the location of the door latch striker (4) on the C-pillar to aid in adjustment.
2. Loosen the two screws (1) that secure the door latch striker to the C-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 26 N·m (19 ft. lbs.), (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Verify correct door and latch position.

TRIM PANEL

REMOVAL

1. Using a standard window handle tool (2), release the handle clips and remove the handle (1) from the window lift mechanism, if equipped with a manual regulator.

NOTE: Full front door shown, rear door similar.

2. Remove the pull handle trim plugs (2) and remove the pull handle screws (3).
3. Remove the screws (1), if equipped.

NOTE: Full front door shown, rear door similar.

4. Using a trim stick C-4829 or equivalent, starting at the bottom by the check strap, separate the push pin fasteners (3) and remove the trim panel (1).

INSTALLATION

NOTE: Full front door shown, rear door similar.

1. Position the trim panel (1) into place and seat the push pin fasteners (3) fully.

NOTE: Full front door shown, rear door similar.

2. Install the pull handle screws (3) and install the trim caps (2).
3. Install the trim panel screws (1), if equipped.

4. If equipped with a manual window regulator, position the window crank handle retaining clip (1) back into place and install the window crank handle (2) onto the lift mechanism shaft and seat fully.

DOOR - HALF FRONT

CYLINDER - DOOR LOCK

REMOVAL

819cec60

81966e8a

1. Remove the latch (5), (Refer to 23 - BODY/DOOR - HALF FRONT/LATCH - REMOVAL).

NOTE: Full door shown, half door similar.

2. Remove the clip (3) and separate the lock cylinder (2) and gasket (1) from the door.

INSTALLATION

NOTE: Full door shown, half door similar.

1. Assemble gasket (1) onto lock cylinder (2) until fully seated.
2. Install lock cylinder (2) into hole in outer door panel.

NOTE: Cylinder post must point forward.

NOTE: Cylinder drain hole must point down.

3. While holding lock cylinder (2) in place slide retainer clip (3) onto lock cylinder.

NOTE: Visually verify that pin on lock cylinder is engaged with bell crank on door module at door module install.

4. Install the latch (5), (Refer to 23 - BODY/DOOR - HALF FRONT/LATCH - INSTALLATION).

DOOR

REMOVAL

1. Remove the lower B-pillar trim panel (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

NOTE: Full front door shown, all others similar.

2. Open the door and disconnect the electrical connector at the B-pillar.
3. Separate the door harness from the footman's loop at the B-pillar.
4. Remove the nuts (1) and lift the door (2) up off hinges and remove.

INSTALLATION

NOTE: Full front door shown, all others similar.

1. Align pins on door hinge to holes in hinge on body and position door into place.
2. Install the nuts (1) and tighten to 8.5 N·m (75 in. lbs.).
3. Install the wire harness onto the footman loop and connect the electrical connector.
4. If necessary, adjust the door (Refer to 23 - BODY/DOOR-FRONT - ADJUSTMENTS).

5. Install the lower B-pillar trim (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT

NOTE: For four door vehicles, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

- Full front door shown, all others similar.
- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.
- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for

the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.

- A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the door fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the upper (1) and lower (4) hinge to door fasteners. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge to door bolts to 26 N·m (19 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. If necessary, loosen the hinge to hinge pillar fasteners (2) and (3). (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
4. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

5. If

necessary, Loosen the hinge to door fasteners (1) and (4). (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

6. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
7. Tighten the door to hinge fasteners to 26 N·m (19 ft. lbs.).

8. Tighten the latch striker bolts (3) 26 N·m (19 ft. lbs.). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to body fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. Loosen the hinge to body fasteners (2) and (3), (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

6. Tighten the latch striker bolts (3) to 26 N·m (19 ft. lbs.). (Refer to 23 -

BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

HANDLE - EXTERIOR DOOR

REMOVAL

1. Remove the door trim panel (2), (Refer to 23 - BODY/DOOR - HALF FRONT/TRIM PANEL - REMOVAL).

2. Remove the latch nut (2).

NOTE: Full front door shown, half door is similar.

3. Remove the remaining handle nut (2) and remove the handle (1).

INSTALLATION

1. Install the handle (1) and install the front nut (2).
2. Tighten the nut to 4.5 N·m (40 in. lbs.).

3. Install the rear nut (2).
4. Tighten the nut to 4.5 N·m (40 in. lbs.).

5. Install the trim panel (2), (Refer to 23 - BODY/DOOR - HALF FRONT/TRIM PANEL - INSTALLATION).

HANDLE - INSIDE RELEASE

REMOVAL

1. Remove the door trim panel (2), (Refer to 23 - BODY/DOOR - HALF FRONT/TRIM PANEL - REMOVAL).

2. Remove the inside handle screw (6).

NOTE: Full front door shown, half door similar.

3. Release the clips (4) and disconnect the handle rods (1).
4. Slide the handle (3) off of the retaining tabs (2) and remove.

INSTALLATION

NOTE: Full door shown, half door similar.

1. Position the handle (3) onto the carrier plate tabs (2) and slide into place fully.
2. Connect the rods (1) and secure the clips (4).

3. Install the handle screw (6) and tighten to 8.5 N·m (75 in. lbs.).

4. Install the trim panel (2), (Refer to 23 - BODY/DOOR - HALF FRONT/TRIM PANEL - INSTALLATION).

HINGE

REMOVAL

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Remove the door (2), (Refer to 23 - BODY/DOOR - HALF FRONT/DOOR - REMOVAL).

2. Using a grease pencil or equivalent, mark the body hinge (1) and (4) location and remove the bolts (2) and (3).

3. Using a grease pencil or equivalent, mark the door hinge (2) and (3) location and remove the bolts (1) and (4).

INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the door hinges (2) and (3), and install the bolts (1) and (4).
2. Align the hinges to the door using the reference marks made during the removal procedure and tighten the bolts to 26 N·m (19 ft. lbs.).

3. Install the body hinges (1) and (4), and install the bolts (2) and (3).
4. Align the hinges to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).

5. Install the door (2), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - INSTALLATION).

LATCH

REMOVAL

1. Remove the door trim panel (2), (Refer to 23 - BODY/DOOR - HALF FRONT/TRIM PANEL - REMOVAL).

2. Remove the latch nut (2) and latch screws (4).

3. Disconnect the latch rods (5) and electrical connector (3) and remove the latch.

INSTALLATION

1. Install the latch screws (4) and tighten to 8 N·m (71 in. lbs.) top screws first.
2. Install the outside door handle nut (2) through the hole in the inner door and tighten to 4.5 N·m (40 in. lbs.).
3. Connect the electrical connector (3).
4. Connect the rods (5) and seat the clips fully.

5. Install the trim panel (2), (Refer to 23 - BODY/DOOR - HALF FRONT/TRIM PANEL - INSTALLATION).

STRIKER - DOOR

REMOVAL

1. Remove the screws (3).
2. Remove the striker (2) and the shims (1), if equipped.

INSTALLATION

1. Install the shims (1), if equipped, and install the striker (2).
2. Install the screws (3) and tighten to 26 N·m (19 ft. lbs.).
3. If necessary, adjust the door latch striker (Refer to 23 - BODY/DOOR - FULL FRONT/STRIKER - ADJUSTMENTS).

ADJUSTMENTS

1. Using a grease pencil or equivalent, mark the location of the door latch striker (2) on the B-pillar to aid in adjustment.
2. Loosen the two screws (3) that secure the door latch striker to the B-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 26 N·m (19 ft. lbs.), (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Verify correct door and latch position.

TRIM PANEL REMOVAL

1. Remove the trim caps (2) and remove the pull handle screws (3).
2. Remove the lower screw (1).

3. Using a trim stick C-4829 or equivalent, separate the push pin fasteners (1) and remove the trim panel (2).

INSTALLATION

1. Position the trim panel (2) into place and seat the push pin fasteners (1) fully.

2. Install the lower screw (1).

3. Install the pull handle screws (3) and install the trim caps (2).

WINDOW

REMOVAL

1. Open the door (2) and lift the window (1) out of the mounting holes (3).

INSTALLATION

1. If necessary, install the grommets (4) into the door holes (3) and seat fully.
2. Install the window (1) into the grommets (4) and seat fully.

DOOR - HALF REAR

DOOR

REMOVAL

1. Remove the lower B-pillar trim panel (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

NOTE: Front door check strap shown, rear doors are similar.

2. Disconnect the electrical connector (3) at the A-pillar cowl area and separate the check strap (2) from the footman's loop (1).

NOTE: Full front door shown, all others similar.

3. Remove the nuts (1) and lift the door (2) up off hinges and remove.

INSTALLATION

NOTE: Full front door shown, all others similar.

1. Align pins on door hinge to holes in hinge on body and position door into place.
2. Install the nuts (1) and tighten to 8.5 N·m (75 in. lbs.).
3. If necessary, adjust the door (2) (Refer to 23 - BODY/DOOR - HALF REAR/DOOR - ADJUSTMENTS)

NOTE: Front door check strap shown, rear doors are similar.

4. Secure the check strap (2) over the footman's loop (1) and connect the electrical connector (3).

5. Install the lower B-pillar trim (2), (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT

NOTE: For four door vehicles, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

- Full front door shown, all others similar.
- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.
- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.
- A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the door fasteners one hinge at a

time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the upper (1) and lower (4) hinge to door fasteners. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge to door bolts to 26 N·m (19 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. If necessary, loosen the hinge to hinge pillar fasteners (2) and (3). (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
4. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

5. If

necessary, Loosen the hinge to door fasteners (1) and (4). (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

6. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

7. Tighten the door to hinge fasteners to 26 N·m (19 ft. lbs.).

8. Tighten the latch striker bolts (3) 26 N·m (19 ft. lbs.).
(Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to body fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (3). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)

3. Loosen the hinge to body fasteners (2) and (3), (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge to body fasteners to 28 N·m (21 ft. lbs.).

6. Tighten the latch striker bolts (3) to 26 N·m (19 ft. lbs.). (Refer to 23 -

BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

HANDLE - EXTERIOR DOOR

REMOVAL

1. Remove the trim panel (1), (Refer to 23 - BODY/DOOR - HALF REAR/TRIM PANEL - REMOVAL).

2. Remove the handle nuts (4) and (2) and remove the handle (1).

INSTALLATION

1. Install the handle (1) and install the nuts (4) and (2).

2. Tighten the nuts to, 4.5 N·m (40 in. lbs.).

3. Install the trim panel (1), (Refer to 23 - BODY/DOOR - HALF REAR/TRIM PANEL - INSTALLATION).

HANDLE - INSIDE RELEASE

REMOVAL

1. Remove the door trim panel (1), (Refer to 23 - BODY/DOOR - HALF REAR/TRIM PANEL - REMOVAL)

2. Remove the screw (6) securing the inside handle (1) to the door (2).

NOTE: Full front door shown, half door similar.

3. Release the clips (4) and disconnect the handle rods (1).

4. Slide the handle (3) off of the retaining tabs (2) and remove.

INSTALLATION

NOTE: Full door shown, half door similar.

1. Position the handle (3) onto the carrier plate tabs (2) and slide into place fully.
2. Connect the rods (1) and secure the clips (4).

3. Install the handle screw (6) and tighten to 8.5 N·m (75 in. lbs.).

4. Install the trim panel (1), (Refer to 23 - BODY/DOOR - HALF REAR/TRIM PANEL - INSTALLATION)

HINGE

REMOVAL

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Remove the door (2), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - REMOVAL).

2. Using a grease pencil or equivalent, mark the body hinge (1) and (4) location and remove the bolts (2) and (3).

3. Using a grease pencil or equivalent, mark the door hinge (2) and (3) location and remove the bolts (1) and (4).

INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the door hinges (2) and (3), and install the bolts (1) and (4).
2. Align the hinges to the door using the reference marks made during the removal procedure and tighten the bolts to 26 N·m (19 ft. lbs.).

819cea6e

3. Install the body hinges (1) and (4), and install the bolts (2) and (3).

4. Align the hinges to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).

819cea62

5. Install the door (2), (Refer to 23 - BODY/DOOR - FULL FRONT/DOOR - INSTALLATION).

LATCH

REMOVAL

1. Remove the door trim panel (1), (Refer to 23 - BODY/DOOR - HALF REAR/TRIM PANEL - REMOVAL)
2. Remove the exterior handle nut (2).

3. Disconnect the latch rods and electrical connector.
4. Remove the latch screws (4) and remove the latch from the door (2).

INSTALLATION

1. Install the latch screws (4) and tighten to 8 N·m (71 in. lbs.) top screws first.
2. Connect the electrical connector.
3. Connect the rods and seat the clips fully.

4. Install the rear exterior handle nut (2) and tighten to 4.5 N·m (40 in. lbs.).

5. Install the trim panel (1), (Refer to 23 - BODY/DOOR - HALF REAR/TRIM PANEL - INSTALLATION).

STRIKER - DOOR

REMOVAL

1. Remove the screws (1).
2. Remove the striker (4) and the shims (3), if equipped.

INSTALLATION

1. Install the shims (3), if equipped, and install the striker (4).
2. Install the screws (1) and tighten to 26 N·m (19 ft. lbs.).
3. If necessary, adjust the door latch striker,

ADJUSTMENTS

1. Using a grease pencil or equivalent, mark the location of the door latch striker (4) on the C-pillar to aid in adjustment.
2. Loosen the two screws (1) that secure the door latch striker to the C-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 26 N·m (19 ft. lbs.), (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Verify correct door and latch position.

TRIM PANEL

REMOVAL

1. Remove the pull handle trim plugs (1) and remove the pull handle screws (2).

2. Using a trim stick C-4829 or equivalent, separate the all the push pin fasteners (3) and remove the trim panel (1).

INSTALLATION

1. Position the trim panel (1) into place and seat the push pin fasteners (3) fully.

2. Install the pull handle screws (2) and install the trim caps (1).

WINDOW REMOVAL

1. Open the door and lift the window (2) out of the mounting holes (1).

INSTALLATION

1. If necessary, install the grommets (4) into the door holes (1) and seat fully.
2. Install the window (2) into the grommets (4) and seat fully.

EXTERIOR

BODY DECALS

REMOVAL

1. Apply a length of masking tape on the body (2) and hood (1), parallel to the top edge of the nameplate to use as a guide, if necessary.

2. Apply a length of masking tape on the body (1), parallel to the top edge of the nameplate to use as a guide, if necessary.

NOTE: Exterior nameplates are attached to body panels with adhesive tape.

3. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.

CAUTION: Use care when separating the emblem from the body surface to avoid scratching the paint.

4. Using a trim stick C-4755 or equivalent, behind the emblem to separate the adhesive backing from the body.

5. Clean adhesive residue from body with MOPAR® Super Clean solvent or equivalent.

INSTALLATION

NOTE: Make sure the body surface is completely clean before applying the emblem.

1. Remove protective cover from adhesive tape on back of emblem.
2. Position the correct emblem properly on the body (2) and hood (1).

3. Position the correct emblem properly on the body (1).
4. Press emblem firmly to the body with the palm of hand.
5. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

PANEL - COWL TOP

REMOVAL

1. Remove the wiper arms, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).
2. Remove the bolts (1) from the cowl trim panel (3).
3. Remove the push/pins (2) from the cowl trim panel (3).
4. Remove the cowl trim panel (3) from the body (4) of the vehicle.

INSTALLATION

1. Install the cowl trim panel (3) to the body (4) of the vehicle.
2. Install the push/pins (2) to the cowl trim panel (3).
3. Install the bolts (1) to the cowl trim panel (3).
4. Install the wiper arms, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

FRONT FENDER

REMOVAL

1. Remove the cowl top panel, (Refer to 23 - BODY/EXTERIOR/PANEL - COWL TOP - REMOVAL).
2. Remove the wheel flares, (Refer to 23 -

BODY/EXTERIOR/WHEEL OPENING FLARE MOLDING - REMOVAL).

3. Remove the wheelhouse splash shield, (Refer to 23 - BODY/EXTERIOR/SPLASH SHIELD - WHEELHOUSE - REMOVAL)

4. Remove the windshield frame bracket, (Refer to 23 - BODY/STATIONARY GLASS/PANEL - WINDSHIELD FRAME - REMOVAL).

5. Remove the cowl bolts (1) and the upper bolts (3).

6. Remove rear bolts (7) from the door opening.

7. Remove the sill bolts (6).

8. Remove the wheelhouse bolt (4) and remove the fender (5).

9. Remove the antenna from the fender, if equipped, (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - REMOVAL).

INSTALLATION

1. If necessary, install the antenna onto the fender, (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - INSTALLATION).

2. Loosely install the fender (5) onto the front end sheet metal mounting structure (2).

3. Loosely install the cowl bolts (1) and the upper bolts (3).

4. Loosely install the door opening bolts (7).

5. Loosely install the wheelhouse bolt (4).

6. Loosely install the sill bolts (6).

7. Adjust the fender to the correct gap and flush dimensions, (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

8. After correct fender gap and flush specifications are obtained, tighten all the upper fender fasteners (1, 3, 4 and 7) to 5 N·m (45 in. lbs.).

9. Tighten the lower sill bolts (6) to 12 N·m (9 ft. lbs.).

10. Install the windshield frame bracket, (Refer to 23 - BODY/STATIONARY GLASS/PANEL - WINDSHIELD FRAME - INSTALLATION).

11. Install the front wheelhouse splash shield, (Refer to 23 - BODY/EXTERIOR/SPLASH SHIELD - WHEELHOUSE - INSTALLATION).

12. Install the wheel opening flares, (Refer to 23 - BODY/EXTERIOR/WHEEL OPENING FLARE MOLDING - INSTALLATION).

13. Install the cowl top panel, (Refer to 23 - BODY/EXTERIOR/PANEL - COWL TOP - INSTALLATION).

SPLASH SHIELD - WHEELHOUSE

REMOVAL

Front

1. Raise and support the vehicle (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
2. Remove the wheel and tire to gain access to the front wheel house liner.
3. Remove the all push/pins (6), (9) from the wheel house liner.
4. Remove the all bolts (7) from the wheel house liner.
5. Remove the wheel speed sensor harness (1) from the wheel house liner.
6. Remove front wheel house liner from front wheel house opening.

Rear

1. Remove the wheel flare rivets (2).

2. Remove the push pin fasteners (4) and remove the splash shield (2).

3. Remove the screws and remove the splash guard (2) if equipped.

INSTALLATION

Front

1. Install the front wheel house liner to front wheel house opening.
2. Install the wheel speed sensor harness (1) to the wheel house liner.
3. Install the push/pins (6), (9) to the wheel house liner.
4. Install the all bolts (7) to the wheel house liner and tighten to specifications.
5. Install wheel and tire and torque to specifications.

Rear

1. If equipped, install the splash guard (2) and install the screws.

2. Install the splash shield (2) and install the push pin fasteners (4).

3. Install the flare molding rivets (2).

MIRROR - OUTSIDE REARVIEW REMOVAL

1. Remove the bolts (3) and separate the mirror (2) from the door (1).

INSTALLATION

1. Install the mirror (2) onto the door and install the bolts (3).
2. Tighten the bolts to 13 N·m (9.5 ft. lbs.).

WHEEL OPENING FLARE MOLDING

REMOVAL

Front

1. Remove the rivets (1) securing the fender flares (4) to the support (3).

2. Using a trim stick C-4755 or equivalent, separate the clips attaching the flare (1) to the fender (3) and remove.
3. Disconnect the marker light electrical connector, if equipped.

Rear

1. Remove the rivets (2) attaching the flare (1) to the wheelhouse liner (3).

2. Using a trim stick C-4755 or equivalent, separate the clips attaching the flare (3) to the body (1).

INSTALLATION

Front

1. Connect the marker light electrical connector, if equipped.
2. Position the flare (1) onto the body (3) and seat the support clips fully.

3. Install rivets (1) attaching the flare (4) to the support (3).

Rear

1. Position the flare (3) onto the body (1) and seat the support clips fully.

2. Install rivets (2) attaching the flare (1) to the wheelhouse splash shield (3)

SIDE STEP REMOVAL

1. Remove the bolts (2).
2. Remove the sill nuts (1) and separate the step (3) from the sill flange.

INSTALLATION

1. Position the side step studs through the holes in the body side flange.
2. Install the nuts (1) and tighten to 12 N·m (9 ft. lbs.).
3. Install the bolts (2) and tighten to 24 N·m (18 ft. lbs.).

GRILLE REMOVAL

1. Twist the center of the push pin insert to release and remove the six push pin fasteners (1)
2. Using a trim stick C-4755 or equivalent, Release the lower clips (3) and separate the grille from the front end module.
3. Disconnect the electrical connectors (4).

INSTALLATION

1. Connect the electrical connectors (4).
2. Position the grille (2) onto the front end module and seat the clips (3) fully.
3. Install the push pin fasteners (1).

BODY ISOLATORS

REMOVAL

NOTE: Four door model shown in the illustration. Body isolators for two door models are similar.

1. If removing the front isolators (2) remove the grille, (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
2. Loosen all body to frame mounting bolts (4) and nuts (3), (two door has 8 bolts and two nuts, four door has 10 bolts and two nuts).
3. Remove the mounting bolts (4) and isolator nuts (1) as necessary.
4. Using a floor jack and wooden block under the body sill, lift the body to gain access to the isolators and remove the isolators as necessary.

INSTALLATION

CAUTION: Whenever a body isolator bolt requires servicing or tightening, it is necessary to remove the bolt and install new thread locker compound to the threads.

NOTE: Four door model shown in the illustration. Body isolators for two door models are similar.

1. Position the isolators (2) under the body as necessary.
2. Lower the cab onto the isolators and install the isolator nuts (1).
3. Tighten the isolator nuts to 54 N·m (40 ft. lbs.).
4. Install the mounting bolts (4) and the isolator nuts (3) as necessary (two door has 8 bolts and two nuts, four door has 10 bolts and two nuts).
5. Tighten the mounting bolts (4) and nuts (3) to 108 N·m (80 ft. lbs.).
6. If necessary, install the grille, (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

HOOD

CATCH - HOOD

REMOVAL

1. Open the hood.
2. Remove the nuts (2) and remove the hood catch (1).

3. Remove the nuts (1) and remove the catch bracket (2).

INSTALLATION

1. Install the catch bracket (2) and install the nuts (1).
2. Tighten the nuts to 7 N·m (5 ft. lbs.).

3. Install the hood catch (1) and install the nuts (2).
4. Tighten the nuts to 15 N·m (11 ft. lbs.).

HINGE

REMOVAL

1. Remove the cowl top panel (3), (Refer to 23 - BODY/EXTERIOR/PANEL - COWL TOP - REMOVAL).

NOTE: It is not necessary to remove the hood to replace the hood hinges. Hood hinges can be replaced one at a time.

2. Support the hood with a suitable device.
3. Remove the hinge to body bolts (2).

4. Using a grease pencil or equivalent, mark location of hood hinges (1) on hood (3) to aid installation.

5. Remove the hinge to hood bolts (2) and remove the hinge (1).

INSTALLATION

1. Position the hinge (1) onto the hood (3).
2. Install bolts (2) finger-tight.
3. Align hinges with installation reference marks made previously and tighten bolts to 26 N·m (19 ft. lbs.).

4. Install the hinge to body bolts (2).
5. Align hinges with installation reference marks made previously and tighten bolts to 24 N·m (17.5 ft. lbs.).
6. If required, adjust the hood to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

7. Install the cowl top panel (3), (Refer to 23 - BODY/EXTERIOR/PANEL - COWL TOP - INSTALLATION).

HOOD

REMOVAL

1. Raise hood.
2. Using a grease pencil or equivalent, mark location of hood hinges (1) on hood (3) to aid installation.
3. Remove bolts (2) attaching hinges to hood.
4. With the aid of a helper, remove hood (3) from vehicle.

INSTALLATION

1. Position hood (3) on hinges (1).
2. Install bolts (2) finger-tight.
3. Align hinges with installation reference marks made previously and tighten bolts to 26 N·m (19 ft. lbs.).
4. If required, adjust the hood to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

HOOK - SAFETY CATCH

REMOVAL

1. Remove the bolt (1) and remove the safety catch (4).

INSTALLATION

1. Install the safety catch (4) and install the bolt (1).
2. Tighten the bolt to 11 N·m (8 ft. lbs.).

SPRING - HOOD POP UP

REMOVAL

1. Remove the bolt (3) and remove the hood spring (2).

INSTALLATION

1. Install the spring (2) and install the bolt (3).

INSTRUMENT PANEL

CENTER BEZEL

REMOVAL

1. Using a trim stick C-4755 or equivalent, release the clips (2) and rotate the lower center trim (3) down and release the tabs (1).

2. Using a trim stick C-4755 or equivalent (2), release the clips in the rear of the upper trim (1).

3. Rotate the upper trim (2) back and release the front (1).

4. Disconnect the electrical connector (4) and remove the upper center cover (1).

5. Remove the screws (2) and using a trim stick C-4755 or equivalent, separate the center bezel (1).

6. Disconnect the HVAC control cables (1 and 9) and disconnect the electrical connectors (3).

7. Remove the screws (2) and remove the center I/P trim panels (1 and 3).

INSTALLATION

1. Install the center I/P trim panels (1 and 3) and install the screws (2).

2. Install the radio, (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
3. Connect the HVAC control cables (1 and 9) and connect the electrical connectors (3 and 4).

4. Position the center bezel (1) onto the I/P and seat the clips fully.
5. Install the lower screws (2).

6. Connect the electrical connector (4) and position the upper center cover onto the top of the I/P.

7. Position the front of the cover (1) onto the center support and rotate the trim (2) back and seat the clips fully.

8. Position the lower tabs (1) into the slots and rotate the trim (3) up and seat the clips (2) fully.

CLUSTER BEZEL

REMOVAL

1. Remove the steering column opening cover, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

2. Remove the screws (2), release the retaining clips and remove the bezel (1).

INSTALLATION

1. Position the bezel (1) into place and seat the clips fully.

2. Install the screws (2).

3. Install the steering column opening cover, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

GLOVE BOX

REMOVAL

1. Open the glove box (1) and squeeze the stop tabs (2) inward.

2. Lower the glove box (2) and release the hinges (1) and remove the glove box.

INSTALLATION

1. Position the glove box tabs onto the hinges (1).

2. Close the box (1) and squeeze the stop tabs (2) inward and

engage into the instrument panel.

GRAB HANDLE

REMOVAL

1. Using a trim stick C-4755 or equivalent, slide the grab handle trim caps (2) off the trim handle (1).

2. Remove the bolts (2) and remove the grab handle (1).

INSTALLATION

1. Install the grab handle (1) and install the bolts (2).

2. Install the trim caps (2) onto the handle (1) and slide into place.

INSTRUMENT PANEL ASSEMBLY REMOVAL

1. Disconnect the electrical connector (3) at the A-pillar cowl area and separate the check strap (2) from the footman's loop (1).

2. Open the doors past 90° to aid in removal of the I/P assembly.

3. Disconnect and isolate battery negative cable.
4. Remove the center console, (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

5. Disconnect the center I/P wire harness electrical connectors (1, 2 and 3).

6. Release the push pin hangers (2) and position aside the harness (1).

7. Using a trim stick C-4755 or equivalent, release the tabs and separate the lower steering column opening cover (1).

8. Using a trim stick C-4755 or equivalent, release the upper clips (1) and rotate the steering column opening cover (3) down and remove from lower tabs (2).

9. Remove the bolts (1) and remove the reinforcement plate (2).
10. Remove the amplifier, (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - REMOVAL).
11. Remove the steering column as necessary, (Refer to 19 - STEERING/COLUMN - REMOVAL).

12. Using a trim stick C-4755 or equivalent, remove the end caps (1).

13. On automatic transmission vehicles, remove the shifter, (Refer to 21 -

TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/SHIFT MECHANISM - REMOVAL).

14. Remove the transference shifter, (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE/SHIFT LEVER - REMOVAL).

15. Using a trim stick C-4755 or equivalent, release the clips (2) and rotate the lower center trim (3) down and release the tabs (1).

16. Using a trim stick C-4755 or equivalent (2), release the clips in the rear of the upper trim (1).

17. Rotate the upper trim (2) back and release the front (1).

18. Disconnect the electrical connector (4) and remove the upper center cover (1).

19. Remove the screws (2) and using a trim stick C-4755 or equivalent, separate the center bezel (1).

20. Disconnect the HVAC control cables (1 and 9) and disconnect the electrical connectors (3).
21. Remove the radio, (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).

22. Remove the screws (2) and remove the center I/P trim panels (1 and 3).

23. Remove the nuts (2) and bolts (1) and remove the center support brackets (4).

24. Remove the clutch pedal clip and separate the clutch pedal rod, if equipped.
25. Remove the brake pedal clip (2) and separate the brake pedal rod (1).

26. Remove the nuts and separate the grounds (2).

27. Disconnect the driver's side electrical connectors.
28. Disconnect the passenger side electrical connectors (1 and 2).

29. Disconnect the antenna connector (1).

30. Remove the glove box (1).

31. Drain the refrigerant, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD)

PROCEDURE).

32. Drain the coolant, (Refer to 7 - COOLING - STANDARD PROCEDURE).

33. Remove the EGR tube (1), (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - REMOVAL).

34. Using cable-type spring clamp pliers or equivalent, release the hose clamps that secure the heater hoses (2) to the heater core tubes (1) and disconnect the hoses from the tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during HVAC housing assembly removal.

35. Remove the nut (2) that secures the A/C liquid line (3) and A/C suction line (5) to the A/C expansion valve (1).
36. Disconnect the A/C liquid and suction lines from the A/C expansion valve and remove and discard the O-ring seals.
37. Install plugs in, or tape over the opened refrigerant line fittings and the expansion valve ports.

38. Position aside the harness at the brake booster.

39. Remove the brake booster bracket nuts (2).

40. Disconnect the positive battery cable.
41. Remove the right side ground.
42. Position aside the power steering reservoir.
43. Remove the battery tray, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

44. Release the wire harness grommet (2) and separate any

remaining support clips for the wires harness (1).

45. Remove the trim caps (2) and remove the fenceline nuts (3).

46. Remove the side support bolts (1) and position the I/P assembly back.

47. Pull the main wire harness (2) from the hole in the cowl (1).

48. Remove the I/P from the vehicle.

INSTALLATION

1. Position the I/P assembly into the vehicle and support back.

2. Position the wire harness (2) through the cowl panel (1) and seat the grommet (3) fully.

3. Loosely install the nuts (3) onto the fenceline studs (1).
4. Position the I/P assembly (4) back and carefully push the heater core and A/C lines and the brake booster support studs, through the cowl.
5. Position the I/P over the fenceline studs (1).

6. Loosely install the side support bolts (1).

7. Install the center support brackets (4) over the studs (3) and install the bolts (1) and nuts (2).

8. Tighten the side support bolts to 11 N·m (8 ft. lbs.).

9. Tighten the fenceline nuts to 12 N·m (9 ft. lbs.).

10. Tighten the bolts (1) and nuts (2) to 8 N·m (6 ft. lbs.).

11. Position the main wire harness (1) back into place and seat all the support clips fully.

12. Install the battery tray, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).
13. Position the power steering reservoir back into place.
14. Install the right side grounds (2) and install the nuts (3).
15. Connect the positive battery cable (4).

16. Install the brake booster bracket nuts (2) and tighten to 18 N·m (13.5 ft. lbs.).
17. Position the wire harness back and secure the support clips fully.

18. Remove the tape or plugs from the opened refrigerant line fittings and the expansion valve ports.
19. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
20. Connect the A/C liquid line (3) and A/C suction line (5) onto the A/C expansion valve (1).
21. Install the nut (2) that secures the A/C liquid and suction lines to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).

22. Remove the previously installed plugs or caps and connect the heater hoses (2) to the heater core tubes (1).

23. Using cable-type spring clamp pliers or equivalent, correctly position the two hose clamps that secure the heater hoses to the heater core tubes and engage the clamps to the tubes.

24. Install the EGR tube (1), (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - INSTALLATION).

25. Fill the coolant, (Refer to 7 - COOLING - STANDARD PROCEDURE).

26. Evacuate the A/C system, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

27. Install the glove box (1), (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

28. Connect the antenna connector (1).

29. Connect the electrical connectors (1 and 2).

30. Connect the grounds (2) and install the nuts.
 31. Install the nut to the lower HVAC support bracket under the glove box.

32. Connect the brake pedal rod (1) and install the clip (2).
 33. If equipped, connect the clutch pedal rod and install the

clip.

34. Install the center I/P trim panels (1 and 3) and install the screws (2).

35. Install the radio, (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
 36. Connect the HVAC control cables (1 and 9) and connect the electrical connectors (3 and 4).

37. Position the center bezel (1) onto the I/P and seat the clips fully.

38. Install the lower screws (2).

39. Connect the electrical connector (4) and position the upper center cover onto the top of the I/P.

40. Position the front of the cover (1) onto the center support and rotate the trim (2) back and seat the clips fully.

41. Position the lower tabs (1) into the slots and rotate the trim (3) up and seat the clips (2) fully.

42. Install the transference shifter, (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE/SHIFT LEVER - INSTALLATION).

43. Install the automatic transmission shifter, if equipped, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/SHIFT MECHANISM - INSTALLATION).

44. Position the end caps (1) onto the I/P and seat fully.

45. Install the steering column, (Refer to 19 -

STEERING/COLUMN - INSTALLATION).

46. Install the amplifier, (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - INSTALLATION).

47. Install the reinforcement plate (2) and install the bolts (1).

48. Tighten the bolts (1) to 11 N·m (8 ft. lbs.).

49. Position the steering column opening cover (3) onto the lower tabs (2), rotate up and seat the clips (1) fully.

50. Position the lower opening trim onto the I/P and seat the clips (1) fully.

51. Position the center harness (1) back into place and seat the support clips (2) fully.

52. Connect the center harness electrical connectors (1, 2 and 3).

53. Install the center console, (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

54. Install the center console, (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

55. Connect the battery cables (4).

56. Secure the front door check straps (2) over the footman's loop (1) and connect the electrical connector (3).

STEERING COLUMN OPENING COVER

REMOVAL

1. Using a trim stick C-4755 or equivalent, release the tabs and separate the lower steering column opening cover (1).

2. Using a trim stick C-4755 or equivalent, release the upper clips (1) and rotate the steering column opening cover (3) down and remove from lower tabs (2).

3. Remove the bolts (1) and remove the reinforcement plate (2).

INSTALLATION

1. Install the reinforcement plate (2) and install the bolts (1).
2. Tighten the bolts (1) to 11 N·m (8 ft. lbs.).

3. Position the steering column opening cover (3) onto the lower tabs (2), rotate up and seat the clips (1) fully.

4. Position the lower opening trim onto the I/P and seat the clips (1) fully.

COVER

REMOVAL

1. Remove the center console, (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).
2. Disconnect the center harness (1) electrical connectors and position aside.
3. Remove the amplifier, (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - REMOVAL).
4. Remove the steering column as necessary, (Refer to 19 - STEERING/COLUMN - REMOVAL).

5. Using a trim stick C-4755 or equivalent, remove the end caps (1).
6. Remove the center trim, (Refer to 23 - BODY/INSTRUMENT PANEL/CENTER BEZEL - REMOVAL).
7. Remove the radio, (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
8. Remove the glove box, (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
9. Remove the upper I/P tweeter speakers, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
10. Remove the cluster bezel, (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
11. Remove the passenger air bag, (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL)
12. Remove the glove box striker.
13. Remove the screws securing the cover to the I/P reinforcement and remove the cover.

INSTALLATION

1. Position the cover over the I/P reinforcement and install the screws.
2. Install the glove box striker.
3. Install the passenger air bag, (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - INSTALLATION).
4. Install the cluster bezel, (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
5. Install the upper I/P tweeter speakers, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
6. Install the glove box, (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
7. Install the radio, (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
8. Install the center trim, (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

9. Position the end caps (1) into place and seat the clips fully.
10. Install the steering column, (Refer to 19 - STEERING/COLUMN - INSTALLATION).
11. Install the amplifier, (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - INSTALLATION).

12. Position the center harness (1) back into place, secure the support clips and connect the electrical connectors.
13. Install the center console, (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

INTERIOR

A-PILLAR TRIM

REMOVAL

1. Remove the sun visor (4), (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).

2. Remove the push pin fastener (6).
3. Using a trim stick C-4755 or equivalent, separate the retaining clips (3) and remove the upper A-pillar trim (2).
4. Using a trim stick C-4755 or equivalent, separate the retaining clips (5) and remove the lower A-pillar trim (4).

INSTALLATION

1. Position the lower A-pillar trim (4) onto the A-pillar and seat the clips (5) fully.
2. Position the upper A-pillar trim (2) onto the A-pillar and seat the clips (3) fully.
3. Install the push pin fastener (6).

4. Install the visor (4), (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).

B-PILLAR TRIM

REMOVAL

Two Door

1. Using a trim stick C-4755 or equivalent, separate the retaining clips (1) and remove the upper trim (2).
2. Remove the push pin fasteners (5).
3. Separate the retaining clips (4) and remove the lower B-pillar trim.

Four Door

1. Remove the seat belt turning loop (2), (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT TURNING LOOP ADJUSTER - REMOVAL).

2. Remove the bolt (2) and disconnect the seat belt (3) from the seat (1).

3. Using a trim stick C-4755 or equivalent, separate the retaining clips (2) and remove the upper B-pillar trim panel (1).

4. Remove the push pin fasteners (3) and separate the lower B-pillar trim panel (2).
5. Pull the seat belt (1) through the slot in the trim (2) and remove the trim.

INSTALLATION

Two Door

1. Install the lower B-pillar trim (3) and seat the clips (4) fully.
2. Install the push pin fasteners (5).
3. Install the upper B-pillar trim (2) and seat the clips (1) fully.

Four Door

1. Pull the seat belt (1) through the lower B-pillar trim (2) and position into place.
2. Seat the clips fully and install the push pin fasteners (3).

3. Position the upper B-pillar trim (1) into place and seat the clips (2) fully.

4. Position the seat belt turning loop (2) onto the height adjuster (1) on the upper sport bar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.

5. Install and tighten the screw (3) that secures the turning loop to the height adjuster. Tighten the screw to 40 N·m (30 ft. lbs.).

6. Engage the upper edge of a new trim cover (4) over the top of the turning loop. Then squeeze the lower end of the trim cover and the turning loop together firmly and evenly until the engagement tabs of the trim cover snap into the slots of the turning loop.

7. Position the seat belt (3) lower anchor to the mounting hole on the outboard side of the front seat (1) cushion frame. Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.
8. Install and tighten the screw (2) that secures the lower anchor to the seat. Tighten the screw to 40 N·m (30 ft. lbs.).

CARPETS AND FLOOR MATS

REMOVAL

Front Carpet

1. Remove the front seat for the side being worked on, (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL).
2. Remove the floor console, (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Remove cowl trim panel for the side being worked on, (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL)
4. Remove the lower B-pillar trim if required, (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM -

REMOVAL).

5. Remove the stud caps (3) or (6) and remove the carpet (1) or (2) as necessary.

Rear Carpet

1. Remove the rear seats, (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL)

1. Remove the rear speaker if necessary, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).

2. Remove the wheelhouse carpets (5), if necessary.

3. Remove the load floor carpet if necessary, (Refer to 23 - BODY/INTERIOR/LOAD FLOOR CARPET - REMOVAL).

4. Remove the rear carpet (4).

INSTALLATION

Front Carpet

1. Install the carpet (1) or (2) and install the stud caps (6) or (3).

2. Install the lower B-pillar trim, (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

3. Install the cowl trim panel, (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

4. Install the floor console, (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

5. Install the front seats, (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION).

Rear Carpet

1. Install the rear carpet (4).
2. Install the wheelhouse carpets (5).
3. Install the load floor carpet, (Refer to 23 - BODY/INTERIOR/LOAD FLOOR CARPET - INSTALLATION).
4. Install the rear speaker, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
5. Install the rear seat, (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION).

CONSOLE - CENTER

REMOVAL

1. On 4x4 vehicles grasp the transfer case shifter knob and pull straight up and remove the knob.

2. On manual transmission vehicles, using a trim stick C-4755 or equivalent, separate the shifter boot (2) from the console bezel (1).

3. Remove the bolt (3) and remove the manual transmission shifter (2) from the shifter shaft (1).

4. Remove the cup holder or ash receiver (1), if equipped.
5. Using a trim stick C-4755 or equivalent, remove the console bezel (2).

6. Disconnect the electrical connector (1).

7. Remove the four console screws (1).
8. Lift the console (4) up off the clip retainers (3) and remove.

INSTALLATION

1. Position the console (4) over the shifters and brake levers and seat the clips (3) fully.
2. Install the four screws (1).
3. Connect the electrical connector (1).

4. Position the bezel (2) over the shifters and brake lever and seat the clips fully.
5. Install the cup holder and ash receiver (1), if equipped.

6. If equipped, position the transfer case shifter knob onto the shift shaft and seat fully.

7. If equipped, position the manual transmission shifter handle (2) onto the shift shaft (1) and install the bolt (3).
8. Tighten the bolt (3) to 33 N·m (24.5 ft. lbs.)

9. Seat the shifter boot (2) onto the console bezel (1) and seat fully.

COWL TRIM COVER

REMOVAL

1. Position aside the lower B-pillar trim as necessary to gain access to the cowl trim, (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).
2. Remove the push pin fastener (3) and separate the retaining clips (1).
3. Remove the cowl trim (2).

INSTALLATION

1. Position the trim (2) into place and seat the push pin fasteners (1) fully.
2. Install the push pin fastener (3).
3. Position the lower B-pillar trim back into place, (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

LOAD FLOOR

REMOVAL

1. Open the load floor cover (1) and pull rearward and remove from the floor slots.
2. Remove the rear seats, (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL)

3. Remove the rear speaker if necessary, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
4. Remove the load floor carpet (2).

INSTALLATION

1. Install the load floor carpet (2).
2. Install the rear speaker, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
3. Install the rear seat, (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION).
4. Position the cover (1) tabs into the floor slots fully and close the cover.

MIRROR - INSIDE REAR VIEW

REMOVAL

1. Remove the set screw (3) that secures the rear view mirror (2) to the support bracket/button (1) on the inside of the windshield glass.
2. Slide the rear view mirror upward far enough to disengage it from the support bracket/button.

INSTALLATION

MIRROR

1. Position and slide the rear view mirror (2) downward over the support bracket/button (1) on the inside of the windshield glass.
2. Install and tighten the set screw (3) that secures the rear view mirror to the support bracket/button. Tighten the screw

to 2 N·m (17 in. lbs.).

SUPPORT BRACKET

NOTE: The rear view mirror support bracket (or button) is permanently bonded to the inside of the windshield glass. If the bracket should become separated from the glass, it may be re-bonded using the following procedure. This procedure requires the use of a Rear View Mirror Adhesive kit that is available through Mopar® in single application packages that include a two-part adhesive and an accelerant with applicator.

1. Mark the proper position for the mirror bracket on the outside of the windshield glass with a wax pencil. The residual adhesive on the inside of the glass from the prior mirror bracket installation can be used as a guide.
2. Clean the bracket contact area on the inside of the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the bonding surface (the smaller side) of the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerant to the bonding surface of the bracket according to the following instructions:
 - Crush the accelerant vial to saturate the felt applicator.
 - Remove the paper sleeve.
 - Apply accelerant to the bonding surface of the bracket.
 - Allow the accelerant to dry for five minutes.
 - Do not touch the bracket bonding surface after the accelerant has been applied.
5. Apply adhesive accelerant to the bracket contact area on the inside of the windshield glass. Allow the accelerant to dry for one minute. Do not touch the bracket contact area of the glass after the accelerant has been applied.
6. Install the bracket according to the following instructions:
 - Apply one drop of adhesive at the center of the bracket contact area on the inside of the windshield glass.
 - Apply an even coat of adhesive to the bonding surface of the bracket.
 - Align the bracket with the marked position on the windshield glass.
 - Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before reinstalling the mirror.

MOLDING - WINDSHIELD

REMOVAL

1. Remove the upper A-pillar trim (2), (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

2. Using a trim stick C-4755 or equivalent, separate the retaining clips (1) and (2) and remove the windshield molding (3).

INSTALLATION

1. Position the windshield molding (3) onto the windshield header and seat the clips (1) and (2) fully.

2. Install the upper A-pillar trim (2), (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

14 - FRONT CROSS BAR
15 - FRONT CROSS BAR BRACKETS

1. Install the sport bars (1) and (8) into the B-pillar and install the B-pillar (10) and rear bolts (9).
2. Install the rear cross bar (2), the brackets (3) and (6), and the bolts (4).
3. Install the side bars (11) and (13) and install the windshield frame bolts (12).
4. Install the front cross bar (14), the brackets (15) and the bolts (5).
5. Tighten the B-pillar (10) and rear bolts (9) to 19 N·m (14 ft. lbs.).
6. Tighten the cross bar bolts (4) and (5) to 19 N·m (14 ft. lbs.).
7. Tighten the windshield frame bolts to 19 N·m (14 ft. lbs.).
8. Install the sport bar covers, (Refer to 23 - BODY/INTERIOR/SPORT BAR - COVERS - INSTALLATION).
9. Install the B-pillar trim, (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

SPORT BAR - COVERS

REMOVAL

1. Remove the hard tops, if equipped, (Refer to 23 - BODY/REMOVABLE TOP/TOP - REMOVAL).
2. Remove the sport bar speaker pod, (Refer to 23 - BODY/INTERIOR/SPORT BAR - SPEAKER POD - REMOVAL).

On four door vehicles;

3. Remove the seat belt retractor (4) and turning loop (2) as necessary, (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL).

On four door vehicles;

4. If equipped, separate the rear dome light (6) from the sport bar cross bar and disconnect the electrical connector (4).

On four door vehicles;

5. Unzip the cover (2) and remove.

On four door vehicles;

6. Using a trim stick C-4829 or equivalent, separate the push pin fasteners and remove the interior lamp bezel (5).
7. Remove the cross bar trim (6) and (4).
8. Remove the side trim (2) and (8).

On two door vehicles;

9. Unzip the cover (1) and separate the trim (2).

On two door vehicles;

10. Unzip the cover (1) and separate the trim (2).

On two door vehicles;

11. Separate the trim (1) and (3).

12. Unzip the side bar covers.

81976e92

13. Using a trim stick C-4829 or equivalent, separate the push pin fasteners (2) and (4) and remove the trim (1) and (3).

INSTALLATION

81976f4b

1. Position the trim (1) and (3) and seat fully.

81976f4b

2. Position the side cover over the side bars and zip closed.

On two door vehicles;

3. Position the trim (1) and (3) onto the sport bars (4) and seat fully.

On two door vehicles;

4. Position the covers (1) onto the sport bar and zip closed.

On two door vehicles;

5. Position the trim (2) onto the sport bar.
6. Position the cover (1) onto the trim (2) and zip closed.

On four door vehicles;

7. Position the side trim (2) and (8) onto the sport bars and seat the push pin fasteners (1) fully.
8. Position the cross bar trim (4) and (6) onto the cross bar and seat the push pin fasteners (3) and (7) fully.
9. Position the interior lamp bezel (5) onto the cross bar and seat fully.

On four door vehicles;

10. Install the cover (2) and zip closed.

On four door vehicles;

11. If equipped, connect the electrical connector (4) and seat the rear dome light (6) onto the cross bar fully

On four door vehicles;

12. Install the seat belt retractor (4) and turning loop (2), (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)

13. Install the sport bar speaker pod, (Refer to 23 - BODY/INTERIOR/SPORT BAR - SPEAKER POD - INSTALLATION).

14. Install the hard tops, if equipped, (Refer to 23 - BODY/REMOVABLE TOP/TOP - INSTALLATION).

SPORT BAR - SPEAKER POD

REMOVAL

1. Remove the hard top thump screws (7), if equipped.
2. Remove the four screws (3) and lower the speaker pod (2).
3. Disconnect the electrical connector (1) and remove the speaker pod.

INSTALLATION

1. Connect the electrical connector (1) and position the speaker pod (2) onto the sport bar.
2. Install the four screws (3) and tighten to 10 N·m (90 ft. lbs.).

3. Install the hard top thumb screws (7).

SUNVISOR REMOVAL

1. Release the visor from the support (1).
2. Remove the screws (3) and remove the visor (4).

INSTALLATION

1. Position the visor (4) up to the windshield trim (2) and install the screws (3).
2. Secure the visor into the support (1).

PAINT

PAINT

SPECIFICATIONS - PAINT CODES

NOTE: Because of late model changes to the available paint colors (Refer to **VEHICLE DATA/VEHICLE INFORMATION/VEHICLE CERTIFICATION LABEL - DESCRIPTION**) for the correct paint codes for each vehicle. (Refer to **23 - BODY/PAINT/PAINT CODE - DESCRIPTION**)

EXTERIOR COLORS

EXTERIOR COLOR	DAIMLERCHRYSLER CODE
Red Rock Crystal Pearlcoat	EEM
Flame Red Clearcoat	PR4
Light Graystone Pearlcoat	EDA
Rescue Green Metallic Pearlcoat	EJR
Jeep Green Metallic Clearcoat	EGJ

Steel Blue Metallic Clearcoat	DBM
Bright Silver Metallic Clearcoat	WSB/WS2
Black Clearcoat	DX8
Stone White Clearcoat	SW1

INTERIOR COLORS

INTERIOR COLOR	DAIMLERCHRYSLER CODE
Dark Khaki Medium Khaki	K
Dark Slate Gray/Medium Slate Gray	S

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clearcoat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The codes listed in the Color Code Chart (Refer to 23 - BODY/PAINT - SPECIFICATIONS), are used for manufacturing purposes.

PAINT TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch Up Paints and Clear Top Coat. For a

description of the paint codes, (Refer to 23 - BODY/PAINT - SPECIFICATIONS).

WARNING: Use an OSHA approved respirator and safety glasses when spraying paint or solvents in a confined area. Personal injury can result.

TOUCH UP PROCEDURE

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch up paint. Do not overlap touch up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch up paint to dry hard.
5. On vehicles without clearcoat, the touch up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch up paint with the same technique as described in [STEP 4](#). Allow clear top coat to dry hard. If desired, [STEP 5](#) can be performed on clear top coat.

WARNING: Avoid prolonged skin contact with petroleum or alcohol – based cleaning solvents. Personal injury can result.

FINESSE SANDING, BUFFING & POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

REMOVABLE TOP

REMOVABLE TOP

STANDARD PROCEDURE

HARD TOP REPAIR

NOTE: The hard top is manufactured from a sheet molded compound (SMC).

SMC is constructed using short fiberglass strands usually less than 5.08 cm (2 inches) long. Sheet stock of glass impregnated resin matting is placed into the mold and pressed under heat to flow material throughout the mold. Tooling is shear edge designed to mold to net (i.e. no trimming at periphery

required).

SMC is repairable in accordance with established procedures described within this manual. (Refer to 23 - BODY - STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR)

Hard Top Locators

There are two hard top locator devices positioned approximately 50 mm (2 in.) from the most forward attachment holes for both two door and four door models. There is an additional locator on the passenger side at the upper B-post mount on four door hard top models.

If the black four way locator is missing, replace. In the event that the rivet stud is damaged or missing, drill out and replace.

HARD TOP REPAIR

If it has been determined that the hard top can be repaired. The following required materials and procedures are to be used.

1. Use a grinder to remove the paint and outline the damaged area. Use a grade 150 grit disc for paint removal.
2. Grind the outlined surface area again with a 240 grit disc to prevent coarse scratches from appearing in the final finish.
3. If cracks extend from the hole, it will be necessary to stop-drill the crack(s) with a 3-mm (1/8-in) diameter drill bit. This will prevent the crack from spreading and allow repair material to be effective.
4. Position a fiberglass mat or cloth on the repair surface area. Cut the mat 2.5 cm (1 in.) larger than repair area but smaller than the outline area. Make the outline area larger if required.
5. Clean the outlined area.
6. Place the fiberglass cloth on aluminum foil.
7. Pour the fiberglass resin into a clean container.
8. Mix the appropriate amount of hardener and resin. Follow the manufacturers instructions.
9. Apply the hardener/resin mixture to both sides of the fiberglass cloth.
10. Place the fiberglass cloth over the repair area. Next, place the aluminum foil over the cloth using a plastic spreader to smooth-out the cloth and resin. Use firm pressure to remove air bubbles and to smooth-out the cloth. Remove the aluminum foil.
11. Allow the resin to cure.
12. Smooth-out the surface area to the contour of the hard top with a 150-grit disc.
13. Apply plastic filler to complete the repair. Finish smoothing the surface area with 240-320 grit paper.
14. Repeat the previous steps on the inside area of the hard top.
15. Featheredge the repaired surface area.
16. Prime the repaired surface area with PPG® Epoxy Primer, or an equivalent product.
17. Apply surface primer to the surface area.
18. Prime the surface area for the color coat.
19. Apply color coat to the repaired surface area.

HARD TOP FRACTURE REPAIR

If it has been determined that the hard top can be repaired. The following required materials and procedures are to be used.

1. Use a grinder to remove the paint and outline the damaged area. Use a grade 150 grit disc for paint removal.
2. Grind the outlined surface area again with a 240 grit disc to prevent coarse scratches from appearing in the final finish.
3. If cracks extend from the damaged area, it will be necessary to stop drill the cracks with a 3-mm (1/8-in) diameter drill bit. This will prevent the crack and/or fracture from spreading and allow repair material to be effective.
4. Bevel the edges of the crack/fracture on both sides with a rotary file.

NOTE: The edges should be beveled on the inside and outside of the top to ensure sufficient surface area for good bonding.

5. Complete the repairs with fiberglass cloth and resin as described in the hard top hole repair procedure. (Refer to 23 - BODY/REMOVABLE TOP - STANDARD PROCEDURE)

HARD TOP SAG REPAIR

Inspect the roof/hard top assembly for the presence of sag, or if the customer complains of water accumulation on the roof. Perform the following procedure to repair.

1. Remove front freedom panels to gain access to the rear hard top assembly.
2. Remove the six bolts that attach the hard top to the body for a two door or eight bolts that hold down the four door.
3. Depress tab on rear wiper motor connector and pull downward to disengage.
4. Make two marks on the inside of the hard top 6 cm (2.5 in.) on both sides of the center roof rib, directly above the sport bar.
5. Move the hard top back about 10 cm (4 in.) to expose the inner rib section.
6. Clean the roof area with isopropyl alcohol.
7. Install the foam repair blocks by removing the protective backing tape from the adhesive side. The foam blocks must be centered above the sport bar pad.
8. Move the hard top assembly back into position.
9. Inspect the hard top seals for damage and replace, if necessary.
10. Inspect the windshield header seal and make sure it is clean, undamaged, and free of debris.
11. Carefully position the hard top assembly on the vehicle making sure that the latches are not pinched between the windshield frame and top.

CAUTION: Do not over tighten the top bolts. Over tightening can cause cracking of the hardtop assembly.

12. Loosely install the six bolts on a two door or eight bolts on a four door. Ensure that the top is centered on the vehicle and locators are in place in the body side holes and tighten the bolts to 18 N·m (13.5 ft. lbs.).
13. Connect the wire wiper motor harness connector.
14. Connect the rear washer fluid hose.
15. Install front freedom panels.

MODULAR HARD TOP FREEDOM PANEL WATER LEAKS

DIAGNOSIS:

1. Ensure that the Freedom Panels are correctly attached to the vehicle. The panels should be located and clamped in the correct sequence as described in the owner's manual. When installing the Freedom Panels always close the windshield latch first.
2. Have an assistant apply water across the hard top affected area with a hose for approximately 3-5 minutes while inspecting the interior of the hard top for waterleaks to determine general leak source location.
3. Water leaks at front center onto Instrument Panel (IP) and/or center console area are indicators of front center Freedom Panel leak path, but could also be a rear center Freedom Panel leak that travels forward. Review the information in the Repair Procedure below to determine if this has occurred.
4. Water leaks from Freedom Panel dial fasteners in speaker bar, leaks near the left or right B-pillar onto sport bar cloth covering, or onto front seats are indicators of leak paths from the rear center of the Freedom Panels. Review the information in the Repair Procedure below.
5. Water leaks at Upper B-pillar out board of the sport bar that drip onto the B-pillar hard trim panel is an indicator of a leak path between the hard top and the Freedom Panel or a leak path under the seal on the hard top. Review the information in the Repair Procedure below.
6. Water leaks at Upper B-pillar out board of the sport bar that drip onto the inner surface of the door panel at the B-pillar is an indicator of a leak path between the door and the Hard top/Freedom Panel intersection. Review the information in the Repair Procedure below.
7. Water leaks from the Upper A-pillar that drip onto the IP ends is an indicator of a leak path between the door inner panel and the Freedom Panel/windshield header intersection. There also could be a leak path at the windshield header area. These will need additional investigation. Review the information in the Repair Procedure below.

REPAIR PROCEDURE:

Freedom Panel Center & Rear Leaks

FREEDOM PANEL CENTER SEAL

1 - CENTER SEAL FRONT MOLDED DETAIL
2 - ADHESIVE TAPE RUNS ENTIRE LENGTH OF SEAL

3 - BUTYL

1. Remove left Freedom Panel.
2. Inspect the center seal that is attached to the right Freedom Panel. Look for water traces at the front molded detail area. Water collecting along the inboard edge of the panel could travel forward from the rear of the panel. If the seal is cut/torn/or otherwise damaged, replacement is required.
3. Lift up the outboard lip on the right Freedom Panel center seal near the front molded detail. Examine area for water entry under adhesive tape and/or butyl that is applied alongside of the tape. Note any areas for repair.

HARD TOP SEAL CUP AREA

1 - CENTER SEAL REAR MOLDED DETAIL

2 - HARD TOP SEAL CUP AREA

4. Perform similar examination on the rear molded detail area, looking for water traces near the adhesive tape and/or butyl.
5. If leaks to the interior were at the dial fasteners or the B-pillar area, and no water traces are found on the right Freedom Panel inboard edge or molded detail areas of the seal, look for water traces on the hardtop panel front flange directly below the Freedom Panels. Water collected here can indicate a leak under the Freedom Panel in the "cup" area of the hard top seal. This type of leak could be a leak path under the hard top seal center mold, or a path past the foam under the right Freedom Panel rear molded detail.

FOAM AND BUTYL LOCATION

1 - EDGE OF FOAM MUST NOT EXTEND PAST TIP OF "D" SECTION ON SEAL
2 - "D" SECTION
3 - BUTYL MUST BE PRESENT TO BLOCK WATER PATH BELOW "D" SECTION

6. Remove right Freedom Panel & set on work table, protecting edges & top surface from damage. Proceed with repairing the seal area on the right Freedom Panel.
7. IF center seal replacement is required, remove old seal and clean seal mounting surfaces of residual adhesive tape. Apply repair butyl. to the front and rear ends of the seal mounting zone. Remove tape liner from new seal. Locate seal at each end onto panel, pressurize each end. Proceed to pressurize center section, ensuring good, continuous adhesion.
8. If seal replacement is not required, add small amounts of repair butyl, to any areas of water entry found along the center seal of the Freedom Panel. Replace the foam on the front detail or the foam under the rear detail if it is damaged or missing with replacement closed cell foam in kit.
9. If the leak path is under the hard top seal center mold, repair with butyl sealer.
10. Replace the Freedom Panels on the vehicle, right side first, followed by the left side. Proceed to position and clamp them in the correct sequence according to the owner's manual. When installing the Freedom Panels always close the windshield latch first.
11. Retest to verify that the leak corrected.

B-Pillar Inboard of the Freedom Panels Corner to Hard Top Leaks

B-PILLAR CUP (4 DOOR SHOWN)

1 - 4 DOOR ONLY
2 - B-PILLAR CUP SEAL

1. Remove Left & Right Freedom Panels.
2. Inspect end details of hard top end seal for water traces to determine leak path. Seals that have the “cup” distorted or rolled will create a leak path. Refit the seal to correct a distorted/rolled seal.
3. Water traces on the hard top corner and leading into the “cup” of the upper B-pillar molded detail (4 DR) near the fastener indicate a leak either under the hard top seal or between the hard top seal and the Freedom Panel.

REAR CORNER FOAM OF FREEDOM PANEL

1 - HORIZONTAL SURFACE FOAM
2 - LOCATOR NOTCH
3 - PANEL TO B-PILLAR INTERFACE FOAM

4. If the water trace is under the hard top end seal leading into the “cup” of the upper B-pillar molded detail, dry off the area & apply butyl to close off the path under the seal to the hard top.
5. If the water trace is over the top of the hard top seal at the outboard corners, examine the rear outboard corners of Freedom Panel for damaged or missing foam. Replace if required.
6. If there is no leak under the hard top seal, no water trace at the outboard corners, and there is a water trace on hard top seal approximately 1 in. - 8 in. inboard of the corners, then inspect the hard top seal for distortion or flatness. There is an insert/stuffer inside the seal end that is 7 in. - 8.75 in. long. Verify that the insert is present and located all the way outboard to the hard top seal end. Shift insert outboard to support the hard top seal end if required.
7. If hard top seal is damaged, replace it using appropriate 2 door seal or 4 door seal(s).
8. Replace the Freedom Panels on the vehicle, right side first, followed by the left side. Proceed to position and clamp them in the correct sequence according to the owner’s manual.
9. Retest to verify that the leak corrected.

B-Pillar Outboard Freedom Panel Corner & Hard Top Leaks

REAR CORNER FOAM OF FREEDOM PANEL

1 - HORIZONTAL SURFACE FOAM
2 - LOCATOR NOTCH

3 - PANEL TO B-PILLAR INTERFACE FOAM

1. Leaks tracing along the door inner panel near the upper rear corner indicate a path between the door & the hardtop/Freedom Panel intersection.
2. Examine the door to body fit for an over-flush condition. Refit if over-flush greater than 1.5 mm (1/16 in.).
3. Inspect end details of hard top end seal for water traces to determine leak path. Seals that have the “cup” distorted or rolled will create a leak path. Refit the seal to correct a distorted/rolled seal.
4. Examine the rear outboard corners of Freedom Panel for damaged or missing foam. Replace if required.
5. If hard top seal is damaged, replace it using appropriate 2 door seal or 4 door seal(s).
6. Replace the Freedom Panels on the vehicle, right side first, followed by the left side. Proceed to position and clamp them in the correct sequence according to the owner’s manual. When installing the Freedom Panels always close the windshield latch first.
7. Retest to verify that the leak corrected.

A-Pillar Outboard Freedom Panel Corner & Hard Top Leaks

HEADER SEAL TO FREEDOM PANEL TRANSITION

1 - EXCESSIVE STEP OFF

2 - BEND FLANGE TO OBTAIN SMOOTH TRANSITION

1. Water traces/drips onto the door trim panel near the handle indicate a door to body leak path.
2. Examine the door fit to body for an over-flush condition. Refit if over-flush greater than 1.5mm.
3. Examine the windshield header seal end detail to Freedom Panel for a smooth transition from the seal to the

panel. A distorted/rolled seal or step off transition can lead to a leak. Refit the seal and/or bend the metal flange of the windshield frame that is to achieve a flush fit.

4. If water traces are on the end of the IP, the leak path is located between the windshield header and/or the windshield header seal and the Freedom Panel corner.

5. Remove left & right Freedom Panels.

6. Inspect end details of windshield header seal for water traces in the rear ward “cup” portion.

7. Water traces on the windshield header seal end detail rearward “cup” indicate a leak path from either the area between the Freedom Panel front corner or the windshield header seal.

FRONT CORNER OF FREEDOM PANEL

1 - PANEL TO WINDSHIELD FOAM
2 - PANEL TO A-PILLAR FOAM

8. Examine the front outboard corners of Freedom Panel for damaged or missing foam. Replace if required.

9. If no issues with the Freedom Panel corner, examine the windshield header seal end details to ensure it is sealed to the windshield frame. Carefully peel back the front lip of the seal and inspect for gaps in the adhesive tape and butyl that is located under the sealing lip across the windshield header. Repair with butyl as required.

10. Replace the windshield header seal if damaged.

11. Replace the Freedom Panels on the vehicle, right side first, followed by the left side. Proceed to position and clamp them in the correct sequence according to the owner's manual. When installing the Freedom Panels always close the windshield latch first.

12. Retest to verify that the leak corrected.

HARD TOP

REMOVAL

1. From inside the vehicle, release the center clamps (2).
2. Release the rear clamps (3).
3. Remove the rear thumb bolts (7).
4. Release the front top clamps (8).

5. Remove the modular tops (1) and (2).
6. On four door models, remove the two front bolts (3).
7. Remove the six side bolts (5) and remove the main hard top (4).

INSTALLATION

1. Install the main hard top (4) onto the vehicle and line up the alignment pins.

CAUTION: Make sure the B and C-pillar seals are not folded up and are positioned correctly.

2. Install the six side bolts (5).
3. On four door models, install the two front bolts (3).
4. Tighten the side bolts (5) from front to rear to 18 N·m (13.5 ft. lbs.)
5. On four door models, tighten the front bolts (3) to 10.5 N·m (7.5 ft. lbs.).

NOTE: Make sure all modular top latches are in the open position.

6. Position the modular tops (1) and (2) onto the vehicle with the right side top (1) being installed before the left side (2).

7. With the modular tops (1) and (6) installed correctly onto the alignment pins, secure the front latches (8).
8. Install and secure the rear thumb bolts (7).
9. Secure the rear clamps (3) fully.
10. Secure the center clamps (2) fully.

SOFT TOP

DESCRIPTION

FOUR DOOR SHOWN, TWO DOOR SIMILAR

1 - SPORT BAR ASSEMBLY
2 - PIVOT BRACKET BOLTS
3 - PIVOT BRACKETS
4 - PIVOT KNUCKLE BOLTS 14 N·m (10.5 ft. lbs.)
5 - FOUR DOOR SOFT TOP
6 - DOOR RAIL THUMB SCREW
7 - DOOR RAIL RETAINER
8 - DOOR RAIL THUMB SCREW
9 - REAR DOOR RAIL THUMB SCREW
10 - REAR DOOR RAIL RETAINER

Soft Top

Wrangler's Soft Top features the same construction as before and attaches and installs similar to the 2006 models. A storage bag for the plastic windows is available through MOPAR® for added convenience.

Sun Rider Soft Top

The Sun Rider Soft Top features the same construction as before and attaches and installs similar to the 2006 models. For added convenience, MOPAR® offers a storage bag for the removable plastic windows. The Sun Rider Top can be half or fully open. Wrangler Unlimited's soft-top opening extends above the rear seat occupants. The approximate dimensions of the open space for the Sun Rider Tops are as follows:

- Wrangler (two-door) 55 in. (1397 mm) wide by 30 in. (762 mm) long and opens above the first row only
- Wrangler Unlimited (four-door): 55 in. (1397 mm) wide by 60 in. (1524 mm) long and opens above first and second row occupants

REMOVAL

Two Door

1. Separate the quarter windows hook and loop strips from the soft top and unzip the quarter windows.
2. Separate the quarter window sides (2) from the side rail retainers (1) and the door frame and remove the quarter window.

3. Unzip the rear window (2) and release window retainer from the rear tailgate retainer (3).

4. Release the front latches (1) from the windshield frame loops (2).

5. Release the soft top retainers (2) from the upper side and lower rear rail retainers (1).

6. Fold the top into the down position.
7. Remove the pivot bracket bolts (3) from the pivot

knuckles (1).

8. separate the knuckles (2) from the pivot brackets.
9. Remove the soft top (1) from the vehicle.

Four Door

1. Separate the quarter windows hook and loop strips from the soft top and unzip the quarter windows.
2. Separate the quarter window sides (2) from the side rail retainers (1) and the door frame and remove the quarter window.
3. Unzip the rear window and release window retainer (2) from the rear tailgate retainer (1).

4. Unzip the rear window (2) and release window retainer from the rear tailgate retainer (3).

5. Release the front latches (1) from the windshield frame loops (2).

6. Release the soft top retainers (2) from the upper side and lower rear rail retainers (1).

7. Fold the top into the down position.
8. Remove the pivot bracket bolts (1) from the pivot knuckles (3) and separate the knuckles from the pivot bracket (2).

FOUR DOOR SHOWN, TWO DOOR SIMILAR

1 - SPORT BAR ASSEMBLY
2 - PIVOT BRACKET BOLTS
3 - PIVOT BRACKETS
4 - PIVOT KNUCKLE BOLTS 14 N·m (10.5 ft. lbs.)
5 - FOUR DOOR SOFT TOP
6 - DOOR RAIL THUMB SCREW
7 - DOOR RAIL RETAINER
8 - DOOR RAIL THUMB SCREW
9 - REAR DOOR RAIL THUMB SCREW
10 - REAR DOOR RAIL RETAINER

9. Remove the soft top (5) from the vehicle.

INSTALLATION

Two Door

1. Position the soft top (1) onto the vehicle with the knuckles (2) positioned to attach to the knuckle brackets.

2. Position the knuckles (1) onto the knuckle bracket (2) and install the bolts (3).

3. Fold the top up and secure the latches (1) to the windshield frame loops (2).

4. Secure the soft top retainers (2) for the upper side and lower rear rails (1).

5. Zip the rear window (2) onto the soft top (1) and secure to the rail retainer (3).

6. Zip the quarter windows onto the soft top and secure the window retainers (2) to the lower rails (1) and the door

frames.

7. Secure the quarter window hook and loop strips to the soft top.

Four Door

FOUR DOOR SHOWN, TWO DOOR SIMILAR

1 - SPORT BAR ASSEMBLY

2 - PIVOT BRACKET BOLTS

3 - PIVOT BRACKETS

4 - PIVOT KNUCKLE BOLTS 14 N·m (10.5 ft. lbs.)
5 - FOUR DOOR SOFT TOP
6 - DOOR RAIL THUMB SCREW
7 - DOOR RAIL RETAINER
8 - DOOR RAIL THUMB SCREW
9 - REAR DOOR RAIL THUMB SCREW
10 - REAR DOOR RAIL RETAINER

1. Install the soft top (5) onto the vehicle.

2. Position the knuckles (3) onto the knuckle bracket (2) and install the bolts (1).

3. Unfold the top up and secure the latches (1) to the windshield frame loops (2).

4. Secure the soft top retainers (2) for the upper side and lower rear rails (1).

5. Zip the rear window (2) onto the soft top (1) and secure to the rail retainer (3).

6. Zip the quarter windows onto the soft top and secure the window retainers (2) to the lower rails (1) and the door frames.

7. Secure the quarter window hook and loop strips to the soft top.

TAILGATE

BACKLITE

REMOVAL

1. Disconnect the rear wiper motor electrical connectors (3).
2. Disconnect the washer hose (4).
3. Disconnect the rear window heater grid connector (2).

4. Remove the glass supports (2), (Refer to 23 - BODY/TAILGATE/SUPPORT CYLINDER - BACKLITE - REMOVAL).

5. Using a trim stick C-4755 or equivalent, open the hinge trim covers (2).
6. Remove the bolts (3) and remove the backlite (1).

INSTALLATION

1. Position the backlite glass onto the hard top and install the bolts (3).
2. Tighten the bolts to 10 N·m (90 in. lbs.).
3. Position the trim covers (2) back onto the hinges and seat fully.

4. Install the glass support cylinders (2), (Refer to 23 - BODY/TAILGATE/SUPPORT CYLINDER - BACKLITE - INSTALLATION).

5. Connect the heated glass electrical connector (2).
6. Connect the rear wiper motor electrical connector (3).
7. Connect the washer hose (4).

HANDLE

REMOVAL

1. Using a trim stick C-4755 or equivalent, remove the inner latch trim (2).

2. Disconnect the latch rod (2) from the handle (1).

3. Remove the nuts (3) and remove the handle (1).

INSTALLATION

1. Install the handle (1) and install the nuts (3).
2. Tighten the nuts to 4.5 Nm (40 in. lbs.)

3. Connect the latch rod (2) to the handle (1).

4. Position the latch trim (2) onto the tailgate opening and seat fully.

HINGE

REMOVAL

NOTE: It is not necessary to remove the tailgate to replace the hinges if they are replaced one at a time.

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Using a trim stick C-4755 or equivalent, separate the hinge covers (3 and 4) from the hinges.
2. Using a grease pencil or equivalent, mark the position of the hinge (1) on the tailgate.
3. Remove the bolts (2) attaching the hinge to the tailgate.

4. Remove the bolts (1 and 2) attaching the hinge to the body.

INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Align the hinges to the door using the reference marks made during the removal procedure and install the body bolts (1 and 2).

2. Install the bolts (2) and tighten to 20 N·m (15 ft. lbs.).

3. Tighten the body bolts to 26 N·m (19 ft. lbs.).
4. Adjust the tail gate if necessary, (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

LATCH

REMOVAL

1. Using a trim stick C-4755 or equivalent, remove the inner latch trim (2).

2. Release the rod clips (1) and disconnect the latch rods (3 and 4).

3. Remove the screws (4) and remove the latch (6).
4. Disconnect the electrical connector (2).

INSTALLATION

1. Connect the electrical connector (2) and install the latch into the tail gate (3).
2. Install the screws (4) and tighten to 8 N·m (71 in. lbs.).

3. Connect the latch rods (3 and 4) and secure the clips (1) fully.

4. Position the latch trim (2) onto the tailgate opening and seat fully.

5. Adjust the latch if necessary, (Refer to 23 - BODY/TAILGATE/LATCH - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT

1. Locate access hole and remove the mylar tape (2) covering it.

2. Insert a 5/32" hex-wrench through hole and into adjustment screw (3). Loosen screw.

3. Operate outside handle several times to release any restriction because of mis-alignment.

4. Tighten adjustment screw to 3 N·m (30 in. lbs.).

5. Test handle for proper operation.

LOCK CYLINDER

REMOVAL

1. Using a trim stick C-4755 or equivalent, remove the inner latch trim (2).

2. Release the clip (3) and disconnect the lock rod (2).

3. Remove the clip (5).

4. Remove the lock cylinder (2) and the gasket (1).

INSTALLATION

1. Install the gasket (1) and the lock cylinder (2).

2. Install the retaining clip (5) onto the lock cylinder (4).

3. Connect the lock rod (2) to the lock cylinder and seat the clip (3) fully.

4. Position the latch trim (2) onto the tailgate opening and seat fully.

STRIKER REMOVAL

1. Open the tail gate.
2. Using a grease pencil or equivalent, mark the location of the stabilizer cup (1) and insert to aid installation.
3. Remove the bolts for the stabilizer cup and remove the cup.

4. Using a grease pencil or equivalent, mark the position of the striker (1) to aid installation.

5. Remove the bolts (2) attaching the striker (1) to the body.
6. Remove the bolts (3) for the insert (4) and remove the insert.

INSTALLATION

1. Install the striker and install the bolts.
2. Adjust the striker (1) and tighten the bolts (2) to 28 N·m (21 ft. lbs.), (Refer to 23 - BODY/TAILGATE/LATCH STRIKER - ADJUSTMENTS).
3. Adjust the tail gate if necessary, (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Install the stabilizer insert (4) with the narrow end toward the rear of the vehicle and install the bolts (3).
5. Tighten the bolts to 10 N·m (90 in. lbs.).

6. Install the stabilizer cup (1) and loosely install the bolts.
7. Adjust the stabilizer (1) and tighten the bolts (2) to 10 N·m (90 in. lbs.), (Refer to 23 - BODY/TAILGATE/LATCH STRIKER - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT

Striker

NOTE: Stabilizer insert must be off when adjusting the striker.

1. Remove the stabilizer insert, (Refer to 23 - BODY/TAILGATE/LATCH STRIKER - REMOVAL)
2. Loosen the striker bolts.
3. Adjust the striker up/down so that it is centered within the latch opening.
4. Adjust the striker fore/aft so the swing gate is under flush to the body -0.5 mm (+/- 1.0 mm).
5. Adjust the striker cross-car engagement to the latch by adding 2.0 mm shims as necessary.

NOTE: Make sure the striker is not twisted within the latch opening. Striker should be parallel to the opening.

6. Tighten the striker bolts to 28 N·m (21 ft. lbs.).
7. Install the stabilizer insert, (Refer to 23 - BODY/TAILGATE/LATCH STRIKER - INSTALLATION).

Stabilizer

1. Adjust the insert up/down so that it is centered within the stabilizer cup.
2. Adjust the insert for/aft so the swing gate is 1.0 mm over flush to the D-pillar when the insert contacts the rubber bumper in the stabilizer cup.
3. Open the tail gate and tighten the bolts to 10 N·m (90 in. lbs.).

NOTE: Make sure the stabilizer cup and insert are parallel to each other and not twisted.

4. Close the tail gate and grab the beltline. Confirm minimal for/aft movement and that closing effort is not excessive. Readjust as required.

SUPPORT CYLINDER - BACKLITE

REMOVAL

WARNING: Do not remove the liftgate support cylinders with the liftgate closed. The support cylinder pistons are operated by high pressure gas and could cause personal injury and/or vehicle damage if they are removed with the pistons compressed (liftgate closed). Once removed, do not attempt to disassemble or repair the support cylinders.

1. Open the backlite and support.
2. Using a small flat bladed tool (3), or equivalent, release the retaining clips (2) while pulling the ball socket (1) away from the ball stud (4).

NOTE: Lift the clips (1) only enough to release the ball studs (3).

3. Remove the support cylinder from the upper and lower ball studs (3).

4. Remove the support cylinders (2) from the backlite (1).

INSTALLATION

WARNING: Do not remove the liftgate support cylinders with the backlite closed. The support cylinder pistons are operated by high pressure gas and could cause personal injury and/or vehicle damage if they are removed with the pistons compressed (backlite closed). Once removed, do not attempt to disassemble or repair the support cylinders.

1. Make sure the retaining clips (1) are seated into the ball socket (2) fully.
2. Install the support cylinder (2) over the ball studs (3) with the thin end connected to the body and the retaining clips snapping into place.

SEATS

SEATS

WARNING

WARNINGS - RESTRAINT SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS. Such repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Any wire harness containing broken, cut, burned or otherwise damaged electrically conductive SRS wiring, terminals or connector components must be removed and replaced with an entire new wire harness. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury on vehicles equipped with seat airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the seat airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the seat airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Occupant Restraint Controller (ORC). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the Supplemental Restraint System (SRS) circuits and components.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy

metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi).

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the DaimlerChrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.

CUSHION/COVER-CUSHION - FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - FRONT - DESCRIPTION).
3. Remove the front seat, (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL).
4. Remove the lift handle, if equipped.
5. Separate the J-straps from the seat cushion frame and remove the seat cushion and cover.
6. Remove the hog rings and separate the cover from the cushion.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - FRONT - DESCRIPTION).
3. Install the seat cushion cover onto the cushion and install new hog rings.
4. Install the cushion onto the seat cushion frame and connect the J-straps.
5. Install the front seat, (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION).

CUSHION/COVER-CUSHION - REAR

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING).
2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - REAR - DESCRIPTION).
3. Remove the rear seat, (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL).

Two Door

1. Remove the seat back frame to seat cushion assembly bolts and separate the seat back assembly.
2. Separate the J-straps and remove the cover and cushion assembly.
3. Remove the hog rings and separate the cushion and cover.

Four Door

1. Separate the rear seat sections.
2. Remove the seat cushion pivot bolts and separate the cushion from the back assembly.
3. Release the J-straps and separate the cushion assembly from the frame.
4. Remove the hog rings and separate the cover from the cushion.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING).
2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - REAR - DESCRIPTION).

Two Door

1. Position the cover over the cushion and attach with new hog rings.
2. Position the seat cushion over the seat frame and fasten the J-straps.
3. Install the seat cushion onto the seat back frame and install the cushion assembly bolts.
4. Tighten the bolts to 50 N·m (37 ft. lbs.).
5. Install the seat, (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION).

Four Door

1. Position the cover over the cushion and attach with new hog rings.
2. Position the seat cushion over the seat frame and fasten the J-straps.
3. Install the seat cushion assembly onto the seat back assembly and install the pivot bolts.
4. Tighten the bolts to 25 N·m (18.5 ft. lbs.)
5. Position the seat halves back together.
6. Install the seat, (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION).

CUSHION/COVER-SEAT BACK - FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - FRONT - DESCRIPTION).
3. Remove the front seat, (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL).
4. Remove the seat recliner easy entry levers, if equipped.
5. Position aside the seat back cover and remove the seat back assembly bolts.
6. If equipped, disconnect the electrical connectors and remove the seat back.

7. Push in the buttons on both headrest sleeves, pull the headrest up and remove.

8. Separate the J-straps (1 & 2) and pull cover up over frame.
9. Unzip the cover zippers.
10. On vehicles equipped with seat air bags, remove the air bag, (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT AIRBAG - REMOVAL).

11. Cut off the hog rings (2) attaching the cover (3) to the cushion (1).

12. Squeeze the locking tab (3) and remove the headrest sleeves (1) and remove the cover.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - FRONT - DESCRIPTION).

3. Position the seat back cover over the seat back frame.
4. Position the seat back cushion on the frame and position the cover over the cushion.
5. Attach the seat cover (3) to the seat back cushion (1) and install new hog rings.

6. On vehicles equipped with a seat airbag, install the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT AIRBAG - INSTALLATION).

7. Zip the rear cover zippers and connect the J-straps (1 & 2).

8. Position the headrest sleeves (2) and seat into the seat back (1) frame fully.

9. Position the seat back onto the seat cushion assembly and connect the electrical connectors if equipped.

10. Install the seat back assembly bolts and tighten to 47 N·m (34.5 ft. lbs.).

11. Connect the electrical connectors, if equipped.

12. Install the front seat, (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)

CUSHION/COVER-SEAT BACK - REAR

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING).

2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - REAR - DESCRIPTION).

3. Remove the rear seat, (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL).

4. Remove the headrest, (Refer to 23 - BODY/SEATS/HEADREST - REMOVAL).

Two Door

1. Remove the back frame to cushion bolts and separate the seat back assembly.

2. Separate the J-straps and unzip the cover.

3. Squeeze the locking tab (3) and remove the headrest sleeves (1).

4. Remove the seat cushion from the seat back frame.

5. Remove the hog rings and separate the cover from the cushion.

Four Door

1. Separate the seat halves.
2. Remove the seat handle bezel.
3. Remove the screws and remove the release handle.
4. Remove the seat cushion pivot bolts and remove the seat cushion from the seat back assembly.
5. Remove the inner and outer latch covers.
6. Remove the seat belt bezel.
7. Separate the J-straps and unzip the cover.
8. Remove the seat cushion from the seat back frame.
9. Remove the hog rings and separate the cover from the cushion.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING).
2. For appropriate seat configuration illustrations, (Refer to 23 - BODY/SEATS/SEAT - REAR - DESCRIPTION).

Two Door

1. Position the cover over the cushion and attach with new hog rings.
2. Position the seat back cushion over the seat back frame, zip the cover and fasten the J-straps.
3. Seat the headrest sleeves (1) into the seat back fully.
4. Install the seat back assembly onto the seat cushion assembly and install the cushion bolts.
5. Tighten the bolts to 50 N·m (37 ft. lbs.).

Four Door

1. Position the cover over the cushion and attach with new hog rings.
2. Position the seat back cushion over the seat back frame, zip the cover and fasten the J-straps.
3. Install the seat belt bezel.
4. Install the inner and outer latch covers.
5. Install the seat cushion assembly onto the seat back assembly and install the pivot bolts.
6. Tighten the bolts to 25 N·m (18.5 ft. lbs.)
7. Position the release handle back and install the screws.
8. Install the release handle bezel.
9. Position the seat halves back together.

Two and Four Door

1. Install the seat, (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION).
2. Install the headrest, (Refer to 23 - BODY/SEATS/HEADREST - INSTALLATION).

HEADREST - FRONT AND TWO DOOR REAR

REMOVAL

1. Push in the buttons on both headrest sleeves, pull the headrest up and remove.

INSTALLATION

1. Press the headrest sleeve release buttons and install the headrest.

HEADREST - REAR FOUR DOOR REMOVAL

1. Release the seat back and fold forward far enough to release the headrest.
2. Using a small flat bladed tool or equivalent, release the headrest by pressing the tool into the slots (1) on the trim caps.

3. Remove the headrest (1) from the headrest bracket and hinge (2).

INSTALLATION

1. Position the headrest (1) onto the bracket and hinge assembly (2) and seat the headrest fully.

SEAT - FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

NOTE: If equipped with a traveling seat belt anchor.

2. Adjust the front seat (1) to its most forward position for easiest access to the front seat belt (3) lower anchor and the B-pillar trim.
3. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
4. Remove the screw (2) that secures the lower anchor to the outboard side of the front seat cushion frame.

5. Remove the four seat bolts (2).
6. Tip the seat back and disconnect the electrical connectors (3).
7. Remove the seat.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. Position the seat into the vehicle and connect the electrical connectors (3), if equipped.
3. Install the bolts (2).
 - a. Adjust the seat rearward.
 - b. Tighten the front inboard bolt to 75 N·m (55 ft. lbs.).
 - c. Tighten the front outboard bolt to 75 N·m (55 ft. lbs.).
 - d. Adjust the seat forward.
 - e. Tighten the rear inboard bolt to 75 N·m (55 ft. lbs.).
 - f. Tighten the rear outboard bolt to 75 N·m (55 ft. lbs.).

NOTE: If equipped with a traveling seat belt anchor.

4. Position the seat belt (3) lower anchor to the mounting hole on the outboard side of the front seat (1) cushion frame. Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.
5. Install and tighten the screw (2) that secures the lower anchor to the seat. Tighten the screw to 40 N·m (30 ft. lbs.).
6. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

23 - OUTBOARD LATCH FLOOR BOLTS 25 N·m (18.5 ft. lbs.)	47 - OUTER LATCH COVER
24 - LATCH TO BACK FRAME BOLTS 45 N·m (33 ft. lbs.)	48 - SEAT BELT RETRACTOR

REMOVAL

Two Door

1. Remove the rear subwoofer (if equipped), (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
2. Lift the seat back release lever and fold seat back forward and release the rear latches (2).
3. Slowly flip the entire seat (1) forward.
4. Press down on release bar on each side to release the front latches (3), and pull seat out and away from lower bracket (4).
5. Remove seat from the vehicle.

Four Door

1. Remove the four front leg bolts (1).
2. Remove the front rear bracket bolts (2).
3. Fold the seat backs (3) into the down position.

4. Remove the center bracket bolt (3).
5. Remove the outer bracket nuts (2) and remove the seat assembly through the tail gate.

INSTALLATION

Two Door

1. Position the seat assembly into the vehicle and lock the rear of the front latches (3) into rear loop of the lower brackets (4).
2. Lift the seat upright and lock the front of the front latches (3) into the front loop of the lower brackets (4).
3. Position the seat assembly down and secure the rear latches (2).
4. Lift the seat back (1) into the upright position to lock the rear latches (2).

Four Door

1. Position the seat assembly into the vehicle and over the rear studs.
2. Install the nuts (2) and tighten to 85 N·m (63 ft. lbs.).
3. Install the bolt (3) and tighten to 75 N·m (55 ft. lbs.).

4. Install the rear bracket front screws (2) and tighten to 75 N·m (55 ft. lbs.).
5. Install the front bracket screws (1) and tighten to 75 N·m (55 ft. lbs.).
6. Install the center belt buckle (4) and make sure the tab is lined up with the slot in the plate.
7. Install the buckle bolt and tighten to 75 N·m (55 ft. lbs.).

STATIONARY GLASS

STATIONARY GLASS

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.
- DaimlerChrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufacturer's warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.
- Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.

Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.

- Skin contact with urethane adhesive should be avoided. Personal injury may result.
- Always wear eye and hand protection when working with glass.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

GLASS - QUARTER WINDOW

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Using a windshield removal tool with a cable pull handle, or equivalent, separate the glass adhesive from the inside of the vehicle.

3. Remove the glass (2) and the spacers (3) from the hard top (1).

INSTALLATION

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The quarter glass fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

Glass Preparation - Installing A Previously Installed Quarter Glass

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Level old bead of quarter glass adhesive (3) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.

NOTE:
Typical
primer

installation shown.

3. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
4. Using a flash light, verify that glass primer is without damage.
5. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.
6. Apply primer (1) around the perimeter of the glass to a width of 18 mm (0.7 in.) and 6 mm (0.25 in.) from the edge.
7. Allow primer to air dry for at least 10 minutes.
8. Using a flash light, verify that glass primer is without damage.

Glass Preparation - Installing A New Quarter Glass

NOTE: Typical primer installation shown.

1. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
2. Apply primer to gluing surface at quarter glass seal.
3. Apply primer (1) around the perimeter of the glass to a width of 18 mm (0.7 in.) and 6 mm (0.25 in.) from the edge.
4. Allow primer to air dry for at least 10 minutes.
5. Using a flash light, verify that glass primer is without damage.

6. Apply a thin coat of blackout glass primer to the glass surface (2) to a width of 18 mm (0.7 in.) and 6 mm (0.25 in.) from the edge (3).
7. Allow primer to air dry for at least 20 seconds.

Quarter Glass Opening Preparation

NOTE: Windshield opening shown, quarter glass opening similar.

1. Clean and vacuum quarter glass opening.
2. Level old bead of quarter glass opening adhesive (1) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.

NOTE: Windshield opening shown, quarter glass opening similar.

3. Clean and dry area of quarter glass opening to be re-glued with a suitable glass preparation solvent and rag.
4. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.
5. Allow primer to air dry for at least 10 minutes.

Quarter Glass Installation

1 - ADHESIVE HEIGHT 12.7 mm (0.50 in)

2 - ADHESIVE TIP WIDTH 3 mm (0.120 in)

3 - INNER WINDSHIELD SURFACE
4 - ADHESIVE WIDTH 9.5 mm (0.375 in)

1. Bead dimensions should be approximately 8.0 mm (0.315 in) wide (4) by 12.7 mm (0.50 in) in height (1).
2. Apply bead of adhesive with a triangular nozzle directly to the quarter glass seal starting at bottom in center of the quarter glass.
3. Locate the bead of adhesive onto the primed glass surface (3).

CAUTION: Always apply bead of adhesive to the quarter glass. Always install the quarter glass within 5 minutes after applying adhesive.

4. Allow end of adhesive bead (1) to run out parallel to the start of the bead and smooth ends flush.

5. Lift quarter glass into place in the center of the quarter glass opening and install over the alignment spacers (3).
6. Carefully lay down the quarter glass and press on.

CAUTION: It is no longer possible to move the quarter glass after installation. The quarter glass should never be pressed into place by more than one person, because the quarter glass can break if pressed simultaneously on both sides.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

PANEL - WINDSHIELD FRAME

REMOVAL

1. Remove the hard top, if equipped, (Refer to 23 - BODY/REMOVABLE TOP/TOP - REMOVAL).
2. If equipped, release the soft top latches (1) and fold the soft top back.

3. Remove the bolts (2) attaching the sport bar (3) to the windshield frame (1).

4. Remove the bolts (4) and remove the reinforcement brackets (1).

5. Remove the cowl top panel, (Refer to 23 - BODY/EXTERIOR/PANEL - COWL TOP - REMOVAL).
6. Remove the hinge bolts (2) and remove the windshield frame (1).

INSTALLATION

1. Install the windshield frame (1) onto the body and install the hinge (3) to body bolts (2).
2. Tighten the hinge bolts (2) to 20 N·m (15 ft. lbs.).

3. Fold the windshield down onto the hood and make sure that the hood to cowl weather seal is secured in place fully.
4. Rotate the windshield frame rearward until the header contacts the sports bar.
5. Install the sport bar bolts (2) and hand tighten.
6. Tighten the outboard upward bolt followed by the remaining bolts to 23 N·m (17 ft. lbs.).

7. Install the reinforcement brackets (1) and install the bolts (4) hand tight.

8. Tighten the reinforcement bracket bolts to 20 N·m (15 ft. lbs.) using the sequence shown.

9. Install the cowl top panel, (Refer to 23 - BODY/EXTERIOR/PANEL - COWL TOP - INSTALLATION)

10. Install the hard top, if equipped, (Refer to 23 - BODY/REMOVABLE TOP/TOP - INSTALLATION)

11. On vehicles with the soft top, close the top and secure the latches (1) to the windshield frame loops (2).

WINDSHIELD

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Remove rear view mirror, (Refer to 23 - BODY/INTERIOR/MIRROR - INSIDE REAR VIEW - REMOVAL).
3. Using a windshield removal tool with a cable pull handle, or equivalent, separate the glass adhesive from the inside of the vehicle.

4. Carefully remove the windshield (1).

INSTALLATION

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The windshield fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located on the cowl at the bottom of the windshield opening should be replaced with new parts. Replace any missing or damaged spacers around the perimeter of the windshield opening.

Windshield Preparation - Installing A Previously Installed Windshield

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Level old bead of windshield adhesive (3) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.

3. Apply four new spacers the top

and sides
of the
glass.
4. Install
the lower
spacer

assemblies (2) onto the glass.

5. Position windshield (1) in center of windshield opening and resting on the lower spacers (2).

6. Apply adhesive tape (1) to the locations shown to aid with final installation.

7. Verify windshield gap is parallel to with windshield.

8. Cut tape with a sharp knife and remove windshield.

NOTE: Typical primer installation shown.

9. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.

10. Using a flash light, verify that glass primer is without damage.

11. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.

12. Apply primer (1) around the perimeter of the glass to a width of 18 mm (0.7 in.) (2) and 6 mm (0.25 in) from the edge.

13. Allow primer to air dry for at least 10 minutes.

14. Using a flash light, verify that glass primer is without damage.

Windshield Preparation - Installing A New Windshield

1. Apply four new spacers the top and sides of the glass.

2. Install the lower spacer assemblies (2) onto the glass.

3. Position windshield (2) in center of windshield opening and resting on the side and lower spacers (2).

4. Clean and check windshield for damage.

5. Position windshield in center of windshield opening.

6. Apply adhesive tape to the locations shown to aid with final installation.

7. Verify windshield gap is parallel to with windshield.

8. Cut tape with a sharp knife and remove windshield.

9. Clean and dry area of glass to be glued with a suitable glass preparation solvent and rag.
10. Apply primer to gluing surface at windshield seal.

11. Apply primer (1) around the perimeter of the glass to a width of 18 mm (0.7 in.) (2) and 6 mm (0.25 in) from the edge.
12. Allow primer to air dry for at least 10 minutes.
13. Using a flash light, verify that glass primer is without damage.

Windshield Opening Preparation

1. Clean and vacuum windshield opening.
2. Level old bead of windshield opening adhesive (1) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.

3. Clean and dry area of windshield opening to be re-glued with a suitable glass preparation solvent and rag.
4. Re-prime any damaged area. If old adhesive has been

exposed for more than 12 hours, entire adhesive area needs to be re-primed.

5. Allow primer to air dry for at least 10 minutes.

Windshield Installation

1. Apply bead of adhesive (1) with a triangular nozzle directly to the windshield seal starting at bottom in center of windshield.

CAUTION: Always apply bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying adhesive.

1 - ADHESIVE HEIGHT 12.7 mm (0.50 in)

2 - ADHESIVE TIP WIDTH 3 mm (0.120 in)

3 - INNER WINDSHIELD SURFACE
4 - ADHESIVE WIDTH 9.5 mm (0.375 in)

2. Bead dimensions should be approximately 9.5 mm wide (4) by 12.7 mm in height (1).

3. Allow end of adhesive bead to run out parallel to the start of the bead and smooth ends flush.

4. Lift windshield (1) into place in the center of the windshield opening and use the tape as a guide to aid installation of the windshield into the center of the cutout.
5. Carefully lay down windshield and press on.

CAUTION: It is no longer possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

6. Install rear view mirror (Refer to 23 - BODY/INTERIOR/MIRROR - INSIDE REAR VIEW - INSTALLATION).

HVAC - ELECTRICAL DIAGNOSTICS

HVAC - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW (CCN)

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The A/C mode switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. VERIFY B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display this DTC as active?

Yes

- Replace the A/C Heater Control in accordance with the service information.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1002–A/C SWITCH REQUEST INPUT CIRCUIT HIGH (CCN)

8188ac79

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Instrument Cluster (CCN) detects voltage above 4.5 volts for 10 seconds on the (C105) HVAC MUX Control circuit.

Possible Causes
(C105) HVAC MUX CONTROL CIRCUIT SHORTED TO VOLTAGE
(C105) HVAC MUX CONTROL CIRCUIT OPEN
(C955) HVAC MUX RETURN CIRCUIT OPEN
A/C HEATER CONTROL
INSTRUMENT CLUSTER (CCN)

Diagnostic Test

1. VERIFY DTC B1002–A/C SWITCH REQUEST INPUT CIRCUIT HIGH IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK THE (C105) HVAC MUX CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the Instrument Cluster C2 harness connector.
 Disconnect the HVAC Control Head C1 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C105) HVAC MUX Control circuit.

Is there any voltage present?

Yes

- Repair the (C105) HVAC MUX Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. CHECK THE (C105) HVAC MUX CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.
 Measure the resistance of the (C105) HVAC MUX Control circuit between the A/C Heater Control C1 harness connector and the Instrument Cluster C2 harness connector.

Does the ohm meter read open circuit?

Yes

- Repair the (C105) HVAC MUX Control circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [5](#)

4. CHECK THE (C955) HVAC MUX RETURN CIRCUIT FOR AN OPEN

Measure the resistance of the (C955) HVAC MUX Return circuit between the A/C Heater Control C1 harness connector and the Instrument Cluster C2 harness connector.

Does the ohm meter read open circuit?

Yes

- Repair the (C955) HVAC MUX Return circuit for an open.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [5](#)

5. CHECK THE OPERATION OF THE INSTRUMENT CLUSTER (CCN)

Reconnect the Instrument Cluster (CCN) harness connector.
Turn the ignition on.
With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Replace the Instrument Cluster (CCN) in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Replace the HVAC control head in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (CCN)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
EVAPORATOR TEMPERATURE SENSOR
INSTRUMENT CLUSTER (CCN)

Diagnostic Test

1. VERIFY B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR DTC WITH THE EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
 Disconnect the Evaporator Temperature Sensor harness connector.
 Turn the ignition on.
 With the scan tool, erase DTCs.
 Turn the ignition off, wait 10 seconds, and turn the ignition on.
 With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [3](#).

No

- Replace the Evaporator Temperature Sensor in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
 Disconnect the Instrument Cluster (CCN) C3 harness connector.
 Measure the resistance between ground and the (C21) Evaporator Temperature Sensor Signal circuit and ground.

Does the ohm meter read open circuit?

Yes

- Replace the Instrument Cluster (CCN) in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.

B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (CCN)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
INSTRUMENT CLUSTER (CCN)

Diagnostic Test

1. VERIFY B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [2](#)

No

- Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR DTC WITH THE EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
 Disconnect the Evaporator Temperature Sensor harness connector.
 Turn the ignition on.
 With the scan tool, erase DTCs.
 Turn the ignition off, wait 10 seconds, and turn the ignition on.
 With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To [3](#).

No

- Replace the Evaporator Temperature Sensor in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the Instrument Cluster (CCN) C3 harness connector.
 Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the Instrument Cluster (CCN) C3 harness connector and the Evaporator Temperature Sensor harness connector.

Does the ohm meter read open circuit?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [5](#).

4. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT TO VOLTAGE

Using a volt meter check for voltage on the (C21) Evaporator Temperature Sensor Signal circuit.

Does the volt meter read any voltage?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [5](#).

5. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (C121) Sensor Ground circuit between the Instrument Cluster (CCN) C3 harness connector and the Evaporator Temperature Sensor harness connector.

Does the ohm meter read open circuit?

Yes

- Replace the Instrument Cluster (CCN) in accordance with the service information.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Repair the (C121) Sensor Ground circuit for an open.

- Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10C1–A/C SELECT SWITCH STUCK (CCN)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Instrument Cluster (CCN) detects that the A/C mode switch stays in a pushed position for more than 5 seconds.

Possible Causes
DTC B1001 OR B1002 ACTIVE IN THE CCN
OBJECT HOLDING A/C MODE SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING A/C MODE SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE DTC B1001 OR B1002 IN THE CCN

Turn the ignition on.

With the scan tool, read CCN DTCs.

Does the scan tool display active: B1001 or B1002?

Yes

- Diagnose and repair the DTC. Refer to the Table of Contents in this Section.

No

- Go To [2](#)

2. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Turn the ignition off.

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes

- Replace the A/C Heater Control in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [3](#)

3. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE A/C MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the A/C mode switch to stay or stick in a pushed position.

Is anything present that would cause the A/C mode switch to stay or stick in a pushed position?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Go To [4](#)

4. CHECK THE A/C MODE SWITCH & STATUS INDICATOR FUNCTION

Start the engine.

Turn the blower control on.

Press the A/C mode switch on and off several times while observing the A/C status indicator.

Does the A/C status indicator turn on and off?

Yes

- Go To [5](#)

No

- Replace the A/C Heater Control in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. VERIFY THAT DTC B10C1–A/C SELECT SWITCH STUCK IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase CCN DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read CCN DTCs.

Does the scan tool display active: B10C1–A/C SELECT SWITCH STUCK?

Yes

- Replace the A/C Heater Control in accordance with the service information.
- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No

- Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

HVAC - SERVICE INFORMATION

HVAC - SERVICE INFORMATION

DESCRIPTION

A manual temperature control (MTC) single zone type heating-A/C system or a manually controlled heater-only

system is standard equipment on this model, depending on market.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to 7 - Cooling for more information before opening or attempting any service to the engine cooling system.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing mounted within the passenger compartment beneath the instrument panel. The HVAC housing includes:

- Recirculation-air door and actuator (2)
- Blower motor (3)
- Blower motor resistor (4)
- Heater core (5)
- Mode control cable (6)
- Blend-air door (7)
- Temperature control cable (8)
- Evaporator temperature sensor (A/C only) (9)
- Mode-air doors (10)
- A/C evaporator (A/C system only) (11)

On heater-only systems, the A/C evaporator is omitted from the HVAC housing and is replaced with an air restrictor plate.

NOTE: An electric positive temperature coefficient (PTC) heater is used on vehicles when equipped with the 2.8L diesel engine. The PTC heater unit compensates for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core. For more information, (refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - DESCRIPTION).

Based upon the system mode selected, conditioned air can exit the standard heater-only or optional heater-A/C housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC air distribution housing and the floor outlets are located on each side of the distribution housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the various outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - A single large defroster outlet is located in the center of the instrument panel, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel top cover, near the belt line at the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.
- **Front Floor Outlets** - There are two front floor outlets, one located on each side the floor panel center tunnel behind the instrument panel.

OPERATION

Both the manual temperature control (MTC) heating-A/C system and the heater-only system are blend-air type systems. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around the heater core. The temperature control determines the discharge air temperature by operating the blend-air door. This design allows almost immediate control of output air temperature.

NOTE: Typical blend-air type HVAC system shown.

The heating-A/C system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the base of the windshield and into the air inlet housing above the heating, ventilation and air conditioning (HVAC) housing and when equipped with A/C, passes through the A/C evaporator (7). Air flow is then directed either through or around the heater core (2). This is done by adjusting the position of the blend-air door (3) with the temperature control located on the A/C-heater control in the instrument panel. Air flow is then directed out the floor outlet (8), instrument panel outlet (10) or the defroster outlet (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode control located on the A/C-heater control. The temperature and mode control uses cables to operate the air doors.

The velocity of the air flow out of the outlets can be adjusted with the blower speed control located on the A/C-heater control.

NOTE: Recirculation mode will not operate when in the Floor, Mix or Defrost position and the recirculation indicator lamp will not illuminate.

The fresh air intake can be shut off by pressing the Recirculation button on the A/C-heater control when the control is set to Panel mode. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6) located within the passenger compartment.

When equipped with A/C, the A/C compressor can be engaged by pressing the A/C (snowflake) button on the A/C-heater control. It will automatically engage when the mode control is set in any Floor to Defrost position. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to direct the conditioned air to the selected system outlets.

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct, which is secured to the top of the instrument panel. The airflow from the defroster outlet is directed by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the defroster duct and molded plastic demister ducts. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are integral to the instrument panel cover and direct air from the HVAC housing through the outlets on the top corners of the instrument panel. The demisters operate when the mode control is set in any Floor to Defrost position.

The panel outlets receive airflow from the HVAC housing through the center air distribution duct and molded plastic panel outlet ducts. The airflow direction from each of the panel outlets can be adjusted by rotating the outlet and/or moving the shutters which are integral to each outlet. Airflow can be turned on or off through each outlet by closing the shutters completely.

The front floor receives airflow from the HVAC housing through molded plastic front floor ducts which are secured to each side of the HVAC air distribution housing. The airflow direction from the floor outlets can not be adjusted.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

NOTE: The work area ambient temperature must be above 21° C (70° F) and the evaporator temperature must be above 13° C (55° F) prior to conducting the A/C Performance Test.

1. Check for diagnostic trouble codes using a scan tool. If no DTCs are found in the powertrain control module (PCM) or engine control module (ECM) (depending on engine application) or the totally integrated power module (TIPM), go to [STEP 2](#). If any DTCs are found, repair as required, then proceed to [STEP 2](#).
2. Connect a tachometer and a manifold gauge set or an A/C recycling/charging station.
3. Operate the heating-A/C system under the following conditions.
 - Engine at idle and operating temperature
 - Doors or windows open
 - Transmission in Park or Neutral with parking brake set (depending on application)
 - A/C-heater controls set to Recirculation mode (max-A/C), full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the A/C System Diagnosis chart.
4. Insert a thermometer in the driver side center panel air outlet and operate the vehicle a minimum of ten minutes to allow the thermometer temperature to stabilize.
5. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the A/C compressor discharge pressure (high side) to the A/C Performance Temperature and Pressure chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Air Temperature at Center Panel Outlet	6 -15° C (42 - 59° F)	7 -18° C (45 - 64° F)	9 - 21° C (48 - 69° F)	11 - 22° C (52 - 72° F)	13 - 24° C (56 - 75° F)
A/C High Side Pressure	1034 - 1896 kPa (150 - 275 psi)	1207 - 2068 kPa (175 - 300 psi)	1379 - 2241 kPa (200 - 325 psi)	1551 - 2413 kPa (225 - 350 psi)	1724 - 2241 kPa (250 - 375 psi)
A/C Low Side Pressure	214 - 365 kPa (31 - 53 psi)	248 - 407 kPa (36 - 59 psi)	283 - 476 kPa (41 - 69 psi)	317 - 483 kPa (46 - 70 psi)	359 - 496 kPa (52 - 72 psi)

6. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the A/C compressor discharge pressure is high, refer to the A/C System Diagnosis chart.

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C compressor clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
	2. Open fuse.	2. Check the fuse in the junction block. Repair the shorted circuit or component and replace the fuse as required.
	3. Inoperative A/C	3. See A/C Compressor Clutch Field Coil in this group. Test the

	compressor clutch field coil.	compressor clutch field coil and replace as required.
	4. Improperly installed or inoperative A/C pressure transducer.	4. See A/C Pressure Transducer in this group. Test the transducer and replace as required.
	5. Improperly installed or inoperative Evaporator Temperature Sensor.	5. See Evaporator Temperature Sensor in this group. Correctly install or test and replace the sensor as required.
	6. Inoperative A/C-heater control, totally integrated power module (TIPM) or PCM/ECM.	6. Refer to the appropriate Electrical Diagnostic Procedures for testing of the A/C-heater control, TIPM or PCM/ECM. Test the module and replace as required.
Normal refrigerant pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level as required.
	2. Temperature control cable improperly installed or inoperative.	2. See Temperature Control Cable this group. Inspect the cable for proper operation. Replace the cable as required.
	3. Blend door inoperative or sealing improperly.	3. See HVAC Housing in this group. Inspect the blend door for proper operation and sealing. Repair as required.
	4. Blend door not in full cold position.	4. See Temperature Control Cable this group. Inspect the cable for proper operation. Replace the cable as required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See A/C Evaporator in this group. Replace the restricted A/C evaporator as required.
	3. Inoperative A/C compressor.	3. See A/C Compressor in this group. Replace the compressor as required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the receiver/drier is restricted.	2. See Receiver/drier in this group. Replace the restricted receiver/drier as required.

	3. Inoperative radiator cooling fan.	3. Test the radiator cooling fan and replace as required. Refer to Group 7.
	4. Refrigerant system overcharged.	4. See Refrigerant System Charge in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level as required.
	5. Air in the refrigerant system.	5. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
	6. Engine overheating.	6. Test the engine cooling system and repair as required. Refer to Group 7.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Replace the accessory drive belt or tensioner as required. Refer to Group 7.
	2. Inoperative A/C expansion valve.	2. See A/C Expansion Valve in this group. Replace the valve as required.
	3. Inoperative A/C compressor.	3. See A/C Compressor in this group. Replace the compressor as required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line as required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See A/C Expansion Valve in this group. Replace the valve as required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this group. Replace the restricted condenser as required.

HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

WARNING: Do not remove radiator cap when engine is hot, personal injury can result.

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure

stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to and from the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Temperature		Minimum Floor Outlet Temperature	
Celsius	Fahrenheit	Celsius	Fahrenheit
16°	60°	54°	130°
21°	70°	56°	132°
27°	80°	57°	134°
32°	90°	58°	136°

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling for more information.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Low coolant level
- Inoperative water pump
- Inoperative thermostat
- Pinched or kinked heater hoses
- Improper heater hose routing
- Plugged heater hoses or supply and return ports at the cooling system connections
- Plugged heater core

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake
- Obstructed heater system outlets
- Inoperative engine thermostat
- Inoperative blower motor system
- Inoperative A/C-heater control
- Inoperative temperature control cable
- Inoperative, obstructed or improperly installed blend-air door

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Inoperative A/C-heater control
- Inoperative temperature control cable
- Inoperative, obstructed or improperly installed blend-air door
- Improper engine coolant temperature

SPECIFICATIONS

CONTROLS

ACTUATOR-RECIRCULATION DOOR

DESCRIPTION

The recirculation door actuator (1) is a reversible, 12 volt direct current (DC) servo motor, which is connected directly to the pivot shaft lever of the recirculation-air door. The recirculation door actuator is located on the right side of the HVAC air inlet housing.

The recirculation door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2), an output shaft with splines (3) that connect it to the recirculation door and three integral mounting tabs (4) that allow the actuator to be secured to the air inlet housing. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

OPERATION

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the instrument panel wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction. Once the A/C-heater control makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move.

The recirculation door actuator cannot be adjusted or repaired and it must be replaced if inoperative or damaged.

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Illustration shown with instrument panel removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
3. Remove the speaker from the passenger side of the instrument panel (refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
4. Reach through glove box opening in the instrument panel

and remove the screws (1) that secure the recirculation door actuator (4) to the right side of the HVAC air inlet housing (2).

5. Remove the recirculation door actuator from the air inlet housing and disconnect the wire harness connector (3) from the actuator.
6. Remove the recirculation door actuator from the vehicle.

INSTALLATION

1. Position the recirculation door actuator (2) to the right side of the HVAC air inlet housing (1) and connect the instrument panel wire harness connector to the actuator.
2. Install the recirculation door actuator onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the recirculation door pivot shaft adapter (4).

3. Install the two screws (1) that secure the recirculation door actuator (4) to the air inlet housing (2). Tighten the screws to 1.2 N·m (10 in. lbs.).
4. Verify the instrument panel wire harness connector (3) is securely attached to the recirculation door actuator.
5. Install the speaker to the passenger side of the instrument panel (refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
6. Install the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

7. Reconnect the negative battery cable.

CABLE-MODE DOOR

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Whenever the mode control cable is removed from the HVAC housing, a new cable must be installed. Failure to replace the mode control cable when required can result in operating modes not being properly obtained.

NOTE: Illustration shown with instrument panel removed for clarity.

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.

NOTE: To aid in reinstallation, note the installed position of the mode control cable to the A/C-heater control prior to removal of the cable.

2. Remove the instrument panel center bezel and disconnect the mode control cable from the A/C-heater control (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).

3. On LHD models, remove the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

4. Disengage the metal retaining clip (1) that secures the mode control cable (2) from the right side of the HVAC air distribution housing (3).

NOTE: To aid in reinstallation, note the position of the mode control cable as it passes through the

instrument panel support prior to removal of the cable.

5. Disconnect the mode control cable from the mode door cam (4) and discard the cable and retaining clip.

INSTALLATION

NOTE: Whenever the mode control cable is removed from the HVAC housing, a new cable must be installed. Failure to replace the mode control cable when required can result in operating modes not properly obtained.

NOTE: Illustration shown with instrument panel removed for clarity.

NOTE: LHD model shown. RHD model similar.

1. Position a new mode control cable (2) to the right side of the HVAC air distribution housing (3) through the opening in the instrument panel support.
2. Connect the mode control cable to the mode door cam (4).

3. Engage the metal retaining clip (1) to the right side of the HVAC air distribution housing. Make sure the retaining clip is fully engaged to the housing.

4. Connect the mode door control cable to the A/C-heater control and install the instrument panel center bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).

5. Visually verify the mode door cam moves from the full defrost position to the full panel position and then back to the full defrost position using the mode control knob on the A/C-heater control. If OK, go to step 10. If not OK, proceed to step 6.

NOTE: Failure to adjust the mode control cable when required can result in operating modes not properly obtained.

6. Disengage the mode control cable from the metal retaining clip located on the right side of the HVAC housing.

7. Turn the mode control knob on the A/C-heater control to the full defrost position.

8. Reach behind the instrument panel and turn the mode door cam clockwise until it stops in the full defrost position and engage the mode control cable to the metal retaining clip. Make sure the cam is in the full defrost position and that the cable is fully engaged to the retaining clip.

9. Verify the mode door cam moves from the full defrost position to the full panel position and then back to the full defrost position as selected with the mode control knob on the A/C-heater control. If not, repeat steps 6 thru 9.

10. On LHD models, install the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

11. Reconnect the negative battery cable.

CABLE-TEMPERATURE CONTROL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Whenever the temperature control cable is removed from the HVAC housing, a new cable must be installed. Failure to replace the temperature control cable when required can result in selected temperatures not properly obtained.

NOTE: Illustration shown with instrument panel removed for clarity.

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.

NOTE: To aid in reinstallation, note the installed position of the temperature control cable to the A/C-heater control prior to removal of the cable.

2. Remove the instrument panel center bezel and disconnect the temperature control cable from the A/C-heater control (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).

3. On RHD models, remove the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

4. Disengage the metal retaining clip (1) that secures the temperature control cable (2) from the left side of the HVAC air distribution housing (3).

NOTE: To aid in reinstallation, note the position of the temperature control cable as it passes through the instrument panel support prior to removal of the cable.

5. Disconnect the temperature control cable from the blend door pivot lever (4) and discard the cable and retaining clip.

INSTALLATION

NOTE: Whenever the temperature control cable is removed from the HVAC housing, a new cable must be installed. Failure to replace the temperature control cable when required can result in selected temperatures not properly obtained.

NOTE: Illustration shown with instrument panel removed for clarity.

NOTE: LHD model shown. RHD model similar.

1. Position a new temperature control cable (2) to the left side of the HVAC air distribution housing (3) through the opening in the instrument panel support.
2. Connect the temperature control cable to the blend door pivot lever (4).
3. Engage the metal retaining clip (1) to the left side of the air distribution housing. Make sure the retaining clip is fully engaged to the housing.
4. Connect the temperature door control cable to the A/C-heater control and install the instrument panel center bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).
5. Visually verify that the blend door pivot lever moves from the full hot position to the full cold position and then back to the full hot position using the temperature control knob on the A/C-heater control. If OK, go to step 10. If not OK, proceed to step 6.

NOTE: Failure to adjust the temperature control cable can result in full heating or cooling capabilities not properly obtained.

6. Disengage the temperature control cable from the metal retaining clip located on the left side of the HVAC housing.
7. Turn the temperature control knob on the A/C-heater control to the full hot position.
8. Reach behind the instrument panel and move the blend door pivot lever forward until it stops in the full hot position and engage the temperature control cable to the metal retaining clip. Make sure the lever is in the full hot position and that the cable is fully engaged to the retaining clip.
9. Verify that the blend door pivot lever moves from the full hot position to the full cold position and then back to the full hot position, as selected with the temperature control knob on the A/C-heater control. If not, repeat steps 6 thru 9.
10. On RHD models, install the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
11. Reconnect the negative battery cable.

CLUTCH-A/C COMPRESSOR

DESCRIPTION

The A/C compressor clutch assembly consists of a stationary electromagnetic field coil (4), bearing and pulley assembly (3), shims (7) and a clutch plate (2) that is splined to the compressor shaft and secured by a bolt (1). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil is retained to the front of the

compressor with three screws (5) and the A/C clutch bearing and pulley assembly is retained by a snap ring (6).

OPERATION

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the powertrain control module (PCM) in the engine compartment.

The A/C compressor clutch components cannot be repaired and must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

A/C COMPRESSOR CLUTCH COIL

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) through the A/C clutch relay. The A/C clutch coil can be tested by either measuring clutch field coil resistance or by measuring current draw. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. If the A/C compressor clutch will not engage, refer to 24 - HVAC Electrical Diagnostics to perform the A/C System Performance Test, which is found within the HVAC System Test. If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the PCM, go to [STEP 2](#). If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS). If the refrigerant charge level is OK, go to [COIL RESISTANCE TEST](#) and/or [COIL CURRENT DRAW TEST](#). If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.

2. Disconnect the wire harness connector from the A/C clutch field coil connector.
3. Use an ohmmeter and measure the resistance of the clutch field coil at the field coil connector terminals.
4. Refer to the A/C Clutch Field Coil Specifications chart for the acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 25° C (77° F).
 - a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
 - b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge (refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch field coil feed terminal. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C clutch should engage immediately, and the clutch field coil supply voltage should be within two volts of the battery voltage. If the field coil supply voltage is OK, go to [STEP 5](#). If the field coil supply voltage is not within two volts of battery voltage, test the clutch field coil feed circuit for excessive voltage drop and repair as necessary.
5. Refer to the A/C Clutch Field Coil Specifications chart for the acceptable A/C clutch field coil current draw. Specifications apply for a work area temperature of 25° C (77° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
 - a. If the A/C clutch field coil current reading is zero, the coil is open and must be replaced.
 - b. If the A/C clutch field coil current reading is above specifications, the coil is shorted and must be replaced.

A/C CLUTCH FIELD COIL SPECIFICATIONS

A/C Compressor	Current Draw	Coil Resistance
Zexel DKS-17DS	3.3 amps @ 11.5 - 12.5 volts	4.2 ± 0.2 ohms

STANDARD PROCEDURE

A/C CLUTCH PLATE INSPECTION

NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

A/C CLUTCH BREAK-IN

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately 20 times (5 seconds on, then 5 seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

NOTE: The compressor clutch assembly can be serviced with the refrigerant system fully-charged.

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

1. Disconnect and isolate the negative battery cable.
2. On 2.8L equipped models, remove the air cleaner housing (refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
3. On 3.8L equipped models, remove the coolant recovery container (refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).
4. Remove the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).
6. Remove the screw that secures the connector bracket (2) to the A/C compressor and position the bracket and wire lead out of the way.

NOTE: A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate from turning during compressor shaft bolt removal.

7. Hold the clutch plate (4) from turning and remove the compressor shaft bolt (3).

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

8. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

NOTE: The pulley and bearing assembly can be removed from the compressor by hand or, if required, with a two jaw puller.

9. Using Snap Ring Pliers 9764 or equivalent (1), remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4).

10. Remove the pulley and bearing assembly from the front of the A/C compressor. If required, install a two jaw puller and turn the puller center-bolt clockwise until the pulley and bearing assembly is completely removed.

11. Remove the three screws (1) that secure the compressor clutch field coil (2) to the front of the A/C compressor (3) and remove the field coil.

INSTALLATION

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

1. Align the dowel pin on the back of the compressor clutch field coil (2) with the hole in the front of the A/C compressor (3) and position the field coil onto the compressor. Be certain that the compressor clutch field coil wire lead is properly routed so that it is not pinched between the A/C compressor and the field coil.

CAUTION: The field coil retaining screws must be securely installed or they may vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

2. Install the three screws (1) that secure the compressor clutch field coil to the front of the A/C compressor. Tighten the screws to 5 N·m (44 in. lbs.).

CAUTION: Be certain to position the compressor clutch field coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.

CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the clutch will result.

3. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

4. Using Snap Ring Pliers 9764 or equivalent (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4). Be certain that the snap ring is fully and properly seated in the groove.

5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 1.50 mm (0.059 in.) thick onto the compressor shaft.

6. Install the clutch plate (4) onto the front of the A/C compressor (5).

7. Install the compressor shaft bolt (3). Tighten the bolt to 20 N·m (177 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

NOTE: On models with the clutch plate recessed into the pulley, use a 90° wire gap gauge to measure the clutch air gap. On other models, use a blade type feeler gauge to

measure the air gap.

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.30 - 0.60 mm (0.012 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.

CAUTION: Be certain that the compressor clutch field coil wire harness is properly routed so that it is not pinched between the A/C compressor and the field coil connector bracket.

9. Carefully route the compressor clutch field coil wire lead and install the connector bracket (2) and retaining screw onto the A/C compressor. Tighten the screw to 4.3 N·m (38 in. lbs.).

10. Connect the engine wire harness to the compressor clutch field coil connector.

11. Install the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).

12. On 2.8L equipped models, install the air cleaner housing (refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).

13. On 3.8L equipped models, install the coolant recovery container (refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).

14. Reconnect the negative battery cable.

CONTROL-A/C HEATER

DESCRIPTION

NOTE: Typical A/C-heater control shown.

The A/C-heater control (1) for the manual temperature control (MTC) single zone system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The heating-A/C system uses a combination of electrical and cable operated controls. These controls provide the vehicle

operator with a number of setting options to help control the climate and comfort within the vehicle.

The A/C-heater control is located in the instrument panel and contains:

- a rotary control for mode control of the discharged air (2).
- a rotary control for blower motor speed selection and to turn the blower motor off (3).
- a rotary control for temperature control of the discharged air (4).
- a push-button control to turn the rear window defogger system on and off (5).
- a push-button control for recirculation control of the discharged air (6).
- a push-button control to turn the A/C system on and off (7).

The A/C-heater control cannot be repaired or adjusted and it must be replaced if found inoperative or damaged. The control knobs for the A/C-heater control are available for service replacement.

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Typical A/C-heater control and center bezel shown.

1. Disconnect and isolate the negative battery cable.
2. Disengage the center bezel (7) from the instrument panel and disconnect the wiring harness connectors from the power outlets and any switches, as equipped (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).

NOTE: To aid in reinstallation, note the installed positions of the control cables prior to removal.

3. Using a small screwdriver or similar tool, disengage the retaining clips that secure the control cables (1 and 9) to the

back of the A/C-heater control (8).

4. Using a small screwdriver or similar tool, disengage the retaining clips that secure the control cables to the mode control sector gear (2) and the temperature control sector gear (5).

5. Disconnect the wire harness connectors (3 and 4) from the rear of the A/C-heater control and place the center bezel on a work bench.

6. Remove the four screws (6) that secure the A/C-heater control to the back of the center bezel and remove the control.

INSTALLATION

NOTE: Typical A/C-heater control and center bezel shown.

1. Install the A/C-heater control (8) into the instrument panel center bezel (7).

2. Install the four screws (6) that secure the A/C-heater control to the center bezel. Tighten the screws to 2 N·m (17 in. lbs.).

3. Position the center bezel to the instrument panel and connect the wire harness connectors (3 and 4) to the back of the A/C-heater control.

NOTE: Install the mode control cable onto the A/C heater control first. Then install the temperature control cable.

4. Connect the control cables (1 and 9) to the mode door control sector gear (2) and the temperature control sector gear (5) and fully engaged the retaining clips. Make sure the retaining clips are fully engage to the sector gears.

5. Connect the control cables to the back of the A/C-heater control and fully engage the retaining clips. Make sure the retaining clips are fully engaged to the back of the A/C-heater control.

6. Connect the wire harness connectors to the switches and power outlets, as equipped and install the center bezel to the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).

7. Reconnect the negative battery cable.

RESISTOR-BLOWER MOTOR

DESCRIPTION

The blower motor resistor is mounted to the HVAC housing on the passenger side of the vehicle. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind

the mounting plate are resistors (3) located between a two-piece stamped steel base (4).

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. The blower motor resistor has three resistors, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control for the heating-A/C system directs the ground path for the blower motor through the correct resistor to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistors. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistors, increasing the blower motor speed. When the blower motor control is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be adjusted or repaired and it must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

BLOWER MOTOR RESISTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to 8W - WIRING DIAGRAM INFORMATION. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - REMOVAL).
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor speed control and the blower motor resistor or blower motor as required. If not OK, replace the inoperative blower motor resistor.

REMOVAL

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
3. Reach through glove box opening in the instrument panel and disconnect the wire harness connector (1) from the blower motor resistor (2) located on the rear of the HVAC housing (3).
4. Remove the two screws (4) that secure the blower motor resistor to the HVAC housing and remove the resistor.

INSTALLATION

NOTE: LHD model shown. RHD model similar.

1. Position the blower motor resistor (2) onto the rear of the HVAC housing (3) through the glove box opening.
2. Install the two screws (4) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor resistor.
4. Install the glove box (refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
5. Reconnect the negative battery cable.

SENSOR-EVAPORATOR TEMPERATURE

DESCRIPTION

The evaporator temperature sensor measures the temperature of the conditioned air downstream of the A/C evaporator. The evaporator temperature sensor is an electrical thermistor (1) mounted on the end of a molded plastic housing (2) that is inserted into the driver side of the HVAC housing near the coldest point of the A/C evaporator. The evaporator temperature sensor is retained in the HVAC housing by two integral retaining tabs (3) and is connected to the vehicle electrical system by use of a wire lead and connector (4) with two terminals.

OPERATION

The evaporator temperature sensor monitors the surface temperature of A/C evaporator and supplies an input signal to the cabin compartment node (CCN). The CCN uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the CCN through sensor ground circuit and a 5-volt reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The CCN uses the monitored voltage reading as an indication of evaporator temperature. The CCN is programmed to respond to this input by requesting the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) to cycle the compressor clutch off and on as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - OPERATION for more information).

The evaporator temperature sensor is diagnosed using a scan tool (refer to 24 - HVAC Electrical Diagnostics for more information).

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Illustration shown with air distribution housing removed for clarity.

NOTE: It is not necessary to remove and disassemble the HVAC housing to service the evaporator temperature sensor. The evaporator temperature sensor can be removed for service from underneath the instrument panel.

1. Disconnect and isolate the negative battery cable.
2. Reach up under the driver side of the instrument panel and disconnect the electrical connector for the evaporator temperature sensor (1) from the instrument panel wire harness.
3. Using needle nose pliers, disengage the two retaining tabs (3) that secure the evaporator temperature sensor to the HVAC housing (2) by carefully pulling the sensor straight out of the side of the HVAC housing.
4. Route the electrical connector and wire lead of the evaporator temperature sensor out from under the heater core tubes and remove the sensor from the vehicle.

INSTALLATION

NOTE: Illustration shown with air distribution housing removed for clarity.

1. Route the electrical connector and wire lead of the evaporator temperature sensor (1) under the heater core tubes located on the driver side of the HVAC housing (2).
2. Install the evaporator temperature sensor into the driver side of the HVAC housing. Make sure the retaining tabs (3) are fully engaged to the housing.
3. Connect the electrical connector for the evaporator temperature sensor to the instrument panel wire harness.
4. Reconnect the negative battery cable.

TRANSDUCER-A/C PRESSURE

DESCRIPTION

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C discharge line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting on the A/C discharge line. A rubber O-ring seals the connection between

the A/C pressure transducer and the discharge line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C discharge line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the transducer on a sensor return circuit to determine refrigerant pressure. The PCM/ECM is programmed to respond to the A/C pressure transducer and other sensor inputs by controlling the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM/ECM will disengage the A/C compressor clutch when high side pressure rises above 2971 kPa (431 psi) or fall below 206 kPa (30 psi). The A/C pressure transducer input to the PCM/ECM will also prevent the A/C compressor clutch from engaging when ambient temperatures are below about 1.0° C (50° F) due to the pressure/temperature relationship of the refrigerant. When the refrigerant pressure rises above 1655 kPa (240 psi), the PCM/ECM will actuate the cooling fan.

The A/C pressure transducer is diagnosed using a scan tool (refer to 9 - Engine Electrical Diagnostics for more information).

The A/C pressure transducer cannot be adjusted or repaired and it must be replaced if found inoperative or damaged.

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

NOTE: Typical A/C pressure transducer shown.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer located on the A/C discharge line (3) near the A/C compressor.
3. Remove the A/C pressure transducer from the fitting on the A/C discharge line and remove and discard the O-ring seal.

INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

NOTE: Typical A/C pressure transducer shown.

1. Lubricate a new rubber O-ring seal (4) with clean refrigerant oil and install it onto the discharge line fitting (3).
2. Install the A/C pressure transducer (2) onto the A/C discharge line. Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DISTRIBUTION

DUCT-DEFROSTER

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown. RHD model similar.

1. Remove the instrument panel and place it on a workbench (refer to 23 - BODY/INSTRUMENT

PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

2. Remove the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER - REMOVAL).
3. Remove the right and left demister ducts (1 and 3) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - REMOVAL).

NOTE: If the foam seal on the top of the HVAC housing is deformed or damaged, the seal must be replaced.

4. Remove the four screws (2) that secure the defroster duct (6) to the instrument support (4) and the HVAC housing assembly (5) and remove the duct.

INSTALLATION

NOTE: LHD model shown. RHD model similar.

NOTE: If the foam seal on the top of the HVAC housing is deformed or damaged, the seal must be replaced.

1. Position the defroster duct (6) to the top of the HVAC housing assembly (5).
2. Install the four screws (2) that secure the defroster duct to the HVAC housing assembly and the instrument panel support (4). Tighten the screws to 1.2 N·m (10 in. lbs.).
3. Install the right and left demister ducts (1 and 3) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - INSTALLATION).
4. Install the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER - INSTALLATION).
5. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

DUCTS-FLOOR DISTRIBUTION

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground)

cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

PASSENGER SIDE

1. Remove the instrument panel and place it on a workbench (refer to 23 - BODY/INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - REMOVAL).
2. Remove the HVAC housing assembly from the instrument panel (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
3. Disconnect the floor duct (1) from the passenger side of the air distribution housing (2) and remove the duct.

DRIVER SIDE

NOTE: Illustration shown with instrument panel removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Remove the steering column opening cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER-STEERING COLUMN OPENING - REMOVAL).
3. Disconnect the floor duct (1) from the driver side of the air distribution housing (2) and remove the duct.

INSTALLATION

NOTE: LHD model shown in illustrations. RHD model similar.

PASSENGER SIDE

1. Connect the floor duct (1) to the passenger side of the air distribution housing (2). Make sure the duct is fully engaged to the housing.
2. Install the HVAC housing assembly into the instrument panel (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).
3. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - INSTALLATION).

DRIVER SIDE

NOTE: Illustration shown with instrument panel removed for clarity.

1. Connect the floor duct (1) to the driver side of the air distribution housing (2). Make sure the duct is fully engaged to the housing.
2. Install the steering column opening cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER-STEERING COLUMN OPENING - INSTALLATION).
3. Reconnect the negative battery cable.

DUCT-INSTRUMENT PANEL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

DRIVER AND PASSENGER SIDE

NOTE: Driver side instrument panel duct shown. Passenger side duct similar.

1. Remove the instrument panel and place it on a workbench (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANE COVER - REMOVAL).
3. Remove the demister ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - REMOVAL).
4. Remove the defroster duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-DEFROSTER - REMOVAL).
5. Remove the screw (3) that secures the outlet end of each instrument panel duct (1) to the instrument panel support (2), as required.

6. Remove the screw (2) that secures each instrument panel duct (1 and 4) to the center of the instrument panel support (3), as required.
7. Disconnect each instrument panel duct from the center duct (5) and remove the panel ducts, as required.

CENTER

1. Remove the instrument panel and place it on a workbench (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the instrument panel cover (refer to 23 -

BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - REMOVAL).

3. Remove the demister ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - REMOVAL).

4. Remove the defroster duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-DEFROSTER - REMOVAL).

5. Remove the driver and passenger side instrument panel ducts (refer to [DRIVER AND PASSENGER SIDE](#)).

NOTE: If a foam seal on the top of the HVAC housing is deformed or damaged, the seal must be replaced.

6. Remove the two screws (3) that secure the center duct (2) to the top of the HVAC housing assembly (4) and remove the duct from the instrument panel support (1).

INSTALLATION

NOTE: LHD model shown in illustrations. RHD model similar.

DRIVER AND PASSENGER SIDE

NOTE: Driver side instrument panel duct shown. Passenger side duct similar.

1. Position the instrument panel ducts (1 and 4) to the top of the instrument panel support (3).
2. Connect the instrument panel ducts to the center duct (5). Make sure the ducts are fully engaged to each other.
3. Install the screw (2) that secures each instrument panel duct to the center of the instrument panel support. Tighten the screws to 1.2 N·m (10 in. lbs.).

4. Install the screw (3) that secures the outlet end of each

instrument panel duct (1) to the instrument panel support (2). Tighten the screws to 1.2 N·m (10 in. lbs.).

5. Install the defroster duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-DEFROSTER - INSTALLATION).

6. Install the demister ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - INSTALLATION).

7. Install the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - INSTALLATION).

8. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

CENTER DUCT

NOTE: If the foam seal on the top of the HVAC housing is deformed or damaged, the seal must be replaced.

1. Position the center instrument panel duct (2) into the instrument panel support (1) and onto the top of the HVAC housing assembly (4).

2. Install the two screws (3) that secure the center duct to the HVAC housing assembly. Tighten the screws to 1.2 N·m (10 in. lbs.).

3. Install the driver and passenger side instrument panel ducts (refer to [DRIVER AND PASSENGER SIDE](#)).

4. Install the defroster duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-DEFROSTER - INSTALLATION).

5. Install the demister ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - INSTALLATION).

6. Install the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - INSTALLATION).

7. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

DUCT-INSTRUMENT PANEL DEMISTER

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper

precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Right side duct shown. Left side similar.

1. Remove the instrument panel and place it on a workbench (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - REMOVAL).
3. Remove the two screws (3) that secure each demister duct (2) to the instrument panel support (4), as required.
4. Disconnect each demister duct from the defroster duct (1) and remove the demister ducts, as required.

INSTALLATION

NOTE: Right side duct shown. Left side similar.

1. Position each demister duct (2) onto the top of the instrument panel support (4).
2. Connect each demister duct to the defroster duct (1). Make sure the ducts are fully engaged to each other.
3. Install the two screws (3) that secure each demister duct to the instrument panel support. Tighten the screws to 1.2 N·m (10 in. lbs.).
4. Install the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - INSTALLATION).
5. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

HOUSING-HVAC

DESCRIPTION

NOTE: LHD model shown RHD model similar.

All models are equipped with a common HVAC housing

assembly that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing assembly consists of three separate housings:

- **HVAC housing** — The HVAC housing (1) is mounted to the back of the instrument panel and contains the A/C evaporator. The HVAC housing consists of an upper and a lower housing that are attached together and has mounting provisions for the air inlet housing, blower motor and the air distribution housing.
- **Air inlet housing** — The air inlet housing (2) is mounted to the passenger side end of the HVAC housing. The air inlet housing contains the recirculation-air door and actuator when equipped with A/C.
- **Air distribution housing** — The air distribution housing (3) is mounted to the rear of the HVAC housing and contains the heater core, blend-air and mode-air doors and door linkage.

The heating-A/C system is a blend-air type system. The blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the temperature control cable, which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system. The mode door cable operates the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. When equipped with A/C, the recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric recirculation door actuator and the blower motor are connected to the vehicle electrical system by the instrument panel wire harness. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housing at the selected speed by use of the blower motor resistor, which is located in the HVAC housing behind the glove box.

The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door. The HVAC housing must be removed from the vehicle for service of the A/C evaporator and the heater core.

REMOVAL

HOUSING-AIR DISTRIBUTION

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and

(refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the floor distribution ducts from the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - REMOVAL).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

3. Remove the foam seal (1) from the flange (4) located on the front of the HVAC housing (2).
4. Remove the screw (3) that secures the flange to the HVAC housing and remove the flange.

5. Remove the screw (1) that secures the bracket (2) retaining the heater core tubes (3) to the passenger side of the air distribution housing (5) and remove the bracket.
6. Carefully pull the heater core (4) out of the side of the air distribution housing.

7. Remove the two metal retaining clips (3) that secure the bottom of air distribution housing (2) to the HVAC housing (4).
8. Remove the seven screws (1) that secure the air distribution housing to the rear of the HVAC housing.
9. Remove the air distribution housing from the HVAC

housing.

10. If required, disassemble the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - DISASSEMBLY).

HOUSING-AIR INLET

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model shown. RHD model similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the four screws (2) that secure the air inlet housing (1) to the top of the HVAC housing (3) and remove the inlet housing from the HVAC housing.

NOTE: If the foam seal on the top of the inlet housing is deformed or damaged, the seal must be replaced.

3. If required, disassemble the air inlet housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - DISASSEMBLY).

SCREEN-AIR INLET

NOTE: LHD model shown. RHD model similar.

1. Remove the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Disengage the retaining tabs that secure the air inlet screen (1) to the passenger compartment side of the cowl panel (2).
3. Pull the air inlet screen straight downward and remove the screen from the cowl panel.

HOUSING-HVAC

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The HVAC housing and instrument panel must be removed from the vehicle as an assembly.

NOTE: The HVAC housing must be removed from the instrument panel and disassembled for service of the A/C evaporator, air intake housing, mode-air and blend-air doors and the heater core.

NOTE: LHD model shown in illustrations. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Partially drain the engine cooling system (refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE - DRAINING COOLING SYSTEM).
4. Remove the nut (2) that secures the A/C liquid line (3) and A/C suction line (5) to the A/C expansion valve (1).
5. Disconnect the A/C liquid and suction lines from the A/C expansion valve and remove and discard the O-ring seals.
6. Install plugs in, or tape over the opened refrigerant line

fittings and the expansion valve ports.

7. If equipped with the 3.8L engine, remove the upper intake manifold to help gain access to the hose clamps that secure the heater hoses to the heater core (refer to 9 - ENGINE/MANIFOLDS/MANIFOLD-INTAKE-UPPER - REMOVAL).

8. Using cable-type spring clamp pliers or equivalent, release the hose clamps that secure the heater hoses (2) to the heater core tubes (1) and disconnect the hoses from the tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during HVAC housing assembly removal.

9. Remove the instrument panel and place it on a workbench (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

10. Remove the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - REMOVAL).

11. Disconnect the instrument panel wire harness connectors from the evaporator temperature sensor, blower motor resistor, blower motor and the recirculation door actuator.

12. Remove the two bolts (1) that secure the air inlet housing (4) to the passenger side of the instrument panel support (3). Use caution not to damage the housing alignment pin (2) during removal of the HVAC housing assembly from the support.

13. Remove the demister ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - REMOVAL).
14. Remove the defroster duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-DEFROSTER - REMOVAL).
15. Remove the instrument panel ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL - REMOVAL).
16. Remove the four bolts (1) that secure the HVAC housing assembly (3) to the center of the instrument panel support (2) and remove the housing from the support. Use caution not to damage the housing alignment pin (4) during removal of the housing from the support.

DISASSEMBLY

HOUSING-AIR DISTRIBUTION

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

NOTE: Whenever the control cables are removed from the HVAC housing, new cables must be installed. Failure to replace the control cables when required can result in selected temperatures and operating modes not properly obtained.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air distribution housing (3) from the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL).
3. Remove the heater core from the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/CORE HEATER - REMOVAL).
4. If equipped with the 2.8L diesel engine, remove the electric positive temperature coefficient (PTC) heater unit from the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - REMOVAL).

5. Remove the temperature control cable (1) from the left side of the air distribution housing (2) and discard the cable (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CABLE-TEMPERATURE CONTROL - REMOVAL).

6. Remove the screw and washer (6) that secures the blend door cable lever (7) to the air distribution housing and remove the cable lever.

NOTE: To remove the blend door pivot lever, disengage the retaining tab and pull the lever straight off of the blend door pivot shaft.

7. Remove the blend door pivot lever (4) and washer (3) from the end of the blend door pivot shaft (5).

8. Remove the mode door cable (1) from the right side of the air distribution housing (2) and discard the cable (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CABLE-MODE DOOR - REMOVAL).

9. Remove the screw and washer (3) that secure the mode door cam (4) to the air distribution housing and remove the cam.

NOTE: If any foam seal on the air distribution housing outlets is deformed or damaged, the seal must be replaced.

10. Carefully cut the foam seals (1) along the parting line (2) of the two halves of the air distribution housing (3). If a seal is deformed or damaged, it must be replaced.

11. Remove the five screws (4) and one metal clip (5) that secure the two halves of the air distribution housing together.

12. Disengage the three plastic retaining tabs (6) that secure the two halves of the air distribution housing together and carefully separate the housing.

NOTE: If a seal on an air door is deformed or damaged, the air door must be replaced.

13. Disengage the air door(s) (1, 2, 3 and 4) from the mode door levers and remove the air doors from the air distribution housing (5).

NOTE: To remove the mode door levers, disengage the lever retaining tabs located on the inside of the air distribution housing and pull the levers straight out of the housing.

14. Remove the four mode door levers (1, 2, 3 and 4) from the right side of the air distribution housing (5).

HOUSING-AIR INLET

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air inlet housing (2) from the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - REMOVAL).

3. Remove the two screws (1) that secure the recirculation door actuator (3) to the right side of the air inlet housing (2) and remove the actuator.

4. To remove the recirculation door pivot shaft adapter (1) from the right end of the recirculation-air door, first carefully push down on the tab of the door lever pivot shaft adapter located inside of the air inlet housing (2), then pull the pivot shaft adapter straight out of the end of the recirculation-air door pivot shaft.

NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.

NOTE: If a rubber seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

5. Carefully pinch the two ends of the recirculation air-door together and remove the air-door from the air inlet housing. If the seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

HOUSING-HVAC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air inlet housing (2) from the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - REMOVAL).
3. Remove the air distribution housing (3) from the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL).

4. Remove the three screws (1) that secure the blower motor (2) to the bottom of the HVAC housing (3) and remove the blower motor.
5. Remove the two screws (4) that secure the blower motor resistor (5) to the back of the HVAC housing and remove the resistor.

6. Using needle nose pliers (1), disengage the two retaining tabs (2) that secure the evaporator temperature sensor (3) to the driver side of the HVAC housing (4) and remove the sensor.

7. Remove the A/C expansion valve from the A/C evaporator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/VALVE-A/C EXPANSION - REMOVAL).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

8. Remove the foam seal (2) from the flange (3) located on the top of the HVAC housing (4).

9. Remove the four screws (1) that secure the flange to the HVAC housing and remove the flange.

NOTE: If the foam insulator for the evaporator is deformed or damaged, it must be replaced.

10. Carefully remove the A/C evaporator (1) and its insulator (2) from the HVAC housing (3).

NOTE: If the foam seal for the condensate drain is

deformed or damaged, it must be replaced.

11. If required, remove the foam seal (1) from around the condensate drain located on the bottom of the HVAC housing (2).

12. Remove the two metal clips (1) and ten screws (2) that secure the two halves of the HVAC housing together (4 and 5).

13. Disengage the eight plastic retaining tabs (4) that secure the two halves of the HVAC housing together and separate the housing.

ASSEMBLY

HOUSING-AIR DISTRIBUTION

NOTE: Whenever the control cables are removed from the HVAC housing, new cables must be installed. Failure to replace the control cables when required can result in selected temperatures and operating modes not properly obtained.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Install the four mode door levers (1, 2, 3 and 4) onto the right side of the air distribution housing (5). Make sure the lever retaining tabs are fully engaged to the housing.

NOTE: Properly position the air doors within the air distribution housing by first aligning the four mode door levers to the scribe lines located on the right outer side of the air distribution housing. Then, install the air doors onto the mode door levers with the UP mark on each air door facing toward the top of the housing.

NOTE: If a seal on an air door is deformed or damaged, the air door must be replaced.

2. Align the four mode door levers to the scribe lines on the right outer side of the air distribution housing (5) and install the air door(s) (1, 2, 3 and 4) onto the mode door levers with the UP mark on each air door facing toward the top of the housing.

3. Align the air door(s) with the pivot shaft hole(s) in the air distribution housing (3) and install the two halves of the housing together. Make sure the three plastic retaining tabs (6) are fully engaged.

4. Install the five screws (4) and one metal clip (5) that secure the two halves of the air distribution housing together. Tighten the screws to 1.2 N·m (10 in lbs.). Make sure the metal clip is fully engaged to the housing halves.

NOTE: If any foam seal on the air distribution housing outlets is deformed or damaged, the seal must be replaced.

5. Inspect the foam seals (1), especially at the parting line (2). If a foam seal is deformed or damaged, it must be replaced.

NOTE: Align the pins on the mode door levers with the grooves in the back of the mode door cam prior to installation of the cam.

6. Align the mode door levers on the right side of the air distribution housing (2) to the mode door cam (4) and install the cam onto the housing. Make sure the levers are correctly engaged to the cam.

7. Install the screw and washer (3) that secure the mode door cam to the air distribution housing. Tighten the screw to 0.6 N·m (5 in. lbs.).

8. Install a new mode door cable (1) (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CABLE-MODE DOOR - INSTALLATION).

9. Install the washer (3) and the blend door pivot lever (4) onto the end of the blend door pivot shaft (5) located on the left side of the air distribution housing (2). Make sure the lever retaining tab is fully engaged to the pivot shaft.

NOTE: Align the pin on the blend door lever with the groove in the pivot lever prior to installation of the blend door lever.

10. Install the blend door lever (7) onto the air distribution housing. Make sure the levers are correctly aligned to each other.

11. Install the screw and washer (6) that secures the blend door lever to the air distribution housing. Tighten the screw to 0.6 N·m (5 in. lbs.).

12. Install a new temperature control cable (1) (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CABLE-TEMPERATURE CONTROL - INSTALLATION).

13. If equipped with the 2.8L diesel engine, install the electric positive temperature coefficient (PTC) heater unit (refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - INSTALLATION).

14. Install the heater core (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/CORE-HEATER - INSTALLATION).

15. Install the air distribution housing (3) onto the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).

16. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC -

HOUSING-HVAC ASSEMBLY - INSTALLATION).

HOUSING-AIR INLET

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Carefully install the recirculation-air door into the air inlet housing (2) by pinching the two ends of the air-door together and aligning the pivot shafts of the air-door to the pivot shaft holes in the air inlet housing.

NOTE: Install the recirculation door pivot shaft adapter by carefully pushing it straight into the end of the recirculation door pivot shaft.

2. Install the recirculation door pivot shaft adapter (1) into the right side pivot shaft of the recirculation air-door. Make sure the adapter is fully engaged to the pivot shaft.

3. Install the recirculation door actuator (2) onto the right side of the air inlet housing (1). If necessary, rotate the actuator slightly to align the splines of the actuator output shaft (3) with those on the recirculation door pivot shaft adapter (4).

4. Install the two screws (1) that secure the recirculation door actuator (3) to the air inlet housing (2). Tighten the screws to 1.2 N·m (10 in. lbs.).

5. Install the air inlet housing (2) onto the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING- AIR INLET - INSTALLATION).
 6. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

HOUSING-HVAC

NOTE: If the A/C evaporator is being replaced, add 50 milliliters (1.7 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that

the insulator is properly positioned.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Install the two halves of the HVAC housing (4 and 5) together and engage the eight plastic retaining tabs (4). Make sure the retaining tabs are fully engaged.
2. Install the ten screws (2) and two metal clips (1) that secure the two halves of the HVAC housing together. Tighten the screws to 1.2 N·m (10 in lbs.). Make sure the metal clips are fully engaged to the housing halves.

NOTE: If the foam seal for the condensate drain is deformed or damaged, it must be replaced.

3. If removed, install the foam seal (1) around the condensate drain located on bottom of the HVAC housing (2).

NOTE: If the foam insulator for the evaporator is deformed or damaged, it must be replaced.

4. Install the A/C evaporator (1) into the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator (2) around the A/C evaporator is properly positioned.

5. Install the flange (3) onto the top of the HVAC housing (4).
6. Install the four screws (1) that secure the flange to the HVAC housing. Tighten the screws to 1.2 N·m (10 in lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

7. Install the foam seal (2) onto the flange.
8. Install the A/C expansion valve onto the A/C evaporator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/VALVE-A/C EXPANSION - INSTALLATION).

9. Install the evaporator temperature sensor (1) into the driver side of the HVAC housing (2). Make sure the retaining tabs (3) are fully engaged to the housing.

10. Position the blower motor (2) into the bottom of the HVAC housing (3).
11. Install the three screws (1) that secure the blower motor to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).
12. Position the blower motor resistor (5) into the HVAC housing.
13. Install the two screws (4) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).

14. Install the air inlet housing (2) onto the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING- AIR INLET - INSTALLATION).
15. Install the air distribution housing (3) onto the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).

NOTE: If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

16. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

INSTALLATION

HOUSING-AIR DISTRIBUTION

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Position the air distribution housing (2) onto the rear of the HVAC housing (4).
2. Install the two metal retaining clips (3) that secure the bottom of the air distribution housing to the HVAC housing.
3. Install the seven screws (1) that secure the air distribution

housing to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).

NOTE: If the foam seals for the heater core are deformed or damaged, they must be replaced.

4. Carefully install the heater core (4) into the passenger side of the air distribution housing (5).
5. Install the retaining bracket (2) and the screw (1) that secures the heater core tubes (3) to the air distribution housing. Tighten the screw to 1.2 N·m (10 in. lbs.).

6. Position the flange (4) to the front of the HVAC housing (2).
7. Install the screw (3) that secures the flange to the HVAC housing. Tighten the screw to 1.2 N·m (10 in. lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

8. Install the foam seal (1) onto the flange.
9. Install the floor distribution ducts onto the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - INSTALLATION).

NOTE: If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

10. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

HOUSING-AIR INLET

NOTE: LHD model shown. RHD model similar.

1. Position the air inlet housing (1) onto the top of the HVAC housing (3).
2. Install the four screws (2) that secure the air inlet housing to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).

NOTE: If the foam seal on the top of the inlet housing is deformed or damaged, the seal must be replaced.

3. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

SCREEN-AIR INLET

NOTE: LHD model shown. RHD model similar.

1. Position the air inlet screen (1) to the passenger compartment side of the cowl panel (2) and engage the retaining tabs that secure the screen to the cowl. Make sure the retaining tabs are fully engaged.

NOTE: Make sure the air inlet screen retaining tabs are fully engaged. Failure to fully engage the screen to the cowl and dash panel will result in a leak.

2. Push the air inlet screen upward to engage the retaining tabs that secure the screen to the dash panel. Make sure the retaining tabs are fully engaged.

3. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

HOUSING-HVAC

NOTE: LHD model shown in illustrations. RHD model similar.

1. Position the HVAC housing assembly (3) into the instrument panel support (2). Be certain that the housing alignment pin (4) is correctly located.
2. Install the four bolts (1) that secure the HVAC housing assembly to the center of instrument panel support. Tighten the bolts to 4 N·m (35 in. lbs.).

NOTE: If a foam seal on the top of the HVAC housing is deformed or damaged, the seal must be replaced.

3. Install the instrument panel ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL - INSTALLATION).
4. Install the defroster duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-DEFROSTER - INSTALLATION).
5. Install the demister ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL DEMISTER - INSTALLATION).

6. Verify that the housing alignment pin (2) is correctly located in the passenger side of the instrument panel support (3).
7. Install the two bolts (1) that secure the air inlet housing (4) to the instrument panel support. Tighten the bolts to 4 N·m (35 in. lbs.).
8. Connect the instrument panel wire harness connectors to the evaporator temperature sensor, blower motor resistor, blower motor and the recirculation door actuator.
9. Install the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - INSTALLATION).
10. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

11. Remove the previously installed plugs or caps and connect the heater hoses (2) to the heater core tubes (1).
12. Using cable-type spring clamp pliers or equivalent, correctly position the two hose clamps that secure the heater hoses to the heater core tubes and engage the clamps to the tubes.
13. If equipped with the 3.8L engine, install the upper intake manifold (refer to 9 - ENGINE/MANIFOLDS/MANIFOLD-INTAKE-UPPER - INSTALLATION).

14. Remove the tape or plugs from the opened refrigerant line fittings and the expansion valve ports.

15. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

16. Connect the A/C liquid line (3) and A/C suction line (5) onto the A/C expansion valve (1).

17. Install the nut (2) that secures the A/C liquid and suction lines to the A/C expansion valve. Tighten the nut to 8 N·m (70 in. lbs.).

18. Reconnect the negative battery cable.

19. If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

20. Refill the engine cooling system (refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - COOLING SYSTEM FILL).

21. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

22. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

MOTOR-BLOWER

DESCRIPTION

The blower motor (1) is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel (2) within the HVAC air inlet housing at the selected

speed.

The blower motor is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire harness connector (3) and three mounting tabs (4). The squirrel cage-type blower wheel is secured to the blower motor shaft and is positioned within the air inlet housing on the passenger side of the HVAC housing.

OPERATION

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

The blower motor will operate whenever the ignition switch is in the Run position and the blower motor control is in any position except Off. The blower motor receives battery current through the totally integrated power module (TIPM) whenever the ignition switch is in the Run position.

Blower motor speed is controlled by regulating the ground path through or around the blower motor resistor and through the blower motor control located within the A/C-heater control.

The blower motor can be accessed for service from underneath the instrument panel.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is UNABLE to detect an OPEN circuit for the blower motor.

The blower motor control system is diagnosed using a scan tool (refer to 24 - HVAC Electrical Diagnostics for more information).

The blower motor and blower motor wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is UNABLE to detect an OPEN circuit for the blower motor.

To determine if an open condition exists within the blower motor circuit wiring, it is necessary to disconnect the negative battery cable and check for continuity within the blower motor circuits using an ohmmeter. For circuit

descriptions and diagrams, refer to Air Conditioning/Heater in Group 8W - Wiring Diagrams.

OPERATION

Possible causes of an inoperative blower motor include:

- Open fuse
- Inoperative blower motor resistor
- Inoperative blower motor switch
- Inoperative blower motor
- Inoperative blower motor circuit wiring or wire harness connectors

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material on fresh air inlet screen
- Foreign material in blower wheel
- Foreign material in HVAC housing
- Improper blower motor mounting
- Deformed or damaged blower wheel
- Worn blower motor bearings or brushes

VIBRATION

Possible causes of a blower motor vibration include:

- Improper blower motor mounting
- Foreign material in blower wheel
- Deformed or damaged blower wheel
- Worn blower motor bearings

REMOVAL

NOTE: The blower motor is located on the bottom of the passenger side of the HVAC housing. The blower motor can be removed from the vehicle without having to remove the HVAC housing.

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. From underneath the instrument panel, disconnect the instrument panel wire harness connector (3) from the blower motor (4).

3. Remove the three screws (2) that secure the blower motor to the bottom of the HVAC housing (1) and remove the blower motor.

INSTALLATION

NOTE: LHD model shown. RHD model similar.

1. Position the blower motor (4) into the bottom of the HVAC housing (1).
2. Install the three screws (2) that secure the blower motor to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).
3. Connect the instrument panel wire harness connector (3) to the blower motor.
4. Reconnect the negative battery cable.

OUTLETS-AIR

DESCRIPTION

NOTE: LHD model shown. RHD model similar.

There is one defroster air outlet (1) located on the top of the instrument panel (2). The airflow from the defroster outlet is directed by fixed vanes in the outlet and cannot be adjusted. The defroster air outlet is not serviceable from the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - REMOVAL).

There are two side window demister air outlets (3). One located on each end of the instrument panel top cover. The airflow from the side window demister air outlets is directed by fixed vanes in the outlets and cannot be adjusted. The side window demister air outlets are not serviceable from the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL COVER - REMOVAL).

There are four round instrument panel air outlets (4). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and two air outlets are located at the top of the instrument panel center bezel. Each of the instrument panel air outlets contain movable vanes that can direct or shut off the flow of the conditioned air leaving each of the instrument panel outlets. Each instrument panel air outlet can be serviced separately.

REMOVAL

1. Rotate each air outlet (1) counter-clockwise to disengage its retaining tabs.

NOTE: If the foam seal on the air outlet is deformed or damaged, it must be replaced.

2. Carefully pull each air outlet straight out of the instrument panel (2).

INSTALLATION

NOTE: If the foam seal on the air outlet is deformed or damaged, it must be replaced.

1. Position each air outlet (1) straight into the instrument panel (2).

2. Rotate each air outlet clockwise to engage its retaining tabs. Make sure the retaining tabs are fully engaged.

PLUMBING

PLUMBING

DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a A/C system consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a small molecular structure. The ends of the refrigerant lines are made from lightweight aluminum and braze-less fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and

can reduce the flow of refrigerant within the system.

OPERATION

High pressures are produced in a refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

Depending on vehicle, model and market application, refrigerant lines are connected to each other or other A/C system components with block-type or quick-connect type fittings. To ensure the integrity of the refrigerant system, O-rings and/or gaskets may be used to seal the refrigerant system connections.

The refrigerant lines and hoses cannot be repaired and must be replaced if leaking or damaged.

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage and serious or fatal injury.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kilopascals (21 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage, personal injury or death.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

NOTE: If the A/C refrigerant system charge is empty or low, a leak in the A/C system is likely. Visually inspect all A/C lines, fittings and components for an oily residue. Oil residue can be an indicator of an A/C system leak location.

NOTE: The only way to correctly determine if the refrigerant system is fully charged with R-134a is to completely evacuate and recharge the A/C system.

Connect a suitable manifold gauge set and determine if the static A/C system pressure is above or below 345 kPa (50 psi) (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT). If less than 345 kPa (50 psi), proceed to [SYSTEM EMPTY](#). If greater than 345 kPa (50 psi), go to [SYSTEM LOW](#).

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg) or greater vacuum) (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to [STEP 2](#).
2. Prepare and dispense 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) and proceed to [STEP 1](#) of the System Low procedure.

SYSTEM LOW

1. Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
2. Operate the heating-A/C system with the engine at idle under the following conditions for at least 5 minutes.
 - Doors or windows open
 - Transaxle in Park or Neutral with the parking brake set (depending on application)
 - A/C-heater controls set to outside air, full cool, panel mode, high blower and with A/C compressor engaged

CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in an R-134a refrigerant system.

3. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only DaimlerChrysler approved refrigerant dye.

STANDARD PROCEDURE

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: Eye protection must be worn when servicing an air conditioning refrigerant system. Turn off

(rotate clockwise) all valves on the equipment being used, before connecting to or disconnecting from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

When servicing the A/C system, an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

- **LOW PRESSURE GAUGE HOSE** - The low pressure hose (Blue with Black stripe) attaches to the low side service port. This port is located on the A/C suction line near the A/C expansion valve at the rear of the engine compartment.
- **HIGH PRESSURE GAUGE HOSE** - The high pressure hose (Red with Black stripe) attaches to the high side service port. This port is located on the A/C liquid line near the left front of the engine compartment.
- **RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE** - The center manifold hose (Yellow,

or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions may result in serious or fatal injury.

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT).
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.

4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT CHARGE LEVEL or the Underhood HVAC Specification Label for the proper amount of R-134a refrigerant).

An R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. Refer to the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
2. A manifold gauge set and an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 should be connected to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is operating and the blower motor is running at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm).
7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning could result in possible personal injury or death.

8. Disconnect the charging station and manifold gauge set from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

COMPRESSOR-A/C

DESCRIPTION

A/C COMPRESSOR

This A/C system uses a Zexel DKS-17DS ten cylinder, double-acting swash plate-type A/C compressor (1). This A/C compressor has a fixed displacement of 175.5 cubic centimeters (10.7 cubic inches) and has the suction and discharge ports (2) located on the compressor cylinder block (5).

The DKS-17DS compressor uses a electrically operated clutch (6) to engage and disengage it from the engine accessory drive belt. This A/C compressor also has an integral high pressure relief valve (4) located on the cylinder head (3) and a label which identifies the use of R-134a refrigerant.

HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head at the rear of the A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - DESCRIPTION). This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C

compressor.

The A/C compressor cannot be repaired and must be replaced if inoperative or damaged. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/RECEIVER/DRIER-A/C - REMOVAL).

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3430 to 3930 kPa (497 to 570 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2990 kPa (4370 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING**A/C COMPRESSOR NOISE**

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainers. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CLUTCH-A/C COMPRESSOR - INSTALLATION).
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DESCRIPTION - REFRIGERANT LINES).

5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY), (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
6. If the high pressure relief valve still does not seat properly, replace the A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL).

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch field coil or engine.

NOTE: 2.8L engine shown in illustrations. 3.8L engine similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. On 2.8L equipped models, remove the air cleaner housing (refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
4. On 3.8L equipped models, remove the coolant recovery container (refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).
5. Remove the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
6. On 2.8L equipped models, remove the generator (refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
7. Remove the nuts (2) that secure the A/C discharge line (1) and A/C suction line (3) to the A/C compressor (4).
8. Disconnect the A/C discharge and suction lines from the A/C compressor and remove and discard the O-ring seals and gaskets.
9. Install plugs in, or tape over the opened refrigerant line fittings and compressor ports and position the refrigerant lines out of the way.
10. Disconnect the engine wire harness connector (5) from the field coil connector (6).

11. On 2.8L equipped models, remove the splash shield from the left front fender to gain access to the lower compressor retaining bolt (refer to 23 - BODY/EXTERIOR/ SPLASH SHIELD-WHEELHOUSE - REMOVAL).

12. Remove the front lower bolt (4) and the rear bolt (3) that secure the A/C compressor (2) to the mounting bracket.

13. Support the A/C compressor and remove the upper front bolt (1) that secures the A/C compressor to the mounting bracket and remove the compressor from the engine compartment.

INSTALLATION

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: 2.8L engine shown in illustrations. 3.8L engine similar.

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL for more information). When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL

LEVEL). Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

2. Position the A/C compressor into the engine compartment.

3. Loosely install the three bolts (1, 3 and 4) that secure the A/C compressor to the engine. Tighten each of the fasteners to 28 N·m (21 ft. lbs.) using the following sequence:

- The upper bolt at the front of the compressor.
- The lower bolt at the front of the compressor.
- The bolt at the rear of the compressor.

4. On 2.8L equipped models, install the splash shield onto the left front fender (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-WHEELHOUSE - INSTALLATION).

5. Connect the engine wire harness connector (5) to the field coil connector (6).

6. Remove the plugs or tape from the opened refrigerant line fittings and compressor ports.

7. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the discharge and suction line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

8. Connect the A/C discharge line (1) and A/C suction line (3) to the A/C compressor (4).

9. Install the nuts (2) that secure the A/C discharge and suction lines to the A/C compressor. Tighten the nuts to 23 N·m (17 ft. lbs.).

10. On 2.8L equipped models, install the generator (refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

11. Install the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

12. On 2.8L equipped models, install the air cleaner housing (refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).

13. On 3.8L equipped models, install the coolant recovery container (refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).

14. Reconnect the negative battery cable.

15. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

16. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

CONDENSER-A/C

DESCRIPTION

The A/C condenser (1) is located in the front of the engine compartment behind the grille. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with a tapping block for the refrigerant lines (2) and the integral automatic transmission fluid cooler (3) (when equipped with an automatic transmission), mounting brackets (4) that attach the condenser to the radiator and a replaceable receiver/drier (5).

The A/C condenser may be removed for service without removing the radiator from the vehicle when equipped with a manual transmission. When equipped with an automatic transmission, the radiator and condenser must be removed from the engine compartment as an assembly.

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C condenser has no serviceable parts except for the O-ring seals and gaskets. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is removed from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if found to be leaking or damaged.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: Before removing the A/C condenser, note the location of each of the radiator and condenser air seals. These seals are used to direct air through the A/C condenser and the radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the coolant recovery container (refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).
4. On 2.8L equipped models, disconnect the air intake hose from the throttle body and position the hose out of the way.
5. Remove the nuts (3 and 5) that secure the A/C discharge line (2) and A/C liquid line (4) to the left side of the A/C condenser (1).
6. Disconnect the A/C discharge and liquid lines from the A/C condenser and remove and discard the O-ring seals and gaskets.
7. Install plugs in, or tape over the opened refrigerant line fittings and condenser ports.

NOTE: Illustration shown with A/C condenser removed for clarity.

8. Remove the grille (refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
9. Remove the upper radiator closure.
10. If equipped with an automatic transmission, remove the radiator and A/C condenser as an assembly and place it on a workbench (refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
11. Remove the bolts at the five locations shown (3) that secure the A/C condenser (1) to the radiator.

12. If equipped with an automatic transmission, separate the A/C condenser from the radiator.

13. If equipped with a manual transmission, remove the two bolts that secure the radiator to the upper radiator support and carefully push the top of the radiator rearward to provide clearance for the refrigerant line tapping block (2), then lift the A/C condenser out from the front of the engine compartment.

14. If required and equipped with an automatic transmission, remove the bolt (4) that secures the transmission cooler line adapter (5) to the left side of the automatic transmission fluid cooler (6).

15. If required, remove the A/C receiver/drier (7) from the right side of the A/C condenser (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/RECEIVER/DRIER-A/C - REMOVAL).

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: If only the A/C condenser is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: Be certain that each of the radiator and condenser air seals are installed in their proper locations. These air seals are required for the A/C and engine cooling systems to perform as designed.

NOTE: Illustration shown with A/C condenser removed for clarity.

1. If removed, install the A/C receiver/drier (7) onto the right side of the A/C condenser (1) (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/RECEIVER/DRIER-A/C - INSTALLATION).
2. If removed and equipped with an automatic transmission, install the transmission cooler line adapter (5) using new O-rings to the left side of the automatic transmission fluid cooler (6) and install the retaining bolt (4). Tighten the bolt securely.
3. If equipped with a manual transmission, carefully push the top of the radiator rearward to provide clearance for the refrigerant line tapping block (2) and position the A/C condenser into the front of the engine compartment, then reposition the radiator and install the two bolts that secure the radiator to the upper radiator support. Tighten the bolts securely.
4. If equipped with an automatic transmission, position the A/C condenser to the front of the radiator on the workbench.
5. Install the bolts at the five locations shown (3) that secure the A/C condenser to the radiator. Tighten the bolts to 5 N·m (45 in. lbs.).
6. If equipped with an automatic transmission, install the radiator and A/C condenser as an assembly (refer to 7 - COOLING/ENGINE/RADIATOR - INSPECTION).
7. Install the upper radiator closure.
8. Install the grille (refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

9. Remove the tape or plugs from the opened refrigerant line fittings and condenser ports.

10. Lubricate a new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the refrigerant line fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

11. Connect the A/C discharge line (2) and A/C liquid line (4) to the left side of the A/C condenser (1) and install the retaining nuts (3 and 5). Tighten the nuts to 23 N·m (17 ft. lbs.).

12. On 2.8L equipped models, reconnect the air intake hose to the throttle body.

13. Install the coolant recovery container (refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).

14. Reconnect the negative battery cable.

15. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

16. If the A/C condenser is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

17. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

18. If equipped with automatic transmission, check the automatic transmission fluid level and fill as required.

CORE-HEATER

DESCRIPTION

NOTE: LHD model shown. RHD model similar.

The heater core (1) is mounted into the passenger side of HVAC air distribution housing, located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes and fins and is secured into the air distribution housing by plastic retaining tabs.

The heater core tubes (2) are secured to the heater core by use of crimped fittings (3) and to the HVAC housing by a metal bracket and screw. The heater core tubes are not serviced separately from the heater core.

The HVAC housing assembly must be removed from the vehicle to service the heater core and tubes.

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and it must be replaced if inoperative, leaking or damaged.

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the floor distribution duct from the passenger side of the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - REMOVAL).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

3. Remove the foam seal (1) from the flange (4) located on the front of the HVAC housing (2).
4. Remove the screw (3) that secures the flange to the HVAC housing and remove the flange.

5. Remove the screw (1) that secures the bracket (2) retaining the heater core tubes (3) to the passenger side of the air distribution housing (5) and remove the bracket.
6. Carefully pull the heater core (4) out of the side of the air distribution housing.

INSTALLATION

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

NOTE: If the foam seals for the heater core are deformed or damaged, they must be replaced.

1. Carefully install the heater core (4) into the passenger side of the air distribution housing (5).
2. Install the retaining bracket (2) and the screw (1) that secures the heater core tubes (3) to the air distribution housing. Tighten the screw to 1.2 N·m (10 in. lbs.)

3. Position the flange (4) to the front of the HVAC housing (2).

4. Install the screw (3) that secures the flange to the HVAC housing. Tighten the screw to 1.2 N·m (10 in. lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

5. Install the foam seal (1) onto the flange.

6. Install the floor distribution duct onto the passenger side of the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - INSTALLATION).

NOTE: If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

7. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

CORE-VALVE-SERVICE PORT

DESCRIPTION

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The high side service port (1) is located on the A/C liquid line (2) near the left front of the engine compartment. The low side service port (3) is located on the A/C suction line (4) near the A/C expansion valve at the dash panel. Both the high side and low side A/C service port valve cores are serviceable.

NOTE: The protective cap aids in service port sealing and helps protects the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions may result in serious or fatal injury.

NOTE: Typical A/C service port shown.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

NOTE: Typical A/C service port shown.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).
4. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
5. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

6. Install the protective cap (1) onto the service port.

EVAPORATOR-A/C

DESCRIPTION

The A/C evaporator (1) is located within the HVAC housing, behind the instrument panel. The A/C evaporator and insulator (2) are positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (4) are connected and sealed to the A/C expansion valve by use of rubber O-rings and a tapping block (3).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing.

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever an A/C expansion valve is removed from the A/C evaporator.

The A/C evaporator cannot be repaired and must be replaced if found to be leaking or damaged.

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air distribution housing from the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL).
3. Remove the A/C expansion valve from the A/C evaporator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/VALVE-A/C EXPANSION - REMOVAL).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

4. Remove the foam seal (2) from the flange (3) located on the top of the HVAC housing (4).
5. Remove the four screws (1) that secure the flange to the HVAC housing and remove the flange.

NOTE: If the foam insulator for the evaporator is deformed or damaged, it must be replaced.

6. Carefully remove the A/C evaporator (1) and its insulator (2) from the HVAC housing (3).

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: If only the A/C evaporator is being replaced, add 50 milliliters (1.7 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator is properly positioned.

NOTE: If the foam insulator for the evaporator is deformed or damaged, it must be replaced.

1. Install the A/C evaporator (1) into the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator (2) around the A/C evaporator is properly positioned.

2. Install the flange (3) onto the top of the HVAC housing (4).

3. Install the four screws (1) that secure the flange to the HVAC housing. Tighten the screws to 1.2 N·m (10 in lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

4. Install the foam seal (2) onto the flange.

5. Install the A/C expansion valve onto the A/C evaporator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/VALVE-A/C EXPANSION - INSTALLATION).

6. Install the air distribution housing onto the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).

7. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

8. If the A/C evaporator is being replaced, add 50 milliliters (1.7 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINE-A/C DISCHARGE

DESCRIPTION

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser. The A/C discharge line contains a fitting (2) for the A/C pressure transducer (3) and is secured to the A/C compressor and the A/C condenser by use metal fittings (4).

The A/C discharge line is sealed to the A/C compressor and to the A/C condenser by use of rubber O-ring seals (5) and metal gaskets (6). The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C discharge line has no serviceable parts except the O-ring seals and gaskets. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C discharge line is removed.

The A/C discharge line cannot be repaired and must be replaced if found to be leaking or damaged.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: 3.8L engine shown. 2.8L engine similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM

RECOVERY).

3. Disconnect the engine wire harness connector (4) from the A/C pressure transducer (5) located on the A/C discharge line (2) near the A/C compressor (6).

4. If required, remove the A/C pressure transducer from the A/C discharge line and remove and discard the O-ring seal.

5. On 2.8L diesel engines, disconnect the air intake hose from the throttle body and position the hose out of the way.

6. Remove the nuts (3) that secure the A/C discharge line to the A/C condenser (1) and A/C compressor.

7. Disconnect the A/C liquid line from the A/C condenser and A/C compressor and remove and discard the O-ring seals and gaskets.

8. Install plugs in, or tape over the opened discharge line fittings and condenser and compressor ports.

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: 3.8L engine shown. 2.8L engine similar.

1. Position the A/C discharge line (2) into the engine compartment.
2. Remove the tape or plugs from the discharge line fittings and the condenser and compressor ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C discharge line to the A/C condenser (1)

and A/C compressor (6).

5. Install the nuts (3) that secure the A/C discharge line to the A/C condenser and the A/C compressor. Tighten the nuts to 23 N·m (17 ft. lbs.).

6. On 2.8L diesel engines, reconnect the air intake hose to the throttle body.

7. If removed, install the A/C pressure transducer (5) onto the A/C discharge line using a new O-ring seal. Tighten the A/C pressure transducer securely.

8. Connect the wire harness connector (4) to the A/C pressure transducer.

9. Reconnect the negative battery cable.

10. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

11. Adjust the refrigerant oil level (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

12. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C LIQUID

DESCRIPTION

The A/C liquid line (1) is the refrigerant line that carries refrigerant from the A/C condenser to the A/C evaporator. The A/C liquid line contains the high side service port (2) and is secured to the A/C expansion valve by a tapping block (3) and to the A/C condenser by a metal fitting (6).

The A/C liquid line is sealed to the A/C condenser and the A/C expansion valve by use of rubber O-ring seals (4) and a metal gasket (7). The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C liquid line has no serviceable parts except for the O-ring seals, gaskets, high-side service port valve and cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C liquid line is removed.

The A/C liquid line cannot be repaired and must be replaced if found to be leaking or damaged.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C liquid line can be serviced separately from the A/C suction line.

NOTE: 3.8L engine shown in illustrations. 2.8L engine similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the nut (2) that secures the A/C liquid line (3) and A/C suction line (5) to the A/C expansion valve (1).
4. Disconnect the A/C liquid and suction lines from the A/C expansion valve and remove and discard the O-ring seals.
5. If required remove the retaining bracket (4) that secures the A/C liquid line to the A/C suction line and separate the liquid line from the suction line.

6. On 2.8L equipped models, disconnect the air intake hose from the throttle body and position the hose out of the way.
7. Remove the nut (2) that secures the A/C liquid line (1) to the tapping block of the A/C condenser (3) located in the left front of the engine compartment.
8. Disconnect the A/C liquid line from the A/C condenser and remove and discard the O-ring seal and gasket.
9. Install plugs in, or tape over the opened suction and liquid line fittings and the condenser and expansion valve ports.

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system (refer to 24 -

HEATING & AIR

CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: 3.8L engine shown in illustrations. 2.8L engine similar.

1. Position the A/C liquid line (1) into the engine compartment.
2. Remove the tape or plugs from the opened suction and liquid line fittings and the condenser and expansion valve ports.
3. Lubricate a new rubber O-ring seals with clean refrigerant oil and install them and a new gasket onto the suction and liquid line fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid line to the A/C condenser (3) and install the retaining nut (2). Tighten the nut to 23 N·m (17 ft. lbs.).

5. If removed, install the A/C liquid line (3) into the tapping

block of the A/C suction line (5).

6. On 2.8L equipped models, connect the air intake hose to the throttle body.

7. Connect the A/C liquid line and A/C suction line to the A/C expansion valve (1) and install the retaining nut (2).

Tighten the nut to 8 N·m (70 in. lbs.).

8. If removed, install the bracket (4) that secures the A/C liquid line to the A/C suction line.

9. Reconnect the negative battery cable.

10. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

11. Adjust the refrigerant oil level (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

12. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C SUCTION

DESCRIPTION

The A/C suction line (1) is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C compressor. The A/C suction line contains the low side service port (2) and is secured to the A/C expansion valve by use of a tapping block (3) and to the A/C compressor by a metal fitting (5). The tapping block portion of the A/C suction also secures the A/C liquid line (7) to the A/C expansion valve.

The A/C suction line is sealed to the A/C expansion valve and A/C compressor by use of rubber O-ring seals (4) and a metal gasket (6). The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C suction line can be serviced separately from the A/C liquid line and has no replaceable parts except for the O-ring seals, gaskets, low side service port valve and cap. The O-ring seals and gaskets must be replaced whenever the A/C suction line is removed.

The A/C suction line cannot be repaired and must be replaced if found to be leaking or damaged.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C liquid line can be serviced separately from the A/C suction line.

NOTE: 3.8L engine shown in illustrations. 2.8L engine similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the nut (2) that secures the A/C liquid line (3) and A/C suction line (5) to the A/C expansion valve (1).
4. Disconnect the A/C liquid and suction lines from the A/C expansion valve and remove and discard the O-ring seals.
5. If required, remove the retaining bracket (4) that secures the A/C liquid line to the A/C suction line and separate the liquid line from the suction line.

6. On 2.8L diesel engines, disconnect the air intake hose from the throttle body and position the hose out of the way.
7. Remove the nut (1) that secures the A/C suction line (2) to the A/C compressor (3).
8. Disconnect the A/C suction line from the A/C compressor and remove and discard the O-ring seal and gasket.
9. Install plugs in, or tape over the opened liquid and suction line fittings and the compressor and expansion valve ports.

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to

determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: 3.8L engine shown in illustrations. 2.8L engine similar.

1. Position the A/C suction line (2) into the engine compartment.
2. Remove the tape or plugs from the opened liquid and suction line fittings and the compressor and expansion valve ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and a new gasket onto the liquid and suction line fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C suction line to the A/C compressor (3) and install the retaining nut (1). Tighten the nut to 23 N·m (17 ft. lbs.).
5. On 2.8L diesel engines, reconnect the air intake hose to the throttle body.

6. If removed, install the A/C liquid line (3) into the tapping block of the A/C suction line (5).
7. Connect the A/C liquid line and A/C suction line to the A/C expansion valve (1) and install the retaining nut (2). Tighten the nut to 8 N·m (70 in. lbs.).
8. If removed, install the bracket (4) that secures the A/C liquid line to the A/C suction line.
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
11. Adjust the refrigerant oil level (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).
12. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

OIL-A/C REFRIGERANT

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, polyalkylene glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The Zexel DKS-17DS A/C compressor used in this vehicle is designed to use VC-46 PAG oil. Use only this type of refrigerant oil the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: The Zexel DKS-17DS A/C compressor used in this vehicle is designed to use VC-46 PAG refrigerant oil. Only refrigerant oil of the same type should be used to service the R-134a A/C system. Do not use any other refrigerant oil. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C condenser, A/C evaporator or A/C receiver/drier is replaced. See the

Refrigerant Oil Capacities chart.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. Refer to [COMPRESSOR OIL DRAIN PROCEDURE](#).

REFRIGERANT OIL CAPACITIES

COMPONENT NAME	ml.	oz.
Total System Fill	150 ml.	5.0 oz.
A/C Condenser	60 ml.	2.0 oz.
A/C Evaporator	60 ml.	2.0 oz.
A/C Receiver/Drier	30 ml.	1.0 oz.
A/C Compressor	Drain and measure the oil from the old compressor. Refer to COMPRESSOR OIL DRAIN PROCEDURE .	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.
3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - INSTALLATION).

RECEIVER/DRIER-A/C

DESCRIPTION

The A/C receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The A/C

receiver/drier is installed on the high-side of the A/C system and is connected directly to the right end of the A/C condenser by a bolt (3). The A/C receiver/drier can be serviced separately from the A/C condenser.

OPERATION

The A/C receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C receiver/drier has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C receiver/drier is removed.

The A/C receiver/drier cannot be repaired and must be replaced if found to be leaking or damaged, or if an internal failure of the A/C compressor has occurred.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: Illustration shown with A/C condenser removed from vehicle for clarity.

1. Disconnect and isolate the negative battery cable.

2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the grille (refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Remove the bolt (3) that secures the A/C receiver/drier (1) to the right side A/C condenser (2).
5. Disconnect the A/C receiver/drier from the A/C condenser and remove and discard the O-ring seals.
6. Install plugs in, or tape over the opened receiver/drier fittings and the condenser ports.

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: If only the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: Illustration shown with A/C condenser removed from vehicle for clarity.

1. Remove the tape or plugs from the receiver/drier fittings and the condenser ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the receiver/drier fittings. Use only the specified O-rings as they are made of a special material for

the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

3. Connect the receiver/drier (1) to the right end of the A/C condenser (2).

4. Install the bolt (3) that secures the receiver/drier to the A/C condenser. Tighten the bolt to 22 N·m (16 ft. lbs.).

5. Install the grille (refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

6. Reconnect the negative battery cable.

7. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

8. Add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/OIL-A/C REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

9. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT-A/C

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY for more information).

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

STANDARD PROCEDURE

REFRIGERANT CHARGE LEVEL

Single Unit	0.51 kg (1.125 lbs.)
-------------	----------------------

VALVE-A/C EXPANSION

DESCRIPTION

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1) with an inlet port (2), outlet port (3) and an integral thermal sensor (4).

The A/C expansion valve is located between the A/C refrigerant lines and the A/C evaporator in the engine compartment.

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the A/C evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

A/C EXPANSION VALVE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid COI is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid COI is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to [STEP 6](#). If not OK, replace the inoperative A/C expansion valve.

WARNING:

Protect the skin and eyes from exposure to liquid COI or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid COI or another suitable super-cold material. **Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to [STEP 7](#). If not OK, replace the inoperative A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance (refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST).

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Disconnect and isolate the negative battery cable.

2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the nut (2) that secures the A/C liquid line (3) and A/C suction line (5) to the A/C expansion valve (1).
4. Disconnect the A/C liquid and suction lines from the A/C expansion valve, remove and discard the O-ring seals and position the refrigerant lines out of the way.

5. Remove the two bolts (3) that secure the A/C expansion valve (2) to the evaporator tube tapping block (1).
6. Remove the A/C expansion valve from the evaporator tube tapping block and remove and discard the O-ring seals.
7. Install plugs in, or tape over the opened refrigerant line and evaporator tube fittings and all expansion valve ports.

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

1. Remove the tape or plugs from the opened refrigerant lines and evaporator tube fittings and all of the expansion valve ports.
2. Lubricate new O-ring seals with clean refrigerant oil and

install them onto the refrigerant line and evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

3. Install the A/C expansion valve (2) onto the evaporator tube tapping block (1).

4. Install the two bolts (3) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).

5. Connect the A/C liquid line (3) and A/C suction line (5) to the A/C expansion valve (1) and install the retaining nut (2). Tighten the nut to 8 N·m (70 in. lbs.).

6. Reconnect the negative battery cable.

7. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

8. Adjust the refrigerant oil level (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).

9. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

HEATER-CABIN

HEATER UNIT

DESCRIPTION

NOTE: LHD model shown. RHD model similar.

An electric positive temperature coefficient (PTC) heater unit (1) is used on vehicles when equipped with the 2.8L diesel engine. The PTC heater unit aids in passenger compartment heating by compensating for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core and is controlled by the diesel

engine control module (ECM) and the totally integrated power module (TIPM) through two relays in diesel accessory fuse/relay block located below the left front fender.

The PTC heater consists of a molded plastic mounting plate (2) with an integral wire connector receptacle (3). Concealed behind the mounting plate are four heating elements with fins (4) that transfer the heat produced by the PTC heater to the conditioned air flowing within the air distribution housing. Two retaining tabs (5) are molded onto the opposite end of the heater unit to support the heater unit inside the air distribution housing. The PTC heater unit is connected to the vehicle electrical system through the instrument panel wire harness.

The PTC heater unit is accessed for service from underneath the instrument panel.

OPERATION

The positive temperature coefficient (PTC) heater unit dissipates 1 kW of electrical power through 4 heating bars. The totally integrated power module (TIPM) operates the three relays for the PTC heater unit. The PTC heater unit is split into two "banks". Each bank is driven separately based on alternator load. This allows for lower in-rush current and optimum battery charging. After a bank has been turned on, another bank can only be turned on 10 seconds after the previous. On average, the PTC banks are not switched more than 25 times for each vehicle start. Electrical power output is between 900-1050 W.

The control system for the PTC heater unit is diagnosed using a scan tool. Prior to replacing a PTC heater unit, check for any diagnostic trouble codes (DTCs) related to the ECM, TIPM and heating-A/C system (refer to 24 - HVAC Electrical Diagnostics for more information).

The PTC heater unit cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

POSITIVE TEMPERATURE COEFFICIENT (PTC) HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Prior to replacing the positive temperature coefficient (PTC) heater unit, check for any diagnostic trouble codes (DTCs) related to the engine control module (ECM), totally integrated power module (TIPM) and the heating-A/C system and repair as necessary (refer to 24 - HVAC Electrical Diagnostics for more information).

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the PTC heater unit (refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - REMOVAL).
3. Using an ohmmeter, check for continuity between all of the PTC heater unit terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the PTC heater unit and the TIPM. If NOT OK, replace the PTC heater unit.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: PTC heater shown removed from distribution housing for clarity.

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

NOTE: To disconnect the wire harness connector from the heater unit, pull downward on the connector lock while pulling the connector away from the heater unit.

3. Disengage the wire connector lock (2) that secures the wire harness connector (1) to the positive temperature coefficient (PTC) heater unit (3) located on the left side of the HVAC air distribution housing and disconnect the connector from the heater.

NOTE: LHD model shown. RHD model similar.

4. Remove the two screws (1) that secure the PTC heater unit (2) to the left side of the HVAC air distribution housing (3).
5. Carefully remove the PTC heater unit from the air

distribution housing by pulling it straight out of the housing.

INSTALLATION

NOTE: LHD model shown. RHD model similar.

1. Carefully install the positive temperature coefficient (PTC) heater unit (2) into the left side of the HVAC air distribution housing (3). Make sure to position the two locator tabs on the end of the heater unit into the molded locator indentations on the right side of the air distribution housing.
2. Install the two screws (1) that secure the PTC heater unit to the air distribution housing. Tighten the screws to 1.2 N·m (10 in. lbs.).

NOTE: PTC heater shown removed from distribution housing for clarity.

3. Connect the wire harness connector (1) to the PTC heater unit (3) while pushing upward on the connector lock (2). Make sure the wire harness connector and lock are fully engaged.
4. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
5. Reconnect the negative battery cable.

RELAY-HEATER UNIT

DESCRIPTION

Three relays (1) are used for the electric positive temperature coefficient (PTC) heater system when equipped with the 2.8L diesel engine. The relays are International Standards Organization (ISO)-type relays. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The PTC relays are electromechanical devices that switch fused battery current directly to the heating elements of the PTC heater unit. The PTC relays are energized by control circuits of the totally integrated power module (TIPM).

The PTC relays are located in the diesel accessory fuse/relay blocks at the rear of the engine compartment.

OPERATION

The ISO-standard relays used for the electric positive temperature coefficient (PTC) heater system are electromechanical switches that use a low current ASD power input to control the high current fused battery power output to the PTC heater unit. On each relay, the movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to one or more of the heating elements of the PTC heater.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The terminals for the PTC relays are connected to the vehicle electrical system through receptacles in the diesel accessory fuse/relay blocks. The inputs and outputs of the PTC relays include:

- Terminals (30) receive battery current through a fusible link at all times.
- Terminals (85) are connected to a ground circuit.
- Terminals (86) are connected to control circuits of the totally integrated power module (TIPM).
- Terminals (87) provide fused battery current to the PTC heating elements through the PTC relays only when the PTC relay coil is energized.
- Terminals (87A) are not connected to any circuit in this application, but provide battery current output only when the PTC relay coil is de-energized.

The three PTC relays cannot be repaired and must be replaced if found inoperative or damaged. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relays and for complete TIPM and HVAC wiring diagrams.

REMOVAL

NOTE: LHD model shown in illustrations. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the positive temperature coefficient (PTC) relays number 1 and 2 (1) as necessary from the diesel accessory fuse/relay block (2) located at the inner right front fender (3).

3. Remove the PTC relay number 3 (1) as necessary from the diesel accessory

fuse/relay block (2) located at the inner left front fender (3).

INSTALLATION

NOTE: LHD model shown in illustrations. RHD model similar.

1. Position the positive temperature coefficient (PTC) relays number 1 and 2 (1) as necessary into the proper receptacle of the diesel accessory fuse/relay block (2) located on the inner right front fender (3).
2. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on each relay until the terminals are fully seated.

3. Position the PTC relay number 3 (1) as necessary into the

proper receptacle of the diesel accessory fuse/relay block (2) located on the inner left front fender (3).

4. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on the relay until the terminals are fully seated.

5. Reconnect the negative battery cable.

25 - EMISSIONS CONTROL

EVAPORATIVE EMISSIONS

SOLENOID - EVAP/PURGE

REMOVAL

The EVAP canister purge solenoid (1) is located near the battery.

1. Lift the solenoid assembly from the tongue-type bracket.
2. Disconnect electrical connector (1).
3. Disconnect quick-connect fittings (2) and (3) from solenoid.

INSTALLATION

The EVAP canister purge solenoid (1) is located near the battery.

1. Connect quick-connect fittings (2) and (3) to solenoid.
2. Connect electrical connector (1).
3. Push solenoid assembly onto the tongue-type bracket.
4. **The vapor/vacuum lines and hoses must be firmly connected. Also check the vapor/vacuum lines at the ESIM switch and filter for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

CAP - FUEL FILLER

DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with an ORVR system and an ESIM switch, the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

ORVR

OPERATION

The ORVR (On-Board Refueling Vapor Recovery) system is used to remove excess fuel tank vapors. This is done while the vehicle is being refueled.

Fuel flowing into the fuel filler tube (approx. 1" I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spitting back at the operator), and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

VALVE - PCV 3.8L

REMOVAL

The PCV valve is located in the left valve cover (2) near the ignition coil (4).

1. Remove clamp (3).
2. Remove hose (1).
3. Remove PCV valve (2).

The PCV valve (1) is of typical metal construction.

INSTALLATION

1. Clean mounting hole in valve cover.
2. Install PCV valve (2) into valve cover.
3. Install hose (1) and clamp (3).

LINES - VACUUM

DESCRIPTION

A vacuum schematic for emission related items can be found on the VECI label. Refer to Vehicle Emission Control Information (VECI) Label for label location.

SWITCH-EVAP SYSTEM MONITOR

OPERATION

The ESIM (Evaporative System Integrity Monitor) is very similar to the NVLD. However, the design of the ESIM has been simplified and unlike the NVLD the ESIM does not require a solenoid. The ESIM mounts directly to the canister, eliminating the need for a mounting bracket. It is critical that the ESIM is mounted vertically. On vehicles where the canister is mounted on an angle, the ESIM requires an adaptor to maintain a vertical position. When the ESIM is installed vertically, the electrical connector is in the 3 o'clock

position.

The ESIM assembly consists of a housing, a small weight and a large weight that serve as check valves, a diaphragm, a switch and a cover. There is one large weight and one small weight check valve in the ESIM assembly. A seal is attached at the end of each weighted check valve. The large weight check valve seals for pressure. The small weight check valve seals for vacuum. The weighted check valves are contained within the ESIM housing.

The ESIM (Evaporative System Integrity Monitor), while physically different than the NVLD system, performs the same basic function as the NVLD does – controlling evaporative emissions. The ESIM has been simplified because the solenoid used on the NVLD is not used on the ESIM.

The ESIM consists of housing, two check valves (sometimes referred to as weights), a diaphragm, a switch and a cover. The larger check valve seals for pressure and the smaller one seals for vacuum.

During refueling, pressure is built up in the evaporative system. When pressure reaches approximately .5 inches of water, the large check valve unseats and pressure vents to the fresh air filter.

Conversely, when the system cools, and the resulting vacuum lifts the small check valve from its seat and allows

fresh air to enter the system and relieves the vacuum condition. When a calibrated amount of vacuum is achieved in the evaporative system, the diaphragm is pulled inward, pushing on the spring and closing the contacts.

The ESIM conducts test on the evaporative system as follows: An engine off, non-intrusive test for small leaks and an engine running, intrusive test for medium/large leaks.

The ESIM weights seal the evap. system during engine off conditions. If the evap. system is sealed, it will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. When the vacuum in the system exceeds about 1" H2O, the vacuum switch closes. The switch closure sends a signal to the PCM. In order to pass the non-intrusive small leak test, the ESIM switch must close within a calculated amount of time and within a specified amount of key-off events.

If the ESIM switch does not close as specified, the test is considered inconclusive and the intrusive engine running test will be run during the next key-on cycle. This intrusive test will run on the next cold engine running condition.

Conditions for running the intrusive test are:

- After the vehicle is started, the engine coolant temperature must be within 50°F (10°C) of ambient to indicate a cold start.
- The fuel level must be between 12% and 88%.
- The engine must be in closed loop.
- Manifold vacuum must be greater than a minimum specified value.
- Ambient temperature must be between 39°F and 98°F (4°C and 37°C) and the elevation level must be below 8500 feet (2591 meters).

The test is accomplished by the PCM activating the purge solenoid to create a vacuum in the evaporative system. The PCM then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the switch does not close, then a general evaporative failure is recorded. The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Even when all of the thresholds are met, a small leak won't be recorded until after the medium/large leak monitor has been run. This is accomplished by the PCM activating the purge solenoid to create a vacuum in the evaporative system. The PCM then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the medium/large leak test runs and the ESIM switch doesn't close, a general evaporative test is run. The purge solenoid is activated for approximately 10 seconds, increasing the amount of vacuum in the system. If the ESIM switch closes after the extended purge activation, a large leak fault is generated. If the switch doesn't close, a general evaporative system fault is generated.

The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Stage one of the purge monitor is non-intrusive. The PCM monitors the purge vapor ratio. If the ratio is above a calibrated specification, the monitor passes. Stage two is an intrusive test and it runs only if stage one fails. During the stage two test, the PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The vapor ratio is compared to a calibrated specification and if it is less than specified, a one-trip failure is recorded.

The ESIM switch stuck closed monitor checks to see if the switch is stuck closed. This is a power down test that runs at key-off; when the PCM sees 0 rpm's, the purge solenoid is energized for a maximum of 30 seconds,

venting any vacuum trapped in the evaporative system. If the switch opens or was open before the test began, the monitor passes. If the switch doesn't open, the monitor fails. This is a two-trip MIL. The star scan tool can be used to force the ESIM switch stick closed monitor to run.

The PCM also uses the ESIM to detect a loose or missing gas cap. The PCM controller looks for a change in the fuel level (25% minimum) and then gas cap is loose or missing. If a medium/large leak is detected, a loose gas cap light illuminates and a pending one-trip fault code is set. On the PCM, this is a three-trip fault before the code matures

REMOVAL

The ESIM (EVAP System Integrity Monitor) switch is attached to the EVAP canister and is usually not serviceable. Replace the switch by replacing the EVAP canister. Refer to EVAP canister removal/installation.

If servicing separately, refer to the following:

The ESIM switch (2) is located on the EVAP canister (1)
The picture displays a typical EVAP Canister and a typical ESIM switch.

1. Remove both plastic lines from switch by folding line tabs (2).

2. Disconnect electrical connector at switch.
3. Clean any dirt from ESIM switch and its lines.

4. A lock tab (see arrow) is used on the back of the switch. Push lock tab towards switch while rotating switch counterclockwise 1/4 turn for removal.
5. The fresh air lines and hoses from the ESIM must have a clear opening to the atmosphere. Check the fresh air lines, including the fresh air filter, for obstructions or restrictions at the ESIM. Also check the routing to the exit to atmosphere. If a restriction is present, the system will not allow free flow passage of clean air, and an early shut off of the fuel fill nozzle may occur during fuel fill.

INSTALLATION

The following pictures display a TYPICAL EVAP

Canister and a typical ESIM switch. After installing any ESIM switch, the electrical connector on the switch must be in the 3 O'clock position. This step must be done for proper ESIM switch operation.

1. The fresh air lines and hoses from the ESIM must have a clear opening to the atmosphere. Check the fresh air lines, including the fresh air filter, for obstructions or restrictions at the ESIM. Also check the routing to the exit to atmosphere. If a restriction is present, the system will not allow free flow passage of clean air, and an early shut off of the fuel fill nozzle may occur during fuel fill.

2. Be sure O-ring (2) and EVAP canister opening are clean.

CAUTION: The electrical connector (3) on the ESIM switch must be in 3 O'clock position after installation. This step must be done for proper switch operation.

3. Position ESIM switch (2) into EVAP canister (1) and rotate until electrical connector is in 3 O'clock position (3).
4. Connect electrical connector.
5. Connect plastic lines to ESIM switch.

CANISTER - VAPOR

OPERATION

A maintenance free, EVAP canister is used on all vehicles. The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

The EVAP canister is also to be considered as part of the ORVR system.

REMOVAL

The EVAP canister (1) is located under the vehicle next to the rear prop shaft. The ESIM switch (2) is attached to the EVAP canister.

1. Raise and support vehicle.
2. Clean dirt or debris from canister vacuum lines.
3. Disconnect electrical connector (4) at ESIM switch (2).
4. Disconnect rubber hose (1) from ESIM switch.
5. Disconnect fitting (3) at EVAP canister.

6. Remove two bolts (2) at front of canister mounting bracket (1).
7. Remove two bolts at rear of canister mounting bracket.

8. To separate EVAP canister (4) from mounting bracket (1), pry on lock-tab (2).

INSTALLATION

1. Attach canister to mounting bracket. Lock canister to mounting bracket by using lock tab (2).

8192388c

2. Install two bolts (2) at front of canister mounting bracket (1).
3. Install two bolts at rear of canister mounting bracket.

812923888

4. Connect electrical connector (4) to ESIM switch (2).
5. Connect rubber hose (1) to ESIM switch.
6. Connect fitting (3) to EVAP canister.
7. Lower vehicle.
8. **The vapor/vacuum lines and hoses must be firmly connected. Also check the vapor/vacuum lines at the ESIM switch, filter and EVAP purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

HEATER-CRANKCASE 2.8L

DIESEL

REMOVAL

81923884

The crankcase heater (2) is located in the hose (1) leading to the crankcase breather (6).

1. Disconnect electrical connector (5).
2. Separate hose (1) from heater.
3. Separate heater from hose (3).

INSTALLATION

81b37a7c

The crankcase heater (2) is located in the hose (1) leading to the crankcase breather (6).

1. Twist heater (2) into hose (3).
2. Twist hose (1) into heater.
3. Connect electrical connector (5).

EXHAUST GAS RECIRCULATION - 3.8L

EXHAUST GAS RECIRCULATION - 3.8L

EGR Valve Nuts 2.8L Diesel	32.4	24	-

VALVE - EGR 3.8L

REMOVAL

The EGR valve and solenoid assembly (1) is attached to the rear of the right cylinder head.

1. Use a diagnostic scan tool to record any DTC's

(Diagnostic Trouble Codes).

2. Disconnect and isolate the negative battery cable.

A metal gasket (2) is used between the EGR valve/solenoid assembly, and the right cylinder head.

A metal tube (1) connects the EGR valve/solenoid assembly to the intake manifold.

3. Remove the upper (plastic) half of the intake manifold.

4. Disconnect electrical connector (2) at EGR valve.

5. Remove tube mounting bolt (2).

6. Remove two tube mounting bolts (1) at EGR valve end of tube.

7. Remove and discard gasket (5) and O-ring (3).

8. Remove two EGR valve mounting bolts (3).

9. Discard gasket (2).

INSTALLATION

1. Clean gasket mounting area at rear of cylinder head and EGR valve.
2. Install new gasket (2).
3. Position EGR valve (1) to rear of cylinder head and install two EGR valve mounting bolts (3).

4. Clean gasket mounting areas at both ends of EGR tube.
5. Install new gasket (5) and new O-ring (3) to EGR tube.
6. Install two tube mounting bolts (1) at EGR valve end of tube.

7. Install tube mounting bolt (2).

8. Connect electrical connector (2) to EGR valve.

9. Install the upper (plastic) half of the intake manifold.
10. Install two tube flange bolts (2) at intake manifold.
11. Connect negative battery cable.
12. Using a diagnostic scan tool, erase any previously recorded DTC's (Diagnostic Trouble Codes).

OPERATION

OBD II MONITOR RUN PROCESS

The following procedure has been established to assist technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

NOTE:

Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. EVAP Monitor runs after key off. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

Monitor Preliminary Checks:

1. Plug a scan tool into the vehicle's Data Link Connector (DLC).
2. Turn the ignition, KEY ON - ENGINE OFF. Watch for MIL lamp illumination during the bulb check. MIL lamp must have illuminated, if not, repair MIL lamp.
3. Using a scan tool check for Powertrain related DTCs.
 - Verify that No Emissions Related DTCs are Present. If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
 - The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.

Using the scan tool check the CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?

- YES - all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.
- NO - then the following procedure needs to be followed to run/complete all available monitors.

NOTE:

Only the monitors, which are not YES in the CARB Readiness Status, need to be completed. Specific criteria need to be met for each monitor. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.

Evaporative Emission System Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine

running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. Criteria for EVAP monitor:

- Engine off time greater than one hour .
- Fuel Level between 15% and 85%.
- Start Up ECT and IAT within 10°C (18°F).
- Vehicle started and run until Purge Monitor reports a result.

NOTE: If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

Catalyst / O2 Monitor

The Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (less than 50 mph) (73km/h) for a few minutes. Some vehicles run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria.

- Engine RPM between 1200 to 3000.
- Engine temperature greater than 70°C (158°F)
- Engine run time greater than 92 seconds
- MAP between 10 - 20 kPa (7.5 - 15 Hg)
- Vehicle speed between 20 - 70 mph (29–103 km/h)

EGR Monitor

After the vehicle has reached the below conditions and during a throttle decel the EGR monitor will run.

- Engine RPM between 1375 - 2500
- Engine temperature greater than 70°C (158°F)
- Engine run time greater than 125 seconds
- Vehicle speed between 25 - 70 mph (37–103 km/h)

O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down.

Mis-Fire Monitor

The Misfire Monitor is a continuous two-trip monitor. The monitor uses two different tests/counters:

NOTE: The Adaptive Numerator must be learned before the PCM will run the Mis-Fire Monitor. The

PCM updates the Adaptive Numerator at every key-ON, and is relearned after battery disconnect. The Misfire Monitor will not run until the Adaptive Numerator has updated since the last battery disconnect. If the Adaptive Numerator is equal to the default value then the PCM knows that the Adaptive Numerator has not been learned and does not permit the Misfire Monitor to run. If the Adaptive Numerator exceeds a calibrated percentage, the PCM sets a DTC for CKP NOT LEARNED and illuminates the MIL.

- 200 Revolution Counter - Looks for misfire that can cause immediate catalyst damage.
- 1000 Revolution Counter - Looks for misfire that can cause emissions to increase 1.5 times the Federal Test Procedure (FTP) standards. This test must also identify misfire percentages that might cause a “durability demonstration vehicle” to fail an Inspection and Maintenance Program tailpipe emissions test.

VALVE - EGR 2.8L

REMOVAL

The EGR valve (5) is located at the rear of the intake manifold (7).

1. Disconnect and isolate negative battery cable at battery.
2. Remove plastic engine cover.
3. Relieve cooling system pressure and remove EGR cooler (8). Refer to Engine Cooling for removal procedures.

4. Remove vacuum line from fitting (6).
5. Remove EGR valve mounting bolts (8) and remove EGR valve (5) from intake manifold.
6. Remove and discard old mounting gasket located between EGR valve and intake manifold.
7. Clean mounting areas at bottom of valve and at top of intake manifold.

INSTALLATION

The EGR valve (5) is located at the rear of the intake manifold (7).

1. Clean mounting areas at bottom of EGR valve and at top of intake manifold.
2. Place new mounting gasket between EGR valve and intake manifold.
3. Install EGR valve (5) and mounting bolts (8) to intake manifold. Tighten bolts to 15 N·m (11 ft. lbs.) torque.
4. Connect vacuum line to fitting (6).

81b2ac70

5. Install EGR cooler (8). Refer to Engine Cooling for removal procedures.
6. Install plastic engine cover.
7. Connect and negative battery cable to battery.

SOLENOID-EGR

REMOVAL

The EGR Solenoid (3) is located on the top of valve cover.

1. Remove plastic engine cover.
2. Disconnect electrical connector (2).
3. Disconnect vacuum/pressure lines (1).
4. Remove two mounting bolts (4) and remove solenoid.

INSTALLATION

The EGR Solenoid (3) is located on the top of valve cover.

1. Position solenoid (3) to valve cover and install two mounting bolts (4).
2. Connect electrical connector (2).
3. Connect vacuum/pressure lines (1).
4. Install plastic engine cover.

VALVE-EGR AIR FLOW CONTROL

REMOVAL

The EGR air control valve (9) is located near the center of the intake manifold (7). A cast intake housing (3) connects the control valve to the intake manifold.

1. Disconnect and isolate negative battery cable at battery.
2. Remove plastic engine cover.

3. Remove rubber intake tube clamp (3).
4. Disconnect rubber tube (2) from air control valve (1).

5. Disconnect air control valve electrical connector from control valve at point (2).

6. Remove EGR air control valve mounting bolts (2) and remove valve (9).
7. Remove and discard old mounting gasket located between EGR air control valve (9) and intake manifold connecting housing (3).
8. Clean mounting areas at bottom of air control valve and at intake manifold connecting housing (3).

INSTALLATION

The EGR air control valve (9) is located near the center of the intake manifold (7). A cast intake housing (3) connects the control valve to the intake manifold.

1. Clean mounting areas at bottom of air control valve and at intake manifold connecting housing (3).
2. Install new mounting gasket between EGR air control valve (9) and intake manifold connecting housing (3).
3. Install EGR air control valve and mounting bolts (2). Tighten bolts to 13 N·m (10 ft. lbs.) torque.

4. Connect air control valve electrical connector to control valve at point (2).

5. Connect rubber tube (2) to air control valve (1).
6. Install and tighten rubber intake tube clamp (3).
7. Install plastic engine cover.
8. Connect negative battery cable to battery.

81b467c8
